The Double-Edged Role of Artificial Intelligence and Other Disruptive Technologies

Springer

Studies in Systems, Decision and Control

Volume 587

Series Editor

Janusz Kacprzyk, Systems Research Institute, Polish Academy of Sciences, Warsaw, Poland

Editorial Board

Dmitry A. Novikov, Institute of Control Sciences (Director), Russian Academy of Sciences, Moscow, Russia

Peng Shi, School of Electrical and Mechanical Engineering, University of Adelaide, Adelaide, SA, Australia

Jinde Cao, School of Mathematics, Southeast University, Nanjing, China

Marios Polycarpou, KIOS Research Center, University of Cyprus, Nicosia, Cyprus

Witold Pedrycz, Department of Electrical and Computer Engineering, University of Alberta, Edmonton, AB, Canada

The series "Studies in Systems, Decision and Control" (SSDC) covers both new developments and advances, as well as the state of the art, in the various areas of broadly perceived systems, decision making and control–quickly, up to date and with a high quality. The intent is to cover the theory, applications, and perspectives on the state of the art and future developments relevant to systems, decision making, control, complex processes and related areas, as embedded in the fields of engineering, computer science, physics, economics, social and life sciences, as well as the paradigms and methodologies behind them. The series contains monographs, textbooks, lecture notes and edited volumes in systems, decision making and control spanning the areas of Cyber-Physical Systems, Autonomous Systems, Sensor Networks, Control Systems, Energy Systems, Automotive Systems, Biological Systems, Vehicular Networking and Connected Vehicles, Aerospace Systems, Automation, Manufacturing, Smart Grids, Nonlinear Systems, Power Systems, Robotics, Social Systems, Economic Systems and other. Of particular value to both the contributors and the readership are the short publication timeframe and the worldwide distribution and exposure which enable both a wide and rapid dissemination of research output.

Indexed by SCOPUS, DBLP, WTI Frankfurt eG, zbMATH, SCImago.

All books published in the series are submitted for consideration in Web of Science.

Preface

Scholars, practitioners, and professionals consider business innovation as a necessity to minimize business risk. Through technological innovation, businesses can adapt to societal changes and reduce the impact of both internal and external threats and risks. Business resilience is the ability to deal with challenging conditions by ensuring the existence and prosperity of the organization. In today's rapidly evolving global landscape, businesses face unprecedented challenges and opportunities. The twin imperatives of building resilience against disruptions and driving innovation for sustainable growth have become paramount for long-term success. This book delves into the complex and often paradoxical role of artificial intelligence (AI) and other disruptive technologies in navigating this intricate terrain.

While AI and related technologies offer transformative potential for enhancing business resilience—from predictive analytics for risk mitigation to automated systems for operational continuity—they also present significant challenges. Ethical considerations, potential biases in algorithms, job displacement concerns, and the environmental impact of technology development all demand careful consideration. This double-edged sword requires a nuanced understanding to harness the benefits while mitigating the risks.

This book aims to provide a comprehensive exploration of this dynamic interplay between technology, resilience, and sustainability. It is targeted towards a diverse audience, including academics, students, researchers, business practitioners, policymakers, and anyone interested in the intersection of technology, business strategy, and sustainable development.

We explore a range of critical topics, including but not limited to technological innovation and inclusivity, sustainable educational planning and integrating technology into educational development strategies, the impact of data analytics on business intelligence, financial technology and inventory management efficiency, augmented reality and digital marketing, and many more.

This work is intended to inspire critical thinking, foster collaboration, and contribute to a more informed and responsible approach to harnessing the power of technology for the benefit of both businesses and society.

Our hope is that this book will serve as a valuable resource for navigating the complex challenges and opportunities presented by AI and other disruptive technologies in the pursuit of sustainable business excellence.

Contents

Accounting Harmonization Dynamics in the Arab Middle Eastern Countries: A Comparative Analysis 1
Muiz Abu Alia, Aladdin Dwekat, Mohammad Yaaqbeh, Bashar Fattouh, and Dana Hodali

AI at the Heart of Development: Revolutionizing Accounting Processes for Comprehensive Progress 15
Bader AlTamimi, Nader AlTamimi, and Mohammad Abdallah

Artificial Intelligence in the Banking Industry: A Bibliometric and Directions Ahead 23
Islam Abdeljawad, Muiz Abu Alia, Shorouq Flaifel, and Sanaa Zeidan

The Impact of Data Analytics on the Business Intelligence Technology 37
Tamara Adel Al-maaitah, Dirar Abdelaziz Almaaitah, Al smadi Khalid, Tariq Khairo Issa Al Daabseh, Ala'a Mohammed Fadel Al-junaidi, and Nour Abdulwahab Qatawneh

Does Implementing Lean Management Have the Potential to Affect the Performance of an Organization? 51
Lama Ahmad Alsmadi, Khalid W. Wazani, and Qais Hammouri

The Moderating Role of Firm Size on the Relationship Between Intellectual Capital and Firm Performance Among Industrial Companies Listed on Palestine Exchange (PEX) and Amman Stock Exchange (ASE) for the Period 2016 to 2022 65
Ghassan Daas and Abeer Yahya

The Impact of Integrated Marketing Communications on the Purchasing Behavior of Telecommunications Customers 83
Iyad A. A. Khanfar and Mohammad Musa

The Effect of Deferred Tax Assets and Tax Planning on Earnings Management: Evidence from a Stock Exchange 99
Munia O. Abu Hammad and Mohammad H. Abu-Nassar

The Impact of Financial Technology on Inventory Management Efficiency 113
Nader AlTamimi, Bader AlTamimi, and Mohammad Abdallah

The Effect of Changing Murabaha Rates on the Financial Performance of the Islamic Banks Listed on a Stock Exchange 123
Nidal Mahmoud Al-Ramahi, Tareq Hammad Almubaydeen, and Mohammad Zyad Alasad

The Possibility of Islamic Banks Dealing with Tawarruq Disciplined by the Sharia Standard 137
Suhail Al-Ahmad, Odeh Abdullah, Alaa Sartawi, and Khaled Alzeaideen

Determinants of Cash Holdings: Evidence from High Uncertainty Environment 145
Islam Abdeljawad, Aya Abdelhaq, and Ezeya Shareef

The Effect of Corporate Governance and Tax Avoidance on Firm Value of Industrial and Service Companies 159
Mohammad H. Abu-Nassar and Waed Mansour Qoqazeh

Board of Directors' Attributes and Quality of Sustainability Reports Among Industrial Companies and Banks Listed on a Stock Exchange 177
Abdulnaser I. Nour, Areen Ahmad Dagher, Sara Basem Douglas, and Kamel Jebreen

Driving Customer Satisfaction: Exploring the Impact of Digital Banking Transformation in Banks 199
Belal Yousef Aqel, Shoruq Flaifel, Sanaa Zeidan, and Mofeed Thaher

Examining the Relationship Between Hiring People with Disabilities and Customer Perspectives: Moderator Role of Physical Disability 213
Mohammad Abuhashesh, Alaa Adnan Awad, Ra'ed Masa'deh, and Shafig Al-haddad

The Effect of Brand on Consumer's Purchase Decision: Mobile Phones as a Case Study 231
Iyad A. A. Khanfar and Ahmed Khozaimyah

Integration of Artificial Intelligence Along with AR and VR Ensure Prosperous Future in Digital Marketing 253
Mai Mohammad Zakaria, Mohamed Doheir, and Norfaridatul Akmaliah Othman

Business Intelligence in Construction Companies as a Competitive Advantage: Insights from a Literature Review 267
Qais I. Tanbour

Banks Profitability Determinants: Empirical Evidence from Developing Countries 279
Muath Asmar, Hasan Farhood, and Safaa Jerab

Fintech and Financial Inclusion: A Bibliometric Analysis and Insights 297
Islam Abdeljawad, Bilal Aqel, and Muiz Abu Alia

The Effect of Human Capital Disclosure in Integrated and Sustainable Reports on the Financial Performance of Companies Listed in a Stock Exchange 311
Abdulnaser I. Nour, Taimaa Kharoub, and Aya Yahya

Improving Marketing Mix Elements with Artificial Intelligence: A Comprehensive Review 327
Hanady Al-Zagheer, Qais Hammouri, Ayad Fadhil Altememi, and Ibrhim Abu Nahleh

Examining How the Quality of E-Government Services Influences Beneficiary Satisfaction: SANAD Application as a Case Study 339
Zakaria Azzam and Ayser Abu Ghazaleh

Navigating Digital Banking Transformations: Insights from a Systematic Literature Review 359
Belal Yousef Aqel and Rani Shahwan

The Impact of Individual's Characteristics and Access to the Telecommunication Infrastructure on Digital Financial Inclusion 373
Duha Farouq Tanbour

Examining the Determinants of Postgraduate Students' Behavioral Intentions in Utilizing MOOCs for Advanced Learning 383
Qais Hammouri, Mohamad Ahmad Saleem Khasawneh, Hanady Al-Zagheer, and Ibrahim Lewis Mukattash

The Impact of Marketing Mix Elements on the Purchase Decision: Flower Consumers as a Case Study 391
Iyad A. A. Khanfar and Osama Muhammad Ibrahim

Enhancing Profitability Through Sustainability: Unveiling the ESG-Financial Performance Nexus in European Firms 409
Aladdin Dwekat, Mohammad N. Yaaqbeh, and Zeena Mardawi

Application of Artificial Intelligence in Insurance Companies: A Bibliometric Review and Content Analysis 423
Muath Asmar and Mohammad Jaradat

Does Internal Auditing Impact the Achievement of Sustainable Development in the Banking Industry? 437
Kayed M. Tanbour and Abdulnaser I. Nour

Unveiling the Dynamics of Business Intelligence: Definition, Components, Tools, and Data Mining 457
Asmaa Jameel AI-Nawaiseh and Mahmoud Barakat Alnawaiseh

Mobile Payment Adoption: Challenges and Opportunities 473
Islam Abdeljawad, Muiz Abu Alia, Na'el Musa, Alaa Jarrar, and Lina Yousef Wishahi

The Impact of a Company's Accounting Income and Capital Structure on the Economic and Financial Sustainability—An Empirical Study on Industrial Companies Listed on the Palestine and Amman's Stock Exchange During for the Period 2016–2022 487
Ghassan Daas and Maram Mashaqi

The Mechanism of Issuing Bonds and Financial Certificates and the Parties Involved in the Process 509
Ahmad Habes Theyab AL-Mjali

The Effect of E-Performance Evaluation on Talent Management: A Conceptual Model 523
Hanady Al-Zagheer, Qais Kilani, Qais Hammouri, and Ayad Fadhil Altememi

Enhancing Financial Integrity: The Role of Accounting Information Systems in Mitigating Creative Accounting Practices Among Industrial Companies Listed on a Stock Exchange 533
Ziad Abdul Haleem Altheebeh and Braa Adel Alqaise

Attracting Consumer Attention by Exploring the Effects of Sales Promotion Tools: A Case Study on Carrefour Customers 543
Mustafa S. Al-Shaikh and Hadeel Mohammad Ahmad Shaza

The Impact of Digital Marketing Techniques on Purchasing Decisions of Services: Telecommunications Customers as a Case Study 559
Iyad A. A. Khanfar and Rawaah Bassem Ahmed Al-Qaisi

Accounting Harmonization Dynamics in the Arab Middle Eastern Countries: A Comparative Analysis

Muiz Abu Alia, Aladdin Dwekat, Mohammad Yaaqbeh, Bashar Fattouh, and Dana Hodali

Abstract This study investigates accounting harmonization within and between seven Arab Middle Eastern countries, using 2018 data from 255 industrial companies. By utilizing C-index and I-index metrics, the research aims to assess the harmonization extent and nature of seven key accounting measures in a diverse economic region. The findings reveal a variety of harmonization levels. High harmonization is evident in inventory valuation, PPE valuation, straight-line depreciation, and foreign currency translation, suggesting alignment with standardized accounting practices. Conversely, borrowing costs, investment property valuation, and inventory costing methods exhibit lower harmonization, attributed to the flexibility within accounting standards and regional economic conditions. A significant aspect of the study is comparing international financial reporting standards (IFRS) adopters with local standards users. While IFRS generally promotes higher harmonization, it does not uniformly guarantee this across all accounting areas. This highlights the influence of local economic and industry-specific factors on accounting practices, along with global standards. Conclusively, the study underscores the need for aligning local accounting practices with global standards like IFRS to enhance comparability and transparency in financial reporting. It contributes to the discourse on global accounting harmonization, suggesting a nuanced approach to standardization that considers local specificities. The findings are vital for policymakers, standard-setters, and financial analysts, offering insights for achieving more uniform accounting practices worldwide.

1 Introduction

Following globalization, accompanied by technological innovation, capital markets around the world have become more integrated. Operating, financing and investing activities of firms are no longer limited to their countries, and multinationality of companies has figured as an important attribute of the today business. Furthermore, the global economy has changed as the volume of international trade and foreign direct investment has been enhanced [1].

The international accounting community had to has a relevant appropriate response to enhance the usefulness of the financial statements for the information users on the international level. Usefulness of accounting information is dependent on the availability of specific qualitative characteristics including comparability [2, 3]. The International Accounting Standards Board (IASB) has sought to improve comparability of the financial statements prepared using the IFRS [1]. Comparability enables users to identify the trends of the firm performance and financial position of an entity, and to compare between different entities [4].

Nowadays the majority of the countries, including Arab countries, permits or requires the use of IFRS, with the purpose of benefiting from the accompanied advantages [4, 5]. However, while IFRS adoption is formally (de jure harmonization) increasing, the practical (de facto) harmonization is still moot given the cultural, legal, political, economic and regulatory differences exist between countries [1, 6]. Other studies questioned the appropriateness of the IFRS for non-developed countries implying the difficulty of achieving the promised advantages [7]. Due to the environmental differences, companies find themselves define, recognize and measure items of the financial statements differently. Even when the same standards are used, financial reporting practices are different following the way they are interpreted and applied by companies [8, 9].

Therefore, availability of comparable financial statements between companies is questionable, either within the same country or among different countries [10]. This study addresses this issue as it investigates the comparability of financial statements prepared by 255 companies listed on seven stock exchanges in the Arab Middle Eastern countries. Data was manually obtained from the financial statements of these companies available on the websites of exchanges of Jordan, Egypt, Saudi Arabia, Oman, Kuwait, Qatar and Palestine. Comparability is estimated based on the alternatives of seven measurement methods used by these companies. In detail, the degree of harmonization is measured in each country (within-country comparability), and between the countries (between-country comparability). Moreover, the study examines whether the financial statements of the companies that use IFRS are more harmonized compared with those that adopt other financial reporting frameworks. In the light of the aforementioned measures, this research adopts C and I indices developed by Van der Tas [11] to estimate the harmonization degree between companies in the same country, between countries and between different accounting standers adopters [12].

The study provides evidence on the comparability of IFRS-based financial statements from a region that has long been neglected in the harmonization literature. While accounting harmonization has been addressed in other regions, especially developed countries, this study estimates the harmonization degree of accounting measures between selected Arab countries and within each of them. In general, the Arab countries has similar features such as the common culture, however several differences, such as economic development and political stability, between them exist [13, 14].

Beside understanding the extent of accounting harmonization in, and between, these countries, the study uncovers the practices already used and the practices that regulators need to re-evaluate to maintain comparable financial statements. Consequently, the confidence of accounting information users in the financial statements will be attained.

2 Background, Literature Review and Research Questions

Comparability is attained when accounting rules are implemented consistently by firms from one period to another and between firms [4]. However, accounting practices may show differences between countries and even between firms of the same country because of the prevailing circumstances and the differences in interpretation and application of the accounting standards [15–17].

Accounting harmonization, the process by which accounting diversity is reduced, serves the globalization of financial markets as it facilitates comparisons between financial and economic information and improves communication [18]. Cross-border activities of firms highlighted the demand for accounting harmonization in terms of rules and practices [19]. Comparability on international level has become more important following the notable increase in the volume of international trade, the spread of multinational companies, the growth of foreign direct investment, as well as the internationalization of the financial markets [1].

IFRSs enhance the comparability and the quality of financial information on the international level [4, 20]. The issuance of IFRS has been considered as the most notable event of international harmonization, however their uniformed application was and remains a concern [4]. A lack of uniform IFRS application beside the different measurement alternatives permitted by these standards explain this concern. Accordingly, the wide international adoption of IFRS may not lead to comparable financial information [19]. The literature [16, 21, 22] attributed this to the differences in terms of economic, political, legal, financing styles, cultural, taxational, global, firm-specific factors [6, 10].

Several previous studies have addressed the harmonization extent between companies whether in the same country or from different countries [23, 24]. Early studies in the EU countries found a slight influence of IFRS on accounting harmonization between EU companies [25, 26]. However, other studies noticed an increase

in harmonization in several areas of the world [27–32]. On the other hand, a third category of studies reported mixed results [33].

Following the adoption of IFRS, [34] noticed an increased in accounting harmonization between Italian and Spanish companies. Similarly, [35] observed more accounting harmonization as a result of IFRS adoption. Consistently, [36] reported that the degree of measurement harmonization of Asian companies has significantly enhanced in the era of IFRS. Also, [24] found an increase in the comparability of the financial statements of the companies that adopt IFRS 15 compared with those that do not. However, mixed results on the comparability of the financial reporting between adopters and non-adopters of IAS 16 were reported by [17]. Likewise, [9] found a variance in accounting harmonization levels among European countries. After the IFRS adoption by countries of South East Asia, [12] revealed that I and C indices show high comparability in some areas such as foreign currency translation. A lower level of harmonization was observed in other areas like inventory valuation, depreciation of property.

Considering the above discussion, the following Research Questions (RQs) were developed:

RQ1: To what extent do accounting measurements vary among industrial listed companies in the Arab Middle Eastern countries?

RQ2: How do accounting measurements differ within individual Arab Middle Eastern countries?

RQ3: How does the level of accounting harmonization compare between IFRS adopters and local standard adopters in the Arab Middle Eastern countries?

3 Research Methodology

3.1 Sample

The Arab countries are economically developing or emerging countries. On the other hand, they have common similarities especially in terms of culture. In most of them, firms are required to use IFRS as a basis for preparing financial statements. This study focuses on the Arab Middle Eastern countries that have stock exchanges including Jordan, Egypt, Saudi Arabia, Oman, Kuwait, Qatar and Palestine. The rest of the countries were neglected due to the lack of stock exchanges, the limitation of obtaining required data, and the limited number of the listed industrial companies.

The study covers all industrial companies listed on the seven stock exchanges in 2018, conditional to the availability of their data. Other sectors were excluded given their specific reporting practices and regulatory requirements. Accordingly, the distortion caused by industry differences would be reduced. The total number of the included companies is 255 company (34 from Oman, 20 from Kuwait, 56 from Saudi Arabia, 81 from Egypt, 13 from Palestine, 42 from Jordan and 9 from Qatar). While Egypt doesn't permit the use of IFRSs, Saudi Arabia requires them only for

banks and insurance companies. In Palestine, Jordan, Bahrain, Oman, and Kuwait, IFRSs are required for all domestic listed companies [5].

3.2 Data and Measures

Data related to 7 accounting measures was obtained from the financial statements of the sample companies available at the Web sites of the exchanges. The accounting measurements considered by the study are: (i) inventory valuation; (ii) inventory costing method; (iii) borrowing costs; (iv) PPE; (v) depreciation; (vi) foreign currency translation rate; and (vii) investment property.

Following the previous studies [17], Indices developed by [11] are used to measure harmonization. H (Herfindahl) index is used to estimate harmonization between companies of the one country in the same period. It reflects the probability of using similar accounting methods by two randomly selected companies. However, H index can be applied only when companies use one alternative accounting method [37]. In detail, the H index equals the square of relative frequencies of each alternative accounting measure of a specific transaction; it is calculated as follows [38]:

$$\mathrm{H} = \sum_{i=1}^{n} \cdot \mathrm{P}_i^2$$

where: n is the number of alternative accounting methods and *Pi* is the frequency of method *i*.

C index is used if several alternatives are available for measuring a particular item. It measures harmonization level between firms on a national level depending on the number of pairs of firms that follow the same measurement. C index ranges from 0 to 1, representing the number of compatible pairs of firms compared with the total number of pairs. It increases as the same method is used by more firms. According to this index, financial statements of two firms are compatible (harmonized) if both of them apply the same accounting measure. C index is calculated as follows [38]:

$$\mathbf{C} = \mathbf{\Sigma}(\mathbf{n}_i \mathbf{x}(\mathbf{n}_i - \mathbf{1}))/(\mathbf{N}\mathbf{x}(\mathbf{N} - \mathbf{1}))$$

where: *N* is the number of the alternative methods, *n* is the number of sampled financial reporting and at the number of entities applying the *t* accounting method.

The I-index measures differences between countries in accounting practices. It doesn't indicate the statistical significance of accounting harmonization, rather it is a scale to estimate the harmonization level for comparative purposes [33, 39]. The formula of I-index is as follows:

$$\mathbf{I} = \left[\sum_{\mathbf{m}=\mathbf{1}} \mathbf{M} \cdot \left(\prod_{\mathbf{n}=\mathbf{1}}^{\mathbf{N}} \cdot \mathbf{P}_{\mathbf{mn}} \right) \right]^{(\mathbf{1}/(\mathbf{N}-\mathbf{1}))}$$

where: *m* is the alternative accounting method, *n* number of firms, *Pmn* relative frequency of the utilization of method *m* in country *n*.

I index values range from 0 to 1. It reflects the percentage of the pairs of measured firms that are comparable. The possible sensitivity increases if the number of observed countries increases. To control this sensitivity, [40] proposed the adjusted I index. When all firms in a particular country choose one of the available alternatives, the proportions are recorded as 0.99 for the unanimous method instead of 1, and 0.01 for the non-practiced method instead of 0. This method is used given its simplicity [41].

Based on [11], harmonization is classified into three categories, high, medium and low. High harmonization is observed if the index is 80% or more. From 60% to less than 80% it is medium, while a percentage less than 60% indicates that the harmonization is low [36].

Annual reports of the sampled firms were scanned to identify the methods used to measure each of the considered items. Then, the number of firms using each alternative for every country is counted for computing C index and I index [27, 34, 36]. Furthermore, notes of the financial statements were scanned to determine if the used methods are fully disclosed in an understandable manner. Following [42], seven measurement methods of selected items including PPE, inventories, foreign currency translation, and borrowing costs are included, given their significant effect on income and assets valuation. Further, these items are widely implemented by industrial firms and sufficient related disclosure is available. Considered measures, shown in Table 1, are included based on the financial reporting frameworks adopted in the countries covered by the study.

4 Results

The results of the current research are categorized into: (i) harmonization on national level; (ii) harmonization across countries, and (iii) harmonization between IFRS adopters compared with local standards adopters.

(i) ***Harmonization on national level***

As mentioned earlier, C-index is used to measure accounting harmonization between companies of the same country. Results of C Index are presented in Table 2.

Inventory Valuation and Costing Method: There is a noticeable variance in the harmonization of inventory valuation and costing methods. While Oman, Kuwait, and Qatar show full harmonization in inventory valuation, indicating a consistent approach across firms, inventory costing methods generally exhibit lower harmonization levels. This suggests diverse costing practices within the same country, potentially due to differing industrial requirements or interpretations of accounting standards [15].

Table 1 Detailed accounting measurement methods

No.	Accounting measurement	Measurement methods	References
1	Inventory valuation	Lower of cost or net realizable value (NRV); pure cost; lower of cost or NRV, with variations for raw materials; other methods; not disclosed; and not applicable	[12]
2	Inventory costing method	FIFO (first-in, first-out); weighted average (W/A); mixed; not disclosed; and not applicable	[12]
3	Borrowing costs	Capitalized; expensed; not disclosed; and not applicable	[43]
4	PPE	Cost method; revaluation model (fair value); not disclosed; and not applicable	[17]
5	Depreciation	Straight-line; declining balance; units of production; mixed methods; not disclosed; and not applicable	[12, 17]
6	Foreign currency translation rate	Current exchange rate; average rate; other rates; not disclosed; and not applicable	[12]
7	Investment property	Cost model; revaluation model; not disclosed; and not applicable	[44]

Table 2 C-index values across accounting measures and countries

Accounting measure	Jordan	Egypt	Saudi Arabia	Oman	Kuwait	Qatar	Palestine
Inventory valuation	0.66	0.73	0.86	1.00	1.00	1.00	0.58
Inventory costing method	0.34	0.41	0.57	0.62	0.44	0.58	0.24
Borrowing costs	0.54	0.58	0.71	0.55	0.66	1.00	0.47
PPE	1.00	0.95	1.00	1.00	1.00	1.00	1.00
Depreciation	1.00	0.93	0.93	0.94	1.00	1.00	0.85
Foreign currency Translation	0.95	0.84	0.93	1.00	1.00	1.00	1.00
Investment property	0.71	1.00	0.52	0.47	0.56	0.40	0.40

Note Table 2 consolidates the C-index values for each accounting measure in each country, offering a comprehensive overview of harmonization levels

Borrowing Costs: The harmonization in borrowing costs also varies, with Qatar showing full harmonization. This could imply a uniform understanding and application of the relevant standards for capitalizing or expensing borrowing costs among Qatari firms. In contrast, countries like Jordan and Palestine show lower levels of harmonization, possibly reflecting varied business practices or economic conditions influencing accounting decisions.

Property, Plant, and Equipment: A high degree of harmonization is observed across all countries in the measurement of PPE. This uniformity is attributed to the companies' reluctance to use the revaluation model in measuring PPE items. From the 255 Arab industrial companies, only 2 Egyptian companies use the fair value, implying immature practice of fair value measurement. Such results are consistent with [45].

Depreciation: The harmonization of depreciation methods is notably high in all countries, suggesting a common approach to asset depreciation. This could be due to the straightforward nature of the straight-line method, commonly preferred for its simplicity and consistency over time.

Foreign Currency Translation and Investment Property: While there is significant harmonization in foreign currency translation rates, investment property valuation shows varied levels of harmonization. This difference may arise from the choice between cost and fair value models, with the latter depending more on market conditions and management judgment [45].

In summary, the analysis indicates that while some accounting measures exhibit high levels of harmonization within countries, implying standardized practices, others show considerable variation. These results are consistent with previous studies [12, 17, 33]. This disparity can be attributed to the complexity of certain accounting areas, differences in industry practices, and the flexibility allowed by accounting standards. Understanding these variations is crucial for stakeholders relying on financial statements for decision-making, as it impacts the comparability and reliability of financial information across borders. Local standard-setters are required to reduce alternatives. Accordingly, Arab countries becomes more attractive for local and foreign investments.

(ii) ***Harmonization Across Countries***

Table 3 (A) shows mixed results related to the harmonization between Arab countries confirming the results of many studies [9, 17, 32], completely or partially. While harmonization is low for inventory costing, borrowing costs and investment property, it is high for inventory valuation, PPE, depreciation, and foreign currency translation. Differences in the financial reporting frameworks may explain such differences [1]. In general differences in the contexts of countries lead to different accounting practice [9]. These results highlight the need for improving comparability of financial statements related to some accounting practices between Arab countries.

Table 3 I index across countries, IFRS-adopters and non-IFRS-adopters

Accounting measure	A: Harmonization between countries (I-Index)	B: Harmonization between IFRS adopters and local standards adopters	
		IFRS adopters (I-Index)	Local standards adopters (I-Index)
Inventory valuation	0.80	0.82	0.78
Inventory costing method	0.44	0.42	0.47
Borrowing costs	0.56	0.50	0.56
PPE	0.98	1.00	0.97
Depreciation method	0.95	0.97	0.93
Foreign currency translation rate	0.92	0.98	0.87
Investment property	0.55	0.52	0.60

(iii) ***Harmonization Between IFRS Adopters Compared with Non-IFRS Adopters***

The comparative analysis of harmonization between IFRS and local standards adopters reveals significant insights. Table 3 (B) illustrates the nuanced landscape of accounting harmonization, where IFRS adopters generally exhibit higher levels of harmonization in key accounting practices compared to local standards adopters. In terms of inventory valuation, PPE, and depreciation method, IFRS adopters show notably higher harmonization, approaching near-uniform application in some areas. This aligns with previous findings [17, 32] that suggest IFRS's effectiveness in converging accounting practices. However, for inventory costing methods and investment property, harmonization levels are relatively lower for IFRS adopters, indicating a variance in application and interpretation.

This variability might be attributed to the flexibility within IFRS and the influence of local business environments [1], highlighting the complexity of achieving uniformity even under a global standard.

The observed differences in harmonization levels challenge the prevailing notion that IFRS adoption is a one-size-fits-all solution for global accounting challenges. They suggest that the effectiveness of international standards like IFRS might be contingent on various factors, including the nature of the accounting area and the specific regional context [15, 31, 33]. Therefore, while IFRS plays a crucial role in harmonizing accounting practices, the journey towards global harmonization in accounting remains a nuanced and multifaceted endeavour. Local circumstances of different countries must be adequately considered by the IASB when developing IFRS [16]. Furthermore, Arab countries should enhance the preparers' and regulators' IFRS-knowledge, hence raising the sound application of these standards. This will significantly contribute to improving comparability.

5 Summary of Results, Conclusion and Recommendation

This study provides evidence on the accounting harmonization from the Arab World that has long been neglected in the harmonization literature. In this comprehensive exploration of accounting harmonization, the study delved into several essential areas of inquiry (RQ1, RQ2, RQ3), focusing on the extent and nature of harmonization within and between selected Arab Middle Eastern countries and the influence of international versus local accounting standards.

Addressing the first research question (***RQ1***), the study identified varying levels of harmonization within individual countries. Notable distinctions were observed in practices such as inventory valuation and PPE valuation, where countries like Kuwait, Oman, Saudi Arabia, and Qatar demonstrated high harmonization. This suggests a strong adherence to certain harmonized accounting practices within these countries. Conversely, areas like inventory costing methods and investment property valuation showed lower levels of harmonization, reflecting diverse approaches likely influenced by local economic conditions and specific industry practices.

Turning to the second research question (***RQ2***), the analysis revealed significant differences in accounting practices. While some areas exhibited high levels of harmonization across countries, particularly in the realms of inventory valuation and fixed asset-related measures, disparities were pronounced in inventory costing methods, borrowing costs, and investment property valuation. These findings highlight the challenges posed by varying economic contexts and regulatory environments in achieving global accounting harmonization.

The third research question (***RQ3***) explored harmonization between the IFRS adopter versus non-IFRS adopters. Mixed results were obtained. In some accounting areas, IFRS adopters experience higher harmonization, yet this was not a universal trend across all accounting measures. This outcome suggests that while IFRS play a crucial role in shaping accounting practices, they are not the sole factor influencing harmonization. Local economic conditions and industry-specific requirements also have a significant bearing on accounting practices.

In conclusion, this study illuminates the intricate landscape of accounting harmonization in the Arab Middle East. It underscores the need for a nuanced approach to global accounting standards, one that acknowledges and accommodates the diversity of economic and regulatory environments.

Based on these insights, several recommendations emerge, each grounded in the nuanced understanding of the study's findings:

(1) **Streamlining Accounting Measurement Options**: The diverse levels of harmonization observed, particularly in areas like inventory costing and investment property valuation, suggest a need for more streamlined and uniform accounting practices. By reducing the range of permissible methods, especially in areas with low harmonization, financial reporting can achieve greater comparability and reliability. This recommendation is particularly relevant in the context of global investment and financial analysis, where inconsistency

in accounting practices can lead to misunderstandings or misinterpretations of financial health and performance.

(2) **Aligning Local Standards with IFRS**: The mixed impact of IFRS adoption on harmonization levels underscores the delicate balance between global standardization and local relevance. For countries like Egypt and Saudi Arabia, which primarily use local standards, aligning more closely with IFRS could bridge gaps in harmonization, especially in the context of international trade and investment. This alignment should be approached with sensitivity to local economic conditions and regulatory needs, ensuring that the adoption of IFRS complements rather than overrides regional specificities.

(3) **Acknowledging Diversity in Financial Analysis**: The variability in accounting practices across different regions necessitates a more informed and adaptable approach to financial analysis. Analysts and investors should be equipped to recognize and adjust for these variations, ensuring that their evaluations and decisions are based on an accurate understanding of different accounting practices. This recommendation is vital for fostering informed investment decisions and accurate market assessments in a globalized economic landscape.

(4) **Expanding the Scope of Research**: Given the dynamic nature of global accounting practices, there is a clear need for ongoing research in this field. Future studies should expand to include a broader range of countries and regions, particularly those not extensively covered in existing literature. This expansion would provide a more comprehensive understanding of global harmonization challenges and opportunities, informing future policy and standard-setting initiatives. Such research is crucial not only for academic enrichment but also for providing practical insights to policymakers and standard-setters as they navigate the complexities of global accounting harmonization. It is also recommended to estimate the relationship between accounting comparability and the promised advantages of engaging in international accounting harmonization trend, such as attracting foreign investment.

AI at the Heart of Development: Revolutionizing Accounting Processes for Comprehensive Progress

Bader AlTamimi, Nader AlTamimi, and Mohammad Abdallah

Abstract Artificial intelligence (AI) has significantly transformed accounting processes, ushering in a new era of efficiency, accuracy, and strategic insights. This paper explores the profound impact of AI on accounting practices, highlighting its role in fostering comprehensive progress towards development goals. By automating tasks, improving financial analysis, providing real-time insights, enhancing transparency and accountability, and promoting sustainability, AI revolutionizes accounting practices. However, it is crucial to address the challenges and ethical considerations associated with AI adoption. Through strategic investment, collaboration, and continuous learning, organizations can leverage AI to drive sustainable development in the digital age.

Keywords Artificial intelligent · Accounting · Financial analysis · Decision-making

1 Introduction

Artificial Intelligence (AI) is a key innovation in today's world, transforming traditional approaches and propelling advancement in a variety of industries. In the field of accounting, the integration of AI into complex accounting procedures represents a significant turn in the direction of increased effectiveness, accuracy, and perceptive analysis. This study examines how AI has impacted accounting procedures and highlights how important it is to achieving goals for holistic development.

Organizations are using artificial intelligence (AI) more and more to automate repetitive processes, streamline operations, and extract valuable insights from vast amounts of financial data. AI-driven algorithms are revolutionizing the way accountants work, from tedious data input to complex financial analysis. They free up accountants from repetitive chores and enable them to concentrate on higher-value work like identifying financial patterns and formulating strategic suggestions [1].

Moreover, AI-driven accounting solutions provide instantaneous financial performance information, empowering businesses to act quickly and intelligently. These systems forecast future trends, assess possible dangers, and optimize resource allocation by carefully examining past data and finding patterns. This allows for more intelligent decision-making and resource management [2].

Apart from augmenting operational efficacy, artificial intelligence assumes a crucial function in propagating transparency, accountability, and sustainability in accounting procedures. For example, AI-driven audit solutions provide more thorough and effective audits by precisely identifying anomalies and discrepancies. This promotes confidence and trust among stakeholders in addition to acting as a deterrent against fraudulent activity [3].

Furthermore, AI-enabled accounting procedures support sustainability initiatives by maximizing the use of available resources, reducing waste, and pinpointing opportunities for increased productivity [4]. Organizations match their accounting practices with larger developmental goals and societal imperatives by minimizing their environmental impact while optimizing their contributions to society and the economy.

However, the revolutionary possibilities of artificial intelligence in accounting, it is crucial to tackle the corresponding obstacles and moral dilemmas. The digital era requires enterprises to embrace innovation and exploit the full potential of artificial intelligence (AI) while also guiding sustainable development through strategic investment, collaboration, and continuous learning.

The methodology for this research relied on a demanding review of previous studies and literature to provide a comprehensive understanding of the challenges and ethical considerations surrounding the relationship between AI and accounting. By building upon the insights gleaned from previous research, this study aimed to contribute to the scholarly discourse and advance knowledge in this emerging area of study.

2 Background

Artificial Intelligence (AI) has revolutionized numerous industries, and accounting is no exception. The history of AI in accounting traces back to the mid-twentieth century when researchers began exploring the potential of computational systems to automate tasks traditionally performed by accountants. The roots of AI in accounting can be seen in the development of expert systems, which aimed to replicate human expertise in specific domains [5].

In the 1970s and 1980s [6], expert systems emerged as one of the earliest forms of AI applied in accounting. These systems utilized knowledge bases and rule-based reasoning to analyze financial data, interpret regulations, and provide recommendations. While rudimentary compared to contemporary AI technologies, expert systems laid the foundation for further advancements in the field.

The late twentieth century [5] witnessed the emergence of more sophisticated AI techniques such as neural networks and machine learning. These approaches enabled accountants to leverage vast amounts of data for pattern recognition, predictive modeling, and decision-making. Machine learning algorithms, in particular, proved instrumental in automating repetitive accounting tasks, such as data entry, classification, and reconciliation.

The twenty-first century marked a significant acceleration in AI adoption within the accounting profession [7]. Advanced analytics, natural language processing (NLP), and robotic process automation (RPA) became integral components of modern accounting software suites. These technologies empower accountants to extract insights from unstructured data, automate complex workflows, and enhance audit procedures [8].

One notable area where AI has made substantial inroads in accounting is fraud detection and risk management [9]. AI-powered algorithms can analyze transactional data in real-time, identify anomalies, and flag potentially fraudulent activities [10]. Moreover, AI enables accountants to conduct more thorough risk assessments and compliance audits by analyzing vast datasets with unparalleled speed and accuracy.

Furthermore, AI-driven predictive analytics have transformed financial forecasting and budgeting processes. By analyzing historical data and market trends, AI algorithms can generate more accurate forecasts, helping businesses make informed decisions and mitigate financial risks [11].

3 AI in Accounting

The infusion of Artificial Intelligence (AI) into accounting marks a significant shift in financial management, promising to modernize practices and propel progress towards development goals. This review address existing research on AI's impact on accounting processes and its implications for achieving comprehensive progress.

The integration of Artificial Intelligence (AI) into accounting practices marks a significant evolution in the field, fostering a symbiotic relationship between technology and financial management [1]. AI offers an excess of tools and techniques that enhance the efficiency, accuracy, and strategic decision-making capabilities of accountants. One key aspect of this relationship is the automation of routine tasks. AI-driven algorithms can process large volumes of data at high speeds, automating tasks such as data entry, reconciliation, and transaction processing. This automation not only reduces the time and effort required for these tasks but also minimizes the potential for human error [12].

Moreover, AI enables advanced data analysis and predictive modelling, providing accountants with deeper insights into financial trends, risk assessment, and forecasting [13]. By leveraging machine learning algorithms, accountants can identify patterns and anomalies in financial data, enabling more informed decision-making and strategic planning. Additionally, AI-powered natural language processing technologies facilitate the extraction and interpretation of insights from unstructured data sources like emails, invoices, and contracts, streamlining audit procedures and enhancing compliance measures [14].

The relationship between AI and accounting also extends to the realm of regulatory compliance and risk management [15]. AI technologies can monitor transactions in real-time, flagging suspicious activities and helping organizations comply with regulatory requirements. Furthermore, AI-driven predictive analytics can assess financial risks and identify potential frauds, enabling proactive risk mitigation strategies.

4 Enhanced Financial Analysis

Artificial Intelligence (AI) has revolutionized financial analysis by leveraging advanced algorithms and data processing capabilities to enhance efficiency and accuracy [9]. AI enables the analysis of vast amounts of financial data at unprecedented speeds, providing real-time insights into market trends, investment opportunities, and risk assessment. Through machine learning algorithms, AI can identify complex patterns and correlations within financial data, allowing for more accurate predictions and informed decision-making.

Furthermore, AI-powered predictive analytics tools can forecast future financial trends and outcomes based on historical data and current market conditions. These forecasts enable financial analysts to anticipate market movements and make proactive investment decisions, thereby maximizing returns and minimizing risks [16].

Additionally, AI enhances financial analysis through natural language processing (NLP) technologies [17], which can interpret and analyze textual data from financial reports, news articles, and social media. By extracting valuable insights and sentiments from textual data, AI-powered NLP tools enable analysts to gauge market sentiment, identify emerging trends, and assess the impact of news events on financial markets.

5 Real-Time Decision-Making

Artificial Intelligence (AI) plays a crucial role in facilitating real-time decision-making across various domains [18, 25, 26]. By harnessing advanced algorithms and data processing capabilities, AI enables organizations to analyze vast streams of data instantaneously, extracting actionable insights to inform timely decisions.

One key aspect of AI-driven real-time decision-making is its ability to process data at unprecedented speeds [19, 27]. AI algorithms can rapidly sift through massive datasets, identifying patterns, trends, and anomalies in real-time. This capability empowers decision-makers to respond swiftly to changing circumstances, whether in financial markets, supply chain management, or customer service [28].

Furthermore, AI-powered predictive analytics tools enhance real-time decision-making by forecasting future trends and outcomes based on current data inputs. These forecasts enable organizations to anticipate potential risks and opportunities, proactively adjusting strategies to capitalize on market dynamics [10, 29].

Moreover, AI facilitates real-time decision-making through automated decision-making systems. These systems leverage AI algorithms to analyze incoming data streams and execute predefined actions or decisions without human intervention. This not only reduces response times but also enhances consistency and efficiency in decision-making processes [20, 30].

6 Challenges and Ethics

The integration of Artificial Intelligence (AI) into accounting practices introduces a multitude of challenges and ethical considerations that necessitate careful navigation. One significant challenge is the potential disruption to traditional accounting roles [21]. As AI technologies automate routine tasks such as data entry, reconciliation, and transaction processing, there is a legitimate concern about the displacement of human workers. While AI can enhance efficiency and accuracy, it also raises questions about the future role of accountants and the need for ongoing workforce training and upskilling to adapt to the evolving landscape [22].

Moreover, the accuracy and reliability of AI-driven accounting systems pose ethical dilemmas [23, 24]. While AI algorithms can analyze vast amounts of financial data with speed and precision, there is always a risk of algorithmic bias or errors in the data inputs. This raises concerns about the integrity and transparency of AI-powered accounting processes, particularly in critical areas such as financial reporting and auditing. Ensuring the accountability and trustworthiness of AI systems requires robust validation processes and continuous monitoring to detect and address any discrepancies or biases.

Additionally, data privacy and security are paramount ethical considerations in the relationship between AI and accounting. AI algorithms rely on access to large volumes of data, including sensitive financial information, which must be safeguarded against unauthorized access, manipulation, or misuse [22]. The ethical use of AI in accounting requires adherence to stringent data protection regulations and the implementation of robust security measures to protect sensitive information.

Furthermore, there are broader ethical implications surrounding the responsible use of AI in accounting. This includes considerations such as the ethical implications of AI-driven decision-making, the potential for AI to perpetuate or exacerbate

existing inequalities, and the ethical responsibilities of organizations and individuals in the development and deployment of AI technologies [21].

7 Conclusion

The comprehensive review of previous studies and literature regarding the integration of Artificial Intelligence (AI) in accounting practices has provided valuable insights into the challenges and ethical considerations inherent in this evolving relationship. Through an in-depth analysis of existing research findings, theoretical frameworks, and empirical evidence, several key conclusions can be drawn.

Firstly, the integration of AI in accounting holds immense potential to enhance efficiency, accuracy, and decision-making processes within the profession. AI technologies offer opportunities to automate routine tasks, analyze vast amounts of financial data, and provide valuable insights for strategic planning and risk management. However, the adoption of AI also presents challenges, including concerns about job displacement, algorithmic bias, data privacy, and security.

Secondly, while AI-driven automation can streamline accounting processes and improve productivity, there is a need to address the potential impact on employment opportunities for accountants. Efforts to mitigate job displacement may include workforce training and upskilling initiatives to equip professionals with the skills needed to adapt to the changing landscape.

Furthermore, ensuring the accuracy and reliability of AI-driven accounting systems is paramount to maintaining trust and transparency in financial reporting and auditing practices. Addressing algorithmic bias and implementing robust validation processes are critical steps to uphold the integrity of AI-powered decision-making processes.

Additionally, safeguarding data privacy and security remains a significant ethical consideration in the relationship between AI and accounting. Stricter regulations and enhanced security measures are essential to protect sensitive financial information from unauthorized access or misuse.

Artificial Intelligence in the Banking Industry: A Bibliometric and Directions Ahead

Islam Abdeljawad, Muiz Abu Alia, Shorouq Flaifel, and Sanaa Zeidan

Abstract In the past few years, fintech has become the junction between finance and technology, which are two core sectors. Financial technology and banks are expected to continue forming a stronger union in the future as new applications that are driven by artificial intelligence emerge, creating a lot of opportunities. This article examines the effect of financial technology on banking operations, highlighting the advantages of incorporating cutting-edge artificial intelligence technology. The collaboration of financial technology and artificial intelligence is not only meant to strengthen banks' stability but also to widen their competitive edge and diminish inefficiencies. These contemporary systems are anticipated to assist in improving outputs, increasing efficiency, improving risk management, and accelerating the decision-making process. This integration has been completely transformative and has, to a great extent, altered the landscape of the financial and banking industries. It has significant implications for the future of the banking industry.

Keywords Artificial intelligence (AI) · Banks · Risk management · Fintech · Credit risk

1 Introduction

The concept of creating machines capable of intelligent decision-making and reasoning dates back to the mid-twentieth century. However, it is only in recent years that commercial applications of artificial intelligence (AI) techniques have gained significant traction, offering solutions to a plethora of problems and enhancing various processes. The pervasive integration of AI across all facets of life has spurred global competition in delivering advanced AI-based solutions [1]. Consequently, companies are compelled to explore innovative technological avenues [2] and make

A. M. A. Musleh Al-Sartawi et al. (eds.), *Business Resilience and Business Innovation for Sustainability*, Studies in Systems, Decision and Control 587,
https://doi.org/10.1007/978-3-031-87584-7_3

substantial investments in both infrastructure and expertise to harness the competitive advantages associated with AI [3].

AI has found its way into financial applications in the recent years with many tasks being executed by it such as determining stock market trends, forecasting bankruptcy, and the analysis of customer satisfaction which have been made possible by the intelligent application of big data science, artificial neural networks, and deep learning techniques [4]. Financial institutions today enjoy the application of advanced technologies for the processing of huge datasets with accuracy and speed impossible for human beings to emulate. These technologies allow forecasting market behaviours, trading, and client service customization. They also increase the investment performance [5]. Accordingly, AI technologies are now an irreversible aspect of financial services, increasing both the quality and productivity of the industry.

This research aims to provide insights into the current landscape of AI applications in bank management, with a particular focus on risk management, while also proposing avenues for future research. The following research questions will be addressed:

1. How do AI applications impact the banking industry?
2. What role does AI play in managing risks, particularly credit risk?

By the scope of this research, AI has been shown as a force of transformation in business, banking, and society-wide changes that cannot be ignored. AI helps to perform credit analysis becoming the tool of the accurate decision making in the financial context as well as in other fields. Technologies like smart devices allow banks to develop new and innovative financial products that directly appeal to their clientele, and in turn, boost client satisfaction and attract additional customers.

In the process of analysing AI in banking, we decided to use bibliometric analysis as a tool to answer the main research questions. Following Adeyinka-Ojo's [6] classification method, we meticulously selected and examined research studies related to the central research questions. In January 2024, we searched the Web of Science database for a publication from 2019 to 2023. We formed the search phrase using "AI," "finance," and "banking" as the main keywords related to the research topic. The research gave a total of 1473 publications after two rounds of filtering: the first one was by language and document type, and the other one was based on title, abstract, and keywords. Therefore, we structured the obtained literature into five main themes to equip the reader with a comprehensive understanding of the research topics and the relationship between them. The main purpose of this segmentation was to give a better insight and understanding into the subject and give an opportunity to look at the relationships between the researched topics.

The paper is structured as follows: Sect. 1 introduced the research, Sect. 2 explores bibliometric results, Sect. 3 reviews the main five themes, Sect. 4 investigates the challenges of the use of artificial intelligence. Lastly, Sect. 5 concludes.

2 Bibliometric Analysis

Following the outlined methodology for reviewing selected articles, Table 1 presents the main dataset obtained from the Web of Science.

Figure 1 displays the annual publication count, while relevant journals are categorized in Fig. 2, showing that IEEE Access published the highest number of documents, followed by Sustainability, with Expert Systems with Applications ranking lower.

The analysis of retrieved articles reveals a steady and significant growth rate of approximately 22% per year in the number of publications during the study period. Additionally, China emerges as a prominent country in terms of publications, as illustrated in Fig. 3.

Figure 4 highlights the top ten frequent keywords, with "Artificial Intelligence" being the most prevalent, followed by "Machine Learning," and "Innovation" being the least common. Figure 5 illustrates the co-occurrence of keywords, indicating multifaceted connections with artificial intelligence across various dimensions such as risk management, credit risk, chatbots, credit scoring, security, neural networks, machine learning, deep learning, data mining, and fraud detection. The analysis in

3 Review of Main Themes

3.1 AI and FinTechs

AI and FinTech integration is a contemporary technology embedded into financial services that are used in data analysis [7]. The integration of AI into the FinTech industry, with the assistance of big data and advanced management tools, increases the overall productivity and usefulness of the industry, which in turn opens many avenues for innovation. FinTech startups, which at present are under-exploited and hence attract large investor attention [1], have become one of the most attractive areas for investment.

AI technologies provide a whole spectrum of powerful and efficient tools [8, 9], that can be used from the analysis of financial and banking sector to idea generation and the automation of crucial organizational processes. In return, the banks are now in search of a partnership with FinTech companies by means of strategic partnership, data sharing, and joint apps development. The partnership is an example of how technology can be embraced by the banking sector, facilitating the uptake of new technologies on the one hand, and improving the customer experience through services like financial analytics, micro services, and advanced banking digital services on the other. In addition to this, it also helps with cost reduction through its emphasis on the need to be able to process large volumes of payments, documented records, and official paperwork within banks and stock exchange companies [10].

AI models and applications have been developed at a breakneck pace due to the technological advancements and this in turn has made AI a core in the banking sector [7]. The AI has long been acknowledged as a disruptive technology with the potential to transform the companies' operations and the banking services industry,

as it departs from traditional business methods towards modern technology-driven approaches [11]. AI's relevance is not limited to forecasting financial companies' revenues, but is also critical in improving corporate operations, analysing big data, and preventing fraud [12]. The acquisition and analysis of huge volumes of data have great effect on the performance of enterprises, producing valuable insights of high quality for best decision-making [13].

While the financial technology offers many upsides it is also important to recognize and deal with challenges and disadvantages in order to ensure that financial services are provided securely and efficiently to the customers. One important issue is that it may bring the potential of job losses, which means that there would be fewer human employment [14]. Digital transformations in the financial sector cause financial institutions to switch to independent high-tech systems which are mostly automated, as such systems take over tasks such as data collection and the initial analysis. Yet, it should be noted that such automated systems are not supposed to fully replace the human workers in this industry. Whilst many researchers agree that AI robotics is a major factor for the substitution of human labor, there is a different viewpoint. In their article, the authors Kanimozhi and Jacob [15] contend that AI will actually generate new employment opportunities.

3.2 AI in Financial Institutions

Artificial intelligence (AI) is expected to become a critical tool for banking and financial services, which will use smart applications to detect patterns, spot anomalies, and streamline financial operations. Although it was anticipated that artificial intelligence would evolve faster, the process turned out to be a gradual one that required several stages of thorough development and testing.

Following the 2008–2009 financial crisis, technology companies began to enjoy the spotlight in the startup world. The wave of new startups was stimulated by a set of precautionary measures, rules, and laws, which were developed in response to the crisis, covering the issue of financial terrorism and money laundering, all of which are aimed at defending the interests of the society, namely banks, companies, and individuals [1].

Of course, the success of financial organizations depends not only on their technical achievements but also on their social intelligence. The way these organizations manage the flow of information through language, technological networks, partnerships with other entities, or any other sources, is the most important [16]. Within the realm of financial and banking sector, technical difficulties, entailed in natural language processing which is the main issue in the sense of accurately extracting and analysing complex financial statements, arise. Using AI models, which are becoming more and more sophisticated at a breath-taking pace, companies, as well as individuals must adjust to the new realities. This entails boosting machine learning performance by training data extension, hence speeding up the training time with a high-performance computing. One of the major reasons behind the recent advancements of

deep learning is the plentiful data and quick processors with more speed. High level communication with customers is of huge importance for a proper comprehension of the system, and for the purpose of maintaining it. User management of the models is necessary to avoid wrongful data and results [17]. The development of the Internet technology has greatly contributed to the progress of the society and economy, which has become so common to be used in different economic and scientific fields. It has become an inexorable source of the general public, banks, and business partners who need to grasp the fundamental information of the institution.

In the era of big data, the efficiency of data transfer, preservation, and dissemination as well as real time access to financial, commercial, and other related datasets has been significantly enhanced by big data [18]. Financial services providers that modify their software and integrate smart technology, data, analytics, and other financial products into their banking solutions are more likely to design the best strategies and distribution of their products.

AI implementation ensures a consistently data-driven approach, increasing the efficiency as well as reliability of decision-making in the banking system. Different from the specific kinds of deviances that result from human assessment, which remain greatly influenced by individual behaviour, artificial intelligence plays a crucial role in ensuring unbiased risk assessment [19].

The emergence of the Coronavirus (COVID-19) in the world has triggered the change of the global course, which has exhibited the requirement for the new strategies and innovations. The global reaction to the pandemic has accentuated the research and implementation of novel job processes, establishing new habits, and even the birth of new digital currencies [1]. This life-changing period illustrated both the strength and adaptability of different sectors, such as finance and technology, which were committed to creating new concepts that could help to tackle the problems imposed by the pandemic.

3.3 AI and Risk Management

Artificial intelligence, at the moment, is the most recent research domain of risk management [20]. A comprehensive and comprehensible knowledge of risks is an asset that helps managers to take the right decisions, which in their turn serve as the foundation for increasing organizational efficiency as well as for ensuring good performance, hence making the difference between successful and unsuccessful managers. Therefore, there is a lot of money spent by organizations developing strategies that prevent huge financial and operational risks [18].

With the situation where the details regarding the choices and transactions are vague, taking decisions that involve risk may be hard thus. AI, in this respect, acts a significant tool which prevent or minimize the probability of such losses in the mentioned circumstances. It is very much important to admit, that people like avoiding ambiguity which may lead to the suboptimal decision. Using the data on past rationality and the reaction to unpredictable situations are not the only ways to

predict the future. The new elements are expected to come in. The central characteristic of decision making is the employment of a fair and logical reasoning process, considering individual and cognitive factors that will affect different individuals and their risk-taking behavior.

AI has assumed a major role in reducing the risks in the banking sector with a number of ways. It has certainly gone a long way in raising the credit risk management competency of banks by evaluating the repaying capacity of their customers using the latest data analytics technology. Eventually, this gives rise to the positive feedback cycle on the financial sustainability and has a more effective and secure banking system. Moreover, the term traditional technology has been redefined, with the use of smart contracts being one of the most notable improvements [21].

The consequences of improper investment choices appeared during the 2008 global economic crisis [22]. To be concluded, it is necessary to say that this situation stipulates the development of the newest risk control technologies, where artificial intelligence plays a crucial role and gives the banks a better opportunity for risk assessment and management.

3.4 AI and Bank Credit

For a long time, the commercial banks have been very instrumental in the building of databases which cover lots of customers' personal details. The implementation of these databases is intended to improve the overall performance of the bank, which, in turn, boosts the formulation of strategic decisions Al-Araj et al. [23]. However, Though the central objective of banks is the continuous production of profits, the strategies to pursue this goal may differ based on the policies of the state [24]. The establishment and utilization of advanced financial databases by banks show how significant they are in shaping the financial landscape and ensuring the availability of accurate information.

Banks' credit service delivery is one of the important processes that gives individuals and companies the access to finance for their aspirations and requirements. Consumers' banking behavior is being monitored, and credit files are being established with the help of internet and social media, making it possible to get more precise assessment of their ability to pay loans back. This enables the measurement of credit risks, makes decision making to be accurate, takes alternative data like browsing records, and incorporates them to get more insights [25]. Fintech start-ups, who try to speed up and perfect the credit eligibility decision process, do this by collecting massive amounts of data and creating their own rating systems along with traditional ones [14]. The credit services supported by artificial intelligence is a noteworthy innovation. If artificial intelligence is applied the right way, credit operations will experience an increase in efficiency and accuracy, at the same time improving customer experience.

3.5 AI and SME's Credit

Small and medium-sized companies aren't normally able to get loans from specialized institutes because of the insufficiency of their credit history and financial information. For this reason, a smart evaluation system integrated with AI technologies is of great significance for assessing if the borrower is capable to pay off the debt. However, this evaluation will be extremely useful for credit service agencies which can be used as a risk mitigation tool for future credit risks. Without a good risk management in this context, companies run the risk of losing a great chunk of their finances which can possibly result in irrecoverable losses [7].

As a matter of fact, microcredit availability is directly related to the overall economy and involving different areas such as the agriculture sector and so on. In most countries, farmers have not really experienced the full benefits of banking services, and thus the issue of credit has been rather inadequately addressed. Financial inclusion's main purpose is to create an opportunity for many groups, including farmers, to access banking services [26]. Nonetheless, financial institutions mostly utilize historical data for lending decisions,scenario for which farmers seldom have the historic data. Within this notion, artificial intelligence algorithms serve as meaningful components. Banks and financial organizations may benefit from credit bureaus in terms of developing customer folders that are used to determine creditworthiness later [27]. They are totally based on analysis of huge data covering customers' behavior and finances in order to find predictive models and criteria [28].

According to Krivorotov [29]. The data of consumer behavior obtained through credit cards constitutes the basis of the advanced models today,these models are aimed at developing an extensive scoring matrix of consumers' credit quality. Machine learning techniques integrated with the availableness of vast data sets have far surpassed the effectiveness of the risk control approach of yester years. This serves as an evidence of the importance that include artificial intelligence and machine learning possess in the financial industry. Machine learning techniques play a dominant role in the development of the risk models; enabling the latter to grasp the dynamic nature of the risk factors, which in turn improves their performance and enhances their scope in identifying and mitigating risk.

In order to effectively address credit risks, financial inclusion has to be promoted, which in turn involves creating the environment for the provision of financial services to all the segments of the society including the SME business sector. This approach implies financial viability of this project and the possibility of reaching everyone who needs our services. Mixing financial technology and artificial intelligence is the principal aspect that contributes to the development of the most heterogeneous group of people. The government promotes this by offering companies with incentives and building the necessary infrastructure for this integration to be a success. For example, the Chinese government has established AI and digital finance as the driving force with the goal of having inclusive digital finance. This assistance has led to several major achievements which include the growth of financial services coverage, lending to small and medium businesses and control role on financial risks [26].

The effectiveness of the capital allocated to financial inclusion strategies in China might be gradually reduced in the future. However, this is not expected to happen immediately [30]. This emphasizes the need for ongoing evaluation and adaptation to maintain the effectiveness of financial inclusion strategies.

4 The Challenges Ahead

Despite the fact that AI technologies progress significantly, there are certain issues that can be raised nowadays. For instance, such issues arise due to uncertainty, insecurity, insufficiency of transparency in the system and lack of specifications and safety of the system users [31]. AI bias inherent in propensities for specific trends is another crucial problem for society. Additionally, other obstacles come together which are rivalry among banks, changing customers' tastes, high costs of maintaining technological infrastructure which is key for the safe and uninterrupted bank work, and inevitable need to adapt computer systems and ATMs [5].

Ethical controversies, and the historical misapplication of AI additionally complicate these issues [32]. The abuse of personal data as it has come to light in the Facebook case where the data of 50 million accounts was exploited without permission would not only draw the Facebook CEO Mark Zuckerberg to the senate of the United States but bring the share price of the company down as well [22].

The rapid increase in cybercrime and fraud cases makes the already complicated job of a company even more difficult [33], as they have to hire a team to investigate and examine such instances, which costs money. Those costs tripled in billions, highlighting the point of how vital the efficient ones are. An AI system whose purpose is charitable can effectively tackle fundamental challenges that prevent charitable organizations from functioning properly, such as donation collection mechanisms, money laundering prevention, and terrorism related issues [34]. This emphasizes the role of the constant reinforcement of ethics, regulations, and vigilance in the given of AI technologies.

Artificial intelligence technologies application in financial industries is not problem free, and there are several crucial aspects that need to be addressed. Such models should be understandable and transparent, they have to comply with established regulations, documents, and principles by specialists who write legal reports and ethical principles for acceptable AI usage. The insufficient clarity in the executing of AI systems is a serious issue which, among others, is often encountered when AI technologies are used in finance and insurance. The problem of providing explanations can often arise in complex decision-making process of the intelligent models. This makes it difficult to explain the reasons and the criteria used to make these decisions. Such a situation also damages the images of the financial sector, as it could be regarded as a system that is not fair and unexplainable. These issues need to be addressed as a priority in order to create confidence in AI technologies implemented by financial institutions. Table 1 presents main challenges associated with AI.

5 Conclusion

The study findings show unequivocally that it is AI which boosts the competitiveness of companies in general, and mainly the financial sector. These studies reveal an AI implication, where data processing becomes faster, the efficiency increases, and productivity increases as well. Hence, it will increase profits as well as it contributes to better risk management, risk reduction and risk control. The artificial intelligence utilization is considered indispensable and it is a tool that all financial companies must master in order to thrive in the market. Its contribution to the decision-making process, which is regarded as significant in promoting the company's growth and maintaining a high market value, is invaluable.

Nevertheless, it is essential to pay attention to the specific limitations in the previous research. Of particular importance is, such studies have neglected to broadly discuss the areas of what AI cannot do in the financial industry. For instance, AI is incompetent to generate and build up personal relationships with a client. It cannot engage the client in emotional interaction based on modalities of tone voice and body language. Furthermore, it could be sluggish in terms of adaptation and interaction in scenarios of hyperdynamic environment. These limitations should not be overlooked, on the contrary, they should be used for the formation of a holistic picture about the role and perspectives of AI in finance.

In spite of these shortcomings, artificial intelligence technology still provides companies with a number of advantages such as multiplying the opportunities and eliminating difficulties as well as opening broader horizons in the field of financial services. As AI technology advances in the future, there must be further investigations and development in AI technology together with a knowledge balance of its capabilities and shortcomings will be crucial to maximize its potential and innovate the financial sector.

The Impact of Data Analytics on the Business Intelligence Technology

Tamara Adel Al-maaitah, Dirar Abdelaziz Almaaitah, Al smadi Khalid, Tariq Khairo Issa Al Daabseh, Ala'a Mohammed Fadel Al-junaidi, and Nour Abdulwahab Qatawneh

Abstract The main aim of this study to determine the role of data analytics in enhance administrative rates and profitability of business. The augmented version of the DeLone and McLean framework shows promise for innovation. Nonetheless, it necessitates a detailed elaboration on its implementation within the managerial tier of Business Intelligence structures. Additionally, an illustrative depiction of the framework would enhance comprehension. The proposed research model extends the DeLone and McLean model's application from the human level to the organizational level in BI technology achievement or efficiency study at order to gather principal quantitative data from managers and IT developers at Jordanian-listed companies that rely on BI systems for different managerial levels, a cross-sectional survey is being designed, sample size 150 and the researcher use PLS to analysis the data. This paraphrase changes the structure of the original sentence and uses synonyms where appropriate, while maintaining the original meaning. It also avoids the use of personal pronouns and passive voice to keep the statement in an academic tone. A technologically advanced questioner is used toward collect crucial quantitative data from Institutions managers that focus on business intelligence structures to create functional, tactical, and strategic conclusions for the Jordanian Institutions. The main results of this research: (1)—structure excellence. (2)—Information excellence and exercise excellence are important forecasters of employer pleasure, nevertheless perceived advantage is not, according to practical data. (3)—Data value was developed to be an effective predictor of perceived advantage and employer satisfaction. (4)—The effect of the alleged value on customer satisfaction was crucial since both elements have a beneficial impact on businesses' profitability. This study has significant value related to the report is a new effort to measure the organizational level efficiency of BI

technologies outside the setting of industrialized nations. No previous study, toward the superlative of the authors' information, has shared all the scopes considered in this study into an only model.

Keywords BI structures · Data analytics · Big data · Efficiency · Jordan country

1 Introduction

Data management and intelligent technology have made great strides in the time of numerical alteration, impacting almost every aspect of company, including finance, accounting, trade, advertising, and knowledge and controller. Businesses today depend more on intelligent technologies to assist them analyze vast data and making decisions that will help them stay competitive because of the vast measurements of commercial statistics available. The main objective of the innovative technologies included into artificial intelligence is to improve innovative methods for data gathering and analysis that assistance organizations expand their decision-making process via the use of data analytics, this will be done by utilizing different data analysis techniques that integrate business and artificial intelligence [1]. Using data analysis can improve the process of making effective strategic and operational decisions, to be more specific, business intelligence (BI) employs technologies like a sizable database, or data warehouse, online analytical processing, data mining, dashboard/screen tools, production reporting, end-client query and reporting, and modelling tools [2]. According to [3]. Due to the multiple advantages that may be gained through BI, including cost savings, a decrease in human error rates, improved client facility, increased production, competence, and efficiency, as well as a faster decision-making process, it is in high demand. In light of this, we were inspired to conduct this study for two reasons: first, several Jordanian businesses have been harmed by BI structure that is incapable to manage their commercial procedures besides deliver the anticipated firm's advantage, and second, there aren't any models or outlines aimed at assessing BI efficiency at the organization level. The purpose of this article is to fill in these knowledge gaps by presenting a model for BI efficiency dimension that is based on. It then attempts to empirically validate this model consuming data from instrument conducted in the administrative locations of registered Jordanian companies that have executed BI system to address the problem of its failure. The following is a summary of the remaining text in the article: the following in light of this, we were inspired to undertake this study for two reasons: first, many Jordanian businesses have been harmed by BI technology that cannot meet their business needs, second, this part explains the academic underpinnings of BI achievement assessment. We next go through our study plan and hypothesis. The study methods and data analysis process are then provided. Our conclusions, theoretical contributions, and application of our conclusions are then presented. Finally, several inherent constraints and potential directions for further study are discussed.

2 Literature Review

According to the research that has been published to far, measuring BI performance or effectiveness—two concepts that are sometimes used interchangeably—is an intrinsically complicated issue. This is due to the fact that both practitioners and researchers continue to have a lot of concerns about the various measuring methodologies [4]. Numerous dependent constructs, as well as structure usage, client fulfilment, and remaining influence or profit, were used in related research to determine whether a BI was active or positive. According to a current organized evaluation research by (Massad et al. 2024) the is the model used the most frequently in BI effectiveness and achievement studies. Since its first release in 1992 [5]. As an alternative, some academics suggest consuming the individual advantage or effect of BI as a achievement metric. To evaluate individual advantages in the BI industry, a number of criteria have been used and created, including effort performance, individual efficiency, decision-making efficiency, and problem detection [6], that are recognized have an influence on BI performance in Jordanian businesses, established intangible metrics in Jordan to measure the effectiveness of BI, including increased production, inside procedures, decision creation, client facility, competitive value, and summary functional charges. They maintained that while achievement is measurable in theory, it is challenging to quantify in practice. In the situation of Jordanian commerce, this research uses imperceptible organizational profits as a proxy for BI structure. In this research, [4] stated that the primary problem that are recognized have an influence on BI performance in Jordanian businesses. Marzouk and Hanafy [7] the necessary structure use such like the BI structure, the researchers are seeking to quantify structure value rather than utilization. Since perceived usefulness in [8, 9], IS achievement model is seen from an ex-post viewpoint as opposed perspective in the context of IS usage, the former is conceptually distinct from the latter. Others included that Instead of the influence of structure usage on people and organizations, use is not crucial to the achievement of BI. Similarly, significant usage of BI technologies won't necessarily result in advantages for both individuals and organizations [10, 11], Instead, prolonged reliance on false or misleading information will have a negative impact on the selection of options and lead to a reduction in the value of the company. Therefore, it's critical that the appropriate clients use the right information in the correct situation at the correct period [12]

3 Hypothesis Formulation

Eleven related hypotheses have been developed based on the confident and important and positive expectations amongst the seven concepts: structure excellence, Information excellence, data excellence, exercise excellence, supposed advantage, client satisfaction, and firms' advantage in order to examine the relations amongst the

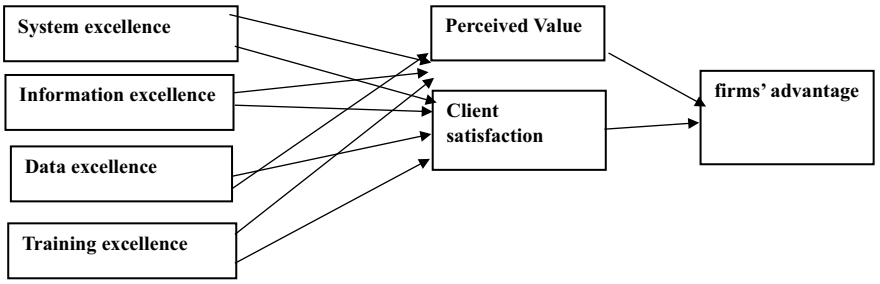

Fig. 1 Research model

constructions in the planned BI structure efficiency assessment model as shown in Fig. 1.

The research did not think it was rational to use single-construct measures of achievement. Instead, we reaffirm that it is oversimplified, inadequate, constrained, and potentially deceptive to evaluate the adoption of BI structures by organizations from the perspective of only one concept [13]. As suggested by earlier researchers, this study, relatively than concentrating on a specific component of achievement or single construct, focuses on significant factors that signify the achievement of a comprehensive structure for a variety of constructs that are employed. As a result, several viewpoints have been taken into account while constructing our model due to their enormous potential for assessing the efficacy of BI structure.

3.1 Structure Performance

Structure excellence is a widely acknowledged BI efficiency or achievement aspect. Businesses' growing reliance on BI structures motivates senior management to focus on enhancing their technical excellence. Structure excellence discusses the mechanical possessions of a structure in standings of combination, suppleness, convenience, reliability, reaction period, and additional metrics. Study [12] model discovered a favorable result in the BI setting. Shows client happiness is positively and statistically influenced by the excellence of the BI classification in relations of response rapidity, convenience, suppleness, and combination. The [14] model, which discovered a substantial association between Structure excellence and client pleasure with BI, produced the same outcome. Therefore, we speculate:

H1: The perceived value and BI Structure excellence are positively correlated.
H2: Client happiness and BI Structure excellence are positively correlated.

3.2 Reliable Information

Regarding the usefulness of BI, the issue of information excellence has attracted a great deal of scholarly attention, this is so that decision-making may be done effectively. BI analyses data with high stages of ambiguity and generates critical data with high grades of dependability [15]. According to DeLone and McLean (2016), information or production excellence denotes to the characteristics of information produced by a structure, such as relevance, dependability, setup, conciseness, money, timeliness, correctness, and other factors. This conclusion was supported by [16] who established a statistically important relationship among the information excellence concept and client satisfaction in the framework of business intelligence (BI). Therefore, we assume that:

H3. There is a positive link among perceived profit and the excellence of BI information.
H4. There is BI information excellence and client happiness have a good link.

3.3 Data Excellence

One of the main components for creating a positive company in the twenty-first period is data excellence. According to [17] effective statistics management and admission to data foundations may guarantee good data excellence, though extract, convert, and load procedures guarantee the correctness, consistency, and currency of the data. This is due to the fact that poor data excellence affects BI functionality and results in bad business choices [18], Since their absence might result in implementation failure, data excellence is therefore crucial to the achievement of BI (Almaaitah et al. 2024), By demonstrating that numerous real advantages exist to assist enhance clients' perceptions of values, numerous academics have exposed that data excellence has a favorable impact on those values and he found that excellent data excellence that satisfies clients' demands enhances decision-making and boosts the degree of fulfilment.

So, we propose:

H5. The perceived value and the excellence of BI data are positively correlated.
H6. BI data excellence and client satisfaction are positively correlated.

3.4 Training Standard

A crucial factor in determining BI efficacy is training excellence Due to the complexity of BI, poor training is another problem that is pertinent to problems with BI failure, BI exercise agendas might be of limited utility when consumers realize that training is an excess of time, that training time is incorrect, that the

trainers are incompetent, or that the training is insufficient [19]. The accessibility of exercise programs for clients has an impact on client fulfilment. Although earlier research has demonstrated that high-excellence client training influences perceived value and client happiness, the BI effectiveness study does not provide evidence to support this claim.

So, we make the following assumption:

H7. There is a positive connection among perceived value and BI training excellence.
H8. Client satisfaction and the excellence of BI training are positively correlated.

3.5 Perceived Value

In order for IS research to be effective, the perceived value construct has played a crucial role for almost three decades. Perceived value refers to how much a client thinks utilizing the BI would improve the excellence of his or her work and task performance [20]. Productivity, getting things done more quickly, making things simpler, and overall usefulness are the metrics to gauge the perceived value [21, 22]. In addition to criticizing, brought up model-related concerns [23] came to the same conclusion that around is a connection among organizational advantages and perceived profits thru the BI execution stage. It was discovered that perceived value positively correlated with firm's advantage. Consequently, we assume:

H9. Perceived value and client satisfaction have a positive link.
H10. Perceived value and organizational value are positively correlated.

3.6 Client Satisfaction

The main concept behind client satisfaction revolves around how clients feel about BI in terms of how well it meets their expectations [24]. The degree to which clients think the BI they have access to fits their work needs is referred to as client satisfaction (Zhao 2021; [25]). Due to its high validity, this section has been the greatest often employed construct to quantify BI achievement for a long period. Client happiness is a prerequisite for net organizational gains, according to the original and updated versions [26]. The results of (Almaaitah et al. 2024) provide evidence that there is a connection between client happiness and advantages or value to the organization. There is a strong correlation between organizational advantages and satisfaction with the IS, according to another study by (Zhao 2021).

As a result, we assume:

H11. Client happiness and organizational value are positively and significantly correlated.

4 Data Collection

Due to the organizational structure of the study, a key informant technique was employed to get information about the efficacy of BI in their companies. In organizational IS research, the use of key informants is common. Functional level to strategic level practical and business bosses who employ BI for decision-making in their organizations are the focus of this study. These responders are among the most knowledgeable about the efficiency of BI. Some of them are in charge of the administration of BI initiatives inside their organizations, while others are BI end clients in their respective lines of work. Instead, then expressing their own opinions, the informants were urged to provide those that were typical of their companies. The questionnaire was given personally to one defendant from each of the sampled corporations. The data gathering procedure was place between May and August of 2023. A 77% effective response rate was attained out of 171 prospective companies with 170 responses. After incomplete replies were disregarded, 150 responses remained, yielding a useful response rate of 66.6%. The determination of the minimal sample size is one of the most essential difficulties through Smart PLS. The "10-times rule" method is a popular minimum sample size estimation technique in Smart PLS.

Within the model. Given that the number of routes leading to the endogenic mechanisms in the planned model was 11, our sample size met the well acknowledged "10 times rule" and was thus adequate to provide credible Smart PLS results. This study therefore essential a minimum sample size of 110 applicants. We assessed the non-response bias during pre-data processing. The chi-square analysis,) suggested techniques, revealed no significant changes among initial and late answers with regard to important components at the significance level of 5%. As a result, it was determined that nonresponse bias was unimportant. When using self-reported data, associations may frequently be affected by common method bias. To address such a problem, the most reliable method for identifying common method bias in data was Herman's single-factor test. The test results, only about 29.7% of the covariance in our data can be attributed to a single component, which is less than the necessary 50%. Overall, it can be said that this study did not have a significant issue with common technique bias. The demographic traits, which are summarized in Table 1, also suggest that our sample is well representative.

5 Data Analysis

Using Smart PLS 4 software analysis, the suggested model and assumptions were empirically validated. This programme, which is frequently used in IS research like this one, can analyses complicated models and performs well with tiny data sets in order to ascertain loadings, path coefficients, determination coefficients, predictive relevance, and significant levels, a Smart PLS algorithm, predictive model, and

bootstrapping approach were employed. Two phases of the research model examination were conducted. The structural model was tested in the second stage, while the measurement model's validity and reliability were analyzed in the first. In this study, the measurement model was assessed first, then the structural model.

5.1 Measurement Model Analysis

See Table 2.

5.2 Structural Model Analysis

See Tables 3 and 4.

The relationship (H4: 50.465, p 0.05) among information excellence and client pleasure was supported. Both perceived value (H5: 50.740, p 0.05) and client fulfilment (H6: 50.317, p 0.05) are positively impacted by data excellence. However, training excellence has a favorable impact on client satisfaction (H8: 50.099, p 0.05) but no influence on perceived value (H7: 50.034, $p > 0.05$). It was established that perceived values had an effect on both client satisfaction (H9: 50.159, p 0.001) and firms' advantage (H10: 50.185, $p > 0.05$). Lastly, client satisfaction has a favorable impact on firms' advantage ($p = 0.001$, 50.488). As a result, in the framework of our research findings, H1, H3, and H7 were taken into consideration with no influence scope.

6 Analysis and Recommendation

In the structural situation of Jordanian firms, this article aims to build a thorough and multifaceted model for evaluating the efficiency of BI technologies. Theoretical underpinnings for the current work come from and other related investigations. This model describes how seven concepts—structure excellence, information excellence, data excellence, training excellence, perceived value, client happiness, and firms' madvantage—represent features of a particular BI effectiveness. Our data, which was gathered through instruments of 120 managers at Jordanian listed enterprises who utilize BI designed for strategic, tactical, and operational decision-making, was used to test the model. Eight of the eleven submitted hypotheses have empirical validity in the context of our data, according to the data analysis. Contrary to expectations, the perceived advantage was not significantly influenced by structure excellence.

Structure excellence is only a component of the larger and more comprehensive dimension known as structure integration, which provides a compelling argument in favor of this. Given this, the BI structure's technical capabilities may be required to

Table 2 Factor loading, reliability and convergent validity outcomes

Concept and measurement element	FL	CA	CR	AVE
Structure excellence		0.970	0.980	0.895

guarantee that it functions regularly but may not be sufficient to offer advantages or affect clients' perceptions. Contrarily, our Results from empirical research confirmed the link between Structure excellence and client happiness. For BI clients, structure dependability, flexibility, integration, reaction speed, and simplicity of use are crucial factors. Therefore, it might be claimed that a well-designed structure based on practical qualities promotes client satisfaction with the BI structure. Unexpectedly, our findings did not demonstrate a positive connection among information excellence and perceived advantage.

The findings are consistent with the idea that when consumers opinion the information from the BI structure as favorable, they are more likely to be happy and I'm happy with it. As a result, our findings further confirm's claim that consumers will be happier with the BI structure if the information is of a better caliber. Data

excellence is one of several factors that this study takes into account, and it is crucial to the achievement of BI structures. As predicted, the sole independent factor that influences equally perceived value and client satisfaction is data excellence. The client value and satisfaction with the BI structure were found to be enhanced by data correctness, precision, reliability, and completeness. This shows that having access to high-excellence data enhances client productivity, helps them do activities faster and with less effort, and ultimately raises their level of fulfillment by the structure. Surprisingly, perhaps there isn't enough evidence to support this link since training programs place more focus on structure usage characteristics such structure functioning, information accessibility, and simplicity of use than on the advantages of reporting and KPIs for everyday tasks and decision-making.

7 Research Limitation and Future Studies

Due to various constraints, there are more prospects for study in the future. Since objective data could not be obtained, we first and principally used self-reported perceived metrics to evaluate organizational value. When there are no accessible objective performance statistics, perceptual or subjective metrics might be used instead, however this could result in skewed results. Future research is likely to produce results that differ from ours by utilizing objective or monetary metrics like effectiveness and (ROI) or by employing balance sheet metrics. Due to our extremely small sample size, we chose not to employ the control factors that might potentially affect the dependent variable; nevertheless, future research incorporating controller variable star such firm size, manufacturing, or administrative provision to identify any potential effects on organizational advantages. Third, information was gathered from Jordan, a single cultural and geographic region.

Future studies are urged to examine our suggested model using information from various countries or cultural situations to determine whether the conclusions are generalizable. Fourthly, even if this study's sample size is smaller than what is required for the Smart PLS analysis, we accept that this is one of its drawbacks. Future research may thus expand on this model to gather more data that will improve the conclusions and more accurately reflect the population.

Does Implementing Lean Management Have the Potential to Affect the Performance of an Organization?

Lama Ahmad Alsmadi, Khalid W. Wazani, and Qais Hammouri

Abstract The main objective of this study is to explore the impact of the implementation of lean management in Jordanian pharmaceutical warehouses. The study attempted to examine the impact of lean management (focus on clients, standardization, and continuous improvement) on organizational performance. This study was applied to the five most popular Jordanian pharmaceutical warehouses located in Amman. To reach the purpose of this study, data were collected from 226 employees by using a questionnaire. (SPSS) program was used to analyze and examine the hypothesis. The results showed there is a significant positive impact of lean management (focus on the client, standardization, and continuous improvement) on organizational performance in Jordanian pharmaceutical warehouses at a level of ($\alpha \leq 0.05$). Moreover, the study recommended companies and pharmaceutical warehouses pay more attention to lean management and make the concept of lean management part of their culture.

Keywords Lean management · Organizational performance · Pharmaceutical warehouse

1 Introduction

Management is the foundation of any organization's success, whether it's in the field of business, health, service sector, and beyond. The impact of management practices is a critical determinant in the success or failure of economic entities [1]. Moreover, the cornerstone of organizational prosperity hinges on adept management that utilizes scientific methods for decision-making and undertakes various managerial tasks to innovate, grow, and adjust in response to both local and global circumstances [2].

Consequently, the concept of lean management has emerged as a cutting-edge and contemporary approach increasingly adopted and implemented by businesses [3].

The efficiency of an organization's management is defined by its ability to react swiftly to changes and modify its operational methods to align with evolving demands [4]. In addition to effectively leveraging data and being agile in the face of challenges and prospects, this managerial style focuses on principles, optimizing processes and reducing waste, while continually striving for excellence through collaborative effort [5]. The goal is to maximize benefits for customers and minimize any non-value-adding activities for both the organization and its clients. Lean management represents a departure from the outdated and insular approach of traditional bureaucratic management, adopting a more streamlined and efficient strategy [6].

The Jordanian pharmaceutical warehouse sector was selected for study due to its significance within the industrial sphere and its overall impact on the Jordanian economy, owing to its competitive edge and substantial contributions [7]. Despite rapid advancements across various commercial and service sectors, companies within this sector face an increasing array of challenges and intense rivalry among peers. Moreover, these obstacles and shifts are not confined to specific levels or segments of a company; they span numerous facets and stakeholders with the potential to affect various aspects of the business, such as client contentment and the organization's reputation [8].

An examination of the practices in some pharmaceutical warehouses exposes pressing need for adopting lean management. This approach aims at minimizing waste, cutting down costs, enhancing service quality, catering to customer demands, and amplifying competitiveness and profitability. Lean management necessitates cultivating an optimal work environment, fostering a positive psychological climate, harnessing teamwork, employing oversight mechanisms, and investing in knowledge. It also encourages creativity and innovation, promotes transparency, combats bureaucratic delays, and adapts to contemporary changes [9]. Essentially, lean management offers a strategic blueprint for establishing a dynamic and evolving organization, directed at pinpointing, and resolving pressing issues [10].

The concept of organizational performance captivates both researchers and business executives due to its heightened relevance in an era of continuous and rapid change [11]. The implementation of lean management principles and best practices are focused on enhancing organizational performance to achieve the set goals and aspirations of the entity [36]. Lean management, as characterized by experts such as James Womack, Daniel Jones, and Daniel Roos, is explained in detail in their book "The Machine That Changed the World". Broadly, lean is understood as a mindset and collection of doctrines aimed at optimizing production (or service provision) and supply chains by eliminating any activities that do not enhance value to the product or service, thereby reducing inefficiencies [12, 13].

The Jordanian pharmaceutical warehousing sector is recognized as one of the most important levers of the national economy, and it has grown substantially because of its high efficiency and ability to compete both domestically and internationally. However, since observing the researcher working in drug stores for a sufficient period, it became clear to him that some Jordanian drug stores face several challenges and

obstacles in developing modern and contemporary administrative methods, poor management, and increased labor market competition. They also face a level of complexity and lag in production and customer service, particularly throughout the period 2020–2021 (Covid-19), which has resulted in this crisis increasing the weight and obstacles owing to changing conditions [14].

To stay competitive, warehouses that excel by employing the most current management techniques to address challenges must consider adopting and integrating modern management systems, such as lean management. In light of this, the problem statement for the study could be framed around the question: what is the role of lean management in enhancing organizational performance within Jordanian pharmaceutical warehouses? The objective of this research is, therefore, to examine the influence of lean management on the organizational performance of pharmaceutical warehousing operations in Jordan.

2 Literature Review

2.1 Lean Management

Lean management encapsulates an organization's competence in overseeing operational performance with a focus on rapid reaction to changes and the ability to rapidly modify working procedures to fulfill evolving requirements [15]. It aims to tackle difficulties and leverage opportunities in order to secure optimal outcomes for clients while striving to minimize any processes that fail to contribute value to the business or its customers [16]. Additionally, lean management streamlines operations by reducing the amount of time dedicated to superfluous tasks such as redundant actions, transportation, waiting periods, overproduction, etc., along with addressing quality complications and unnecessary complexity [17]. This approach is bolstered by a crucial element of management that ensures that the workforce operates in the most favorable environment possible [18].

While there is no universally principles for lean management, scholars generally align on a core set of guiding principles utilized by senior management to navigate the implementation of lean practices [19–21], which can be listed into three primary principles. First among these is the customer-focused principle, which underscores the value derived for customers as the primary driver for adopting lean management's emphasis on agility and efficiency [22]. It goes beyond internal organizational benefits, placing the effectiveness of the organization in interpreting and materializing customer needs at its heart, thereby integrating customers into the solution ecosystem rather than viewing them as part of the challenge [23].

The second principle is standardization, which involves setting explicit and precise performance benchmarks that facilitate the acceleration of task completion and ensure a seamless flow of production activities in line with established specifications [24, 25]. Implementing this principle demonstrates an organization's dedication to

and compliance with established processes and standards for accomplishing tasks [26]. It enables management to measure real achievements against predefined standards [27]. The clear description of work standards simplifies the oversight of tasks and activities across all units and enhances performance tracking [28, 29]. This, in turn, assists management in pinpointing and amending deficiencies and shortcomings within the operational processes.

Lastly, fostering continuous improvement is a key lean management principle that entails utilizing methods to evaluate an organization's current operations, identify necessary actions, recognize potential obstacles, and involve all organizational members in enhancing their work processes [30, 31]. This reflects the dynamic and adaptable nature of lean management, acknowledging that challenges may emerge related to any principle. By ensuring that every staff member is actively engaged in continual enhancement of operational processes, the company is better shielded against potential issues, maintaining its resilience and capability to evolve effectively [32, 33].

2.2 Organizational Performance

In recent times, the idea of performance has garnered considerable attention and is now a common term across all domains of human endeavor [34]. Performance is a subjective interpretation of reality, producing numerous scholarly deliberations on the concept and the array of tools used for its measurement. The term "organizational performance" is ubiquitous in educational discussion; however, precise definitions are inadequate [35, 36]. The several terminologies that are used to articulate performance give rise to growing dialogue on potential misunderstandings of the concept [37, 38]. Consequently, notions such as productivity, efficiency, effectiveness, economy, profitability, competitiveness, etc., are often conflated with the idea of organizational performance [39]. This has led to calls for a clear definition of performance to avoid ambiguity and ensure clarity in its understanding and application.

Satisfaction and productivity are indeed recognized as two critical aspects of an organization's performance [40, 41]. Customer satisfaction specifically is the emotional response a customer has upon assessing whether a product's actual performance meets or falls short of their expectations. If the product's attributes align with or better expectations, satisfaction is likely to be high; conversely, if they do not, disappointment may ensue. The model of customer satisfaction operates on a cause-and-effect basis, with factors influencing satisfaction—such as customer expectations, perceived quality, and perceived value [42, 43]. Central to the model is customer satisfaction itself, which then influences outcomes reflected on the model's right side. These outcomes include customer complaints and indicators of customer loyalty, such as customer retention and willingness to accept price variances [44].

Productivity is often measured as the proportion of produced output to the volume of inputs employed [45]. It is an efficiency indicator that measures the proficiency

with which an economy uses inputs like labor and capital to yield a particular level of output [46]. Recognized as a pivotal driver of economic growth and competitiveness, productivity provides essential data for comparisons and assessments of performance on both international and national scales [47]. Companies, which differ in structure and operational focus, typically employ varied approaches when measuring their productivity, customizing tools and methods to fit their distinctive needs [48]. Broadly, productivity measurement can be categorized into several types, including a focus on profitability, task completion, management of time, utilizing feedback, peer evaluations, correlating labor time with goods manufactured, tracking employee development, and investigating customer satisfaction. These diverse metrics collectively assist in comprehensively evaluating and enhancing company productivity [49]. The research model under discussion is encapsulated in Fig. 1.

Based on the previous discussion and in order to achieve the goal of this study, we formulated the following hypotheses:

H1: Focus on client has a positive impact on organizational performance.
H2: Standardization has a positive impact on organizational performance.
H3: Continuous improvement has a positive impact on organizational performance.

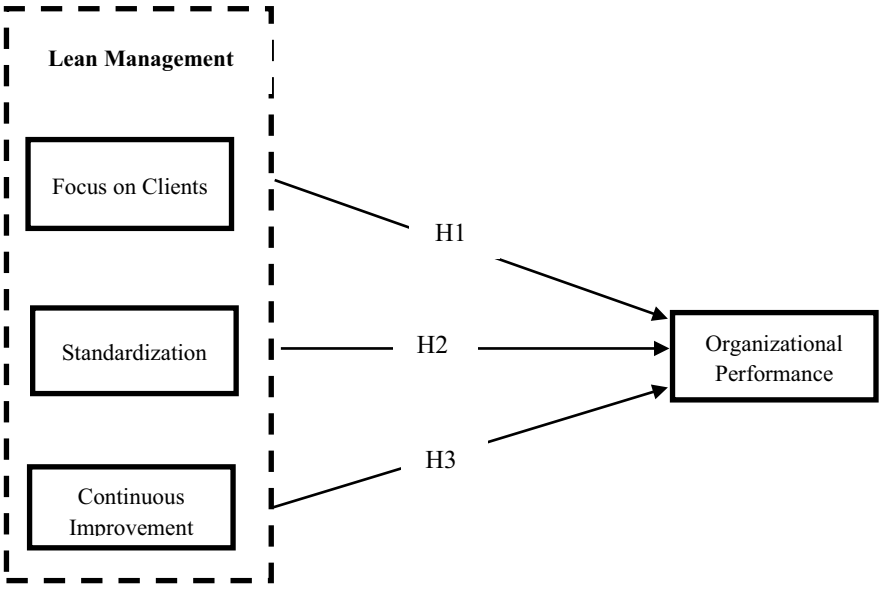

Fig. 1 The proposed model

Table 1 Pharmaceutical warehouses in Amman city

No.	Study population name	No. of employee
1	Khoury drug store	251
2	Sharaya drug store	64
3	Masrouji drug store	62
4	Orient drug store	85
5	Modern drug store	41

3 Methodology

The aim of this study is to understand the impact of the implementation of lean management on organizational performance in Jordanian pharmaceutical warehouses. Descriptive research contains gathering data to test hypotheses or answer questions about the current state of the subject of study. The survey research design was chosen for the study. The survey instrument was designed to collect information about people's attitudes toward lean management and organizational performance. However, during data collection, we maintained the highest standards of confidentiality and data protection, ensuring that all participant information was anonymized and securely stored. Informed consent was rigorously obtained from all participants, who were fully briefed on the purpose, methods, potential impacts, and significance of the study, affirming their voluntary participation without any undue pressure. Additionally, we actively identified and managed any potential conflicts of interest to preserve the impartiality and integrity of the research process. The study protocol, including the ethical considerations, received approval from the pharmaceutical warehouses, reflecting our commitment to uphold the ethical principles.

3.1 Research Population and Sample

The population of the study consists of all employees working in the Jordanian pharmaceutical warehouses located in Amman city. The researcher chose the most popular and collaboration warehouses to deliver questionnaires shown in the table below. These warehouses consist of (503) employees divided into three groups: managers (56), supervisors (61), and employees (386). Table 1 summarizes the total number of employees for each pharmaceutical warehouse distributed in Amman.

3.2 The Instrument Used

The questionnaire is the main data collection instrument for collecting the research primary data. The questionnaire includes three sections. The first section explained

Table 2 Sample demographic

Measure	Category	Count	Perc. %
Age	18–25	54	24
	26–35	54	24
	36–45	91	40
	Age > 45	27	12
Education	Secondary	18	8
	Diploma	27	12
	Bachelor	172	76
	High school	9	4
Gender	Male	99	44
	Female	127	56
Job position	Employee	140	62
	Supervisor	36	16
	Manager	50	22

the purpose of the questionnaire as well as the confidentiality undertaking that it will only be used for research purposes. The second section includes questions related to demographic information (gender, age, educational qualification, administrative level). The third section includes the measurement items related to the study. Such items adapted to a Likert-type graded scale (strongly agree = 5, agree = 4, neutral = 3, disagree = 2 and strongly disagree = 1). The collected data were keyed into the SPSS. Table 2 shows the demographic information of the sample.

4 Data and Results

4.1 Reliability

The reliability analysis was applied to the level of Cronbach Alpha (α), which is the internal consistency criterion that was at a minimum acceptable level (Alpha ≥ 0.60). These are the acceptable levels recommended. The results are shown in Table 3.

Table 3 Reliability test

Variable	No. of items	Cronbach's alpha
Focus on clients	9	0.899
Standardization	6	0.909
Continuous improvement	6	0.887
Organizational performance	4	0.928

Table 4 Results of multiple regressions analysis (coefficients)

Model	Unstandardized coefficients		Standardized coefficients	T	Sig.
	B	Std. Error	Beta		
(Constant)	0.652	0.181		3.592	0.195
Customer focus	0.445	0.062	0.396	7.182	0.014
Standardization	0.328	0.064	0.358	5.146	0.001
Continuous improvement	0.133	0.057	0.159	2.327	0.002

Dependent Variable: Organizational Performance

The results shown in Table 3 show that the shown values were close to (1), indicating that the research tool had a convincing internal consistency and reliability that served the research objectives.

4.2 Multiple Regression Analysis

Multiple regression test was used to examine the study hypotheses. Regression analysis is a statistical test utilized to explore the relationship between multiple independent variables and one dependent variable. The findings of such tests depicted that the research model explained 59.5% of the variance. Table 4 shows the coefficient table of multiple regression analysis. As shown in the table, three independent variables are statistically significant at the 0.05 level. Hence, H1, H2 and H3 are supported.

5 Discussion

The current study posed three main hypotheses and their relationship to the impact of the study variables placed within the study variables. The study produced several findings that may help improve organizational performance in Jordanian pharmaceutical warehouses. Based on the analyzed data and the study hypotheses tested previously, the study obtained the impact of lean management which consists of (focus on clients, standardization, and continuous improvement) on organizational performance in Jordanian pharmaceutical warehouses. The Result of this study shows that there is a significant implementation of lean management among the Jordanian pharmaceutical warehouses. All variables of lean management have a direct significant effect at Jordanian pharmaceutical warehouses organizational performance. This result is supported by previous studies conducted by [50–52].

All lean management variables influence organizational performance at Jordanian pharmaceutical warehouses. The continuous improvement had the highest effect on

organizational performance (Beta = 0. 368, t = 5.656, sig. < 0.001), followed by focus on client variable (Beta = 0.300, t = 5.718, sig. < 0. 00), then standardization (Beta = 0.264, t = 3.984, sig. < 0. 00). The focus on client was holding the highest effect on productivity (Beta = 0. 396, t = 7.182, sig. < 0.001), followed by standardization variable (Beta = 0.358, t = 5.146, sig. < 0. 00), then continuous improvement (Beta = 0.159, t = 2.327, sig. < 0. 00). This result is supported the previous studies, such as: [53–56].

6 Conclusion and Recommendation

The results show that participants agree on the high implementation of each Lean management variable (focus on clients, standardization, and continuous improvement), indicating that these variables are prevalent in Jordanian pharmaceutical warehouses. Moreover, the overall result indicates that there is a significant implementation of the lean management among Jordanian pharmaceutical warehouses. This indicates that the managers and supervisors working at Jordanian pharmaceutical warehouses realize the importance of the implantation of the lean management variables. The results also show that the relationships and correlation between lean management and organizational performance is strong. The relationships and correlation between each variable of Lean management and organizational performance dimensions are strong too.

Finally, the current study indicates that all lean management variables influence Jordanian pharmaceutical warehouses' organizational performance. Continuous improvement had the highest effect on organizational performance, followed by a focus on client variable and then the standardization variable. The focus on client was holding the highest effect on productivity followed by the standardization variable and then continuous improvement variable.

Based on the findings of this research, the following suggestions are proposed to enhance organizational performance in businesses and warehouses:

1. Companies are encouraged to deploy lean management as a strategic tool to elevate their performance levels.
2. It is recommended that specialized training programs on lean management implementation be developed for both managers and staff.
3. Organizations should consider designating a lean management expert to oversee and manage lean initiatives.
4. Entities keen on integrating lean principles should be supported and motivated to do so, as it presents substantial prospects for enhancing productivity, customer satisfaction, operational efficiency, and maintaining a competitive stance in the market.
5. Businesses are advised to integrate lean management principles into their operational models, tailoring them specifically to their unique business requirements, and to embed the lean management standards into their organizational culture.

However, while this study provides insights into the potential effects of implementing lean management on organizational performance, there are several avenues for future research that can expand upon these findings. Further studies could explore the long-term impacts of lean management practices by employing a longitudinal research design that allows for the observation of performance changes over extended periods. Moreover, future research may benefit from incorporating a multi-industry comparative analysis to determine the generalizability of the results across different sectors. Moreover, investigating the mediating role of organizational cultural between lean practices and process effectiveness could also offer valuable contributions.

The Moderating Role of Firm Size on the Relationship Between Intellectual Capital and Firm Performance Among Industrial Companies Listed on Palestine Exchange (PEX) and Amman Stock Exchange (ASE) for the Period 2016 to 2022

Ghassan Daas and Abeer Yahya

Abstract The literature assess the effect of "intellectual capital (IC)" on the performance of the firms and whether firm size can moderates the relationship between "intellectual capital" and "firm performance". The study uses secondary data from annual reports of listed industrial firms on "PEX and ASE" to measure "human capital efficiency (HCE)", "structural capital efficiency (SCE) and "Capital Employed Efficiency" (CEE)" as components of IC in the value-added intellectual coefficient model (VAICTM) and corporate performance indicators "(ROA, ROE, ATO, and EPS)". The study sample includes 44 industrial companies on "PEX and ASE" for the period 2016 to 2022. Multiple regression analysis was used to analyze the data. The study finds with the moderation effect that for industrial companies listed on PEX, HCE has a positive impact on ROE, EPS and ROA. Negative impact of SCE on ROE, and positive impact of CEE on ATO. However, for industrial companies on the ASE, SCE has a negative impact on ROE, whereas CEE have positive impact. Other variables have no impact. The results show that for industrial firms listed on "PEX and ASE", the firm size variable only moderates the relationships between IC and firm performance. The study recommends that the Industrial companies have to disclose in their annual reports all components of IC represented in "HCE, SCE, and CEE".

Keywords Value-added intellectual coefficient model (VAICTM) · Intellectual capital (IC) · Human capital efficiency (HCE) · Structural capital efficiency (SCE) · Capital employed efficiency · Firm performance · ROA, ROE, ATO, EPS, firm size

1 Introduction

The International Financial Reporting Standards (IFRS) dictate that financial statements should accurately reflect a company's current value. However, these standards tend to prioritize physical and monetary assets over intangible ones, such as "intellectual capital" (IC), even if they are significant and relevant to users. IC is a valuable asset for companies as it represents their knowledgeable base. Unfortunately, the exclusion of IC from financial statements means that they do not fully capture the company's true value [1]. To address this limitation, researchers have developed models that recognize, measure, and disclose IC, solving the recognition and measurement problem [2].

As a result of moving from a production economy into a knowledge economy as a basic resource of value creation in modern economics, knowledge plays a more vital contributor resource than "physical and financial assets" in generating sustainable competitive advantages and superior performance [3]. According to the resources-based theory, the competitive advantages of the company depend on the capabilities and resources the organization possesses, and those resources contain both "tangible and intangible" assets [4]. IC is recognized as the knowledge that may be converted into value for driving sustainable competitive advantages and long–term superior performance [2]. It contains three basic components which are "human capital efficiency (*HCE*)" relying on employees' skills, experiences, knowledge, and innovation, "structural capital efficiency (SCE)" which depends on databases, software, computers, and patents, and "capital employed efficiency (CEE)" which refers to the relationships between the company and the customers The "value-added intellectual coefficient model (*VAICTM*)" is a model created by Anti Public. It is considered the best way to measure the "efficiency of intellectual capital's" contribution to a company's value creation.

The (VAICTM) model measures three components: "physical capital, structural capital", and "human capital" that form the value of the company [5]. In addition, firm performance expresses the health of the company during a given period [6]. Various financial ratios can be used to measure "firm performance (FP)" such as "return on assets (ROA)", and "return on equity (ROE)" represent profitability. While "assets turnover (ATO)" measures productivity, and earning per share to evaluate the performance of companies [3]. Whereas firm size is used as a fundamental characteristic of a company which refers to the size of companies at a given period [7]. Most researchers have studied the direct impact of IC on FP such as [1–3, 8–11]. This study is based on investigating the moderating role of firm size on the relationships between IC and FP.

2 Problem Statement

IC as a form of intangible asset has a salient role in a firm's performance. Most prior research investigated the direct relationships between IC and FP by using qualitative measures of IC such as HCE, SCE, CEE, and financial ratios as a measure of FP represented in ROA, ROE, ATO, and EPS. Such as [1–3, 8–11]. However, the investigation of the moderating role of firm size on the relationships between "intellectual capital" and firm performance has not been discussed yet in "PEX and ASE". The main question of this study is "What is the moderating role of firm size on the relationship between IC and FP for industrial companies listed on "PEX and ASE"? And the next sub-question addressed:

(1) What is the effect of "human capital efficiency (HCE)", on the FP among industrial listed companies listed on "PEX and ASE"?
(2) "What is the effect of structural capital efficiency (SCE)" on the FP among industrial companies listed on "PEX and ASE"?
(3) "What is the effect of "Capital Employed Efficiency" (CEE)" on the FP among industrial companies listed on "PEX and ASE"?
(4) What is the "moderating role of firm size on the effect of HCE, SCE, and CEE"" on the FP among industrial companies listed on "PEX and ASE"?

3 Research Importance

The importance of research emerges from the gap related to exploring the moderating role of firm size on the relationships between IC and FP". The result of this study will be useful for the industrial companies sector seeking to evaluate the importance of IC on an FP and how firm size moderates the impact of IC on FP [3]. Moreover, stakeholders can identify the factors that can affect FP. This study tries to ensure the disclosure of IC by managers is fruitful [1].

4 The Research Objectives

Based on the study problem, the study tries to achieve the following objectives:

(1) Exploring the nature and existence of IC components in industrial companies.
(2) Investigating the effect of "IC components" and the FP in industrial companies.
(3) Understanding how firm size moderates the effect of IC components on FP.

5 Theoretical Framework and Hypothesis Development

Resources-based view (RBV): Penrose (1959) first developed the resource-based perspective which has become the dominant theory in strategic management [4]. This theory is utilized to decipher and examine a company's resources, to attain long-lasting competitive advantages and excellent performance. RBV suggests that a company's competitive advantages stem from its abilities and resources, which consist of both "tangible and intangible" assets, which the human resources capital (IC) is included. RBV proposes that the firm competitive advantage depends on the capabilities and resources that the organization possesses, and those resources contain both "tangible and intangible" assets [1]. RBV stipulates the connection between intangible assets represented in IC and capabilities, resources, profitability, and competitive advantages and investigates the effect of these connections on achieving sustainable competitive advantages and superior performance [12].

Knowledge-Based View (KBV)

As suggested by the resources-based view, it focuses on resources and capabilities inside of the companies including "tangible and intangible" assets. So, the "Knowledge-Based View" is considered as the recent extension for RBV of a company which relates to knowledge within the organization that cannot be easily imitated by rivals [13]. The KBV of a firm analyzes and interprets four attributes of skills represented in (1) skills and knowledge of employees, (2) database and management system, (3) control process, and (4) construction of knowledge [12]. Sustained competitive advantages and superior performance highly rely on Knowledge resources which are considered primary components of IC. It can simplify the success of a firm [4].

Firm performance (FP): Firm performance (FP) is considered a dependent variable. This refers to the ability of the company to exploit its available resources efficiently and effectively to achieve its desired goals, with consideration of their relevance to the current and potential users [6]. The "resource-based view" focuses on both "tangible and intangible" assets to measure benefits and competitive advantages for a company. Whereas measures of financial performance are considered as a dominant model in determining business performance. Many measures have been used to measure profitability, productivity, and market evaluation. "ROA and ROE" represent profitability. While ATO measures productivity. And EPS to evaluate the performance of companies. ROA is an indicator that relates to the company's ability to create profits from the resources invested in it, and show the firm's competency in utilizing its assets [10]. ROE is an indicator that refers to the efficiency of the company in bringing income from stakeholders' money that has been invested [2]. Whereas ATO is a financial indicator that measures the efficiency of the company in using its resources to bring revenues. ATO is computable as total revenue divided by total assets [10, 14]. EPS is a financial indicator that is used by financial analysts to evaluate the performance of companies. It refers to the monetary amount of profits per outstanding common shares during the accounting period [4].

"Intellectual capital": International Accounting Standard 38 (IAS38) define "intangible assets" as non-monetary resources that lack physical substance. These resources can be identified if they are separable or arise from legal or contractual rights, such as computer software, trademarks, databases, and patents. The standard requires that intangible assets be clearly defined and only recognized if there is a potential future economic benefit and their cost can be reliably measured. Despite ongoing debates, there is still no consensus on a universal interpretation of IC [9]. It is defined as the differences between market value and book value known as IC [10], while [2] view "intellectual capital" as knowledge that can generate value and fuel sustainable competitive advantages and long-term success. The fundamental components of "intellectual capital" include "HCE, SCE, and CEE".

Human capital Efficiency (HCE): Human capital is a crucial element of intellectual wealth and creativity. It refers to a business's capacity to reap advantages from its employee's skills, experiences, knowledge, and innovation [8]. It depends on the personal characteristics of employees such as education, entrepreneurship, leadership, and experiences [15]. Most previous studies found a positive effect of HCE on FP. such as, [10] found a positive impact of IC on firms' productivity measured by ATO, [3] indicated a positive effect of HCE and FP represented in ROA and ROE. [4] Found a positive impact of HCE on FP measured by ROA and EPS. Depending on these earlier studies, the first hypothesis is:

> **Hypothesis 1** There is a positive effect of HCE on FP of industrial companies listed on "PEX and ASE".

Structural capital (SC): Structural capital also known as organizational capital [10] "Organizational or company value refers to the assets owned by a firm that persist even after employees leave, such as the company's systems, intellectual properties, operations, structure, and other intangible resources. Knowledge management systems play a crucial role in supporting employees' performance within a business by facilitating the creation, sharing, and transfer of knowledge" [16]. There are two main components to SC: infrastructural resources used in organizational activities, and knowledge innovation, such as patents, copyrights, and databases [14]. According to the resource-based view, SC cannot be substitutable easily so it is an important source of sustainable competitive advantages [1].

Most studies have suggested a positive impact of SCE on FP such as [10] revealed a positive impact of SCE on productivity measured by ATO, whereas [1] found a significant positive effect of SCE on ROA and an insignificant positive effect of SCE on ROE

Al Momani et al. [4] found that ROA and ROE were significantly affected by SCE. However, [3] indicated there is no association between SCE and profitability measured by ROA and ROE. Depend on these earlier studies, the second hypothesis is:

> **Hypothesis 2** There is a positive effect of SCE on FP of the industrial companies listed on "PEX and ASE".

"Capital Employed Efficiency": Capital employed is a key component of "intellectual capital" (IC). It refers to the intellectual resources that are used to manage and regulate a company's relationships with its stakeholders, such as government, society, clients, suppliers, and marketing channels. These stakeholders create the environment of the firm, and maintaining and expanding relational capital is crucial for obtaining new resources and achieving long-term superior performance for a company [11, 17].

There is a difference in the findings of the studies about the effect of CEE on the FP. Agomor [1] stated that CEE enhances the firm's profitability measured by ROA and ROE. Whereas, Al Momani [4] didn't find any association between CEE and ROA and ROE. Xu and Liu [3] revealed the productivity of the firm is positively affected by CEE and the profitability of the firm is negatively impacted by CEE. Depending on these earlier studies the third hypothesis is:

> **Hypothesis 3** There is a positive effect of CEE on the FP of the industrial companies listed on "PEX and ASE"**.**

Firm size: Firm size is considered a moderating variable in the current study. It is a fundamental characteristic of a company and measures the natural logarithm of a company's total assets at a given period [7]. Most previous studies used firm size as a control variable and they indicate a positive impact of firm size on FP that means when a company gets bigger in size of total assets will increase the ability to develop FP by optimal usage of available resources [1–3, 10]. According to our knowledge, this study is the first study to investigate the moderating role of firm size on the relationship between IC and FP. Then, the expected fourth hypotheses is:

> **Hypothesis 4** There is a moderating role of firm size on the effect of IC on FP of industrial companies listed on "PEX and ASE".

6 Method and Procedures

6.1 Population and Sample

This study employs the quantitative approach, which encompasses all numerical data—primary or secondary—in its methodology. The annual reports of all industrial firms on the "PEX and ASE" during 2016–2022 and the websites of the companies serve as the secondary data source for the current study. The study's sample was chosen using the following standards: Throughout the research period, the company needs to be operational and listed on "PEX and ASE", the business is required to include all components of VAICTM in its published annual reports (Table 1).

Table 1 The study population

Subsector	Population	No. of companies listed in PEX	No. of companies listed in ASE	Percentage
1	Pharmaceutical and medical industries	3	3	13.6
2	Chemical industries	0	5	11.4
3	Food and beverages	3	7	22.7
4	Tobacco and cigarettes	1	1	4.5
5	Mining and extraction industries	2	7	20.5
6	Engineering and construction	2	7	20.5
7	Electrical industries	0	2	4.5
8	Textiles, leathers and clothing	0	1	2.3
Total		11	33	100

6.2 Variables

1. **Independent variable**: the "value-added intellectual coefficient model (VAICTM)" is regarded as the most effective means of gauging the effectiveness of "intellectual capital" in generating value for the organization. There are various reasons for using the VAICTM model in the current study: first: quantitative method that depends on real and historical data from financial statements; second: reliability and objectivity of data that are obtained from audited financial statements; third: easily to understand by management and stakeholders [18]. The (VAICTM) model measures three components "human capital, physical capital, and structural capital" that comprise the company's worth [5]. There are five steps to measure "intellectual capital" (Table 2).

2. **Dependent, moderating and control variables**

The "Firm performance" is a dependent variable. Which is measured by "ROA, ROE, ATO, and EPS". Firm size is a moderating variable. While control variables are represented in leverage and firm age (Table 3).

7 Results

The following two regression models were constructed using the annual reports of industrial firms listed on the "PEX and ASE" to test the effect of IC on FP as well as the moderating effect of firm size on the relationship between variables.

Table 2 Calculation of VAICTM

First step:	"Calculation of value added (VA)" [4]. "VA = OP + HC + D + I + DI + T" Where: "OP = Operating profit of company, HC = Employee cost, D = Depreciation, I = Interest, DI = Dividend, T = Tax"
Second step	Estimation of "Human Capital Efficiency (HCE)" [2], HCE = VA / HC
Third step	Estimation of "Structural capital Efficiency (SCE)" [10] SCE = SC / VA "SC = VA – HC" Where: "SC = "Structural capital"
Fourth step	Estimation of "Capital Employed Efficiency" (CEE) [3] "CEE = VA / CE" "CE = Capital employed = Total assets – Total liabilities"
Fifth step:	Estimation of VAICTM [1] VAICTM = HCE + SCE + CEE

Model 1a—$FP = \alpha 0 + \beta 1HCE + \beta 2SCE + \beta 3CEE + \varepsilon$.
Model 1b—$FP = \alpha 0 + \beta 1HCE + \beta 2SCE + \beta 3CEE + \beta\ 4\ FLEV + \beta 5\ FAGE + \varepsilon$.
Model 2—$FP = \alpha 0 + \beta 1HCE1 + \beta 2SCE1 + \beta 3CEE1 + \varepsilon$.

Where

$\alpha 0$: represent Intercept; β 1–6: represent regression coefficients; FP: Firm performance; HCE: Human Capital Efficiency; SCE: Structural Capital Efficiency; CEE: "Capital Employed Efficiency"; FLEV: Financial leverage; FAGE: Firm age; FSIZ: Firm size; ε: error term.

HCE1 = moderating the independent variable by firms size (HCE * size)
SCE1 = moderating the independent variable by firms size (SCE * size)
CEE1 = moderating the independent variable by firms size (CEE * size)

7.1 The Impact of IC Components on ROA

According to Table 4, the "coefficient of determination (R2)" for the industrial companies on PEX was 4.3%. This indicates that only 4.3% of the variation in ROA is accounted for the independent variables "HCE, SCE, and CEE". In contrast, for the industrial companies on ASE, the coefficient of determination (R2) reached 10.3%, which is higher compared to Palestinian industrial companies. To determine whether there is a multicollinearity between independent variables in the regression model, we used VIF. Table 4 shows that there is no internal correlation between independent variables as the VIF is less than 5, indicating no multicollinearity. Based on the findings, we can conclude that there is no significant effect of each of "HCE, SCE, and CEE" on the ROA of the industrial companies on PEX. On the other hand, for the industrial companies on ASE, there is no significant effect for both "HCE and SCE on ROA", but there is a significant effect of CEE on ROA.

Table 3 Measurement of the variables

Type of variable	Variable	Definition	Measurement	References
Independent variable	Intellectual capital	The variations between book value and market value	VAICTM = HCE + SCE + CEE	[4]
Dependent variables	"Return on assets (ROA)"	The capacity of a business to turn a profit from the invested assets. It is a profitability indicators represented by "Return on Assets (ROA) or Return on Investment (ROI)",	Net income as a percentage of total assets	[19]
	"Return on equity (ROE)"	The efficiency of the company in generating income from stockholders' money that have been invested	Net income as a percentage of total equity	[20]
	"Assets turnover ratio (ATO)"	The efficiency of company in using its resources to create revenue	Total revenues as a percentage of total assets	[21]
	Earnings per share (EPS)	The monetary amount of profits per outstanding common shares during accounting period	Net income as a proportion of all outstanding common shares	[11]
Moderating variable	Firm size	Size of industrial companies at a given period	Natural logarithm of the company's total assets	[2]
Control variables	Financial leverage(FLEV)	Financial ratio that measures the ability of the company to pay its obligation	Ratio of total debts divided by total assets	[22]
	Firm age(FAGE)	The duration of the company's operations, counting from the year of founding to the present	Natural logarithm of the current year of the company minus the formation year	[4]

Table 4 The impact of IC on ROA

CEE		0.080	0.413	1.084	CEE		0.000	0.001	1.003

7.2 The Impact of IC Components on ROE

According to Table 5, the industrial companies on PEX have a coefficient of determination of 5.40%. This means that 5.40% of the variation in ROE is accounted for by the independent variables represented in "HCE, SCE, and CEE". On the other hand, the industrial companies on ASE have an R2 of 4.9%, which is lower than that of the PEX companies. The VIF is less than 5. The results indicate that there is no effect of "HCE, SCE, and CEE" on the ROE of the industrial companies on PEX. For the industrial companies on ASE, there is no effect of HCE and SCE on ROE, but there is an effect of CEE on ROE.

7.3 The Impact of IC Components on ATO

Table 6 examines the relationship between the components of IC and assets turnover (ATO). The results show that the coefficient of determination (R2) for PEX companies is 34.3%, while for ASE companies, it is 100%, indicating that the independent variables in the model account for all the variation in ATO for ASE companies, the result seems strange, but this is the fact. Previous studies concentrate of ROA and EPS [4], without having the ATO into consideration, so the result can't be verified for the Jordanian firms. The VIF is less than 5, indicating no multicollinearity between the independent variables. The impact of HCE, SCE, and CEE on ATO is significant for PEX companies. However, for ASE companies, only HCE and CEE affect ATO, while SCE has no significant impact.

7.4 The Impact of IC Components on EPS

According to Table 7, the coefficient of determination (R2) for industrial companies on PEX is 29.3%. This indicates that 29.3% of the variation in EPS can be explained

Table 6 The impact of IC on ATO

Palestine					Jordan				
"Model"	R	R Square	F-sig	DV	"Model"	R	R Square	F sig	DV

IV		B	Sig	VIF	IV		B	Sig	
(Constant)		− 37.181	0.001		(Constant)		0.204	0.001	VIF
HCE		− 0.139	0.877	2.699	HCE		4.437E−6	0.998	1.004
SCE		33.212	0.081	2.578	SCE		0.026	0.633	1.002
CEE		70.840	0.000	1.084	CEE		0.009	0.000	1.003

by the independent variables represented in HCE, SCE, and CEE. On the other hand, the coefficient of determination (R2) is 30.5% for industrial companies on ASE. The independent variables do not exhibit multicollinearity. There is a positive effect of CEE on EPS for the industrial companies on both "PEX and ASE", and there is no impact of HCE and SCE on EPS for both companies listed ln "PEX and ASE".

7.5 The Impact of IC Components on ROA in the Presence of Control Variables

Table 8 displays the influence of IC elements on the ROA in the presence of control variables. The results observed that the coefficient of determination (R2) for industrial companies on PEX is 15.8%. This percentage is higher than the coefficient of determination in Table 4. It means that control variables have a significant impact on increasing R2. The coefficient of determination (R2) for industrial companies on ASE is 22.6%. This percentage is also higher than the coefficient of determination in Table 4. It indicates that R2 is significantly influenced by control variables.

With the presence of the control variables the IC elements have no significant impact on ROA for Palestinian companies, but CEE impact the ROA for the Jordanian firms. The result was consistent with that of Table 4.

Table 8 The impact of IC on ROA in the presence of control variables

Palestine					Jordan				
"Model"	R	R Square	F-sig	DV	"Model"	R	R Square	F sig	DV
1b	0.398a	0.158	0.029	ROA	5	0.476	0.226	0.000	ROA

LEV	− 0.214	0.003	1.408	LEV	− 0.088	0.000	1.030		

7.6 The Impact of IC Components on ROE in the Presence of Control Variables

According to Table 9 in the presence of control variables, the findings indicate that the coefficient of determination (R2) for industrial companies on PEX is 11.8%, which is higher than the coefficient of determination in Table 5. This suggests that control variables may have an important role in raising R2. On the other hand, the coefficient of determination (R2) for industrial companies on ASE is 5.03%, which is also significantly affected by control variables, as evident in Table 5.

With the presence of the control variables the IC elements (SCE, CEE) have no significant impact on ROE, where, HCE has for Palestinian companies, but CEE only has an impact on ROE for the Jordanian firms. The result was consistent with that of Table 5 for the Jordanian firms, but inconsistent for the Palestinian firms.

7.7 *The Impact of IC Components on ATO in the Presence of Control Variables*

Table 10 analyzes findings show that the coefficient of determination (R2) for industrial companies on PEX is 43.5%, which is higher than the R2 in Table 6. This indicates that the control variables have a significant impact on increasing R2. On the other hand, the R2 for industrial companies on ASE is 100%, which is a strange results, but this the fact.

With the presence of the control variables the all IC elements have significant impact on ATO, for Palestinian companies, but HCS and CEE only has an impact on ATO for the Jordanian firms. The result was consistent with that of Table 6 for the Jordanian and Palestinian firms.

7.8 *The Impact of IC Components on EPS in the Presence of Control Variables*

Table 11 findings show that the coefficient of determination (R2) for industrial companies on PEX is 30.1%, which is higher than the coefficient of determination in Table 7. This indicates that control variables play a significant role in increasing R2. The coefficient of determination (R2) is 33% for the industrial companies on ASE, revealing that control variables also play a significant role in these companies.

With the presence of the control variables the IC elements only (CEE) have significant impact on EPS for both firms in "PEX and ASE". The result was consistent with that of Table 7 for the Jordanian firms, and Palestinian firms.

Table 11 The impact of IC on EPS in the presence of control variables

Palestine					Jordan				
"Model"	R	R Square	F-sig	DV	"Model"	R	R Square	F sig	DV

7.9 The Impact of Firm Size on the Relationship Between IC Components and ROA, ROE, ATO, and EPS.

The moderating effect was solarized in Table 12. The results investigate the significant impact before and after the moderating effect through P-Value (Sig). For the Palestinian companies, the moderating effect of the firm size on ROA was for HCE1, ROE for HCE1 and SCE1, ATO for CEE1, and EPS for HCE. While for the Jordanian companies the significant impact after the moderating effect was on ROE for both SCE1 and CEE1.

There is a variation in the results between the two markets. The Palestinian market is more sensitive for the moderating impact of the firm size. The results can be interpreted by the capital volume invested in the Jordanian industrial firms and the number of the industrial firms listed in the exchange markets.

8 Conclusions

The current study investigates the moderating role of firm size on the relationship between "intellectual capital" and firm performance among industrial companies on Palestine Exchange and Amman Stock Exchange. Firstly, there is a negative impact of HCE on ATO, but there is no effect of HCE on ROA, ROE, and EPS. In the presence of control variables represented in firm age and financial leverage, the results display there is no-significant impact of HCE on ROA for industrial companies on "PEX and ASE". The control variables don't play a role on the impact of HCE on ROA. But there is a positive effect of HCE on ROE for industrial companies on PEX. The control variables play a significant role on the impact of HCE on ROE. Those findings agreed with the resources based theory that explain that the spending on employees are considered as investment to improve financial performance [3, 4].

Table 12 Impact of firm size on the impact of IC on "**ROA, ROE, ATO, and EPS"**

IV	Palestine				Jordan			
	B Coefficients	Sig before	Sig after	Conclusions	B Coefficients	Sig before	Sig after	Conclusions
ROA

CEE1	0.013	0.413	0.037	No Moderating effect	9.004E−5	0.001	0.760	Moderating Positive impact
ATO								
HCE1	− 0.003	0.000	0.000	No Moderating impact	− 0.003	0.000	0.000	No Moderating impact
SCE1	0.011	0.041	0.012	No Moderating effect	0.003	0.640	0.136	No Moderating impact
CEE1	0.023	0.020	0.144	Moderating Positive impact	0.056	0.000	0.000	No Moderating impact
EPS								
HCE1	0.121	0.877	0.014	Moderating Positive impact	1.149E−5	0.998	0.912	No Moderating impact
SCE1	− 0.297	0.081	0.277	No Moderating impact	0.003	0.633	0.240	No Moderating impact
CEE1	4.708	0.000	0.000	No Moderating impact	0.001	0.000	0.000	No Moderating impact

Whereas no effect of HCE on ROE for industrial companies on ASE. The control variables don't play a significant role on the impact of HCE on ROE. The current study found a negative impact of HCE on ATO. The control variables play a negative role on impact of HCE on ATO for industrial companies on "PEX and ASE". The control variables don't play a significant role on the impact of HCE on ATO. There is no any impact of HCE on EPS for industrial companies on "PEX and ASE". The control variables don't play a significant role on the impact of HCE on EPS.

Findings show that the SCE has a positive impact on EPS for industrial companies on PEX, and there is no impact of SCE on ROA, ROE, and ATO for industrial companies on "PEX and ASE". In the presence of control variables, a positive impact of SCE on ATO for industrial companies on PEX, findings are in the line with [10] who display that the company develop internal resources to increase the knowledge and innovation of their employees. Whereas, we don't find any impact of SCE on ROA, ROE, and EPS for industrial companies on PEX, and ASE. The control variables don't play a significant role on the impact of HCE on ROA, ROE, and EPS. This study support the results of [1, 4].

The research indicates that while CEE affects ATO and EPS, its effect on ROA and ROE for industrial businesses listed on PEX is not statistically significant. Conversely, for industrial companies on ASE, CEE has a positive effect on all firm performance measures. In the presence of the control variables, CEE had no effect on ROA and ROE and it had a positive impact on ATO and EPS. For industrial companies on ASE, the control variable has a negative impact on the impact of CEE on ROE. This study support the result of [3, 4]. According to [15] revealed a significant positive impact of CEE on the ATO in Italian industrial companies; because management focus on CEE to maximize their productivity.

Recommendations

- To enable investors to take an appropriate investment decision, industrial businesses on "PEX and ASE" are required to clearly disclose in their annual reports all elements of IC represented in HCE, SCE, and CEE.
- Policy makers have to be interested about developing IAS 38 to be able to measure intangible assets in adequate way.
- Managers have to realize the significant role of IC in developing the company's performance in the long—term by providing training courses for employees, rewards and promotions, improving information system, and developing the relationship with their employees and customers.
- In order to ascertain whether "intellectual capital" has the same effect on company performance, future research future research should employ the updated VAICTM model.

The Impact of Integrated Marketing Communications on the Purchasing Behavior of Telecommunications Customers

Iyad A. A. Khanfar and Mohammad Musa

Abstract The primary objective of this research is to examine the influence of integrated marketing communications, encompassing advertising, personal selling, public relations, sales promotion, and direct marketing, on the purchasing patterns exhibited by Zain Telecommunications customers. A sample of the company's customers in Amman is selected using a simple random sampling technique. The researchers opted for a descriptive-analytical approach as it is deemed appropriate for the nature of the study. In order to ensure a satisfactory response rate, 440 individuals are provided with the study tool, resulting in the retrieval of 409 valid questionnaires for statistical analysis. The study encompasses Zain Telecommunications customers located in Amman, Jordan. The findings of the study revealed a significant impact of integrated marketing communications, inclusive of all its components, on the purchasing behavior of Zain customers. Notably, direct marketing exerts the most substantial influence, while public relations exhibits the least impact. Based on the results, the study recommends that the company allocate attention to all elements of integrated marketing communications, with particular emphasis on enhancing the public relations aspect.

Keywords Integrated marketing communications · Advertising · Personal selling · Public relations · Sales promotion · Direct marketing · Purchasing behavior · Zain telecommunications · Amman · Jordan

1 Introduction

The concept of Integrated Marketing Communications (IMC) entails a strategic marketing approach that encompasses the comprehensive coordination and integration of diverse marketing communication elements across various communication channels, encompassing both traditional and digital platforms. The primary objective of IMC is to ensure the delivery of a consistent and all-encompassing message to the target audience, irrespective of the specific media or platforms utilized. Consequently, IMC channels facilitate the creation of a unified and interconnected communication experience for consumers, irrespective of whether they engage with physical stores, websites, social media, or mobile applications. The significance of IMC is particularly evident within the service sector at large, and more specifically, within the telecommunications sector [1].

The implementation of Integrated Marketing Communications (IMC) offers companies the opportunity to optimize their marketing budgets and achieve enhanced outcomes. Moreover, IMC facilitates greater adaptability to market dynamics and consumer trends through the swift and consistent adjustment of communication strategies [18]. The primary objective of IMC is to heighten brand awareness among target markets for products and services. Undoubtedly, IMC serves as an effective tool for professionals in developing and executing marketing communications with greater consistency and success. Despite its intangible nature within the marketing communication process, the emergence of IMC stands as a significant milestone in the advancement of the marketing field [11].

The concept of consumer behavior pertains to the various actions, decisions, and choices undertaken by individuals in the process of acquiring and utilizing products or services. This encompasses a broad spectrum of activities, such as evaluating products, selecting brands, engaging in decision-making processes, and evaluating purchases after the fact. The comprehension of consumer behavior holds significant importance for companies and marketers, as it enables them to formulate strategies that align with the requirements and preferences of their intended consumer base [14].

The necessity of efficient marketing communications in the mobile telecommunications industry is widely recognized. The telecommunications industry establishes its ways to clients through adverts among other promotional activities, majorly aimed at creating customer awareness. This chapter thus underscores the importance of effective communication with potential customers in the sector. For example, by virtue of the importance of customer satisfaction in telecoms companies, professionals are strongly advised to come up with a comprehensive marketing strategy. This comprehensive marketing strategy is to place priority on ensuring that the needs of the customer (satisfaction) are met [14].

1.1 Research Problem and Questions

The telecommunications companies are facing major obstacles in the current highly competitive business market due to fast evolving technology that changes frequently, and this is not a small industry. It greatly affects consumer behavior which has an impact on the decisions of buyers. IMC is a savior to such firms; revenue growth is never easy for any company without it given the influence that this industry has over its market position. Zain, one of Jordan's leading telecommunication players, struggles with retaining existing customers, let alone luring new ones. The objective of this study is to ascertain the actual impact of IMC elements on the purchasing decisions made by Zain's customers in Amman. These elements are designed to raise awareness about the company's products and services and attract potential customers through a range of innovative and diverse marketing strategies. However, the primary challenges lie in the effectiveness of these elements in retaining the company's current customers, attracting new ones, and generating greater profits. Consequently, this study aims to address the following key question: What is the influence of Integrated Marketing Communications elements on the purchasing decisions of Zain's customers in Amman?

1.2 Research Objectives

The primary goal of this research is to comprehensively analyze the influence of Integrated Marketing Communications components on the purchasing behavior of Zain's clientele, while concurrently striving to attain a series of subordinate objectives.

1.3 Research Hypotheses

The main hypothesis (H0) states that "there is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for Integrated Marketing Communications elements on the purchasing decision of Zain Telecommunications Company's customers in Amman." This hypothesis branches into the following sub-hypotheses:

- H01: "There is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for advertising on the purchasing decision of Zain Telecommunications Company's customers in Amman."
- H02: "There is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for public relations on the purchasing decision of Zain Telecommunications Company's customers in Amman."
- H03: "There is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for sales promotion on the purchasing decision of Zain Telecommunications Company's customers in Amman."

- H04: There is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for personal selling on the purchasing decision of Zain Telecommunications Company's customers in Amman.
- H05: "There is no statistically significant effect at the α level of significance ($\alpha \leq 0.05$) for direct marketing on the purchasing decision of Zain Telecommunications Company's customers in Amman."

1.4 Previous Studies

The impact of Integrated Marketing Communications (IMC) on purchase intention, mediated by brand equity, was found to be significantly positive in a study conducted by [16]. Furthermore, [7] discovered that consumers pay close attention to advertising in relation to their expectations, and the integration of multiple communication channels allows companies to offer consumers a more comprehensive and consistent shopping experience. In addition, the performance of insurance companies is positively influenced by advertising, sales promotion, and direct marketing, as concluded [1].

According to [12], the foundation of Integrated Marketing Communications campaigns lies in the assessment of the strengths and weaknesses of contemporary communication channels. The study conducted [4] revealed a significant and measurable influence of Integrated Marketing Communications across all dimensions on consumer purchasing decisions. In a similar vein, discovered a statistically significant impact of Integrated Marketing Communications on the attainment of competitive advantage within private Jordanian universities. Oancea [15] emphasized the interconnectedness between external stimuli, social variables, Integrated Marketing Communications, and consumer behavior. Furthermore, [8] proposed that the examination of sales promotion studies contributes to the process of consumer decision-making.

2 Methodology

The research utilized a descriptive and analytical approach, which is deemed appropriate for examining social and human phenomena, aligning with the subject matter of the study. To test hypotheses and analyze data, the study employed several statistical analysis techniques, utilizing the Statistical Package for the Social Sciences (SPSS) software for questionnaire analysis and generating results and recommendations.

2.1 Study Population and Sample

The research sample consisted of customers of Zain Telecommunications Company located in Amman. In order to achieve a satisfactory response rate, a simple random sampling method was employed. The researchers successfully obtained responses from 440 individuals, and out of those, 409 questionnaires were deemed valid and included in the subsequent statistical analysis.

3 The Results

The underlying premise of this chapter was predicated on the notion that the various components of integrated marketing communications (including advertising, public relations, sales promotion, personal selling, and direct marketing) exert a favorable influence on the purchasing patterns exhibited by Zain's clientele. In order to ascertain the validity of this assumption, a multiple regression analysis was performed to assess the aforementioned hypothesis, culminating in the subsequent findings. Table 1 presents the average ratings and standard deviations of the participants' perceptions pertaining to the elements of integrated marketing communications, organized in descending order based on the mean score.

Upon examining the average scores of the integrated marketing communication (IMC) components, it becomes apparent that the majority of dimensions performed at a moderate level. The Sales Promotion dimension garnered the highest mean score (3.82), whereas the Personal Selling dimension obtained the lowest mean score (3.49) (Table 2).

Table 1 The mean scores and standard deviations of the study's integrated marketing communications components

Paragraph	Order	Mean score	Grade
Axis 1: advertising	3	3.58	Average
Axis 2: public relations	4	3.54	Average
Axis 3: sales promotion	1	3.82	High
Axis 4: personal selling	5	3.49	Average
Axis 5: direct marketing	2	3.68	High

Table 2 Results of multiple regression analysis between independent variables

Dimension	Tolerance	VIF	Result
Advertising	0.211	1.494	No multicollinearity
Public relations	0.329	1.496	No multicollinearity
Sales promotion	0.332	1.429	No multicollinearity
Personal selling	0.499	1.411	No multicollinearity
Direct marketing	0.423	1.431	No multicollinearity

Table 3 Mean scores for advertising message content dimensions

Paragraph	Order	Mean Score	Grade
Advertising axis	3	3.58	Average
Public relations axis	4	3.54	Average
Sales promotion axis	1	3.82	High
Personal selling axis	5	3.49	Average
Direct marketing axis	2	3.68	High

It is observed that the inflation factor values for each dimension in the study are below 10, suggesting the absence of substantial multicollinearity among the independent variables. Consequently, the data is deemed suitable for analysis. Furthermore, the tolerance test results for all dimensions exceeded 0.05, indicating a lack of significant correlation between the independent variables. As a result, all dimensions can be included in the regression model to ascertain their respective statistically significant impact on the dependent variable (Table 3).

Upon analyzing the average scores of the various components of integrated marketing communication, it becomes apparent that the majority of dimensions fall within the moderate range. Among these dimensions, the Sales Promotion axis garnered the highest mean score of 3.82, while the Personal Selling axis attained the lowest mean score of 3.49.

3.1 Dependent Variable: Purchase Behavior

To answer this question, the mean scores and standard deviations of the study participants' estimates of the purchasing behavior dimension were extracted. Below are the results (Table 4).

4 Testing the Study Hypotheses

See Table 5.

The findings of the study indicate that there is a substantial degree of agreement among the participants in relation to the independent variables, with a combination of high and moderate levels observed. Furthermore, the level of agreement pertaining to the dependent variable was overwhelmingly high. The positive attitudes of the sample population towards the aforementioned statements are evident, as indicated by the arithmetic means surpassing the mean of the measurement tool.

The study's hypotheses were tested and discussed in relation to the results obtained. The study was based on the premise that the various components of integrated marketing communications, including advertising, public relations, sales promotion, personal selling, and direct marketing, have a favorable influence on

Table 4 The mean scores and standard deviations of the study participants' estimates of the purchasing behavior dimension

Purchase behavior	Mean	Standard deviation	Rank
Search for telecommunication services from multiple sources	4.05	0.88	1
Allow sufficient time to obtain the required services	3.69	0.865	9
Care about the quality of the service needed in the service search process	3.66	0.954	11
Obtain necessary information about services through family or friends	3.54	0.955	12
Will continue dealing with the company	3.8	0.934	8
Have a positive image of the services provided by the company, which prompted me to subscribe to its services	3.9	1.056	3
Continuously monitor offers at company call centers	3.92	0.953	2
Care about comparing prices of communication services from specific sources	3.82	0.878	6
Prefer to buy services from company-certified centers	3.83	0.954	5
Care about what is being discussed about the company's services	3.81	0.951	7
Review previous experiences before making a purchase	3.84	0.936	4
Prefer between the price of the service and the quality before purchasing	3.66	0.929	10

the purchasing behavior of Zain company's customers. To substantiate this assumption, a multiple regression analysis was conducted to examine the aforementioned hypothesis. The analysis yielded the following outcomes (Table 6).

The results of the multiple regression test for the main hypothesis are presented in the table above. It is evident that there is a substantial correlation, as indicated by the Pearson correlation coefficient of 0.655. Furthermore, the determination coefficient value of 0.429 suggests that the independent variables account for 38.4% of the observed variance. The calculated F value of 0.000, which is lower than the significance level of 0.05, confirms the statistical significance of the regression. Based on these findings, the following conclusions can be drawn:

- **HO1**

The impact of advertising on the purchasing behavior of Zain company's customers is deemed to be positive. Statistical analysis revealed that the t-value is significant at the 0.05 level, while the beta value of 0.332 suggests a moderate level of influence. The results imply that advertising has a positive impact on the Zain company customers' purchase behavior.

- **HO2**

There is evidence of a positive influence of public relations on Zain's customer's purchases and the findings are that the t-value is significant at 0.05 level and beta

Table 5 Arithmetic mean and standard deviation of the study variables

Factor	Source	Mean	Standard deviation	Rank	Degree
Advertising					
1. Provides sufficient information about the company's services	Alfaqih [3]	3.78	1.040	1	High
2. Generates awareness among customers about the company's services	Qawwq [17]	3.59	0.889	3	Average
3. Finds that the advertised messages published by the company are attractive	Qawwq [17]	3.51	1.128	5	Average
4. Perceives that the information published in the advertising messages by the company is motivating	Alfaqih [3]	3.36	1.107	6	Average
5. The personality used in advertising influences the customer's choice of company services	Qawwq [17]	3.51	1.074	4	Average
6. Advertising plays an important role in distinguishing the company's services	Qawwq [17]	3.73	1.011	2	High
Public relations					
7. Public relations management in the company effectively improves its mental image among its customers	Alfaqih [3]	3.71	0.963	1	High
8. The public relations department studies customer opinions about the company's services	Alfaqih [3]	3.24	0.988	5	Average
9. The company organizes events and offers discounts on religious, national, and national occasions, enhancing its relationship with customers	Alfaqih [3]	3.65	1.063	3	Average

Purchase behavior					
29. Search for telecommunication services from multiple sources	Qawwq [17]	4.05	0.88	1	High
30. Allow sufficient time to obtain the required services	Qawwq [17]	3.69	0.865	9	High
31. I prioritize the quality of service I need in the process of searching for a service	Qawwq [17]	3.66	0.954	11	High
32. I obtain necessary information about services through family or friends	Qawwq [17]	3.54	0.955	12	Average
33. I will continue dealing with the company	Al-Baba [2]	3.8	0.934	8	High
34. I have a positive impression of the services provided by the company, which prompted me to subscribe to its services	Alfaqih [3]	3.9	1.056	3	High
35. I continuously follow the offers at the company's call centers	Al-Baba [2]	3.92	0.953	2	High

(continued)

Table 5 (continued)

Factor	Source	Mean	Standard deviation	Rank	Degree
36. I pay attention to comparing prices of telecommunication services from specific sources	Al-Baba [2]	3.82	0.878	6	High
37. I prefer purchasing services from centers accredited by the company	Al-Farhat [3]	3.83	0.954	5	High
38. I pay attention to what is being discussed about the company's services	Qawwq [17]	3.81	0.951	7	High
39. I review previous experiences before making a purchase	Al-Farhat [3]	3.84	0.936	4	High
40. I prioritize between the price of the service and its quality before making a purchase	Qawwq [17]	3.66	0.929	10	High

value of 0.198 which means moderate impact level according to statistical analysis. The study implies that customers' buying behavior at Zain Company is positively affected by public relations: it makes sense, it contributes in a helpful way.

- **HO3**

A positive effect has been observed which is the influence of sales promotion on Zain's customer purchase behavior. Based on the statistical analysis, the t-value is significant at the 0.05 level, and the beta value being 0.433 implies an important effect size. These results point to one conclusion that sales promotion positively influences Zain customers' purchasing behavior.

- **HO4**

Positive results were discovered in the relationship between personal selling and Zain Company's customer behavior from the study. The level of confidence is high since the t-value is statistically significant at 0.05 (95%). This means that indeed there is a strong positive impact. Also, a beta value of 0.282 was found, which although not very high, shows a moderate effect; thus, confirming that personal selling has a positive influence on Zain company's customer behavior.

- **HO5**

The influence of direct marketing on Zain Company's customers observed purchasing behaviour is seen as a positive one. In statistics analysis, it appears that the t-value is significant at the 0.05 level and the beta value of 0.507 reflects a considerable amount

Table 6 Results of the main hypothesis test

Dependent variable	Model summary				Digital marketing techniques	Standard deviation coefficients		Standard coefficients	(T) calculated	T. Sig
	R	R^2	F calculated	DF		Standardized coefficients (B)	Standard error	Beta coefficient β		
Purchasing behaviour	0.655	0.655	54.00	1	Advertising	0.123	0.022	0.364	6.375	0.000
				208	Public relations	− 0.046	0.331	0.051	0.977	0.329
				209	Sales promotion	0.223	0.0245	0.384	6.562	0.000
					Personal selling	0.099	0.0129	0.065	1.055	0.291
					Direct marketing	0.294	0.113	0.401	7.011	0.000

Significant at ($0.05 \geq \alpha$) level

of impact. Based on these results, we can confidently state that the effect of direct marketing on Zain company's customers' purchasing behaviour is positive.

Consequently, the hypothesis positing a favorable impact of integrated marketing communications components on the purchasing behavior of Zain company's clientele is deemed valid.

5 The Results

The findings of the study revealed a significant level of interest among the participants regarding the impact of integrated marketing communication components on the purchasing behavior of Zain's telecommunications service customers. The overall average score of 3.62 indicated a moderate level of relative importance. The dimensions of the integrated marketing communication elements exhibited varying scores, ranging from moderate to high, based on the responses of the participants. Among the various elements, sales promotion garnered the highest impact score, with an average score of 3.82. The results showed that advertising and public relations had moderate relative importance with scores of 3.58 and 3.54, respectively. On the other hand, direct marketing was rated at an average score of 3.68 while personal selling emerged as the least influential component with a score of 3.49. The findings indicate that Zain is successful in using integrated marketing communication elements although there was differing perception within the sample as shown by the varying average scores. This suggests some level of discord but still implies broad approval for their strategies at different levels among consumers reached by these different approaches (advertising, PR or DM).

The results of this investigation coalesce with Ben Melloud's research in 2024, establishing that the amalgamation of various communication channels can forge a more thorough and uniform shopping expedition for customers. In addition, our findings find camaraderie with Al-Freihat's study in 2015 that unearthed a significantly impactful integrated marketing communications. Similarly, our work echoes Al-Faqih's analysis in 2015 affirming the constructive impact that an integrated marketing communications mix has on securing competitive edge. Finally, we end by anchoring our findings to those brought forth by. It documented an unequivocally significant relationship between advertising and its efficacy at swaying buying behaviors.

Moreover, the current study was in line with the findings of [9], who demonstrated the influence of sales promotion programs on consumer behavior. Additionally, the study supported the conclusions of [1], who found that advertising, sales promotion, and direct marketing have a positive impact on the performance of insurance companies. Furthermore, the findings were consistent with [16] research, which showed that integrated marketing communications significantly enhance purchase intention through the mediating role of brand equity.

In contrast, the findings of this study deviated from [2] research, which ranked public relations as the second most influential factor on purchasing behavior. Furthermore, it contradicted Baba's study in terms of the perceived impact of advertising, which was considered the least influential dimension of integrated marketing communication. These findings also diverged from, which demonstrated a significant influence of public relations in attaining competitive advantage for private Jordanian universities. Moreover, they differed from the findings of [6], which indicated that consumers closely follow advertising with regards to their expectations.

5.1 Recommendations

In order to effectively engage with customer interests, Zain should prioritize the utilization of integrated marketing communication elements and stay updated on new activities related to tracking these elements. It is recommended that the company's management devise a comprehensive plan to enhance the performance of public relations, ensuring effective communication with a wide customer base. To better understand the reasons behind the limited impact of public relations on purchasing behavior, conducting scientific research and seeking the expertise of marketing professionals, academics, and experienced individuals is crucial. Additionally, it is important to place greater emphasis on advertising, as customer opinions regarding its role in motivating purchases may vary. Therefore, it is essential to ensure that advertising messages targeted towards customers have the ability to stimulate purchasing decisions. Furthermore, focusing on personal selling in sales centers and locations where direct communication between customers and sales representatives takes place is recommended. This can be achieved by increasing the allocation of free minutes, offering discounts on service prices, and providing gifts to customers. Lastly, it is advisable to continuously diversify the use of integrated marketing communication elements when engaging with customers.

The Effect of Deferred Tax Assets and Tax Planning on Earnings Management: Evidence from a Stock Exchange

Munia O. Abu Hammad and Mohammad H. Abu-Nassar

Abstract The study analyzed the effect of deferred tax assets and tax planning on earnings management. The sample consisted of 34 industrial firms and 38 service firms from the Amman Stock Exchange with complete data entries between 2010 and 2022. Multiple regression is employed to test two hypotheses. Panel cross-sectional data is used to predict the effect of deferred tax assets and tax planning on earnings management. The study revealed that Jordanian services and industrial firms are on average likely to engage in some sort of earnings management. In addition, the Pearson correlation tests showed that tax planning and other control variables (size, leverage, and return on assets) had significant relationships with earnings management. The regression results indicated that there was no significant effect of deferred tax assets and tax planning on earnings management, thus the null hypothesis is accepted and the alternative hypothesis is rejected. Return on assets (ROA) was a statistically significant factor in the regression model. Based on the findings, the study recommends that close governmental monitoring be required to limit the practice of earnings management.

business. Net income which is the amount of money a corporation has earned after subtracting all of its expenses is essential to determine if the company was profitable in a certain period of time [33]. Managers sometimes tend to manipulate net income in order to display good company performance. Although this is true at first glance, more profits will bring about heavy tax burden. Governments aim to attain as much tax revenues as they can, while corporate tax payers will always seek to reduce their tax bill as it will eventually affect their profits. Businesses minimize tax burden, by conducting tax planning, which is a part of earnings management [4, 8, 13].The manipulations of earnings value, which is performed by managers, is difficult to detect by financial statements users. Accordingly, financial statement users should have an awareness and knowledge of the various indicators that can predict earnings because there could be a risk of misleading financial statements [32].

Healy and Wahlen (1999) defined earnings management as a manipulation made by management in preparing the financial statements to its judgment and rearranging transactions to alter accounting reports to either deceive stakeholders about the company's underlying financial condition or have a significant impact on the contractual results that depend on accounting results. Upon employing earnings management, several conditions will arise to which the management will be confronted wherein there is a rise in profit reflecting well on the company's performance. However, this may be associated with increases in income tax as well. While the government, particularly the tax revenue department, anticipates increased income in correlation with income tax, the business sector aims to minimize its corporate tax burden by what is called tax planning [17, 26].

Some factors play an important role as predictors of earnings management in addition to tax planning. These predictors include: discretionary accruals, leverage¸ size of the company, and deferred tax assets [7, 10, 21, 33]. The latter factor can be defined as the amount of income tax that can be recovered in the period to follow. Its value should be monitored at the conclusion of each reporting period, in order to enable the management to revise and assess a new value for deferred tax assets, being a subjective procedure [29]. When accounting income is lower than taxable income this results in temporary variations, causing deferred tax assets to occur. As a result, the corporation will be able to defer the payment of the tax until a later date. Also differences between the Financial Accounting Standards (FAS) and the terms of the Taxation Regulations result in deferred tax. In general, there is a distinction between bookkeeping-based income and taxable income [20].

Tax planning is related to the manipulation process that businesses undertake in order to lower tax debt, without jeopardizing tax regulations. Tax planning can be described as the full, accurate, and timely fulfillment of tax obligations in order to minimize resource waste [13, 21]. Tax planning applies to the tax burden minimization process, but does not breach the tax regulations in place [17]. It is one of the functions of tax management that is used to assess the amount of tax to be paid and what can be done to escape taxes [30].

Meidiawati and Mildawati [14] explained many ways of minimizing tax burden by taxpayers:

1. Tax shifting: is transfer of tax burden from taxpayers to other parties.
2. Capitalization: is reduction in the taxable object price and make it equivalent to the amount of tax that will be charged later on by the buyer.
3. Transformation: is a form of tax evasion in which a company covers the tax burden that has been put on it.
4. Tax evasion: is avoidance of taxes that is performed on purpose by violating the existing tax laws by taxpayers.
5. Tax avoidance: is taxpayer's attempt to minimize their tax burden by using real alternatives that are acceptable to the tax authorities.

The purpose of this study is to investigate the effect of deferred tax assets and tax planning on earnings management. Initially, the underlying assumption of the study is based on the earnings management hypothesis which expects an inverse relationship between earnings management and deferred tax assets. Tax planning is also linked to earnings management and is expected to demonstrate similar relationship with deferred tax assets. Consistent with the previous literature, the study takes into consideration a set of control variables which are ROA, size and leverage. The study is conducted in the Jordanian context.

This study aims to investigate the effect of deferred tax and assets tax planning on earnings management. This effect has been studied in countries outside Jordan with different tax systems. The research will shed a light on the effect of deferred tax assets and tax planning on earnings management in Jordan, according to the Jordanian tax system. It will add value to auditors, income tax department and company's management.

2 Literature Review and Hypothesis Development

Managers strive to increase the recorded earnings in order to show the success of the company and receive bonus payments such as remunerations [1]. However, earnings management behavior is not just the fault of management, since the Financial Accounting Principle (IFRSs) enables management to choose from a variety of alternatives of accounting in preparing financial statements (Robert Jao and Gagaring Pagalung 2011). Earnings management has been a subject of study for decades, with some studies looking into the factors that influence it, others looking into how it could be detected, and even others looking into the variables that might impact earnings management. Earnings management can be characterized as management's manipulation of financial statements based on its discretion and reorganizing activities to change financial report in order to mislead stakeholders about the firm's total financial condition or have a significant effect on contractual results that rely on accounting results [21, 23].

2.1 Deferred Tax Assets and Earnings Management

There are two major forms of earnings management, these forms are: (1) Real earnings management which is characterized as management activities that deviate from standard business practices with the primary goal of exceeding predetermined earnings targets. (2) Accrual earnings management that aims to obscure true economic performance by changing accounting methods or estimates within the generally accepted accounting principles. The assumption in the literature on earnings management is that managers use discretion to raise book-income (before taxes) without raising taxable income [16] to get the benefit of effectively reporting higher book income without paying further taxes in the same time. Hence, a high deferred tax expense (DTE) indicates a larger gap between book and taxable income. This means that earnings management is more likely to avoid reporting an earnings loss in smoothing reported profits.

Temporary differences between book and taxable income are described as differences between book and tax income that can be reversed in subsequent time. Permanent differences are characterized as differences between book income and tax income that cannot be reversed in subsequent period. Deferred tax liabilities and deferred tax assets are the result of temporary variations. According to Suranggane [29] "Deferred tax assets occur when accounting income is smaller than taxable income due to temporary differences". This happens when a corporation is willing to defer the payment of tax until later period. Deferred tax assets are generated when the amount of tax has either been paid or has been carried forward, but it's not yet been reported in the income statement. The real value of deferred tax asset is estimated by comparing the book income to taxable income [8]. The Deferred tax asset (DTA) is generally applied to cases in which a company has either overpaid taxes, pays taxes in advance, or has losses that have been carried over. In practice, by tax loss carry-forwards, accounting and tax losses can be used to protect potential profits from taxes.

Sumomba and Hutomo [28] worked on the effect of deferred tax assets and tax planning on the management of earnings for non-financial companies listed in Indonesia Stock Exchange. Their results show a significant positive effect of deferred tax assets on earnings management. This implies that deferred tax assets are relevant for predicting earnings management. In addition, Warsono [31] investigated how deferred tax assets, deferred tax burden, and tax planning could influence earnings management. The result showed that deferred Tax Assets were significantly and positively correlated with earnings management.

In contrast, Widiatmoko and Mayangsari [32] evaluated the influence of deferred tax asset, on earnings management. Manufacturing companies listed on the Indonesia Stock Exchange from 2011 to 2013 were the study's focus. The study concluded that earnings management was insignificantly correlated with deferred tax assets. Moreover, Rachmany and Tajudin [21] analyze the effect of deferred tax expense on earnings management, and found that deferred tax expense has no significant effect

on earnings management. Due to the contradictory effect of deferred tax assets on earnings management, the first hypothesis is stated as follows:

H1 Deferred tax assets is significantly affect the earnings management.

2.2 Tax Planning and Earnings Management

Midiastuty et al. [15] defined tax planning as "the process of minimizing tax debt but still within the framework of applicable tax regulations". In general, tax planning refers to the reverse process and transaction by which a company's tax debt is reduced to a minimum amount, while remaining within the confines of tax regulations. It's related to the business and transaction manipulations made by the taxpayer. It's used to keep tax debt at minimal amounts, but it's still within taxation regulations. Tax planning, on the other hand, can further be used and explained as planning for fulfillment of tax obligations correctly, completely, and in a punctual way so as to mitigate resources wasting in the most efficient possible way [21]. When tax planning is conducted in this way, it will enable managers to reduce the value of earnings and hence reduce the company's tax amount. Tax planning is carried out by maximizing benefits, minimizing actual taxes, minimizing actual profit and maximizing expenses so that tax is imposed to the bare minimum [24].

Companies must understand tax regulations in order to implement tax planning that does not violate these regulations. There are several strategies for regulating corporate accounting and finances in order to reduce tax liabilities:

a. Tax saving: Tax saving is trying to reduce the tax burden by using a low rate alternative tax.
b. Tax avoidance: Tax avoidance is an attempt to reduce the tax burden by avoiding taxes by steering transactions that are not tax, such as directing transactions to relatively large losses in the previous period.
c. Tax delay: Deferrung of tax payments without breaking the law and violating applicable regulations by postponing the issuance of tax invoices until the time limit allowed, such as credit sales [25].

The relationship between tax planning and earnings management is expected to be positive. This is due to the motivation of management to pay the least amount of taxes, which in turn will encourage management to engage in the practice of earnings management through tax planning. Bunaca and Nurdayadi argued that tax planning is positively correlated with earnings management, implying that the more tax planning, the more likely it is for businesses to run earnings management. This is in line with research carried out by Basalat et al. [3], Warsono [31], Dyah Safitri et al. [6] and Mulatsih et al. [17] concluded that the correlation between tax planning and earnings management is positive and substantial particularly in companies that experience profits (profit companies). Nonetheless, Aditama and Purwaningsih (2016), Mulyani et al. [18], and Mulyati et al. [19] showed that there was no significant impact of tax

planning on the practices of earnings management. Based on the literature and the results of previous studies, the second hypothesis is stated as follows:

H2 Tax planning significantly affects earnings management.

3 Study Design and Methodology

In order to fulfill study objectives, the effect of deferred tax assets and tax planning on earnings management is examined as follow (Fig. 1)

3.1 Study Model

In order to achieve the study objectives, the study used the following model. Size, leverage and return on assets were used as control variables.

$$\mathrm{REM}_{it} = \alpha + \beta 1\mathrm{DTA}_{it} + \beta 2\mathrm{TP}_{it} + \beta 3\ \mathrm{SIZE}_{it} + \beta 4\ \mathrm{LEV}_{it} + \beta 5\ \mathrm{ROA}_{it} + \mathrm{e}_{it} \quad (1)$$

where

REM Dependent variable that represents real earnings management measured the abnormal operations and production costs (Roychowdhury 2006).

DTA Independent variable that represents deferred tax assets is measured by the change in the value of deferred tax assets at the end of period t with t − 1 divided by the value of deferred tax assets at the end of t − 1 [8, 26].

TP Independent variable that represents tax planning is measured by tax retention rate: net income divided by pretax income [8, 12].

SIZE Control variable that represents firm size measured by the logarithm of total asset.

LEV Control variable that represents leverage measured by dividing total long-term debt on total assets.

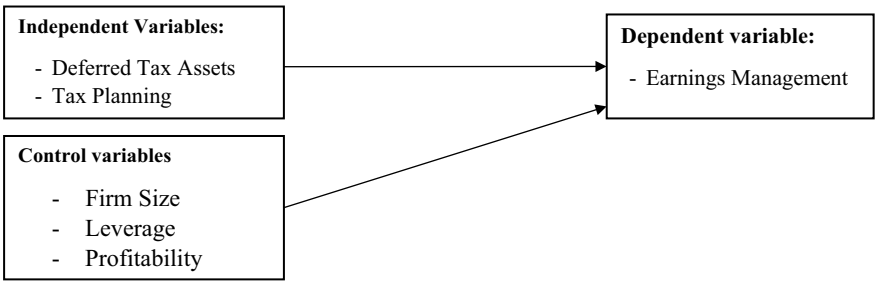

Fig. 1 Conceptual model of the study

ROA Control variable that represents profitability measured by dividing net profit on total assets.
i firm.
t year.
α the constant in the regression model.
β1–β5 Regression coefficient.

Real earnings management is characterized as management activities that deviate from standard business practices with the primary goal of exceeding predetermined earnings targets.

Three real earnings manipulation approaches are considered in measuring REM (Roychowdhury 2006):

1. abnormal cash flows from operations
2. abnormal discretionary expenses, and
3. abnormal production costs

According to Zang (2012) we are going to concentrate on abnormal discretionary expenses and abnormal production costs in our primary tests. Abnormal cash flows from operations are only considered as a robustness test, because Roychowdhury (2006) argued that cash flows from operations are influenced by manipulations of real activities in different directions, making the net effect unclear. The following equations was used in estimating the normal level of discretionary expenses and production costs for each company and year, which are conducted by Zang (2012):

$$\frac{DISXt}{At-1} = \mathrm{K0} + \mathrm{K1}\frac{1}{At-1} + K2\frac{SALESt}{At-1} + \varepsilon t$$

$$\frac{PRODt}{At-1} = \mathrm{K0} + \mathrm{K1}\frac{1}{At-1} + K2\frac{SALESt}{At-1} + K3\frac{\Delta SALESt}{At-1} + K4\frac{\boldsymbol{\Delta} SALESt-1}{At-1} + \varepsilon t$$

$\boldsymbol{DISX_t}$ refers to the discretionary expenses in year t, it represents the sum of advertising expenses, R&D expenses and Selling, and General and Administrative Expenses (SGA).

$\boldsymbol{PROD_t}$ refers to the production costs in year t, it represents the sum of costs of goods sold (COGS) and the change in inventories.

$\boldsymbol{A_{t-1}}$ is total assets.

$\boldsymbol{SALE_t}$, $\boldsymbol{\Delta SALE_t}$ and $\boldsymbol{\Delta SALE_{t-1}}$ mean the level, the change and the lagged change of gross sales from ordinary operations.

The abnormal discretionary expenses (*ADISX*) and abnormal production costs (*APROD*) are computed as the industry-year residuals from the above regression equations. Given sales levels, earnings are managed upward through abnormally low discretionary expenses and/or abnormally high production costs.

We calculate discretionary accruals as the difference between the accounting accruals scaled by lagged assets and the sum of the first four components on the right hand side of Eq. (3):

$$\frac{\text{ACCRUAL}t}{At-1} = \text{K0} + \text{K1}\frac{1}{At-1} + K2\frac{\Delta SALESt - \Delta RECt}{At-1} + K3\frac{PPEt}{At-1} + \varepsilon t$$

ACCRUALt represents earnings before extraordinary items and discontinued operations minus operating cash flows reported in the statement of cash flows for a certain year; A_{t-1} is the lagged total assets; DSALESt is the change of sales; DRECt is the change in accounts receivables; and PPEt is the gross property, plant, and equipment.

Size: is the logarithm of total asset of the firm. Dewi and Fenny (2011) concluded that the size of the company has significant and positive effect on earnings management.

Leverage: is the percentage of total long-term debt scaled by total assets. Dewi and Fenny (2011) found that the leverage has a significant positive effect on earnings management.

ROA: Return on assets, it is the percentage of net profit scaled by total assets.

3.2 Study Sample and Population

Sample of the study includes 72 industrial and services firms. The sample contained 34 industrial sector firms and 38 services sector firms listed on the Amman Stock Exchange which have complete data entries from 2010 to 2022.

4 Results, Discussion, and Conclusion

This section presents the experimental results of the study, followed by discussion and conclusion.

4.1 Descriptive Statistics

Table 1 shows that the mean value of Earnings Management (EM) was 0.198. The minimum value was − 0.19 while the maximum value was 0.60 and standard deviation (SD) was 0.153. The mean value of EM is above 0 (0.192) indicating that Jordanian services and industrial sectors are on average likely to engage in some sort of real earnings management. Standard deviations show exceptionally high values

Table 1 Descriptive statistics

	Minimum	Maximum	Mean	Std. deviation
Earnings management	− 0.19	0.60	0.198	0.153
Tax planning	− 2.29	7.83	0.898	0.871
Deferred tax assets	− 0.93	7.90	0.411	0.453
Size	5.66	9.25	7.469	0.647
Leverage	0.00	0.98	0.376	0.253
Return on assets	− 0.52	0.36	0.004	0.090

that is nearly the value of the mean. This means that values of earning management are highly variable for different companies and do not show a specific pattern.

Tax planning is the first independent variable in the model; measured by dividing net income by pretax income, has an average of 0. 898, a minimum of − 2.29, a maximum of 7.83, while (SD) was 0.871, much larger than the mean indicating highly variable values of tax planning.

The second independent variable is Deferred Tax Assets and was measured by the change in the value of deferred tax assets at the cessation of current period divided by the value of deferred tax assets at the end of pervious period t − 1. The average of Deferred Tax Assets was 0.411, the minimum was − 0.93 and the maximum was 7.90 with a standard deviation of 0.453, which is much larger than the mean and also indicating high variability of the values of deferred tax assets.

In this study there are three control variables: size, leverage and ROA. And the description of these variables is included in Table 1.

4.2 Pearson Correlation Matrix

Table 2 shows correlation analysis using Pearson's correlation coefficient. It is evident from Table 2 that tax planning has significant positive relationship with earnings management (R = 0.079 and sig. = 0.035). The positive relationship between tax planning and earnings management means that when tax planning increases, earnings management also increases and vice versa. These findings confirm arguments that management is motivated to pay the least amount of taxes, which in turn will encourage management to engage in the practice of earnings management through tax planning. The results are consistent with previous studies by Subagyo and Oktavia (2010), Warsono [31], Dyah Safitri et al. [6] and Mulatsih et al. [17].

Table 2 also shows significant correlations between ROA and Leverage and earnings management. The strongest correlation is with ROA followed by leverage. ROA and Leverage have significant correlations with EM, indicating that when ROA increases and Leverage decreases, managers are more likely to practice EM. In Addition, correlation of Earnings Management with Deferred Tax Assets is insignificant, indicating that when there is no correlation between Deferred Tax Assets and earnings management.

Table 2 Pearson correlation analysis

		EM	Tax planning	DTA	Size	Leverage	ROA
EM	Pearson correlation	1					
	Sig						
Tax planning	Pearson correlation	0.079*	1				
	Sig	0.035					
DTA	Pearson Correlation	0.058	− 0.069	1			
	Sig	0.122	0.064				
Size	Pearson correlation	− 0.044	− 0.048	− 0.066	1		
	Sig	0.241	0.196	0.077			
Lev	Pearson correlation	− 0.145**	− 0.026	− 0.063	0.420**	1	
	Sig	0.000	0.486	0.093	0.000		
ROA	Pearson correlation	0.207**	− 0.102**	0.017	0.219**	− 0.307**	1
	Sig	0.000	0.006	0.645	0.000	0.000	

* Correlation is significant at the 0.005 level
** Correlation is significant at the 0.01 level (2-tailed)

4.3 Regression Analysis and the Testing of the Hypotheses

The objective and the main aim is to examine the effect of the independent variables (deferred tax assets and tax planning) on earnings management which is the dependent variable, controlled by: leverage ratio, ROA (return on assets) and firm size. In this section, Table 3 illustrates the results of the regression model. The F value is 7.655 and the model is highly significant at $P < 0.001$. The result indicates that the study model has an explanatory power ($R^2 = 0.052$), however, all variables were not significant predictors for earnings management except for (ROA). Thus, null hypothesis (which states there is no effect of deferred tax assets and tax planning on earnings management) is accepted and the alternative hypothesis is rejected. The results show that ROA has a significant effect on earnings management of companies of both sectors. Whereas DTA, Tax planning and other control variables do no show significant effect on EM. The value of Adjusted R^2 , as presented in table 3, is 4.5% of variation in the earnings management can be explained by the model.

Table 3 shows that the highest contribution to the model is that of ROA that shows a B weight of 0.369, followed by leverage with − 0.028 (inversely proportional to EM). However, ROA is the only variable with significant contribution to the regression model ($P < 0.001$).

Table 3 Pooled linear regression results/dependent variable: earnings management

R square	0.052					
Adjusted R square	0.045					
F	7.655					
Sig	0.000					
Model	Unstandardized coefficients		Standardized coefficients	t	Sig	VIF
	B	Std. error	Beta			
Constant	0.311	0.070		4.464	0.000	
Tax planning	− 0.001	0.005	− 0.008	− 0.233	0.816	1.018
Deferred tax assets	− 0.001	0.006	− 0.006	− 0.169	0.866	1.011
Size	− 0.015	0.010	− 0.063	− 1.469	0.142	1.467
Leverage	− 0.028	0.028	− 0.043	− 0.984	0.326	1.542
Return on assets	0.369	0.071	0.217	5.195	0.000	1.347

The last column in the table display collinearity statistics (tolerance and VIF) to assess the level of multicollinearity between variables. The results of collinearity statistics tests, with VIF values around 1 indicate that there is no multicollinearity problem in the model of the study.

Nonetheless, Aditama and Purwaningsih (2016), Mulyani et al. [18], and Mulyati et al. [19] examined the effect of tax planning, deferred tax asset, and deferred tax expense on earnings management. They discovered that tax planning, deferred tax asset, and deferred tax expense have no influence on the EM. Their findings were similar and consistent with the findings of this study. While Widiatmoko and Mayangsari [32] studied effect of: leverage, company size, tax planning, deferred tax asset and discretionary accruals on EM. Other researchers had an opposite findings. Subagyo and Oktavia (2010), Warsono [31], Dyah Safitri et al. [6] and Mulatsih et al. [17] investigated the effect of deferred tax assets, and tax planning on earnings management and found significant effect on earnings management.

5 Conclusion

This study has investigated the effect of deferred tax assets and tax planning on EM. Earnings management is considered a dependent variable. Deferred tax assets and tax planning are considered independent variables. For comparison purposes, the effect of other factors that affect earnings management were used as three control variables during regression analysis which are: firm size, profitability (ROA) and

leverage. The study included a sample of 72 industrial and services companies listed in Amman Stock Exchange from 2010 to 2022.

Results indicated that: tax planning and deferred tax assets were not significant predictor (independent) variables for EM. However, ROA as a control variable have shown a significant positive relationship with earnings management. Thus our results support the hypothesis that tax planning and deferred tax assets have no significant impact on earnings management as revealed by industrial and services firms listed on Amman Stock Exchange. These findings have profound implications for companies seeking to strengthen their corporate governance frameworks and improve their tax strategies, ultimately leading to increased firm value and competitiveness in the Jordanian market. This study asserts that tax planning and deferred tax assets have no significant relationship with earnings management for combined sectors. Moreover, the study provides evidence from an emerging market based on a sample of non-financial firms.

There are some limitations to this study: the small size of the study sample and the limitation of the sample to industrial and service companies, and therefore it may be difficult to generalize the results of the study to the rest of the sectors in Jordan.

The Impact of Financial Technology on Inventory Management Efficiency

Nader AlTamimi, Bader AlTamimi, and Mohammad Abdallah

Abstract The present study aims to investigate the way that inventory management can be revolutionized by FinTech—specifically, once again, the blockchain. FinTech innovations, such as blockchain, data analytics, and AI, provide an opportunity to make traditional inventory management more up-to-date. Since good inventory management is essential to a successful and efficient supply chain, financial cost reduction, and meeting customer needs, we will review the current state of the field. As well as how blockchain technology allows for improvements in the transparency, traceability, and security of our supply chains. This paper uses detailed empirical methods to examine the impact of FinTech adoption on a variety of important inventory management metrics in increasingly realistic settings, such as holding costs and turnover rates, in many businesses. Our results highlight important cost, stockout, and turnover rate reductions for firms utilizing predictive analytics combined with automated tracking systems, with significant implications for businesses looking to improve operations in their supply chain and derive competitive advantage from technological innovation, finding support for the empirical adoption of FinTech solutions in inventory management operations.

1 Introduction

Financial Technology (FinTech) has transformed the business landscape by overhauling legacy systems and financial controls in every sector of the industry. Its application in supply chains has puzzled many because it promises an increase in productivity and reduction in costs. With that in mind, understanding the effects of FinTech on inventory management efficiency is important for those looking to streamline their business processes.

FinTech [1] stands for "financial technology" and describes financial technologies that innovate and provide financial services through technological advances. In other words, FinTech transforms the financial processes we've known for decades from conventional paper-based processes to digital financial solutions. When it comes to inventory management, FinTech solutions are technologies such as blockchain, data analytics, artificial intelligence, and many more that help you better control, track, analyze, and optimize the level of inventory.

The Supply Chain [2], which includes all of the interconnected stakeholders involved in the processes of creating, distributing and delivering a product or service, is the backbone of any business. Reacting to customer demand in a timely and cost-effective way is crucial. Inventory management is the art of maintaining optimal inventory levels globally, while ensuring that production schedules work. You can see how technology can support inventory management, and FinTech is just one of those "digital" innovations that have started to influence the way that companies manage their inventories.

Although blockchain is a distributed ledger system developed to ensure secure financial exchanges of cryptocurrencies, it has gained significant attention for potential applications outside the financial sector [3]. Blockchain is a decentralized, secure, and irreversible record-keeping system that improves transparency, traceability, and overall security throughout the supply chain [4]. Blockchain-based technology has the potential to improve inventory management efficiency by minimizing errors, preventing fraud and theft cases, and increasing overall visibility. Real-time monitoring of item movements enhanced by blockchain technology may also increase inventory visibility.

Despite of there is an increasing amount of literature discussing the potential impacts of FinTech on improving supply chain and inventory management efficiency, there are several gaps in the current literature. First, empirical studies that measure the real-time effects of FinTech adoption on inventory management metrics are few. The existing papers mainly discuss different conceptual frames and hence, rarely provide evidence for their claims. So, there is an inadequate level of empirical evidence to enable the decision-making process for organizations either contemplating adopting FinTech for inventory management or already using it. Second, the literature also finds that data privacy, interoperability and regulatory compliance are issues that may curb widespread adoption of FinTech solutions for inventory management. Therefore, what is required are checklists, rules of thumb and best practices for companies that aim to successfully implement FinTech inventory management solutions. Third,

the literature argues that future exploration of the role of FinTech in inventory and supply chain management should not solely rely on either practitioners and managers or on researchers who have various levels and directions of interaction with these professionals but also account for the views of those in government, policymakers, consumers, and technologies.

These views have rarely been intersected and integrated with the realm of technology in inventory management in supply chains, which is fundamental to providing a holistic approach to address the potential concerns that arise from the use of FinTech in the field. Therefore, addressing these aspects and their potential concern with the appropriateness of FinTech applications to inventory management within the supply chain is key to developing an organized framework that can enable managers and researchers to harness the potential of FinTech towards driving efficiency and competitiveness.

2 Literature Review

The integration of financial technology (FinTech) into supply chain operations has emerged as a focal point in contemporary business discourse, with particular emphasis on its potential to enhance efficiency in inventory management. FinTech encompasses a range of innovative technologies, including blockchain, data analytics, and artificial intelligence, each offering unique opportunities for transforming traditional inventory management practices.

Blockchain technology, initially developed as the underlying infrastructure for cryptocurrencies like Bitcoin, has garnered significant attention for its applicability in supply chain management. Tapscott and Tapscott [5] assert that blockchain's decentralized ledger system ensures transparency and immutability of transaction records, thereby enhancing trust and accountability among supply chain participants. By providing a secure and tamper-proof record of transactions, blockchain facilitates end-to-end visibility into the movement of goods, enabling stakeholders to track products from their point of origin to final destination [6]. This transparency not only reduces the risk of errors and fraud but also enables faster dispute resolution and regulatory compliance.

Furthermore, FinTech solutions offer advanced analytics capabilities that enable businesses to leverage data-driven insights for more effective inventory management. Predictive analytics, in particular, allow organizations to forecast demand with greater accuracy, optimize inventory levels, and minimize stockouts [7]. By analyzing historical sales data, market trends, and other relevant variables, predictive analytics models can anticipate fluctuations in demand and adjust inventory levels accordingly, thereby reducing carrying costs and improving operational efficiency.

In addition to predictive analytics, automated inventory tracking systems play a crucial role in enhancing inventory management efficiency. Leveraging technologies such as Radio Frequency Identification (RFID) and the Internet of Things (IoT), these systems provide real-time visibility into the movement and status of inventory

throughout the supply chain [8, 9]. By automatically capturing data on inventory levels, location, and condition, these systems enable organizations to monitor inventory in transit, identify bottlenecks or delays, and proactively address supply chain disruptions.

Despite the potential benefits of FinTech in inventory management, several challenges and barriers to adoption persist. One such challenge is the issue of data privacy and security, particularly concerning the sharing of sensitive information across multiple parties in a blockchain network [10]. Additionally, interoperability and standardization remain significant hurdles, as different FinTech solutions may use incompatible protocols or formats, hindering seamless integration into existing supply chain systems [11].

Many gaps are indicated by the literature examining supply chain inventory management and financial technology, or FinTech. Studies that assess the real-time effects of fintech on inventory management across sectors and industries are few and far between. Although a number of theoretical models and conceptual frameworks have been employed, there is disagreement over the best paradigm for integrating FinTech into inventory management. In summary, there are still studies lacking that focus on the difficulties and barriers facing fintech, such as those involving compatibility problems and sensitive data. The extant research extols the potential advantages of FinTech in enhancing supply chain and inventory management efficiency.

The majority of FinTech innovations that have been discussed in the literature, like blockchain, speed up product traceability and transparency throughout the supply chain. They also make it possible to predict product demand going forward, which helps to maintain optimal inventory levels throughout the supply chain. Because of the elimination of overstocks and stock outs as well as cost reductions across the supply chain, it would become more efficient and increase customer satisfaction. This is in line with what we anticipate from fintech.

But there is still a long way to go before these promises are realized, in part because of sensitive data protection considerations [12]. A further obstacle in this road is the need to standardize various systems within a supply chain [13]. In addition to assisting practitioners in understanding the advantages of this initial step of fusing inventory management with FinTech, ongoing research in this field will be helpful to researchers who may expand on their investigation and discover more statistically significant results in this area.

3 The Methodology

The methodology for this research involved conducting a comprehensive review of academic journals and literature from reputable sources, focusing on the integration of financial technology (FinTech) in inventory management within supply chains. We utilized relevant keywords to search for studies over the past decade, encompassing topics such as “FinTech,” “inventory management,” “supply chain,” “blockchain,” “data analytics,” and “artificial intelligence.”

Our approach prioritized peer-reviewed articles and scholarly sources to ensure the reliability and rigor of the reviewed literature. Each article's methodology, data collection, analysis, and result quality were evaluated to determine its relevance and contribution to the study.

Content analysis was employed to identify recurring topics and themes across the synthesized data and results, aiding in drawing meaningful conclusions.

The review aimed to provide a broad perspective on the role of FinTech in enhancing inventory management effectiveness and to stimulate further research in this area. Through this methodology, we aimed to establish a robust foundation for our study's findings.

4 The Proposed Developments

Addressing the identified gaps in the literature concerning the integration of financial technology (FinTech) into inventory management within supply chains requires a multifaceted approach aimed at conducting empirical research, developing best practices, overcoming implementation challenges, fostering interdisciplinary collaboration, and promoting continuous learning and adaptation.

4.1 Conducting Empirical Studies

Conducting comprehensive empirical studies is paramount to gaining a nuanced understanding of the real-world impact of FinTech adoption on inventory management metrics across diverse industries and organizational contexts. These studies should employ rigorous methodologies, including longitudinal analyses and control groups, to provide robust evidence of the effectiveness of FinTech solutions in improving inventory management efficiency [13]. By collecting empirical data and analyzing key performance indicators such as turnover rates, holding costs, and stockouts, researchers can assess the tangible benefits of FinTech adoption and identify areas for further improvement.

However, there are some pros and cons for this, which can be addressed as follows:

Pros:

1. Provides robust evidence of the effectiveness of FinTech solutions in improving inventory management efficiency.
2. Offers insights into the specific impact of FinTech adoption on key performance indicators across diverse industries and contexts.
3. Informs evidence-based decision-making for organizations considering or already implementing FinTech solutions in their inventory management practices.

Cons:

1. Requires significant time, resources, and expertise to design and conduct rigorous empirical studies.
2. May face challenges in obtaining access to proprietary data or securing cooperation from industry stakeholders.
3. Findings may be influenced by confounding variables or external factors beyond the researchers' control, leading to potential biases or limitations in generalizability.

4.2 Developing Best Practices

Developing best practices and guidelines for implementing FinTech solutions in inventory management practices is essential to facilitate successful adoption and integration. Collaboration between scholars and practitioners can be instrumental in this regard, leveraging case studies, benchmarking exercises, and knowledge-sharing platforms to identify common success factors, challenges, and lessons learned from FinTech adoption initiatives [14]. By synthesizing insights from academic research and industry expertise, stakeholders can develop actionable recommendations and frameworks to guide organizations in effectively leveraging FinTech innovations to optimize their inventory management processes. The pros and cons for these points can be summarize as:

Pros:

1. Facilitates knowledge sharing and transfer of best practices among scholars, practitioners, and industry stakeholders.
2. Provides actionable recommendations and frameworks to guide organizations in effectively leveraging FinTech innovations in inventory management.
3. Helps standardize processes and promote consistency in FinTech adoption across different organizations and industries.

Cons:

1. Best practices may not be universally applicable and may need to be tailored to suit specific organizational contexts or industry verticals.
2. Risk of outdated or irrelevant guidelines if not regularly updated to reflect evolving technologies and industry trends.
3. Implementation of best practices may encounter resistance from organizational culture, existing systems, or vested interests, requiring change management efforts to overcome.

4.3 Addressing Implementation Challenges

Addressing the challenges and barriers to FinTech adoption in inventory management requires concerted efforts to overcome technical, regulatory, and organizational

hurdles. This may involve developing technical standards, regulatory frameworks, and industry-wide protocols to facilitate the seamless integration of FinTech solutions into existing supply chain systems [15]. Additionally, proactive measures to address data privacy concerns, interoperability issues, and regulatory compliance requirements are essential to building trust and confidence in FinTech-enabled inventory management solutions. The pros and cons of these principles can be summed up as:

Pros:

1. Enhances trust and confidence in FinTech-enabled inventory management solutions by addressing concerns related to data privacy, interoperability, and regulatory compliance.
2. Promotes smoother integration of FinTech solutions into existing supply chain systems, minimizing disruption and maximizing adoption.
3. Creates a more conducive environment for innovation and experimentation by mitigating perceived risks and barriers to entry.

Cons:

1. Complex technical, regulatory, and organizational challenges may require time-consuming and resource-intensive solutions.
2. Regulatory changes or advancements in technology may outpace efforts to address implementation challenges, necessitating ongoing adaptation and flexibility.
3. Solutions to implementation challenges may not be universally applicable and may need to be tailored to the specific context and requirements of each organization.

4.4 Fostering Interdisciplinary Collaboration

Fostering interdisciplinary collaboration between researchers, practitioners, policymakers, and technology providers is crucial to driving innovation and knowledge exchange in the field of FinTech and inventory management [16]. By bringing together diverse perspectives and expertise from different disciplines, stakeholders can collectively develop holistic solutions to complex challenges and leverage complementary strengths to accelerate the adoption of FinTech innovations in supply chain operations. Interdisciplinary collaboration can also facilitate the co-creation of new knowledge, tools, and methodologies to address emerging trends and opportunities in the rapidly evolving landscape of FinTech and inventory management. The pros and cons for these points can be summarize as:

Pros:

1. Harnesses diverse perspectives, expertise, and resources from different disciplines to drive innovation and knowledge exchange.
2. Facilitates co-creation of holistic solutions to complex challenges by leveraging complementary strengths and insights.

3. Enhances interdisciplinary understanding and collaboration, fostering a culture of openness, creativity, and collaboration.

Cons:

1. Requires effective communication, coordination, and alignment of goals and objectives across interdisciplinary teams, which may be challenging to achieve.
2. Differences in disciplinary cultures, methodologies, and terminology may lead to misunderstandings or conflicts, requiring active efforts to bridge gaps and build mutual understanding.
3. Interdisciplinary collaboration may require additional time, resources, and effort to establish and maintain, potentially slowing down decision-making and implementation processes.

4.5 Promoting Continuous Learning and Adaptation

Promoting a culture of continuous learning and adaptation is essential for organizations seeking to harness the full potential of FinTech in inventory management [17, 18]. Recognizing that the technological landscape is constantly evolving, stakeholders must remain agile and responsive to changing market dynamics by staying abreast of emerging trends, technologies, and best practices. This may involve investing in ongoing education, training programs, and industry conferences to equip stakeholders with the knowledge and skills needed to navigate the complexities of FinTech-enabled inventory management effectively. By fostering a culture of continuous learning and adaptation, organizations can position themselves as leaders in leveraging FinTech innovations to enhance their inventory management practices and gain a competitive edge in the marketplace.

Pros:

1. Equips organizations with the knowledge and skills needed to stay abreast of emerging trends, technologies, and best practices in FinTech and inventory management.
2. Fosters a culture of innovation, agility, and resilience, enabling organizations to respond effectively to changing market dynamics and competitive pressures.
3. Promotes a mindset of continuous improvement and experimentation, driving ongoing optimization and refinement of inventory management practices.

Cons:

1. Requires ongoing investment in education, training programs, and professional development initiatives, which may strain limited resources or budgets.
2. Risk of information overload or decision fatigue if not managed effectively, leading to overwhelm or paralysis in decision-making processes.
3. Cultural barriers or resistance to change may hinder efforts to promote continuous learning and adaptation, requiring leadership buy-in and organizational support to overcome.

5 Conclusion

Literature reviewing financial technology (FinTech) and inventory management along supply chain suggests that several gaps exist. Existing studies are scarce in evaluating real time impacts of FinTech in inventory. In summary, a thorough and multidimensional strategy is required to fill in the gaps found in the literature about the incorporation of financial technology (FinTech) into supply chain inventory management. Strong evidence of the effect of FinTech adoption on inventory management measures can only be obtained through empirical investigations, and the creation of best practices and standards helps ensure successful implementation. To maximize the advantages of FinTech in inventory management, obstacles must be addressed, interdisciplinary collaboration must be fostered, and ongoing learning and adaptation must be encouraged.

Empirical research offers valuable insights into the tangible effects of FinTech adoption, guiding evidence-based decision-making for organizations seeking to optimize their inventory management processes. Concurrently, the development of best practices and guidelines provides actionable recommendations for effectively leveraging FinTech solutions, promoting consistency and standardization across industries. However, these efforts must be accompanied by strategies to address implementation challenges, such as data privacy concerns and interoperability issues, to ensure smooth integration and adoption.

Furthermore, fostering interdisciplinary collaboration fosters innovation and knowledge exchange, harnessing diverse perspectives and expertise to drive holistic solutions to complex challenges. Finally, promoting a culture of continuous learning and adaptation enables organizations to stay ahead of emerging trends and technologies, fostering agility and resilience in the face of evolving market dynamics.

In essence, by embracing a multidimensional approach that encompasses empirical research, best practices development, implementation strategies, interdisciplinary collaboration, and continuous learning, stakeholders can unlock the full potential of FinTech in inventory management within supply chains, driving efficiency, competitiveness, and sustainable growth.

The Effect of Changing Murabaha Rates on the Financial Performance of the Islamic Banks Listed on a Stock Exchange

Nidal Mahmoud Al-Ramahi, Tareq Hammad Almubaydeen, and Mohammad Zyad Alasad

Abstract The study seeks to investigate the influence of fluctuations in Murabaha rates on the financial performance of Islamic banks that are listed on the Amman Stock Exchange (ASE). To achieve this objective, a descriptive analytical approach is employed. The researchers collected data on the independent variable, which is the Murabaha rates, and measured the dependent variable, financial performance, using two indicators: Return on financial assets and return on equity. The data is collected from three Islamic banks (Arab Islamic Bank, Jordan Islamic Bank, and Safwa Islamic Bank) during the financial period from 2019 to 2022. The annual financial reports issued by these Jordanian Islamic banks listed on the ASE were reviewed for data collection purposes. The findings of the study revealed that there is indeed an impact of changing Murabaha rates on the financial performance of Islamic banks, as indicated by the two indicators. It is recommended, in light of the results, that Jordanian Islamic banks develop standardized formulas for Murabaha financing that align with the principles of Islamic banking, while also considering the needs of customers who require financing.

1 Introduction

Islamic banks play a significant role in the banking sector and contribute to the economic growth of the countries in which they operate. These banks strictly adhere to rigorous standards and regulatory frameworks that align with the best international practices in terms of supervision and compliance.

In order to fulfill the goals of Islamic banks, which prioritize profit maximization within the boundaries of Islamic law, it becomes imperative to establish the pricing for the various products they offer. One such product is Murabaha, where the prices must encompass the cost of funds and generate profits, while also accounting for the expenses incurred by the bank.

The financial performance evaluation of this product necessitates the consideration of two key factors: achieving the targeted return on investment and attaining a profitable return ratio on the invested funds. This evaluation aims to provide an accurate assessment of the product's financial strength and to highlight its actual outcomes. Furthermore, the utilization of indicators is often essential in rectifying errors and identifying obstacles that impede the attainment of objectives.

The subject of pricing Murabaha products in Islamic banks has gained significance in light of the pandemic of COVID-19 and the rise in interest rates within the banking industry. This subject is relatively new given it relates to recent changes. However, pricing decisions play a significant role as they directly affect the financial performance and assets of an Islamic bank which includes sales volume that impacts annual profits and return on assets. In turn, these elements help determine the competitive standing for such Islamic banks that take part in ASE.

This research seeks to evaluate the impact of changes in Murabaha pricing on ASE-traded Islamic banks' financial performance. In order to address the research problem, the study will focus on addressing the following key question:

- What is the impact of changes in Murabaha rate pricing on the financial performance of Islamic banks listed on the ASE?

2 Previous Studies

The study of Murabaha financing and its ratios, as well as its impact on the financial performance of Islamic banks, has attracted considerable attention from many scholars. In a recent analysis of Iraqi Islamic banks, Hakar [1] delved into the details of Murabaha financing at these institutions. The results pointed out a significant upsurge in the return on investment rate through Murabaha financing. Indeed, this is a positive indication that Islamic banks are making strides towards effective utilization of this method. Supported these findings by showing that using Murabaha financing for procurement purposes enhances profitability for Islamic banks. Similarly, Al-Ambabi [2] presented empirical evidence supporting positive effects of

Murabaha financing on both liquidity and profitability for Islamic banks, implying an intertwined favorable relationship between these two aspects in such institutions.

Abu Al-Aliqah [3] found that Murabaha had a significant negative effect on return on assets, contrary to previous research findings. In another study, Musareh et al. [4] delved into the determinants of Murabaha margins and found operating expenses and funding volume to play a significant role. Moreover, Isa et al. [5] investigated Islamic Sharia's standpoint towards determining Murabaha rates in contracts and illustrated no contradiction between their practices and Islamic principles.

The primary objective of the present research is to examine the consequences of alterations in Murabaha ratios on the financial efficacy of Islamic banks that are publicly traded on the ASE. By doing so, this chapter intends to provide insights into the transactions conducted by Islamic banks and the extent of their impact during the critical period of the pandemic of COVID-19, encompassing both favorable and unfavorable aspects. These particular facets have not been adequately addressed in previous studies, which have either focused on different categories or examined different timeframes. As a result, this study offers a comprehensive conceptual framework encompassing various variables, thereby serving as a foundation for future investigations in this field.

3 Methodology of the Study

The current study adopted a descriptive-analytical methodology.

3.1 Study Population

The sample for this study comprises Islamic banks that are currently in operation and listed on the ASE. The selection process involved choosing three banks from the complete list of banks listed on the ASE, namely Jordan Islamic Bank, Arab Islamic International Bank, and Safwa Islamic Bank.

3.2 Data Collection Sources

- Secondary Sources: The data utilized for the purpose of constructing the theoretical framework were sourced from a variety of scholarly resources, including books, theses at the master's and doctoral levels, reputable websites, pertinent references, and prior research endeavors.
- Primary Sources: The research was dependent on the essential financial information obtained from the Islamic banks that were part of the selected sample, encompassing the timeframe spanning from 2019 to 2022.

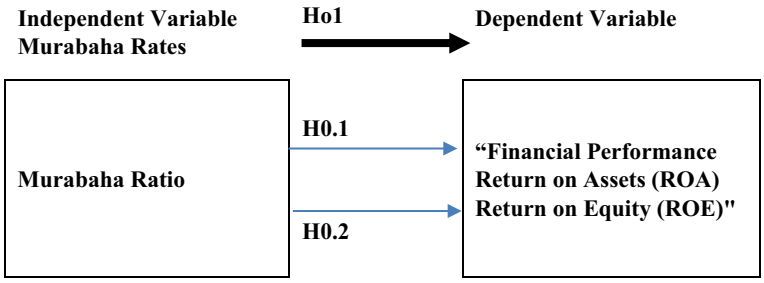

Fig. 1 Study model. *Source* Prepared by the researchers

4 Model of the Study and Its Hypotheses

4.1 Model of the Study

In order to fulfill the aims of this investigation and accomplish its objectives pertaining to the assessment of the influence of the independent variable on the dependent variable, a customized model was devised. The study's model and its variables are depicted in Fig. 1.

4.2 Hypotheses of the Study

Based on the problem statement and research questions, the following hypotheses were formulated:

Primary Hypothesis (H0)

- "There is no statistically significant impact at a significance level ($0.05 \geq$ a) of changes in Murabaha ratios on the financial performance of Islamic banks listed on the ASE."

From this primary hypothesis, the following sub-hypotheses are derived:

- Sub-Hypothesis 1 (H01): "There is no statistically significant impact at a significance level ($0.05 \geq$ a) of changes in Murabaha ratios on the return on assets of Islamic banks listed on the ASE."
- Sub-Hypothesis 2 (H02): "There is no statistically significant impact at a significance level ($0.05 \geq$ a) of changes in Murabaha ratios on the return on equity of Islamic banks listed on the ASE."

4.3 Study Variables Description

In this section, a comprehensive descriptive statistical analysis of both the dependent and independent variables of the study is presented, utilizing the annual financial data of Islamic banks listed in the ASE during the period of 2019–2022.

The descriptive statistics for all variables

The following is the descriptive statistics of all variables that are presented in Table 1.

The table provides a description of the independent and dependent variables as follows:

1. Throughout the study period spanning from 2019 to 2022, Islamic banks listed on the ASE exhibited an average annual mean return on financial assets of 0.186%, accompanied by a standard deviation of 0.115%. The highest recorded value reached 0.291%, whereas the lowest value observed was 0.038%.
2. During the study period from 2019 to 2022, the Islamic banks listed on the ASE exhibited an average annual mean return on equity of 9.227%, with a standard deviation of 4.784%. The range of returns varied, with the highest recorded value reaching 16.51% and the lowest at 2.026%. These figures suggest that Jordan Islamic Bank employed diverse strategies to generate profits, resulting in varying returns for investors. Notably, Safwa Islamic Bank achieved the lowest percentage return of 2.026% in the year 2019.
3. Throughout the study period (2019–2023), Islamic banks listed on the ASE experienced fluctuations in their Murabaha ratios. These changes exhibited an average annual mean of 358,001,358, with a standard deviation of 324,522,781. The highest recorded value reached 7,014,584, while the lowest value was documented at 5,142,261.

Below is a presentation of the descriptive statistics table for each bank separately:

The Table 2 presents a description of the independent and dependent study variables as follows:

- During the designated study period (2019–2022), the Jordan Islamic Bank exhibited a return on financial assets, with an annual arithmetic mean of 0.401%. Notably, the highest recorded value reached 0.272%, while the lowest value was recorded at 0.098%.

Table 1 Description of independent and dependent study variables

Variables	Mean	Standard deviation	Maximum value	Minimum value
Return on financial Assets	0.186	0.115	0.291	0.038
Return on equity	9.227	4.783	16.51	2.026
Changes in murabaha ratios	358,001,358	324,522,781	7,014,584	5,142,261

Table 2 Descriptive statistics for the dependent and independent variables of the Jordan Islamic Bank during the period (2019–2022)

The Scale%	Variables	Change In Murabaha Ratios	Return On Financial Assets	Return On Equity	Return On Financial Assets
Mean		679945941	0.401	13.841	0.401
Standard deviation		227940021	0.021	1.4259	0.021
Maximum value		776425780	0.272	15.49	0.272
Minimum value		416626719	0.098	11.81	0.098

- Throughout the study period (2019–2023), the Jordan Islamic Bank exhibited a return on equity, with an annual arithmetic mean of 13.841%. The highest recorded value stood at 15.49%, while the lowest value was noted at 11.81%.

The Table 3 presents a description of the independent and dependent study variables as follows:

1. During the study period from 2019 to 2022, the Arab Islamic Bank exhibited a return on financial assets. The annual arithmetic mean stood at 0.182%, with the highest recorded value being 0.297%, and the lowest value recorded at 0.11%.
2. During the designated study period (2019–2022), the Arab Islamic Bank demonstrated a return on equity, with an annual arithmetic mean of 12.110%. Notably, the highest recorded value reached 14.21%, while the lowest value was observed at 9.182%.

Table 4 presents a description of the independent and dependent study variables as follows:

1. Throughout the designated study period spanning from 2019 to 2022, Safwa Islamic Bank exhibited an annual arithmetic mean return on financial assets of 0.03%. Within this timeframe, the highest recorded value reached 0.01%, while the lowest value dipped to 0.093%.
2. Over the course of the study period (2019–2022), Safwa Islamic Bank demonstrated an annual arithmetic mean return on equity of 3.6951%. The recorded range for this metric ranged from a high of 7.881% to a low of 1.119%.

Table 3 Descriptive statistics for the dependent and independent variables of the Arab Islamic Bank during the period (2019–2022)

The Scale%	Variables	Change In murabaha ratios	Return on equity	Return on financial assets
Mean		315976987	12.11	0.182
Standard deviation		695514621	1.9214	0.088
Maximum value		308090501	14.21	0.297
Minimum value		40118859	9.182	0.11

Table 4 Descriptive statistics for the dependent and independent variables of the Safwa Islamic Bank during the period (2019–2022)

The Scale%	Variables	Change in murabaha ratios	Return on equity	Return on financial assets
Mean		882537003	3.6951	0.03
Standard deviation		501495308	2.6214	0.032
Maximum value		234751987	7.881	0.01
Minimum value		5025789	1.119	0.093

Table 5 Normal distribution test for study variables

Number	Variable	Skewness	Kurtosis
1	Financial assets	0.163	2.409
2	Ownership rights	0.691	2.417
3	Murabaha rate change	0.841	2.639

4.4 Normal Distribution Test

To assess the conformity of data to a normal distribution, one approach is to perform tests for skewness and kurtosis. These statistical measures serve to identify the presence of normal distribution. Skewness quantifies the degree of asymmetry in the data relative to the mean, with a value close to zero indicating normal distribution. Conversely, kurtosis measures the degree of peakedness or flatness in the distribution. In a normal distribution, the kurtosis value approximates 3. The outcomes of these tests are presented in Table 5.

Based on the data presented in Table 5, it can be deduced that the skewness values pertaining to all dimensions under investigation exhibit a proximity to zero, whereas the kurtosis values demonstrate a proximity to 3. This observation suggests that the variables being studied follow a normal distribution.

4.5 Stationary Test for Study Variables

The constancy of both the mean and the variance of series values over time is indicative of the stability of time series. The covariance between two time periods is only dependent on the time gap (lag) and not on the specific time when the variance is measured. In order to determine whether the study variables are stationary, the Unit Root test is employed. The Levin-Lin Chu (LLC) test is utilized to examine whether the variables contain a unit root and are suitable for panel data associated with time. If the variables do contain a unit root, differencing is necessary to achieve stationarity. It is important to conduct a Unit Root test in order to evaluate the stationarity

Table 6 Unit root test results for study variables

Variable	Computed value at level	p-value	Result
Financial assets	−13.087	0.000	Stationary
Ownership rights	−16.741	0.000	Stationary
Murabaha rate change	−19.571	0.000	Stationary

of time series, as many non-stationary time series can still yield high values for (R^2, F, t)leading to misinterpretation and misleading outcomes.

The LLC test employs a decision rule that relies on the detection of a unit root, which signifies non-stationarity of the time series. When the computed test statistic's significance level exceeds 0.05, it indicates the presence of a unit root. The findings are displayed in Table 6.

Based on the information presented in Table 6, it is clear that the time series data for all variables under investigation exhibited stationarity throughout the observed period, with a significance level of 5%. This conclusion is drawn from the fact that the p-values did not surpass the 5% threshold. As a result, we can confidently reject the notion of a unit root and affirm that these time series are indeed stationary.

4.6 Heteroskedasticity Test

In order to ascertain the absence of heteroskedasticity, the researchers utilized the Breusch-Pagan test to assess residual heteroskedasticity. This statistical test evaluates the hypothesis that the variance of the errors remains constant, as opposed to the alternative hypothesis that the variance of the errors increases in relation to the values of the dependent variable. Specifically, higher values of the dependent variable are associated with larger errors. The findings from this analysis revealed no evidence of heteroskedasticity, as presented in Table 7.

Based on the data presented in Table 7, it is clear that the study models do not exhibit any heteroskedasticity problems. The statistical analysis using the Chi-square distribution yielded p-values of 0.762 and 0.766 for the three models, which did not reach the threshold of statistical significance at the 5% level. Consequently, we accept the null hypothesis of homoskedasticity, indicating that the error variance remains constant.

Table 7 Results of Heteroskedasticity Test

Hypothesis	Chi2	p-value
HO1	0.010	0.762
HO2	0.014	0.766

Table 8 Lagrange multiplier and hausman test

Hypothesis	Test	Chi2	Sig	Most Accurate and Consistent Model
HO1	Lagrange multiplier	66.41510	0.00	Fixed effect model
	hausman	2.147019	0.815	
HO2	Lagrange multiplier	73.22151	0.00	Fixed effect model
	hausman	2.17413	0.901	

4.7 Model Estimation

In order to accomplish the goals of the study, the researchers implemented the Panel Approach, which involved incorporating time series data for variables within the model (cross-sectional data) from the sample over the duration of the study. The researcher utilized estimation techniques that are specifically designed for longitudinal panel data models, including:

3. Pooled Regression Model (PRM).
4. Fixed Effect Model (FEM).
5. Random Effect Model (REM).

Based on the analysis presented in Table 8, the utilization of the Lagrange Multiplier test allows for the distinction between the Pooled Regression Model and the Random Effect Model. The scientific hypothesis posits that the Pooled Regression Model exhibits greater consistency compared to the Random Effect Model. On the other hand, the Hausman test is employed to differentiate between the Fixed Effect Model and the Random Effect Model. The null hypothesis (HO) proposes that the Random Effect Model demonstrates higher levels of consistency than the Fixed Effect Model. Consequently, the findings derived from Table 7 indicate that the Fixed Effect Model provides the most accurate estimation for the subsidiary hypotheses associated with it.

4.8 Hypothesis Testing

Simple Linear Regression analysis was used to test the hypotheses.

Hypothesis 1 Testing

- H01: "There is no statistically significant effect at a significance level of $\alpha \leq 0.05$ for changing the pricing of Murabaha rates on the return on financial assets in the Islamic banks listed on the ASE."

The hypothesis was tested using Simple Linear Regression at a significance level of $\alpha \leq 0.05$. The findings are presented in Table 9.

Table 9 Results of simple linear regression testing for hypothesis 1

Independent variable	Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Value of B	Critical t	Calculated t	Significance level (Sig)
Independent	Murabaha Rate Change	0.601	0.406	0.606	1.873	11.221	0.000
Dependent	Financial Assets						

- To ascertain the significance of the regression model employed, the extracted critical t-value was compared with the calculated t-value. It was observed that the calculated t-value (11.221) surpasses the critical value (1.87), thereby indicating the statistical significance of the regression model utilized.
- As shown in Table 8, the t-test yielded a significance level of (0.000), indicating that it is lower than the predetermined significance level of the study (0.05). Consequently, the null hypothesis is rejected in favor of the alternative hypothesis, which asserts that there is a statistically significant impact, at a significance level of ($\alpha \leq 0.05$), of altering the pricing of Murabaha rates on the return on financial assets in the Islamic banks listed on the ASE.
- The R^2 value, which measures the proportion of variance in the dependent variable (Financial Assets) explained by the independent variable (Murabaha Rate Change), was determined to be 0.406. This indicates that approximately 40.6% of the variability in Financial Assets can be accounted for by changes in Murabaha Rate.

Hypothesis 2 Testing

- H02: "There is no statistically significant effect at a significance level of $\alpha \leq 0.05$ for changing the pricing of Murabaha rates on the return on equity in Islamic banks listed on the ASE."

The hypothesis was tested using Simple Linear Regression at a significance level of $\alpha \leq 0.05$. The findings are presented in Table 10.

Table 10 Results of simple linear regression testing for hypothesis 2

Independent variable	Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Value of B	Critical t	Calculated t	Significance level (Sig)
Independent	Murabaha rate change	0.530	0.300	0.451	1.873	9.037	0.000
Dependent	Equity Returns						

- In order to ascertain the significance of the regression model employed, the critical t-value was obtained and compared to the calculated t-value. The results revealed that the calculated t-value (9.037) surpasses the critical value (1.87), thus affirming the statistical significance of the regression model.
- Based on the data presented in Table 10, it is evident that the significance level for t was found to be (0.000), which is below the predetermined significance level of the study (0.05). Consequently, the null hypothesis is rejected in favor of the alternative hypothesis, which affirms that there exists a statistically significant impact, at a significance level of ($\alpha \leq 0.05$), in altering the pricing of Murabaha rates on the return on equity in Islamic banks listed on the ASE.
- The R^2 value, which signifies the degree of explanation provided by the independent variable (Murabaha Rate Change) on the dependent variable (Equity Returns), was calculated to be 0.300. This indicates that approximately 30% of the variability in Equity Returns can be accounted for by changes in Murabaha Rate.

5 Discussion of Results

The study yielded the following results:

- The findings of this study reveal a notable impact of fluctuations in Murabaha rates on the return on financial assets within Islamic banks that are listed on the ASE. This result aligns with the study carried out by Al-Ambabi [2], which also noted considerable disparities in returns of financial assets among various banks. These findings stress how important it is to have a good balance when managing assets and liabilities. This forms the basis of resource allocation for both short-term and long-term financing activities. Addressing liquidity, profitability, and risk management, in turn, ensures a sustainable institution where optimal finance is achieved. The results also indicate that Islamic bank management uses its financial resources prudently, showing signs of revenue generation through a non-conservative financing policy that has positive implications on their profit rates. This finding is interesting as it provides some insight into what other institutions could consider emulating if they aim at improving their performance indicators.
- New research has uncovered an interesting relationship: how changes in Murabaha rates can affect the equity returns of Islamic banks trading publicly on the ASE. This finding echoes a study by Al-Raqeeb et al. [6] which also found a strong connection between financing via profit-sharing investments and equity returns—likely due to efforts made by Islamic bank management towards improving solvency ratios. This news fits well with their work; it appears that these numbers do paint a picture after all.

- Within the period of investigation from 2019 to 2022, an analysis was carried out to establish the mean yearly yield of monetary resources for Islamic banking institutions which appear on the ASE. Results from this examination show that the typical yearly return stood at 0.186%, with a standard deviation of 0.115%. The maximum recorded figure hit 0.291% while the minimum value noted was 0.038%.
- During the aforementioned time frame, Islamic banks in Jordan exhibited an average annual return on equity of 9.227%, accompanied by a standard deviation of 4.784%. Notably, the highest recorded return reached 16.51%, whereas the lowest stood at 2.026%. These statistics highlight the diverse strategies employed by Jordanian Islamic banks in their pursuit of profit generation, with the objective of expanding investment portfolios and enhancing returns for investors. Specifically, Safwa Islamic Bank achieved the lowest return rate of 2.026% in the year 2019.

5.1 Recommendations

Based on the aforementioned results, the study recommends:

1. Islamic banks in Jordan should establish permanent financing formulas consistent with Islamic banking principles to remain competitive while complying with Sharia law.
2. Islamic banks should adopt Shariah-compliant pricing formulas that meet the financial needs of various sectors, ensuring consistency with Islamic principles.
3. Emphasis must be placed on ensuring that Shariah-compliant financial products and prices reflect the goal of facilitating genuine trade, thereby contributing to economic growth.
4. Continuous efforts should be made to maintain high levels of liquidity, enabling Islamic banks to expand Islamic financing and respond to customer needs in all circumstances, which will have a positive impact on profit rates.
5. Decision makers in Islamic banks should focus on increasing operational efficiency to ensure high profit margins, which will positively impact their financial performance.
6. Further research should explore other financing modes such as Mudarabah and Musharakah in financing different sectors of Islamic banks.

The Possibility of Islamic Banks Dealing with Tawarruq Disciplined by the Sharia Standard

Suhail Al-Ahmad, Odeh Abdullah, Alaa Sartawi, and Khaled Alzeaideen

Abstract This research dealt with the issue of the areas through which the product of Tawarruq can be used disciplined by the Sharia standard issued by the Accounting and Auditing Organization for Islamic Financial Institutions, where it stood on the nature of jurisprudential and disciplined Tawarruq, as well as the Sharia standards issued by AAOIFI, then talk about the definition of the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI), and the research also dealt with the Sharia position of dealing with disciplined Tawarruq and its reality and the areas through which Tawarruq can be applied, including: Repayment of debts of customers coming to Islamic banks while previously bearing usurious debts, where they are subjected to a tawarruq process to collect cash with which they extinguish those debts under the supervision of the bank, revolving credit cards (with a repayment period of more than the usual month), where the cardholder is issued Tawarruq and his proceeds are deposited in his account for deduction when using the card, financing travel tickets if it is not possible to finance them with leasing, and so on according to the details and readings addressed by this research.

1 Introduction

Praise be to Allah, Lord of the Worlds, and prayers and peace be upon our master Muhammad, the master of all creation, his family and companions, and those who follow his Sunnah with charity until the Day of Judgment, and after;

The Sharia standards issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) have included the controls and cases in which Islamic banks may deal with the Tawarruq product, in addition to the procedures required to be adhered to by banks before starting to provide the product, in order to meet the needs of those dealing with Islamic banks, as these Sharia standards have shown through Tawarruq Standard No. (30) that Islamic banks should limit the use of Tawarruq to avoid deficit or lack of liquidity to meet the need and avoid losing their customers and disrupting their operations. Because Tawarruq is not a form of investment or financing, but it is permitted for the need on its terms… Where the criterion is stated in Appendix (B) (Sharia Provisions Document) not to launch, promote or expand the work of Tawarruq in a way that disrupts the work of the basic formulas for investment and financing, and this results in the institution not being tawarruq except in the narrowest scope as in the standard. It also entails limiting Tawarruq to customers in the case where the purpose of their operations cannot be achieved through participation, speculation, murabaha, leasing, istisna'a and the like from investment and financing formulas, or in the case of ridding customers of debts resulting from usurious dealings and not just to pay their usurious obligations, hence this research came to discuss the fact of Tawarruq disciplined by the Sharia standard and the areas of its application and implementation by Islamic banks under the title: The possibility of dealing with Islamic banks with disciplined Tawarruq according to the Sharia standard, according to the axes and topics of their statement and details as follows.

2 The First Axis: Introducing the Sharia Standards Issued by AAOIFI

The Sharia standards issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) are, in fact, the most important Sharia controls for the work of Islamic banks at the present time, and compliance with these Sharia standards is one of the elements of any Islamic bank's commitment to Sharia controls in its business, as these standards are approved in 90% of Islamic banks and financial institutions worldwide, and these standards are prepared by the Sharia Board in the Authority, which consists of 16 scientists and researchers, some of whom represent banks and some have their experience and status in Islamic financial industry, and they are among the finest sheikhs specialized in Islamic financial economics [1].

The Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) is one of the most prominent international non-profit organizations

supporting Islamic financial institutions, established in 1991 and headquartered in the Kingdom of Bahrain, and has great professional achievements, foremost of which is the issuance of 100 standards so far in the fields of accounting, auditing, business ethics and governance, in addition to the Sharia standards adopted by central banks and financial authorities in a group of countries as mandatory or indicative. Central banks, regulatory authorities, financial institutions, accounting and auditing firms and law firms from more than 45 countries, and the standards of the Authority are currently applied by leading Islamic financial institutions around the world, which have provided an advanced degree of harmonization of Islamic financial practices globally [2].

3 The Second Axis: The Meaning of Tawarruq Disciplined by the Legal Standard

The origin of tawarruq is the request for money from silver, then the concept turned into the demand for cash, whether silver, gold, or paper currency, where the origin of the word remained, and its meaning expanded according to the expansion of the concept of cash, and this means: the cash liquidity obtained by individuals or banks through tawarruq by buying the commodity badly, and then selling it in cash to a non-seller for less than what he bought it with, thus obtaining cash [3].

The sale of tawarruq is the purchase of a commodity in the possession of the seller and his property at a deferred price, and then the buyer sells cash to a non-seller to obtain paper cash [4]. It was said that the customer asks the bank to buy a commodity to benefit from its price, and then the bank is obligated to the customer to sell the commodity on his behalf, and this obligation, if not in the condition of the contract, is by virtue of custom and custom (Fiqh Council Resolution No. (2), 1424), or the bank agrees with a person who needs cash to sell him a commodity for a term at a price higher than the price of the day, and then the buyer assigns the bank to sell the commodity to him at a cash price usually lower than the deferred price at which he bought the commodity, so that the tawarruq obtains the cash price, and his liability remains occupied with the bank at the higher price for this transaction [5].

Tawarruq in Standard No. (30) of the Shariah Standards issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI): It is the purchase of a commodity at a forward price bargaining or Murabaha and then selling it to other than the person from whom it was purchased to obtain cash at a current price. It differs from the sample as in the standard in that the sample buys a commodity at a future price and then sells it to the person from whom it was purchased at a lower price [2].

It is also a way out to avoid usury, not a trick to it, because it becomes to him who does not find a lender and does not want to fall into borrowing with interest (Sharia Standards 2023).

4 The Third Axis: Differentiating Between Disciplined Tawarruq According to the Sharia Standard and the Sample

Tawarruq is based on two contracts: one of which owns a commodity from the (Mustawaruq) Tawarruq by Murabaha or deferred sale, through the bank, and the second contract: a contract of sale in which the Tawarruq sells the commodity to a person other than the one who bought it from him to avoid the sample.

It is stated in informing the signatories of the Lord of the Worlds regarding the distinction between them: "If he returns the commodity to its seller, it is the sample, and if he sells it to someone else, it is Tawarruq" [6].

In the sample, when the seller retrieves his commodity, it is as if it never came out of his hand, and its presence in the sale is the same as its absence, and its mediation is a burden, and the matter ends up paying an amount of money to another in more than one of its kind for a term, which is usury, but in Tawarruq, nothing happens to the seller, because the commodity does not return to him in the first place, but rather moves with an independent contract to a new buyer, the purchase of which has nothing to do with the first sale [7].

The Shariah criterion was based on the difference in the rule of Tawarruq from the rule of the sample that the sample is a trick on usury because it falls between two parties who are in fact a borrower and a lender by selling the commodity on deferred and then recovering it at a current price and the buyer obtaining less money than what he is obligated to the seller, and the majority of jurists to prevent the sample, and on the permissibility of Tawarruq except Ibn Taymiyyah and Ibn al-Qayyim, where they said in Tawarruq prevention or hatred. (Sharia Standards 2023).

The Tawarruq can be the customer by buying the commodity subject to Tawarruq from the institution and then selling it to others to collect liquidity, and the Tawarruq can be the institution by buying the commodity subject to Tawarruq and selling it to a third party to collect liquidity, from the customer or from another institution in accordance with the controls for Tawarruq (Al-Ayoufi, Standard No. 30).

5 Fourth Theme: The Sharia Position on Tawarruq Disciplined by the Sharia Standard

With regard to Tawarruq, the Shariah Standard No. (30) of the Shariah Standards was issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) and it has set controls that keep it away from suspicions and caveats that made the Council of the Islamic Fiqh Council of the Muslim World League in its second resolution on the subject of Tawarruq in its seventeenth session, held in Makkah Al-Mukarramah in the period 19–23/10/1424 AH corresponding to 13–17/12/2003 AD, preventing him from doing so after the Islamic windows of conventional banks seized him and violated its controls, the most important of which are:

Not obliging the customer to authorize the bank selling the commodity to him to sell it on his behalf, because this obligation negates the certainty of the existence of the commodity, so it is a fictitious act, and it was called (organized Tawarruq), through the banks' typical work, in which the sale of a commodity—not of gold or silver—from the global commodity markets or others, is arranged on the borrower at a future price, provided that the bank is committed—either under a condition in the contract, or by virtue of custom and custom—to act on his behalf in selling it to another buyer at a price The Academy has decided that this organized Tawarruq is not permissible for the following things: that the seller's obligation in the Tawarruq contract by proxy to sell the commodity to another buyer, or the arrangement of the person who buys it—makes it similar to the sample that is prohibited by Sharia, whether the obligation is explicitly conditional, or by virtue of custom and custom, and because this leads in many cases to a breach of the conditions of the legitimate arrest necessary for the validity of the transaction, and that the reality of this transaction is based on granting cash financing by increasing This transaction is not the real Tawarruq known to the jurists, which the Academy in its fifteenth session had previously said that it was permissible, with real transactions and specific conditions, including its decision, because of the many differences between them, in which the research presented was detailed, as the Academy's decision stipulated: "This sale of tawarruq is permissible in Shariah, and the majority of scholars have said that the principle of sales is permissibility, for the Almighty says: Allah permitted the sale and forbade usury, and there was no usury in this sale, neither intentionally nor in form, and because there is a need for that to pay a debt, or to marry, or otherwise." [4], and the Academy did not stipulate in its decision only that it is different from the sample, then came the decision of the seventeenth session, which includes other conditions that were taken into account in this criterion, the most important of which is the non-commitment of the bank "seller" to rely on the customer in the sale of the commodity that makes it similar to the sample according to the text of the decision, and not to prejudice the arrest, and the decision did not require real arrest, but only in the decision of its eleventh session with the judgmental arrest in the exchange, which is more severe than the sale (Sharia Standards 2023).

The difference between the two deferred prices and the situation does not fall within the property of the bank, which occurred in the transaction for the purpose of justifying obtaining an increase in the financing provided to this person by fictitious transactions in most cases, and this is not available in the transaction shown by some banks.

This is what made the Sharia standard No. (30) of the Sharia standards is based on the reservation on the obligation of power of attorney and that the narrow use of the power of attorney and therefore has made it here such as (disciplined Tawarruq), and here the fatwas went to the importance of stipulating in the Tawarruq documents that: "The customer's right to keep the commodity or sell it himself or authorize whoever he wants to sell it, including the bank, without obliging the customer to authorize him", and in the text of Article (54) of the Code of Judicial Judgments forgivable in the unforgivable dependencies In other cases (if the buyer and the seller receives the

sold item, it is not permissible, but if he gives a bag to the seller to eat and put the food sold in it, he does so, it is a receipt from the buyer).

In item No. (5/1) of Sharia Standard No. (30) and Appendix (B) (Sharia Rulings Document) it is stipulated that: Tawarruq is not a form of investment or financing, but it is permitted for the need under its conditions… The criterion was added in Appendix (B) (Sharia Provisions Document) not to launch, promote or expand the work of Tawarruq in a way that disrupts the work of the basic formulas of investment and financing, and this results in the institution's non-Tawarruq except in the narrowest scope as in the standard. It also entails limiting Tawarruq to customers in the case where the purpose of their operations cannot be achieved through Musharaka or Mudaraba, Murabaha, leasing or Istisna'a and other forms of investment and financing or in the case of ridding customers of debts resulting from usurious dealings and not just to pay their usurious obligations.

According to the Shariah standard, the use of Tawarruq should be limited to avoiding a deficit or shortage of liquidity to meet the need and avoid the loss of its customers and the disruption of its operations.

6 Fifth Theme: Cases in Which Islamic Banks Can Deal with Tawarruq

The legal fatwas went on to say that it is important to stipulate in the Tawarruq documents that are executed by Islamic banks that the customer has the right to keep the commodity or sell it himself or authorize whomever he wants to sell it, including the bank, without obliging the customer to authorize him, as Article (54) of the Ottoman Code of Judicial Judgments stipulates that: It is forgivable in the dependencies what is unforgivable in others, where if the buyer and the seller in the receipt of the sale is not permissible, but if he gives a choir to the seller to kiel And he put the food sold in it, and he did so and that was a receipt from the buyer. A fatwa (No. 19297) was issued by the Permanent Committee for Research and Issuing Fatwas in the Kingdom of Saudi Arabia (Fatwas of the Permanent Committee for Research and Issuing Fatwas in the Kingdom of Saudi Arabia, No. 19297), stating that Tawarruq is permissible: "The issue of Tawarruq is to buy a commodity at a deferred price, and then sell it at a current price other than the one from whom you bought it at the deferred price, in order to benefit from its price, and this work is OK among the majority of jurists, and this is what made Sharia Standard No. (30) one of the Sharia standards. Issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) [1], with the reservation on the obligation to power of attorney as the use of the power of attorney is narrow, and this means disciplined tawarruq, that is, the customer has the right, if it is used, to keep the commodity or sell it himself, or to authorize whoever he wants to sell it, including the bank, without obliging the customer to authorize him, and based on the adoption of Sharia controls related to Islamic banks' dealing with Tawarruq product in accordance with

the provisions and controls of Sharia Standard No. (30), there are several applications and areas that are inevitable to deal with Tawarruq Regulated by the Sharia standard [8], which are as follows:

1. Paying the debts of customers coming to Islamic banks while previously incurring usurious debts, where they are subjected to a tawarruq process to collect cash with which they extinguish those debts under the supervision of the bank.
2. Revolving credit cards (with a repayment period of more than the usual month) where the cardholder is issued Tawarruq and his proceeds are deposited in his account for deduction when using the card (the Shariah standard for cards).
3. Contractors' obligations for labor expenses, emergency services and payment of employees' salaries.
4. Financing travel tickets if they cannot be financed by Ijara (Ijara Services).
5. Financing customers' purchase of gold with illiquidity to require contracting, and it is not permissible to murabaha in that, because in banking applications it is deferred.
6. Repaying debts incurred by traders and companies in the event of a liquidity deficit and the inability to apply other liquidity instruments, such as peace, buying an asset and then leasing it.
7. Party expenses (marriage, graduation, birthday) if the service lease cannot be applied, especially for the payment of the dowry in cash.

7 Conclusion

Praise be to Allah, Lord of the Worlds, that we have completed this effort and we ask God Almighty for success and payment, and after, we conclude in this station the most important results of the research, as follows:

- The Islamic Fiqh Council decided that the sale of tawarruq is permissible in Shariah, because the principle of sales is permissibility, and this sale did not appear in usury, neither intentionally nor in form, and because there is a need to do so to spend a debt, marriage, or others.
- In its decision, the Fiqh Council stipulated only that Tawarruq should be different from the sample.
- The Fiqh Council decided on other conditions for Tawarruq that were taken into account by the Sharia standard, the most important of which is the non-commitment of the bank "seller" to rely on the customer's behalf in the sale of the commodity that makes it similar to the sample, and not to prejudice the real or judgmental arrest in the exchange.
- One of the Sharia controls related to the dealing of Islamic banks with a Tawarruq product in accordance with the provisions and controls of Sharia Standard No. (30) is the payment of debts of customers coming to Islamic banks while previously bearing usurious debts, where they are subjected to a Tawarruq process to collect cash with which they extinguish those debts under supervision and so on.

- Tawarruq is to buy a commodity at a deferred price, and then sell it at a current price other than the one from whom you bought it at the deferred price, in order to benefit from its price, and this work is okay with the majority of jurists.
- Regarding Tawarruq, Shari'a Standard No. (30) of the Shariah Standards was issued by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI) and controls were set for it to avoid suspicions and Sharia caveats.

Determinants of Cash Holdings: Evidence from High Uncertainty Environment

Islam Abdeljawad, Aya Abdelhaq, and Ezeya Shareef

Abstract This study investigates the determinants of cash holding in manufacturing companies listed on the Palestine Exchange between 2012 and 2022. Palestine is an emerging economy characterized by high uncertainty environment due to political instability and occupation. Data were collected manually from audited annual financial statements. Fixed effect regression analysis reveal that cash flow and profitability have a positive impact on cash holding, while firm size and leverage have a negative influence on cash holding. These results provide insights into the financial management practices of Palestinian industrial enterprises and offer implications for decision-makers in optimizing cash holding strategies.

Keywords Cash holding · Manufacturing firms · Uncertainty · Political instability · Palestine

1 Introduction

Cash represents a highly liquid portion of current assets, readily available to address a company's immediate requirements including bill payments, investments, and unforeseen expenses. Cash holdings (CHs) play a crucial role in a company's financial management, influenced by various factors including industry dynamics, and competitive environment. Industries characterized by high uncertainty or volatility often see companies holding more cash as a precautionary measure against unexpected events [1, 2]. In today's competitive business environment, effective financial resource management is essential, highlighting the importance of adequate cash within organizations. Insufficient cash reserves can impede a company's operations and hinder its smooth functioning. Therefore, it is imperative for businesses to maintain an appropriate level of cash to meet various needs [3, 4].

The amount of cash held by corporations is a major topic of study in finance, with consequences for business practices. However, the advantages of having liquid assets are subject to debate, with two primary benefits enabling organizations to invest in rewarding opportunities as they arise. Firstly, liquid assets eliminate the need to liquidate assets for payments, thereby reducing transaction costs. Secondly, liquid assets provide flexibility when alternative options are either unavailable or too costly for the business [5, 6]. While maintaining an adequate level of cash is crucial for sustaining operations, an excess of cash can introduce various challenges, including higher opportunity costs, potential misuse of funds, and increased agency costs. The balance between having sufficient cash and avoiding excessive holdings is critical for businesses. Therefore, understanding the factors influencing a firm's cash-holding decisions is essential.

Economic uncertainty significantly influences CHs, with companies often increasing their cash reserves during uncertain economic periods as a precautionary measure or to seize emerging opportunities [7]. Moreover, the recent financial crisis has underscored the importance of cash and its management. Effective cash management becomes critical during periods of limited liquidity to ensure optimal utilization of available funds [8]. The study focuses on the distinctive environment of Palestine, characterized by its political, regulatory, and business demographics. The situation in Palestine, which is characterized by occupation and limited access to essential services and interregional communication, presents difficulties like governance problems, political instability, and insufficient regulations, all of which reduce investor and management trust [2, 9, 10]. In politically turbulent environments like this, businesses face heightened information asymmetry, leading to a greater necessity for maintaining cash reserves [11, 12].

The goal of this study is to determine the factors that influence cash holdings, which are important for businesses because they provide stability and financial flexibility. Numerous variables, including firm size, profitability, liquidity, net working capital, and cash flow, will be examined in the study. The study intends to shed light on these variables in order to shed light on the factors that influence CHs and how they affect firm value. Solving this research issue could provide insightful information about the variables influencing a company's CHs and inform strategies for risk management and optimal financial performance [13, 14].

This research problem underscores the importance of understanding the determinants of firm's CHs in a unique environment. Studying the determinants of CHs is important for several reasons. Firstly, it aids in understanding a company's financial decision-making by examining the factors influencing its CHs. This can assist investors and analysts in comprehending a company's risk management strategies and investment decisions. Second, because CHs can be a predictor of a company's future financial performance, it makes forecasting future performance easier. Businesses with large cash reserves may be better equipped to weather economic downturns or grasp new opportunities, while those with small cash reserves may be more vulnerable to financial difficulties [15]. In general, researching the factors that influence CHs can provide important information about the financial standing, investment strategy, and corporate governance procedures of a business. As a result, analysts and

investors may be able to manage risk and make better-informed investment decisions [16, 17].

2 Study Framework

2.1 Theoretical Background

The determination of optimal CHs involves consideration of numerous variables [4, 5, 18, 19]. Numerous theoretical models have been put forth by corporate finance researchers to explain the variables influencing a company's decision to hold cash. The trade-off theory, the pecking order theory, and the free cash flow theory are the three primary models that provide information about the CHs of corporations.

2.1.1 Trade-Off Theory

This theory is often regarded as the cornerstone of the literature on cash management. This theory states that businesses weigh the costs and benefits of holding cash to determine the ideal amount. Having a significant amount of cash on hand offers both advantages and disadvantages for businesses. Benefits include the ability to leverage trade discounts and maintain a favorable credit rating. Companies with robust cash positions often attract investor interest, which can benefit the business in the long term. However, one drawback is the missed opportunity for income generation since cash held does not earn returns. Moreover, maintaining insufficient cash reserves can also have negative repercussions, making it challenging for a business to meet short-term obligations and needs.

By effectively managing their cash assets, businesses aim to maximize the benefits derived from them. Cash reserves serve as a protective buffer for firms, enabling them to mitigate the costs associated with external borrowing or liquidating current assets to finance future growth. Therefore, strategic management of cash assets is essential to harness the advantages they offer [2, 5].

2.1.2 The Pecking Order Theory

This theory [20] offers an alternative perspective on investment decisions by incorporating the financing dimension. This model emphasizes the sequence in which investments should be financed.

The pecking order theory states that in order to minimize costs related to information asymmetry, companies should finance investments using retained earnings first, then safe debt, risky debt, and equity [20]. Within this framework, companies do not establish specific target levels of cash but instead utilize cash as an intervening

measure between retained earnings and investment requirements. Holding cash is therefore a means to avoid reliance on external sources of finance.

As a result, companies draw on their cash reserves to finance new investments. They subsequently resort to additional debt issuance and, if necessary, equity issuance when they cannot meet existing debt obligations. Cash and debt are intertwined because the cash level is influenced by financing and investment decisions. Consequently, companies use cash to fulfill dividend payments, meet debt obligations, and accumulate excess cash when resources exceed investment needs [1, 21]. Consequently, cash balances fluctuate over time, decreasing when investments exceed retained earnings and increasing when retained earnings surpass investment requirements.

2.1.3 The Free Cash Flow Theory

This theory, introduced by Jensen [22], delves into the dynamics between investors (delegating authority) and managers (acting as agents) responsible for executing assigned tasks. Jensen [22] posits that managers are incentivized to accumulate cash as it affords them greater control over assets and discretionary authority in making investment decisions for the company.

By maintaining excess cash, managers gain the ability to pursue investments that may not be feasible through financial markets. Moreover, entrenched managers, as highlighted by Fama and Jensen [23], retain surplus cash to evade market discipline due to their risk aversion and poor diversification. Ferreira and Vilela [24] claim that cash gives managers the freedom to give projects that best suit their interests precedence, even if those projects don't always benefit shareholders. As a result, managers are under less pressure to perform well.

The concept of "free cash flows" emerges from managers exploiting corporate CHs to further their own interests, thereby exacerbating conflicts with shareholders [22]. Since the firm's cash-holding policy is subject to managerial discretion, the amount of cash held raises concerns when managers act against the best interests of shareholders. Viewing CHs as risk-free investments, risk-averse managers increase cash retention to mitigate the firm's exposure to risk before abandoning projects with potentially high positive net present value but associated risks [21, 25].

2.2 Hypothesis Development

A sound cash policy is essential for businesses even in prosperous times to meet obligations efficiently and avoid escalating costs or insolvency. The management of cash assets often determines a company's success or failure [4, 26]. CHs are crucial for sustaining ongoing operations and meeting working capital requirements [27].

The primary factors influencing a company's CH level are cash needs. As a coping mechanism, the amount of cash held increases with economic uncertainty. The availability of investment opportunities is one factor that influences CHs. When companies have numerous profitable investment options, they may opt to hold less cash to allocate resources towards these opportunities. Conversely, when attractive investment options are limited, companies may hold more cash until better prospects arise. Additionally, a company's dividend policy can impact its cash reserves, with higher dividend payouts generally resulting in lower CHs [28]. However, several firm characteristics, including company size, profitability, leverage, cash flows and net working capital, also influence the level of CHs.

a. *Firm size*

Firm size is a key determinant of a company's CHs. Small businesses typically maintain higher cash reserves than larger counterparts as a precautionary measure. Uyar and Kuzey [29] claim that larger companies tend to maintain higher cash levels compared to smaller counterparts, leveraging their greater resources for diverse investment ventures. Ahmed et al. [27] found that business size significantly influences corporate CHs.

However, research by Angelovska and Valentinčič [30] indicates that smaller, more liquid companies tend to have higher cash. Effective cash management is essential to a small business's financing strategy because they frequently depend more on short-term financing [30]. Because they have less access to outside funding than larger companies, small and medium-sized enterprises can really benefit from the saying "cash is king" [31]. Using this justification, we develop the first hypothesis:

H1: Firm Size has a negative influence on cash holdings.

b. *Leverage*

Leverage is a major factor in the rise in corporate CHs, as shown by Kariuki et al. [32], which is consistent with the precautionary motive. It is hypothesized that because leveraged companies are more likely to experience financial difficulties, they have a greater propensity to accumulate cash. Moreover, high leverage can lead to underinvestment issues. Holding cash as a reserve helps mitigate this potential agency costs associated with debt [33]. Abdeljawad et al. [34] revealed that leverage had a favorable impact on CH. While high leverage ratios describe a company's capacity to raise money from third parties by issuing debt, other studies by Abdeljawad et al. [34], Shubita [35], and Jamil et al. [36] found no impact of leverage on CH.

However, Ferreira and Vilela [24] argue that financial institutions, with their stronger monitoring role, are likely to discourage CH in businesses with high levels of debt. This viewpoint is consistent with the claim made by Ozkan and Ozkan [37] that leverage, because debt is a stand-in for cash, can be used as a gauge of a company's ability to issue debt. As such, one would anticipate a negative correlation between leverage and CHs. Additionally, Ahmed et al. [27] discover a negative correlation between leverage and corporate cash balances. Leverage and CHs are negatively correlated, according to numerous research studies [38–40]. Based on this argument, we formulate the second hypothesis:

H2: Leverage negatively affects the amount of cash held.

c. *Cash Flow*

The effect of cash flow on a company's CHs is a topic of debate. Because of the asymmetry of information and communication problems associated with external funding, companies have been observed to favor internal financing over external financing [20]. According to Kim et al. [41], cash flow offers investments and maturing liabilities a quick source of liquidity. Businesses with larger cash flows are less likely to encounter financial difficulties and may have fewer constraints on investing in profitable opportunities. During challenging business conditions, cash serves as a safety net to withstand negative shocks and enhance the likelihood of survival [42]. The apprehension of having to reduce dividends or face potential losses from forced asset sales to raise funds is also aligned with the precautionary argument for maintaining capital reserves. These arguments support the positive association between cash flow and CHs. Based on the above, we formulate the third hypothesis:

H3: Cash Flow has a positive influence on cash holding.

d. *Profitability*

The influence of profitability on CH is a subject of interest in prior research. Abushammala and Sulaiman [43] and Ali et al. [44] suggest a positive relationship between profitability and CH. This implies that companies with substantial cash reserves tend to exhibit strong financial performance. Additionally, Rasyid's [45] study's results show a positive correlation between CH and liquidity.

However, Tripathy and Uzma [38] found contrasting results, indicating that profitability has a minimal effect on CH. Additionally, Al-Najjar [46] discovered a negative association between profitability and CH. Inadequate liquidity management can lead to cash shortages and hinder the firm's ability to meet obligations, thereby negatively impacting profitability. Based on previous arguments, we expect the following:

H4: Profitability has a positive influence on cash holding.

e. *Liquidity*

The presence of more liquid assets—which are regarded as alternatives to cash—on a company's balance sheet in addition to cash and marketable securities can have an impact on the ideal amount of CHs. Because liquid assets are easier to convert into cash than other types of assets, it makes sense that companies with higher amounts of liquid assets would also have lower levels of cash on hand. Higher liquidity companies are usually better able to use their liquid assets to satisfy their short-term financial obligations. For instance, Ferreira and Vilela [24] demonstrated how liquid assets can serve as substitutes for cash. According to the trade-off theory, cash and net working capital have a negative relationship. This is so because the bulk of net working capital is made up of liquid assets, which can act as cash substitutes. Similar findings are presented by Basheer [47] and Chireka and Fakoya [48], indicating that liquidity has a detrimental effect on CH. According to Bates et al. [39], net working capital excluding cash is a good indicator of the amount of liquidity a corporation

Table 1 Measurement of variables

Variable type	Variable	Measurement of variable	Reference
Dependent variable	Cash holdings	Cash/total assets	[38]
Independent variables	Firm size	Natural logarithm of the total assets	[38]
	Leverage	Total Liabilities/total assets	[24]
	Cash flow	Cash flow from operating/total assets	[50]
	Profitability	ROA = net profit/total assets	[38]
	Net working capital	(Current assets-current liabilities)/total assets	[51]

holds. A company is likely to maintain low cash levels if it has numerous cash alternatives. Earlier researchers such as Ferreira and Vilela [24] also predicted a similar association. However, Nafees et al. [49] have found a direct relationship between liquidity and CH.

Consequently, research has shown a negative correlation between CHs and liquidity, indicating that lower CHs are linked to higher liquidity. We develop the fifth hypothesis in light of the aforementioned:

H5: Liquidity has a negative influence on cash holding.

3 Methodology

This section details the data collection, sample of study, measurement of variables and statistical techniques utilized to carry out this study.

3.1 Data Collection and Variable Measurement

The secondary data required to measure the study variables was obtained from the annual reports of all industrial enterprises listed on the Palestine Exchange, available on the Palestine Exchange website between 2012 and 2022 given that the information is accessible. The measurement of variables is presented in Table. 1.

3.2 Models

We continue by estimating the model that pinpoints the factors influencing CHs in Palestinian industrial businesses. To investigate the relationship between CHs (the dependent variable) and different explanatory variables, such as cash flow, leverage, firm size, net working capital, and profitability (the independent variables),

we use multiple regression analysis with fixed effects and robust standard errors. The regression model is specified as follows:

$$\text{Cash Holdings} = \beta 0 + \beta 1\ \text{Cash Flow} + \beta 2\ \text{Leverage} + \beta 3\ \text{Net Working Capital} + \beta 4\ \text{Firm Size} + \beta 5\ \text{Profitability} + \in \quad (1)$$

where

β0–β5 are the regression coefficients representing the relationship between the respective independent variables and CHs. ϵ is the error term and the variables were discussed in Table 1.

4 Results and Discussion

4.1 Descriptive Statistics and Correlation Analysis

The descriptive statistics and correlation analyses for each of the study's variables are shown in this section. Table 2 lists the mean, median, highest point, lowest point, and standard deviation for of the sample consisting of industrial companies listed in PEX.

According to the results, the average CHs have a mean value of 6.1%. However, the median value of CHs is 4.5%, highest level observed for the variable "cash holdings" is 25%, while the minimum value recorded for the same variable is 0%, representing instances where there are no CHs.

The firm size has a mean value of 7.29, a median value of 7.38, a maximum value of 8.09, and a lowest value of 5.88. Leverage, cash flow, profitability, and net working capital have mean values of 0.327, 0.057, 0.053, and 0.237, respectively. The highest and lowest values for each of the aforementioned variables are listed in Table 2 together with their standard deviations. The foundation for additional analysis and discussion of the study's findings is laid by these descriptive statistics, which offer insightful information about the distribution and properties of the variables under investigation.

Table 2 Descriptive Statistics

Variable	Mean	Median	Maximum	Minimum	Std. Dev	Observations
Cash holdings	0.061	0.045	0.250	0.000	0.058	121
Cash flow	0.057	0.057	0.231	− 0.269	0.073	121
Firm size	7.294	7.376	8.090	5.881	0.519	121
Leverage	0.327	0.288	2.456	0.054	0.248	121
NWC	0.237	0.267	0.616	− 0.493	0.233	121
Profitability	0.053	0.058	0.318	− 0.622	0.101	121

Table 3 Correlation Analysis

Correlation	(1)	(2)	(3)	(4)	(5)	(6)
1. Cash holdings	1.000					
2. Cash flow	0.487	1.000				
3. Firm size	− 0.273	-0.127	1.000			
4. Leverage	− 0.176	0.035	− 0.201	1.000		
5. NWC	0.466	0.304	0.259	− 0.382	1.000	
6. Profitability	0.497	0.277	0.302	− 0.238	0.407	1.000

Table 3 presents a correlation matrix between CHs and explanatory variables, including cash flow, leverage, firm size, net working capital, and profitability. The correlations between CHs and these variables are as follows: 0.487 for cash flow, − 0.176 for leverage, − 0.273 for firm size, 0.466 for net working capital, and 0.497 for profitability.

The correlation matrix indicates bivariate relationships between CHs and the other variables. It also indicates that no two independent variables exhibit a strong correlation to raise concerns about multicollinearity in regression analysis, ensuring the reliability of the regression results.

4.2 Model Estimation

Table 4 displays the findings of the study model's estimation. The R-square is 73%, and the F test is significant indicating the significance of the model. Panel fixed effects are used in estimating this model based on Hausman test and robust standard errors accounted for the possible heteroscedasticity and autocorrelation.

The findings indicate a negative influence of firm size on CHs, which is consistent with previous research findings [30, 52]. However, these results do not align with the findings of other studies [53].

Furthermore, the findings show a negative correlation between leverage and CHs. This implies that businesses with greater levels of leverage frequently use it to finance their operations or as a substitute for cash on hand. These findings align with previous studies [24, 27, 37, 39]. However, they differ from the findings of other studies [32, 45] which suggest that leverage has positive influence on CH.

Additionally, the findings show that cash flow positively affects CHs. This suggests that businesses tend to hold larger amounts of cash reserves when their cash flow ratio is higher. These findings are consistent with Jebran and Iqbal [54] and Aftab et al. [53]. However, they contradict the outcomes of other studies, including those by Kim et al. [41].

Companies that generate higher profits are more inclined to retain a portion of their earnings as cash or cash equivalents, resulting in increased CHs. This implies that profitability has a positive influence on CHs, as financially successful firms

Table 4 Estimation results

Dependent variable: cash holdings			
Variable	Coefficient	Std. Error	Prob
Cash flow	0.214	0.053	0.000
Firm size	-0.041	0.024	0.094
Leverage	-0.042	0.020	0.035
NWC	0.040	0.036	0.276
Profitability	0.126	0.049	0.011
C	0.343	0.173	0.051
R-squared	0.731		
Adjusted R-squared	0.693		
F-statistic	19.037		
Prob (F-statistic)	0.000		
Durbin-Watson stat	1.306		
Total panel (balanced) observations	121		
Method: panel least squares			
Cross-section fixed (dummy variables) (Hausman test prob. = 0.00)			
Cross-section weights (PCSE) standard errors & covariance (d.f. corrected)			

tend to accumulate and maintain larger cash reserves. This positive relationship has significant implications for CH. The findings of this study align with the conclusions drawn by Ali et al. [44], Nafees et al. [49], Abushammala and Sulaiman [43], and Rasyid [45], all of whom found a favorable impact of profitability on CH. However, these findings diverge from the results of other studies, such as Basheer [47], and Chireka and Fakoya [48], who suggest a negative relationship between profitability and CH.

CH is not impacted by net working capital. The findings of this investigation were consistent with those of Shubita [35] who found that CH is not influenced by liquidity. However, the outcome of this investigation did not agree with that of other studies such as Bates et al. [39], Ferreira and Vilela [24], Rasyid [45], and Ali and Yousaf [52] who asserted that liquidity is associated with CH.

5 Conclusion

In conclusion, this study has provided valuable insights into the determinants of CHs in an environment characterized by high uncertainty and political instability, namely, Palestine. The findings suggest that smaller firms tend to hold more cash relative to their total assets compared to larger firms. Firms with higher levels of leverage tend to hold more cash, possibly as a means of managing financial obligations and securing operational financing. Cash flow positively affects CHs, and profitable firms are likely

to accumulate higher levels of cash reserves. Net working capital has no effect on CHs.

Overall, the study contributes to the understanding of CH determinants in Palestinian industrial enterprises. However, it is important to acknowledge the limitations of the study, including the small sample size due to the small number of manufacturing firms in Palestine. This may hinder the generalizability of the results. Future research could expand the scope to include other sectors and incorporate additional independent variables to further explore the factors influencing CHs. This recommendation aims to advance the knowledge and understanding of corporate cash management in Palestinian industrial enterprises and similar contexts.

The Effect of Corporate Governance and Tax Avoidance on Firm Value of Industrial and Service Companies

Mohammad H. Abu-Nassar and Waed Mansour Qoqazeh

Abstract This study is aimed at investigating the effects of corporate governance and tax avoidance on firm value. The motivation behind conducting this study lies in analyzing, understanding, and proving the extent of the impact of governance practices and the level of tax avoidance on firm value in Jordan. Multiple regression was used to analyze panel cross-sectional data for 38 industrial companies and 41 service companies listed on the Amman Stock Exchange (ASE) that make up the sample from 2010 to 2021. The study finds that the board size increases the firm value for the sample of service companies. However, we find an insignificant effect of the presence of women on boards of directors, audit committee size, and tax avoidance on firm value. As for the control variables included in the study, the results show that return on assets, leverage, and firm size have a significant effect on firm value. The results indicate that the role of corporate governance is unclear in enhancing the value of companies in Jordan, which raises doubt about the true application of corporate governance rules by Jordanian companies. Based on the findings, there is a need for increased government interest in encouraging companies to implement corporate governance.

Keywords Corporate governance · Tax avoidance · Firm value · Jordan

1 Introduction

Tax avoidance is a ubiquitous practice observed across various societies and economic systems. In this context, the need for tax compliance is increasingly recognized as essential to generating the revenue needed to support various development

initiatives. This need is particularly evident in developing countries with large fiscal deficits that are heavily dependent on public sector borrowing [30].

While the effects of tax avoidance at the national level are largely harmful, proponents argue that it could boost the value of firms through substantial tax savings [3, 26] (Rego and Wilson 24). The primary focus of companies remains on enhancing their long-term value, which is often reflected in their performance in the stock market [29]. On the other hand, some believe that the pursuit of profit maximization often entails higher tax liabilities, prompting managers to engage in tax avoidance practices. Thus, this may distort the information conveyed in financial statements, which can lead to an inconsistency in the information between the company and its investors [21, 26].

Historically, corporate tax avoidance has been viewed as a way to transfer tax savings from the government to shareholders in an attempt to increase shareholder value. However, an emerging body of work rooted in agency theory emphasizes the intimate connection between tax avoidance and corporate governance as it affects agency costs. The complexity and ambiguity of tax avoidance tactics may provide managers involved in different types of profit-taking with a cover, such as the use of complex financial structures, as evidenced by the Enron case in the 1990s. Enron's involvement in structured finance transactions led to tax avoidance, government prosecution and eventual collapse (Rego and Wilson 24).

Tax avoidance brings various economic benefits to companies, and management's pursuit of tax relief meets shareholder expectations [10]. The investment community, researchers, accountants, economists, regulators, and market analysts are becoming more interested in tax planning activities. However, the adoption of tax planning practices remains controversial [13]. Furthermore, tax avoidance strategies are crucial management factors influenced by managerial perspectives [17].

There is an effective role for corporate governance in controlling board decisions related to tax avoidance. Sunarto et al. [27] found a significant impact of corporate governance on tax avoidance. According to the findings of Abdul Wahab et al. [2], board size plays a pivotal role in controlling the management's aggressive behavior regarding tax avoidance. It is believed that increasing the size of the board of directors enhances the distribution of supervisory functions in strategic decision-making by the executive management. In the contract, Hoseini et al. [16] did not find any significant impact of board size on tax avoidance.

Corporate governance and tax avoidance are fundamentally related to the performance and value of companies in the business environment. Some studies examined corporate governance, tax avoidance, and other variables in Jordan. Almaharmeh et al. [8] examined the impact of corporate governance on tax avoidance. Alkurdi and Mardini [7] studied the impact of ownership structure and the board of directors' composition on the extent of tax avoidance strategies. Almaharmeh et al. [8] investigated the effect of ownership structure dimensions in Jordanian manufacturing companies on tax avoidance, with a moderating effect of audit quality. Alsmady [9] examined the effect of political connections on corporate tax avoidance with the moderate role of accounting information quality in Jordanian companies.

Still, in the Jordanian market, there appears to be a gap in understanding about how several indicators associated with corporate governance, including board gender diversity and size, along with the size of the audit committee, as well as tax avoidance, affect the firm value of companies. This study is motivated by the inconsistent findings of previous studies on the impact of corporate governance and tax avoidance on firm value. To the researchers' knowledge, the impact of corporate governance and tax avoidance on firm value has not been studied in the Jordanian context. The current study adds value to auditors, the income tax department, and company management. This can be achieved by improving transparency and accuracy in financial reporting and facilitating the audit process to achieve greater efficiency and reliability.

2 Literature Review and Hypothesis Development

2.1 Corporate Governance and Firm Value

Corporate governance is the laws and standards that determine the relationship between the company's management on the one hand and the shareholders and parties associated with the company (bondholders, workers, suppliers, creditors, consumers) on the other hand. Good corporate governance is a structure used by a company to improve the progress of the company without leaving the interests of other stakeholders in accordance with laws, standards and ethical values [11, 19].

The value of a company is highly dependent on corporate governance. Due to the volatility of corporate governance frameworks between countries due to divergent social, economic and financial conditions, the effects of corporate governance also vary [4]. That was supported by Askar et al. who found that the audit committee forced owners and management to cooperate with shareholders and maximize stakeholders' wealth. By providing accurate and transparent data to the company, the audit committee may contribute to increasing the value of the company [21, 22].

It is believed that the large board size detracts from the value of the company. According to Abusharbeh [5], there is a common misconception that a smaller board size leads to higher shareholder value because larger boards are overburdened with more control and suffer from poor communication and collaborative decision-making. Jensen [18] and Ramdani and Witteloostuijn [23] suggest that large board sizes are less beneficial. However, it is it is believed that when the CEO also serves as the chairman of the board of directors, the company's performance increases, which increases the value of the company. Afes and Jarboui [6] examined how good corporate governance affected 160 UK companies' financial performance between 2005 and 2018, taking into consideration the unique characteristics of different business sectors. The findings demonstrated that implementing sound corporate governance improves a company's financial performance as determined by its return on equity.

In contrast, some studies did not find any effect of cooperate governance on firm value. Mangoting et al. [19] studied the impact of corporate governance on

firm value using board size, board gender diversity, independent commissioners, and audit committees. The size, diversity, and audit committee of the board, among other elements of good corporate governance, had no effect on the value of the company.

Due to the contradictory effect of corporate governance on firm value the first hypothesis is stated as follows:

H1: Corporate Governance is significantly affect the firm value of companies in Jordan.

2.2 Tax Avoidance and Firm Value

Tax avoidance is an attempt to legally reduce a taxpayer's taxes. It is legitimate because it uses tax laws and regulations rather than violating them. Tax avoidance indicates and shows the management interest that managers seek to achieve, which may sometimes be personal. This is done by reducing the company's profits, which ultimately leads to the data in the financial statements not showing the real situation and creating the possibility of information asymmetry between the company and investors [25, 31].

Tax avoidance provides many financial benefits to the company and shareholders. By reducing the company's income and thus the tax paid, the management of the corporation attempts to reduce the amount of taxes paid in order to enhance shareholders' wealth [10]. For a business, taxes are a major expense. In general, tax savings boost cash flows, shareholder wealth, and after-tax profits. For well-governed firms, Desai and Dharmapala [12] found a positive relationship between tax avoidance and firm value. Thus, it is expected that companies will actively participate in tax reduction initiatives. Rego and Wilson (24) provide empirical evidence explaining how companies significantly incentivize managers to engage in tax avoidance. According to research by Sunarto et al. [27], reduced effective tax rates result from rewarding business unit managers who support indicators of after-tax success.

On the other hand, tax avoidance has many negative effects on the company and shareholders, the most important of which is the possibility that the tax authorities will discover this and consider it a type of tax evasion, which gives a bad impression of the company in the local community [16]. At the same time, the method of tax avoidance is also one of the crucial managerial choices determined by managers' means [31]. A study by Guedrib and Marouani [15] examined the impact of tax risks and tax avoidance on corporate value of non-financial institutions listed on the Tunisian Stock Exchange were analyzed between 2008 and 2020. The results showed that tax risks reduce the positive impact that tax avoidance has on corporate value. Because of this, tax avoidance and tax-related issues need to be considered when evaluating the effect on business value. Further analyses reveal that tax avoidance reduces the value of a company when combined with a high degree of tax risk. The study conducted by Supanji et al. [28] investigated the correlation between tax

avoidance and firm value and corporate governance. The results indicate that the tax avoidance factor affect firm value.

Based on the above literature, we expect that tax avoidance activities of Jordanian companies will affect firm value. Therefore, our second hypothesis is as follows:

H1: Tax avoidance has a significant effect on firm value.

3 Study Design and Methodology

In order to fulfill study objectives, the impact of corporate governance and tax avoidance on firm value will be examined as follow.

3.1 Data Collection, Methodology and Statistical Methods

The study used secondary data obtained from Amman Stock Exchange. Multiple regression was used in order to examine the effect of independent variables on the dependent variable. The study sample includes industrial and service companies listed on Amman Stock Exchange whose data was completed for the years 2010 to 2021. The variables that were used in the study are firm value as a dependent variable, corporate governance and tax avoidance as independent variables, and firm size, leverage and profitability as control variables.

The following regression model is estimated to test the effect of corporate governance and tax avoidance on firm value:

$$\begin{aligned}\text{FIRMVAL it} = {} & \alpha + \beta 1\ \text{TAXAVOID it} + \beta 2\ \text{BORDSIZE it} + \beta 3\ \text{BORGDIV it} \\ & + \beta 4\ \text{AUDITCOMMIT it} + \beta 5\ \text{FIRMSIZE it} + \beta 6\ \text{LEV it} \\ & + \beta 7\ \text{PROF it} + \text{e it} \end{aligned} \quad (1)$$

where

FIRMVAL	is the firm value,
TAXAVOID	is the tax avoidance,
BORDSIZE	is the board,
BORGDIV	is the board gender diversity,
AUDITCOMMIT	is the Audit committee,
FIRMSIZE	is the firm size,
LEV	is the Leverage,
PROF	is the company's profitability.
α	Firm and year fixed effect.
β1–β7	Regression coefficients.

Table 1 Variable definitions and measurements

Variable	Measurement
• *Dependent variables*	
Firm value (Tobins Q)	(Equity market value + book value of debts)/total assets
• *Independent variables*	
Tax avoidance (effective tax rate (ETR))	ETR = (Total tax expenses)/(Income before tax)
Board size	The number of the board directors
Board gender diversity	The number of female directors / The number of the board directors
Audit Committee	The number of the Audit Committee / The number of the board directors
• *Control variables*	
Firm size	The logarithm of total asset of the firm
Leverage	Total long-term debt divided by total assets
Profitability	Net income divided by total equity (return on equity)

it Firm i in period t.

Variables are defined and measured in Table 1:

3.2 Population and Sample of the Study

The study sample included 38 industrial companies and 41 service companies listed on Amman Stock Exchange, whose data was available for the years 2010 to 2021.

4 Data Analysis

The following tests have been used in order to find out the main effect between the major study variables which are the corporate governance, tax avoidance and firm value:

1. Descriptive statistics.
2. Correlation analysis using Pearson's correlation coefficient which is used to find out the relationship and its strength between the study's variables.
3. Multiple regression analysis is used to test the impact of the independent variables on the dependent variables of the study.

4.1 Descriptive Statistics

Table 2 displays descriptive statistics for the various main variables related to the study sample for the years 2010 to 2021. First, for tax avoidance, Table 2 displays an average of 9.6%, with some variation indicating a standard deviation of approximately 0.1561. This indicates that the companies in the study sample pay an average of 9.6% income tax, noting that the tax rate according to the Jordanian income tax law and for industrial and service companies is 14% during the period from 2010 to 2018, and it became 20% after the law was amended in the year 2019. In light of this result, it is noted that industrial and service companies, according to the above result, actually pay a tax rate that is about 10% lower than the rate specified by the law. This may be due to several reasons, the most important of which may be: the companies sampled in the study practice tax avoidance strategies. The other reason is due to the presence of losses. This is evident from the fact that the lowest value of the effective tax rate was − 81.4%.

Regarding corporate governance, the results showed that the average size of boards of directors is 8.44, and that the minimum is 4 members and the maximum is 13 members. This result is consistent with the Jordanian Companies Law and Article (132), which stipulates the size of the Board of Directors consisting of 3–13 members. The average value for audit committee size is about 25.5%, which means that on average, companies in the sample tend to have audit committees equal to 25.5% of the board size. Additionally, the presence of female directors is relatively low on average, with an average proportion of approximately 4.2%, suggesting that gender diversity on corporate boards is limited, as reflected by the small standard deviation of around 0.092.

The company value shows an average of 1.0801, which is close to one, which indicates that the market value of the study sample companies is very close to the book value, with some difference between the study sample companies due to a standard deviation of about 0.4963.

Table 2 Descriptive statistics of all sampled companies (2010–2021)

	N	Minimum	Maximum	Mean	Std. deviation
Tax avoidance	908	− 0.814	2.033	0.096	0.156
Board size	903	4	13	8.440	2.259
Audit committee size	775	0	1	0.255	0.342
Board gender diversity	904	0	0.5	0.042	0.092
Firm value	880	0.207	3.654	1.080	0.496
Firm size	908	12.925	21.31	17.236	1.411
Leverage	908	0	0.96	0.367	0.241
Profitability (ROE)	908	− 0.315	0.508	0.035	0.112
Valid N (listwise)	749				

4.2 Correlation Analysis

Table 3 presents Pearson's correlation coefficients for dependent variable, independent variables and control variables. This test assesses the strength of the relationship between the variables of the study and the significance of the relationships between the variables.

The correlation matrix presented in Table 3 reveals the following results:

First, "Tax Avoidance" is positively associated with "Firm Size" (R = 0.164(and significant at the 0.01 level and "Tax Avoidance" is strongly associated with "Profitability (ROE)" (R = 0.317 and significant at the 0.01 level). This suggests that larger companies are more likely to engage in tax avoidance, and tax avoidance practices are associated with higher profitability.

Second, "firm value" is positively associated with "firm size" (R = − 0.071) and significant at the 0.05 level and "firm value" is positively associated with "profitability (ROE)" (R = 0.347) and significant at the 0.01 level, indicating that companies with higher values tend to be bigger and more profitable.

Third, "board size" shows a positive and statistically significant correlation with "firm size" (R = 0.416) and significant at the 0.01 level, indicating that as firm size increases, board size tends to be larger. That is, larger companies tend to appoint a larger number of board members, and vice versa. In addition, there is a significant positive relationship between "board size" and "firm value," (R = 0.066 and significant at the 0.05 level), implying that companies with larger board size tend to have higher value.

Fourth, "board gender diversity" is positively associated with "Audit Committee," (R = 0.08) and significant at the 0.05 level, indicating that firms with more female directors are more likely to have large audit committees. At the same time, "board gender diversity" is positively associated with "Profitability (ROE)," (R = 0.112 and significant at the 0.01 level), indicating that companies with more female directors tend to be associated with higher profitability. In addition, "board gender diversity" is negatively associated with "Financial Leverage," (R = − 0.224) and significant at the 0.01 level. This indicates that increasing the number of female members on the board of directors reduces the debt ratio, which may mean that women are generally more conservative than men and less risk-tolerant.

Fifth, "Audit Committee" is negatively correlated with "Board Size", (R = − 0.238) and significant at the 0.01 level and "Audit Committee" is negatively correlated with "Company Size", (R = − 0.111 and significant at the 0.01 level), indicating that firms with large board sizes are more likely to have small audit committee sizes, and large firms tend to have smaller audit committee sizes.

Finally, "leverage" is positively associated with "firm size" (R = 0.375 and significant at the 0.000 level) indicating that larger companies tend to have higher leverage ratios.

Table 3 Pearson correlation analysis

	Board size	Board gender diversity	Audit committee	Tax avoidance	Firm value	Firm size	Leverage	Profitability (ROE)
Board size	1							
Board gender diversity	0.022	1						
Audit committee	− 0.238**	0.080*	1					
Tax avoidance	− 0.013	0.058	0.023	1				
Firm value	0.066*	0.021	− 0.022	0.080*	1			
Firm size	0.416**	− 0.051	− 0.111**	0.164**	0.071*	1		
Leverage	0.076*	− 0.224**	0.012	0.009	− 0.039	0.375**	1	
(ROE)	0.042	0.112**	− 0.091*	0.317**	0.347**	0.273**	− 0.030	1

** Correlation is significant at the 0.01 level (2-tailed)
* Correlation is significant at the 0.05 level (2-tailed)

4.3 Regression Analysis

This section presents the results of the regression analysis; first for the industrial sector, then for the service sector and finally for both sectors.

4.3.1 Industrial Sector Regression Model

Table 4 presents the results of the first model test in the study. The use of multiple regression testing requires low correlation between the independent variables in the model to avoid the problem of multicollinearity. The last two columns in the table display collinearity statistics (tolerance and VIF) to assess the level of multicollinearity between variables. The results of collinearity statistics tests, with Tolerance values near 1 and VIF values around 1 indicate that there is no multicollinearity problem in the first model of the study.

In this particular model, various independent and control variables (x1, x2, x3, x4, x5, x7, and x8) are being examined for their effect on the dependent variable (x6: Firm Value). The table shows that the adjusted R square of the model is 17.8%, which means that the independent variables and control variables can explain about 17.8% of the variation in firm value. The results also reveal that the model significantly explains the variation in the firm value at a significance level of less than 0.05 with F

Table 4 Regression results for model (1): industrial sector

	Beta	t	Sig.	Collinearity statistics	
				Tolerance	VIF
(Constant)		3.485	0.001		
x1(board size)	0.072	1.416	0.158	0.830	1.204
x2 (board gender diversity)	0.019	− 0.386	0.700	0.928	1.077
x3 (audit committee size)	− 0.007	− 0.147	0.883	0.942	1.061
x4 (tax avoidance)	− 0.002	− 0.046	0.963	0.905	1.104
X6 (firm size)	− 0.054	− 1.044	0.297	0.811	1.233
x7 (leverage)	0.230	4.595	0.000	0.855	1.170
x8 (ROE)	0.462	8.873	0.000	0.793	1.261
R square	0.193				
Adjusted R square	0.178				
F	12.815				
Sig.	0.000				

[a] Dependent variable (x5): firm value
[b] Independent variables (X1, X2, X3, X4)
[c] Control variables (X6, X7, X8)

value = 12.815. This indicates that the predicted variables have a significant impact on firm value, making the model valuable for further analysis and interpretation of the data.

Table 4 includes standardized coefficients (Beta), t-statistics (t) and significance levels (Sig). Notably, the constant has a significant value of 0.001, which represents the baseline value of x6 when all predictors are zero. Each predictor specifies its effect on x6, while standardized coefficients express these effects in standard deviation units. The t-statistics assess the statistical significance of each predictor, with lower *p*-values indicating higher significance.

Remarkably, return on equity and leverage variables show a highly significant coefficient (*p*-value of 0.000), indicating their significant impact on the firm value. Conversely, board size, female directors, audit committee, tax avoidance, and firm size show coefficients with *p* values higher than 0.05, indicating no statistical significance in predicting firm value in the context of this regression model. Overall, this model provides crucial insights into the impact of the predictors on the firm value, highlighting the significant role of leverage and return of asset, while noting the comparatively lower impact of other variables.

4.3.2 Service Sector Regression Model

Table 5 displays the results of testing the second model in the study related to service companies. The results of collinearity statistics tests, with Tolerance values near 1 and VIF values around 1 indicate that there is no multicollinearity problem in the second model of the study.

In this model, various independent and control variables (x1, x2, x3, x4, x5, x7, and x8) are being examined for their effect on the dependent variable (x6: Firm value). The table shows that the adjusted R square of the model is 9.2% which means that the independent variables and control variables can explain about 9.2% of the variation in firm value. In addition, the results reveal that the model significantly explains the variation in the firm value at a significance level of less than 0.05 with F value = 4.786. This indicates that the predictor variables have a significant impact on firm value, making the model valuable for further analysis and interpretation of the data.

Table 5 includes standardized coefficients (Beta), t-statistics (t) and significance levels (Sig). Notably, the constant has a significant value of 0.000, representing the baseline value of x6 when all predictors are zero. Each predictor specifies its effect on x6, while the standardized coefficients express these effects in standard deviation units. The t-statistics assess the statistical significance of each predictor, with lower p-values indicating higher significance.

Remarkably, return on equity, board size and firm size variables show a highly significant coefficient (*p*-value less than 0.05), indicating their significant impact on the firm value. Conversely, board gender diversity, audit committee, tax avoidance, and leverage show coefficients with *p* values higher than 0.05, indicating no statistical significance in predicting firm value in the context of this regression model. Overall,

Table 5 Regression results for model (2): service sector

	Beta	t	Sig.	Collinearity statistics	
				Tolerance	VIF
(Constant)		3.631	0.000		
x1(board size)	0.239	3.295	0.001	0.660	1.515
x2 (board gender diversity)	− 0.023	− 0.373	0.709	0.941	1.063
x3 (audit committee size)	− 0.024	− 0.353	0.724	0.777	1.287
x4 (tax avoidance)	0.088	1.421	0.156	0.905	1.104
X6 (firm size)	− 0.187	− 2.804	0.005	0.775	1.290
x7 (leverage)	0.084	1.371	0.172	0.918	1.089
x8 (ROE)	0.261	4.370	0.000	0.969	1.032
R square	0.116				
Adjusted R square	0.092				
F	4.786				
Sig.	0.000				

[a] Dependent variable (x5): firm value
[b] Independent variables (X1, X2, X3, X4)
[c] Control variables (X6, X7, X8)

this table provides crucial insights into the impact of the predictors on the firm value, highlighting the significant role of return on equity, board size and firm size variables, while noting the comparatively lower impact of other variables.

4.3.3 All Company's Regression Model

Table 6 provides the results of testing the third model in the study related to industrial and service companies. The results of collinearity statistics tests, with Tolerance values near 1 and VIF values around 1 indicate that there is no multicollinearity problem in the second model of the study.

In this model, various independent and control variables (x1, x2, x3, x4, x5, x7, and x8) are being examined for their effect on the dependent variable (x6: Firma Value). The table shows that the adjusted R square of the model is 16.6%, which means that the independent variables and control variables can explain about 16.6% of the variation in firm value. In addition, the results reveal that the model significantly explains the variation in the firm value at a significance level of 0.000 with F value = 22.223. This indicates that the predictor variables have a significant impact on firm value, making the model valuable for further analysis and interpretation of the data.

Table 6 includes standardized coefficients (Beta), t-statistics (t) and significance levels (Sig). Notably, the constant has a significant value of 0.000, representing the baseline value of x6 when all predictors are zero. Each predictor specifies its effect

Table 6 Regression results for model (3): both sectors

	Beta	T	Sig.	Collinearity statistics	
				Tolerance	VIF
(Constant)	1.190	5.090	0.000		
x1(board size)	0.015	0.408	0.684	0.781	1.280
x2 (board gender diversity)	− 0.011	− 0.326	0.745	0.928	1.078
x3 (audit committee size)	0.018	0.519	0.604	0.934	1.071
x4 (tax avoidance)	− 0.017	− 0.480	0.631	0.922	1.085
X6 (firm size)	− 0.035	− 0.832	0.406	0.642	1.557
x7 (leverage)	− 0.044	− 1.172	0.242	0.800	1.249
x8 (ROE)	0.427	11.793	0.000	0.852	1.174
R square	0.174				
Adjusted R square	0.166				
F	22.223				
Sig	0.000				

[a] Dependent variable (x5): firm value
[b] Independent variables (X1, X2, X3, X4)
[c] Control variables (X6, X7, X8)

on x6, while the standardized coefficients express these effects in standard deviation units. The t-statistics assess the statistical significance of each predictor, with lower p-values indicating higher significance.

The results show that the return on equity variable has a high significance coefficient (*P* value less than 0.05), indicating their significant impact on company value. In contrast, board size, female directors, audit committee, tax avoidance, firm size and financial leverage show coefficients with p-values higher than 0.05, indicating relatively lower statistical significance in predicting firm value in the context of this regression model. Overall, this model provides crucial insights into the impact of the predictors on the firm value, highlighting the significant role of ROE, while noting the comparatively lower impact of other variables.

4.4 Comparing the Results with Previous Studies

The main results of the current study showed no effect of corporate governances and tax avoidance on firms' value. These findings are inconsistent with those of previous studies [6, 15, 19, 28] which found significant effect of corporate governance and tax avoidance on firm's value. Guedrib and Marouani [15] found that tax avoidance lowers a company's worth when it is coupled with a high degree of tax risk. Afes and Jarboui [6] showed that implementing corporate governance improves a company's financial performance as determined by its return on equity. The results of

Mangoting et al. [20] study indicated that increasing company value and tax avoidance was influenced by the size of independent commissioners. Supanji et al. [28] found that the following factors affect firm value: Audit Committee, Cash Effective Rate, Managerial Ownership, Institutional Ownership, and the Proportion of Independent Commissioners.

5 Conclusions

A comprehensive analysis of the study variables was conducted using three models to study the impact of corporate governance and tax avoidance on firm value. The results of the first model indicated that the independent variables and control variables can explain about 17.8% of the variation in firm value. In addition, return on equity and leverage variables have statistically significant effect on the firm value. The results of the second model indicated that the independent variables and control variables can explain about 9.2% of the variation in firm value. In addition, the board size, firm size, and rerun on equity have a highly statistically significant effect on the firm value. The results of the third model indicated that the independent variables and control variables can explain about 16.6% of the variation in firm value. In addition, the variable return on equity has a highly significant coefficient effect on the firm value.

In conclusion, the analysis of this study demonstrates that corporate governance practices and tax avoidance strategies do not have powerful drivers of firm value in Jordanian industries and services. However, the complex nature of firm value requires further exploration of additional factors that contribute to its dynamics. These findings have profound implications for companies seeking to strengthen their corporate governance frameworks and improve their tax strategies, ultimately leading to increased firm value and competitiveness in the Jordanian market.

Based on the study results, companies should strengthen their corporate governance practices, including board structures and audit committees, to positively impact firm value. In addition, Jordanian companies should implement effective tax planning strategies to manage tax liabilities and capitalize on legal tax-saving opportunities, which can boost firm value.

Board of Directors' Attributes and Quality of Sustainability Reports Among Industrial Companies and Banks Listed on a Stock Exchange

Abdulnaser I. Nour, Areen Ahmad Dagher, Sara Basem Douglas, and Kamel Jebreen

Abstract The study's objective was to investigate the effects of board attributes on sustainability reporting in 18 banks and industrial enterprises listed on the Palestine Stock Exchange between 2013 and 2022. The study employed Linear Regression Analysis to select between the fixed regression model and the random regression model based on the *p*-value, as well as Descriptive Statistics for each variable and the Correlation Coefficient for the strength of the associations between the variables. We employed randomization if the percentage is more than five percent. R corn 4.1.1. The study found that the size of the board of directors and gender diversity are significant factors in the caliber of sustainability reports, and that the CEO's independence and dual personality have a detrimental impact on the caliber of sustainability reports. The study made the following recommendations for the Board of Directors: it should be larger, more diversified, and comprise non-executives. It is also advised that banks and businesses in the industrial sector reveal the level of their CSR and show more concern for the environment and human resources.

1 Introduction

Sustainability disclosures are becoming increasingly important in developing countries as governments recognize social and environmental issues and investors' interest in transparency increases [1, 2]. Establishing internal control systems and maintaining efficient stakeholder communication are critical tasks for the board of directors, and a diverse board improves the caliber of decision-making [3–5]. Gender diversity on corporate boards significantly influences firms' sustainability engagement, as evidenced by recent literature [6, 7]. Even one female board member can improve a company's social responsibility, particularly in settings where men predominate [8]. In addition to bringing more diversified skills and experience to the board, the size of the board of directors has a significant impact on the company's operations, management, and ability to fulfill strategic goals related to sustainable development [5, 9], which is one of the main drivers of its effectiveness [10], Furthermore, independent directors possess unique incentives and values in contrast to executive directors, who typically prioritize short-term objectives. While independent directors do not take part in the company's production or operations and instead seek to enhance the decision-making process, executive directors are directly involved in these activities and their choices are frequently impacted by their administrative roles within the organization. Regarding the Board of Directors, considering their autonomy [11–13]. Being the CEO and chairman at the same time creates a conflict in leadership and governance [14].

The industrial sector contributes significantly to economic development by providing employment opportunities, increasing productivity and exports [15]. Financial institutions, especially banks, also play a key role in influencing corporate social responsibility across all industries by improving corporate governance, transparency, and disclosure [16]

The board of directors plays a crucial role in leading businesses [17, 18], yet it is frequently blamed for oversight shortcomings and corporate missteps that reduce shareholder value [19]. Businesses aim to strike a balance between sustainability and financial performance, putting long-term expansion ahead of immediate profits [20]. Public enterprises are essential to sustainable development and resource utilisation in Palestine; nevertheless, despite their ability to alleviate poverty and economic issues, there is a dearth of study on corporate social responsibility (CSR) in contested locations such as Palestine [21].

Sustainability reports are essential resources for promoting communication between businesses and a wide range of stakeholders, such as government agencies, communities, suppliers, employees, shareholders, and investors. These reports emphasize responsibility and transparency by providing insightful information about how businesses handle sustainability issues, contribute value, and reduce risks. Sustainability reports are essential for the Board of Directors because they keep an eye on management procedures, assess business performance, and direct strategic decision-making. Boards can assure long-term sustainability, improve company

governance, and increase competitiveness in the market by utilizing the information found in sustainability reports.

Our study, which is unique in that it focuses on revealing the quality of corporate social responsibility in addition to levels, by including pictures, numbers, and graphics, aims to analyse the impact of board characteristics on the quality of sustainability reports in industrial companies and banks listed on the Palestine Stock Exchange from 2013 to 2022. It also concentrated on assessing how board composition affects CSR issues (environment, human resources, employees, and products).

2 Theoretical Background, Literature Review and Hypotheses Development

Sustainability reports foster communication between companies and stakeholders, promoting transparency and accountability. They help stakeholders understand a company's sustainability efforts and value creation while managing risks. For the board of directors, sustainability reporting is crucial for overseeing management behavior and evaluating performance, ensuring effective guidance. Sustainability reporting involves measuring, disclosing, and evaluating organizational efforts to achieve sustainable development goals [2]. Agency theory states that by regulating managers' behaviour, independent board members can improve board oversight and lower agency costs [22, 23] In order to attain competitive excellence and continual development, boards must balance economic, social, and environmental objectives. Resource dependence theory highlights the significance of management boards' competencies in promoting sustainability [24].

2.1 Gender Diversity

Gender diversity on corporate boards is crucial for addressing sustainability issues and enhancing management effectiveness, according to recent studies. Theoretical frameworks including as resource dependence theory and stakeholder theory encourage the participation of women on boards, and research suggests that the diversity of their perspectives improves decision-making [25]. Research indicates that organisations with a higher proportion of female board members typically exhibit superior stakeholder management, community involvement, and philanthropic endeavors [26]. Furthermore, there is a correlation between higher female representation and a higher probability of generating integrated sustainability reports [27]. Although this topic has received more attention from developed nations, research shows that sustainable practices and board gender diversity are positively correlated in both developed and emerging markets [28]. Research from Asia, Africa,

and Europe in particular has shown that corporations with larger percentages of female board members typically have more robust environmental, social, and governance (ESG) disclosures [29, 30]. To completely comprehend the mechanisms underlying these links and their consequences for corporate governance and sustainability, more research is necessary, even in light of the increased focus and data supporting these relationships. Based on the above theoretical and empirical arguments, we hypothesize that:

H1: There is a positive correlation between Board Gender Diversity and the Quality of Sustainability Reports.

2.2 Board Size

The total number of board members who are employed by a specific corporation is known as the board size. In terms of financial knowledge and problem-solving abilities, boards typically contain a wider range of backgrounds, which benefits the company's reputation and image [31]. The quality of sustainability reporting is positively correlated with board size, as repeatedly shown by recent study. Research by [32–36] all demonstrate that stronger sustainability reporting and larger boards are positively correlated. According to agency theory, corporations in Malaysia that have a larger board have better sustainability disclosure [37]. In a similar vein, [38] found that bigger boards improve disclosures about sustainability in Pakistani businesses. Additionally, [39] discovered a statistically significant and favorable correlation between board size and sustainability reporting. Additionally, [40] emphasized how important board size is to enhancing sustainability reporting for Nigerian listed non-financial companies. Based on the above theoretical and empirical arguments, we hypothesize that:

H2: There is a positive correlation between Board Size and the Quality of Sustainability Reports.

2.3 Board Independence

For the Board of Directors to effectively oversee the agent and internal operations, independence is essential. By making sure there are an adequate number of independent directors, this is accomplished [41]. Board independence and sustainability reporting are positively correlated, according to recent studies. Research [27] found that, among 134 multinational corporations, board independence was positively correlated with integrated reporting quality. After examining 88 South Asian listed businesses, Abdelhaq et al. [42] came to the conclusion that board independence has a big impact on environmental sustainability reporting. In a similar vein, Amer

et al. [43] highlighted how important board independence is to encouraging sustainability reporting among 176 Latin American publicly traded companies. Furthermore, Githaiga and Kosgei [31] demonstrated that independence, financial know-how, and gender diversity on boards have a favorable effect on sustainability reporting in East African listed businesses. These results were corroborated by study [40], which showed that board independence improves sustainability reporting for Nigerian listed non-financial enterprises. Based on the above theoretical and empirical arguments, we hypothesize that:

H3: There is a positive correlation between Board Independence and the Quality of Sustainability Reports.

2.4 CEO Duality

CEO duality, in which a single individual serves as both the chairman and the CEO at the same time, facilitates executive authority coherence and expeditious decision-making, which benefits businesses in critical business situations [44]. This arrangement makes it easier for management and the board to communicate effectively since the CEO can use their power to improve performance and reveal pertinent information [39]. When considering CEO duality from the perspective of agency theory, profit maximization may take precedence over CSR activities [35]. Research by [43, 45] discovered inverse relationships between CEO duality and ESG disclosure in publicly traded firms, indicating that centralized authority may obstruct efficient governance and decision-making, resulting in disputes and eroding the legitimacy of corporate governance frameworks. Based on the above theoretical and empirical arguments, we hypothesize that:

H4: There is a negative correlation between Board CEO Duality and the Quality of Sustainability Reports.

3 Methodology

3.1 Population and Sample

From 2013 to 2022, banks and industrial enterprises registered on the Palestine Stock Exchange made up the study population. The sample comprises companies that satisfy multiple requirements, of which:

First, being listed on the Palestine Stock Exchange.

Second, being listed within the specified timeframe.

These requirements led to the inclusion of 18 banks and industrial enterprises in the sample. Comprising seven of the eight banks and eleven industrial enterprises; Al Safa Bank was left out in because it was listed in 2022.The study focused on the industrial sector and banks because they represent an important sector in Palestine, as they are considered among the emerging Palestinian sectors that affect the state's economy.

3.2 Variable Measurement

The Dependent Variable: Quality of Sustainability Reporting

Measuring, revealing, and holding organizations responsible for their efforts toward attaining sustainable development goals are all part of sustainability reporting [2].

The study [46] provided the baseline for the corporate social responsibility levels used to judge the quality of sustainability reports, which were then adjusted to fit the study's sample. The measurement of corporate social responsibility involves examining the information contained in the financial reports of banks and industrial enterprises. A score of 1 indicates the presence of CSR, while a score of 0 indicates its absence.

$$\text{CSR-Level} = \sum \text{Employee, Product, Environment, and Community Points}/30.$$

Independent Variables

Four independent variables were employed in the study: Gender Diversity, Board Size, Independence, and CEO Duality. Moreover, four control variables were employed: Leverage, Profitability, Firm Size, and Firm Age.

The operational definitions of dependent, independent, and control variables are given in Table 1.

3.3 The Regression Model

The following multiple regression model was created in order to investigate the effects of board of directors characteristics on the quality of sustainability reports in banks and industrial enterprises listed on the Palestine Stock Exchange between 2013 and 2022:

$$CSR - L = \alpha i + \beta 1BGD + \beta 2BSIZE + \beta 3BIND + \beta 4CEO + \beta 5LEV + \beta 6PROF + \beta 7SIZE\,F + \beta 8AGE + \varepsilon it$$

Table 1 Measurement of variables

Variable	Label	The definition	Operational definition	References
Corporate social responsibility-level	CSR-L	Ability to manage operations efficiently and achieve profitability, leading to business sustainability and effective achievement of financial goals [46]	$\sum$ Points of (community, environment, employee, and product)/30	[46]
Gender diversity	BGD	A certain proportion of women must be on the board of directors [47]	The proportion of female directors	[31]
Board size	BSIZE	The board size represents the total number of individuals serving as board members within a specific company [31]	The number of board members	[31, 48]
Independence	BIND	The board is composed of several independent directors [31]	The ratio of independent directors to the total number of directors on the board	[49]
CEO duality	CEO	Means that the CEO also serves as the chairman of the board [48]	Converted the variable to a binary representation, where "0" means that the CEO is not the chairman and "1" indicates that they are	[39, 48]
Leverage	LEV	The debt-to-assets ratio measures how much of a company's assets are financed by debt. It is computed by dividing total liabilities by total assets. This metric assesses a company's reliance on borrowed capital or leverage [50]	Total liabilities to total assets	[51, 52]
Profitability	PROF	The profits a company achieves from revenues after deducting all costs and expenses observed during a certain period	Net income divided by total assets is the return on asset equation	[51]

(continued)

Table 1 (continued)

Variable	Label	The definition	Operational definition	References
Firm Size	SIZE	Typically, a company's capitalization, total assets owned, and total sales generated all indicate its size	The asset total log at the conclusion of the period	[39]
Firm Age	AGE	The period during which the company exists and is active in the market	Number of years passed since listing	[53]

3.4 Additional Analysis

Two further metrics were included in the study: In the first research, the quality of corporate social responsibility was ranked from 0 to 6 based on the board of directors' qualities, as determined by looking at numbers and photos [8].

0: No information disclosed, 1: An item's general disclosure; 2: Items referenced in general disclosures that have accompanying photos; 3: are descriptive and qualitative disclosures that provide clear and precise details; 4: are mostly qualitative and descriptive disclosures that include supporting images or diagrams; 5: are digital disclosures or disclosures that include numerical data; and 6: are full digital disclosures that include pictures or graphs.

The impact of the board of directors' attributes on the CSR items of environment, human resources, society, and product is the subject of the second examination.

4 Result and Discussion

4.1 Descriptive Statistics

Table 2 presents the findings of the descriptive statistical analysis of the study variables, which comprise the dependent, independent, and control variables Together with the other analytical variables that were examined in the study:

Table 2 shows the descriptive statistical analysis that industrial companies and banks listed on the Palestine Stock Exchange generally disclose their CSR levels, with an average CSR-L of 0.55 ($p = 0.90$d). However, there is a need to improve the detection of CSR-Q, which is indicated by the lower average CSR-Q of 0.18 ($p = 0.99$d), which is equivalent to 3%. Regarding items of CSR, (ENV) is lower (mean = 0.28), while disclosures related to (HR), (CI), and (PRO) are relatively higher. (BGD) is low (0.08), with the average percentage of female board members being around 9%, which is below corporate governance requirements. Most board

Table 2 Descriptive statistical analysis

Variable	Mean	Std. Dev	Min	Max
CSR-L	0.55	0.18	0.2	0.93
CSR-Q	0.18	0.12	0.03	0.71
ENV	0.28	0.28	0	0.89
HR	0.57	0.2	0.1	1
CI	0.78	0.27	0	1
PRO	0.71	0.27	0	1
BGD	0.08	0.11	0	0.45
BSIZE	8.92	2.16	4	14
BIND	0.39	0.11	0.6	1
CEO	0.14	0.35	0	1
LEV	0.44	0.27	0.06	0.93
PRO	0.04	0.08	− 0.62	0.27
SIZE	555,442,870.18	1,156,879,385.1	760,584	6,508,221,806
AGE	14.4	6.24	0	25

members are independent (mean = 0.93) and non-executive (mean = 0.14). Firms tend to rely on equity (mean leverage = 0.44) and show low profitability (mean = 0.04). In addition, the average size and age of firms are 555, 442, 870.15 and 14.4, respectively.

4.2 Correlation Coefficient

The associations between independent and control factors and the dependent variables (CSR-L and CSR-Q) and CSR-L items in banks and industrial enterprises listed on the Palestine Stock Exchange were examined using the Pearson correlation coefficients in Table 3. There appears to be no problem with multicollinearity among the research variables, as indicated by the maximum correlation coefficient value of 0.47, which indicates that correlations between independent variables usually fall below 0.7.This makes it possible to assess the importance of each variable and how it affects the dependent variable's prediction.

The variables BGD, BSIZE, BIND, LEV, PROF, and SIZE have a positive correlation with CSR-L, while the variables CEO and AGE have a negative correlation with CSR-L.

BGD, BSIZE, BIND, and SIZE have a positive correlation with CSR-Q. Additionally, there is a negative correlation between CSR-Q and (CEO, LEV, PROF, AGE).

Table 3 Correlation Coefficient Analysis for industrial companies and banks

	CSR.L	CSR.Q	ENV	HR	CI	PRO	BGD	BSIZE	BIND	CEO	LEV	PROF	SIZE	AGE

(continued)

Table 3 (continued)

	CSR.L	CSR.Q	ENV	HR	CI	PRO	BGD	BSIZE	BIND	CEO	LEV	PROF	SIZE	AGE
SIZE													1	0.05 (0.529)
AGE														1

Notes *Significant at the 0.01 level (two-tailed); ** Significant at the 0.05 level (two-tailed); *** Significant at the 0.10 level (two-tailed)

The correlation between ENV (CSR-L) and (BGD, BSIZE, BIND, PROF, and SIZE) is positive. Additionally, there is a negative correlation between ENV (CSR-L) and (CEO, LEV, and AGE).

The correlation between HR (CSR-L) and (BGD, BSIZE, BIND, LEV, and SIZE) is positive. Additionally, there is a bad correlation between HR (CSR-L) and (CEO, PROF, and AGE).

(BGD, BSIZE, CEO, LEV, PROF, SIZE, and AGE) and CI (CSR-L) have a positive correlation. Moreover, BIND and CI have a negative association (CSR-L).

4.3 Regression Analysis

The effect of independent variables (BGD, BSIZE, BIND, CEO) and control factors (LEV, PROF, SIZE, AGE) on the dependent variable (CSR-L) was determined in this section using a panel linear regression model (fixed effects model and random effects model). The best model was then chosen using the Hausman test. Thus, we employ a fixed effects model otherwise, and a random effects model if the Hausman test value is $p > 0.05$. However, when employing VIF, no collinearity issues were discovered [54–56].

We chose to interpret the Random effects model based on the p-value of the Hausman test ($p = 0.159$).

The results of a linear regression study performed on banks and industrial enterprises listed on the Palestine Stock Exchange are presented in Table 4. First, the first hypothesis is supported by a substantial positive effect (0.483, $p < 0.001$) between the percentage of females on boards of directors (BG) and (CSR-L). Second, prior research has shown that (BSIZE) positively affects CSR-L (0.008, $p = 0.221$), as reported in papers like [36, 42]. The adverse impact of BIND on CSR-L (-0.112, $p = 0.388$) defies agency theory and certain research [27]. The CEO's detrimental effect on CSR-L (-0.039, $p = 0.322$) is consistent with earlier studies [36], stating that when the CEO is also the chairman, profit maximization should take precedence above social considerations. Furthermore, CSR-L is significantly impacted negatively by (LEV) (-0.229, $p < 0.001$), but positively by (PROF) and (SIZE) (0.027, $p = 0.841$ and 0.058, $p < 0.001$, respectively). Lastly, (AGE) has a negative relationship with CSR-L (-0.011, $p < 0.001$), suggesting that recently listed businesses put profits before social responsibility.

We chose to interpret the Random effects model based on the p-value of the Hausman test ($p = 0.279$).

Table 5 displays the results of a linear regression analysis carried out on Palestine Stock Exchange-listed companies, which indicated multiple noteworthy correlations with (CSR-Q). Between BGD and CSR-Q, there is a positive effect of 0.042 ($p = 0.553$). Greater transparency is typically associated with larger boards, which is

Table 4 LR analysis between CSR.L and other variables

Fixed effect model					Random effect model					
Variable	Beta	SD	P	R2/ AR2	Beta	SD	P	R2/ AR2	Hausman test	VIF

Notes * Significant at the 0.01 level (two-tailed); ** Significant at the 0.05 level (two-tailed); *** Significant at the 0.10 level (two-tailed)
Mode 1 >> formula = CSR.L ~ BGD + BSIZE + BIND + CEO + LEV + PROF + SIZE + AGE

consistent with agency theory's emphasis on increased monitoring capability translating into increasing responsibility. BIND, however, revealed a negative effect that might have been influenced by variables outside the purview of the study, including social interactions or control relationships. The claim that agency expenses can be reduced by keeping the functions of CEO and board chairman distinct is supported by the substantial negative impact of the CEO. Furthermore, leverage showed a strong negative correlation, suggesting that when debt levels rise, businesses become less likely to take responsibility because of the increased dangers. Although not statistically significant, PROF revealed a negative effect that could have an impact on CSR-Q. On the other hand, AGE significantly lowered CSR-Q, whereas SIZE significantly increased it.

We chose to interpret the Fixed effects model based on the p-value of the Hausman test ($p = 0.001$).

The environment (CSR-L item) and other variables in industrial enterprises and banks listed on the Palestine Stock Exchange are analyzed using linear regression, as presented in Table 6.

The CSR-L items show a positive correlation of 0.447 ($p = 0.009$) between BGD and ENV. BSIZE has a positive impact on ENV (CSR-L items) of 0.004 ($p = 0.72$). BIND positively affects ENV (CSR-L items) by 0.228 ($p = 0.223$). BIND has a 0.027 favorable impact on ENV (CSR-L items).

Between LEV and ENV (CSR-L items), there is a significant negative effect of − 0.297 ($p = 0.001$).PROF and ENV (CSR-L items) have a negative relationship of − 0.041 ($p = 0.955$). SIZE and ENV (CSR-L items) had a significant positive influence of 0.053 ($p < 0.001$). Showing a statistically significant negative correlation between AGE and ENV (CSR-L items) of − 0.023 ($p < 0.001$).

Mode 5 >> formula = CI ~ BGD + BSIZE + BIND + CEO + LEV + PROF + SIZE + AGE

Between BGD and CI, there is a statistically significant positive effect of 0.51 ($p = 0.001$) (CSR-L item). There is a positive relationship between CEO and CI (CSR-L item), a negative effect between BIND and CI (CSR-L item), and a substantial positive effect of 0.031($p = 0.006$) on CI (CSR-L item) according to BSIZE.

Between LEV and CI (CSR-L item), there is a significant negative effect of − 0.449($p < 0.001$), a positive effect of 0.298 ($p = 0.167$) from PROF on CI (CSR-L item), a substantial positive effect of 0.073 ($p < 0.001$) from SIZE on CI (CSR-L item), and a positive effect of 0.002 ($p = 0.337$) from AGE on CI (CSR-L item).

We chose to interpret the Random effects model based on the p-value of the Hausman test ($p = 0.209$).

The linear regression analysis of Product (CSR-L item) and other variables in banks and industrial enterprises listed on the Palestine Stock Exchange is presented in Table 9.

BGD and PRO (CSR-L item) have a substantial positive effect of 0.927 ($p < 0.001$), while BSIZE and PRO (CSR-L item) have a positive effect of 0.016 ($p = 0.154$). BIND has a positive effect of 0.465 ($p = 0.026$) on PRO (CSR-L item), while CEO has a negative effect of − 0.076 ($p = 0.235$) on PRO (CSR-L item).

LEV has a significant positive effect of 0.617 ($p = 0.004$) between PROF and PRO (CSR-L item), and a negative effect of –0.067 ($p = 0.388$) on PRO(CSR-L item). On PRO (CSR-L item), SIZE has a substantial positive impact of 0.04 ($p = 0.001$), while AGE has a negative impact of − 0.002 ($p = 0.494$) on PRO.

5 Conclusion

The purpose of the study was to look into how the qualities of the board of directors affected the caliber of sustainability reports from 2013 to 2022, as determined by the levels of corporate social responsibility. It was discovered that banks and industrial enterprises in Palestine prefer revealing CSR levels over quality, with averages of 0.18, or 3%, for quality and 55% for CSR levels. Among the most significant findings are that gender diversity positively influences the quality of sustainability reports, which is consistent with many studies, including the study [28]. Increasing the representation of women on boards of directors can improve sustainability practices and effectively meet stakeholder needs. The study also focuses on societal aspects, productivity, human resources, and the environment. The Study's [30] findings corroborate the idea that gender diversity improves boards of directors' oversight capabilities. Second, it showed that since larger boards of directors include a wider range of backgrounds and expertise, the size of the board positively affects the caliber of sustainability reports. Third: We disregarded the third hypothesis since the evidence showed that independence had a detrimental effect on sustainability reports' quality. This was explained by the existence of unaccounted-for determinants of independence, such as accounting expertise. Furthermore, the credibility and impartiality of a report may suffer when it lacks independence, and the data it contains may be skewed by prejudices, special interests, or other forms of manipulation. As a result, reports lose some of their credibility and usefulness as instruments

Table 10 Results

Hypothesis number	Hypotheses	Result
1	There is a positive correlation between Board Gender Diversity and the Quality of Sustainability Reports	Supported
2	There is a positive correlation between The size of the Board and the Quality of Sustainability Reports	Supported
3	There is a positive correlation between Independence and the Quality of Sustainability Reports	Rejected
4	There is a negative correlation between CEO Duality and the Quality of Sustainability Reports	Supported

Source Developed by authors

for gauging sustainability. As a result, independence is seen as a crucial component in guaranteeing the caliber of sustainability reports and upholding their legitimacy and openness. Agency theory, which states that independent board members improve board monitoring and lower agency expenses, is in conflict with this. Numerous investigations, including studies [43], refute this. In conclusion, the study revealed that the CEO's duality has a negative impact on sustainability report quality when there is a conflict between the CEO and the Chairman of the Board of Directors. This could potentially impact the level of objectivity in reporting, which is in line with other research, such as study [45], which found that it was detrimental to use one person's strength to undermine both positions. The Board of Directors makes decision-making difficult and raises the possibility of executive remuneration conflicts and improper use of corporate governance procedures. Increasing the number of women appointed to the board, increasing its size, and designating non-executive directors were among the proposals. The report also recommended broadening the definition of corporate social responsibility disclosure to include figures, photographs, and graphics as well as paying more attention to environmental and human resource concerns by following environmental regulations and raising funds. The study was constrained in that it only examined a small number of dependent and variable variables, as well as concentrating on two sectors of the Palestinian society: banks and industrial enterprises. Future studies could look into other attributes of the board and different metrics for evaluating the quality of sustainability reports, like the Global Reporting Initiative. They could also use data from other industries, including services or enterprises operating in comparable settings (Table 10).

Driving Customer Satisfaction: Exploring the Impact of Digital Banking Transformation in Banks

Belal Yousef Aqel, Shoruq Flaifel, Sanaa Zeidan, and Mofeed Thaher

Abstract The main findings of the study showed that mobile banking has a significantly positive impact on improving customer satisfaction. This impact was measured by the overall score from the customers' point of view (3.72). This shows that the level of appreciation is high, and the highest average was for the "Digital Interaction" field, where it received 3.97. The lowest average was for the "User Experience" field, which obtained (3.47) reflecting the opinion of customers about the effectiveness and quality of mobile banking services. which suggests a high level of estimation. The study presented several important recommendations, including banks must continue to enhance the provision of online banking services to ensure customer satisfaction. The design of the bank's application should be appropriate and easy to use. Educate customers that using services Online banking is safe, and they can train customers on that.

Keywords Digital banking transformation · Customer service · Online banking

1 Introduction

With the rapid technological development that we live in our world, which has led to digital transformation and development in financial institutions, where the application of digital technology works to intelligently exploit data to improve operations and provide financial services more efficiently and innovatively, digital transformation is considered a relatively recent term in the banking sector, It represents a modern and decisive challenge in the development of the banking sector and represents tremendous opportunities to improve banking services and better meet customer needs [1]. The change in banking operation activities efficiently without increasing the number

of branches to serve customer remotely which reflect cost reduction however the importance of security levels, risk, ease of use, public awareness are main factors affect the digital banking transformation process [2].

In the fourth industrial revolution in the event of covide 19 pandemic most customers satisfied with digital transformation as well bank employees agree to take this initiative of development [3]. Corona pandemic imposed many global challenges, such as imposing closures and preventing movement. As a result of these challenges, the pandemic contributed to accelerating innovation and finding quick digital solutions, which contributed to increasing the use of modern technology in all its forms, which prompted banks to develop modern and advanced methods that suit the market's need [4].

The remarkable technological development in recent years has led to the occurrence of a new phenomenon called (the digital economy), which refers to the transformations taking place in financial institutions, and global analyzes indicate the great potential for the growth of digital financial services, but with the establishment of the necessary foundations and rules to regulate its development. To gain a competitive advantage, companies must focus on the role of the customer, his experience, and the provision of innovative digital services.

According to The Palestinian Central Bureau of Statistics 80% of Palestinians have access to the Internet in the West Bank and Gaza Strip, it is enjoying good growth, technology sector companies. Abu Mansour [5], There are (13) banks were licensed by Palestinian Monetary Authority (PMA) including (7) local banks and (6) foreign banks, operating through (245) branches, (89) offices and 39 cash offices [6], we can consider the market is monopolistic competitive due to many banks operating however, With the aim of improving the customer experience We must deepen understanding of their needs, interests, and preferences for the products provided to them because this helps raise and improve the level of services provided to them, thus raising the competitive value of the bank and attracting more new customers [7].

Customer satisfaction has been defined as the feeling of the consumer after using the product or providing the service to him, and the feeling of satisfaction leads to loyalty and increasing the company's reputation in the market in addition to spreading positive word of mouth among people, so companies aim to provide the best services to ensure customer satisfaction, and on the contrary, the gap Between what the customer expects and what he gets. Customers in banks provide an evaluation of the quality of services based on five dimensions which are reliability, tangibles, responsiveness, assurance and empathy) [8]. Banks provide advanced and diverse technological banking services in order to attract the largest possible number of customers by allocating bank resources towards trust and privacy and paying greater attention to them, which will reflect positively on performance, create great confidence and greater security for customers in their online uses, and remind them to constantly protect their privacy and secure financial information [9].

Due to the continuous technological developments, banks are forced to continue providing their banking services in an advanced digital manner. Therefore, banks are considered one of the sectors that spend heavily on technological investments, such as online banking applications, which include several services such as digital payment, digital stores, electronic signature, etc., and it has great benefits for customers, such as saving time and effort, easy access to banking information and knowing exactly what was spent through the bank, in addition to enabling residents of remote areas to access electronic banking services easily [10]. The study deals with seeing the impact of the digital transformation of Palestinian banks on customer satisfaction, the study was determined to measure the following variables: (Usefulness Mobile applications, Accessibility, security, user experience, digital interaction).

1.1 Problem Statement

The research problem arises as a result of confirming the importance of the impact of digital transformation, the research will provide insights about these questions what is the effect of mobile banking on improving customer satisfaction measured by banks embrace digital transformation, accessibility of services, security available in banking services, the usefulness mobile applications, user experience and digital interaction according to customers' point of view? Are there statistical differences in the response's degree of the customers' point of view about according to the variables of gender and qualification?

1.2 Objectives of the Study

The main objective of this study is to clarify the impact of digital transformation in Palestinian banks on customer service by clarifying Customers' banking experience with digital banking transformation, electronic banking services contribute to reducing time and effort for customers and Customers' fears about using electronic banks.

1.3 The Importance of the Study

The importance of this research is evident in the importance of the topic it addresses, which relates to the impact of digital transformation in Palestinian banks on improving customer service, which positively affects the development of the banking sector, improving customer satisfaction.

2 Literature Review

In recent years, research on digital transformation has increased significantly, and the terms and definitions that express it have varied, and it has been noted that there are differences [11, 12]. Digital transformation is: "something with certain characteristics; that is driven by something; to create certain impacts; on certain aspects of the organization" [13]. In the master's thesis conducted by Ditshego on banks in Africa, he showed that banks face pressures and challenges from customers due to their desire for their banking experience to be easier and simpler than it is, so banks in Africa seek to change their business models to suit customer requirements. Knowing that the general belief is that banks have enough experience and skills to transform digitally easily, in the end and at some point, they must transform digitally in order for the bank to develop, With due regard to the new business model must be based on the customer [14].

Bank of England created a study on banks' use of modern technologies, and the results were that three-quarters of banks use advanced strategies and technologies that suit the needs of the bank and its customers, but after the Corona pandemic this percentage increased [15].

Many studies investigate the determinants of user's acceptance online banking lead these factors user friendliness whereas accessibility and compatibility doesn't affect the continues of using electronic channels may be this due preliminary registration stage [16]. During the last decade, the use of modern technologies has accelerated significantly in various industries and one of the industries that has witnessed development is the financial sector with the aim of providing better services and increasing banks' profits, and thus the impact is reflected in the growth and development of the economy [17], It is important for banks to work to improve and enhance banking services as much as possible, through advertising and awareness campaigns on the importance of using electronic banking services and encouraging customers to use them by offering them a set of incentives and dispensing with traditional banking methods. It is new to mention the need to pay attention to addressing customer problems through Effective automated responses via social media or websites [18].

Investing in new systems and technologies is not limited to monetary investments only. Investment must be made in employees in terms of training them to be highly competent in dealing with the company and customers, so they are considered an important part of the digital transformation success process. With technological development, the importance of cybersecurity increases, which focuses on protecting electronic systems from expected attacks, so banks must be ready to face any challenges to maintain data security for customers [19], Digital technology has changed the business models of banks, leading to an increase in productivity which enables success and reliance on many financial matters [20].

Competition is increasing between financial institutions to search for the best and latest digital technologies to increase its value in the market [21], as a result of adopting this digital technology, businesses have been able to provide great services to their customers [22], given that all financial institutions mostly seek one goal

which is to achieve profit, competition, continuity and loyalty from customers and clients however, they differ in the way in which they achieve this goal [23].

Digital transformation in the banking sector is not an easy process, it requires restructuring part of the work, whether it is restructuring internal operations or even changing current methods. In addition, the infrastructure for banking services requires huge sums of money, but in the long run when customers get used to on digital services instead of traditional ones, the cost of resources will decrease, and the number of actual employees present in banks will decrease, and this leads to a reduction in operating costs, as it is possible for a part of the bank's employees to work remotely to monitor electronic banking operations [24]. Investing in technology and digital transformation has become a necessity to increase knowledge of customer behavior and considerations and increase profits [25], because it is the leader in the field of business, and as a result, a greater role has emerged for interacting with customers and strengthening relationships with them. Accordingly, companies must focus on the role and experience of the customer and provide innovative digital services to gain a competitive advantage [26] because the complete digital transformation of banking operations leads to raising the performance of banks and attracting the largest possible number of investments to banks [27].

The rate of use of digital transformation in Palestinian society has increased recently, and the Palestinian Ministry of Communications are giving priority to investing in the technological sector in order to improve its operations and electronic payment methods have effectively contributed to enhancing the financial performance of Palestinian banks, which has helped to reduce costs and increase bank profits [28], Digital technology has changed the business models of companies, leading to an increase in productivity [29].

3 Hypotheses Development

Digital transformation the process of change towards information technology and communications technology, and the banking sector includes the digitization of documents, electronic signature, and digital currency trading. In the twenty-first century, the world witnessed a revolution in smartphone technology and applications, which facilitated the transformation in how we interact with the digital environment. Concepts such as artificial intelligence and machine learning technologies also emerged, adding a new dimension to digital technology and its use in various fields [5].

H.1: There is a relationship between the degree to which banks embrace digital transformation and improved customer satisfaction.

Trust has been defined in several forms, including that the consumer is willing to use something in exchange for the other party being able to meet the consumer's needs, and that trust results from a deep desire to do something [30].

Banking applications via mobile phones have been classified as one of the most important services, especially in developing countries, trust is considered one of the

most important variables regarding a sensitive topic such as money, and this trust affects the level of customer satisfaction with banking services, trust has been defined as credibility and ethics, it is a feeling that works against the feeling of uncertainty [31, 32].

Banks seek to empower customers digitally by exploiting the mobile phones that customers own without regard to geographic restrictions and to dispense with cash in hand, through mobile phone applications. Given that banks aim to reach customer satisfaction, the customer must feel safe when using the digital applications, and that there is integrity in the digital banking application [33]. Therefore, banks work to use modern and advanced systems to maintain the security of customers' personal and sensitive information within a group of security issues, and any defect in this security causes great harm to the bank and its customers [34].

H.2: The level of digital security available in banking services affects the level of customer satisfaction.

"Internet banking (e-banking) is the use of internet and telecommunication networks to deliver a wide range of value added products and services to bank customers", Internet banking services are often considered a complement to real banking services, which has enabled customers to conduct their electronic banking transactions at times convenient for them without the need to go to the bank. A modern type of banks has emerged without real headquarters, only virtually via the Internet, which helps banks to enter the financial markets, without the actual need for a physical bank headquarters. Mobile banking is among the latest in a series of recent mobile technological wonders. Although automated teller machine (ATM), telephone, and Internet banking offer effective delivery channels for traditional banking products.

H.3 There is a relationship between the usefulness mobile applications and customer satisfaction.

In the master's thesis conducted on banks in UK, the results were summarized that banks can provide several digital banking services, which improves the customer experience by ensuring that they have access to the various services comfortably, in addition to sending text messages to customers in the form of alerts in a regular manner. Continuously to inform them of the status of their bank accounts, and to ensure the best experience for them, so that banks consider that both employees and customers must participate through an appropriate investment strategy, and continue digital innovation [35].

It must be noted that the provision of a number of ATMs contributes to greater access to customers, which helps reduce the costs of financial transactions, in addition to bank branches and specialized centers for communications, electronic services, and Internet services. All of the above contributes to giving customers a feeling of security, safety, ease of use, and reducing restrictions, which constitutes a factor. Fundamental to customer satisfaction [36]. Raising the level of banking service and reaching the largest number of customers has a significant impact on the development of banking industries, which enhances customer satisfaction when they access information, web services, advanced and modern programs and devices [37].

H.4 There is a relationship between the accessibility and customer satisfaction.

There is a strong relationship between the accessibility of services and resources and customer satisfaction. If customers can reach the products they need faster that's will increase the loyalty and their experience is good and of high value, if the distance is long, this increases the cost of time and effort, and vice versa, because cost is an important criterion, and the high cost of transportation, shipping also does not facilitate easy access to the product, and contributes to low customer loyalty and lack of satisfaction.

With the digital change in banks, consumers have increased their feeling that they are able to perform electronic banking tasks and thus increase the customer base. Given the possibility of customers accessing the Internet on their mobile phones at all times and places, they can now access their bank accounts, which prompts banks to adopt new strategies that seek to Address customers electronically and build a good relationship with them to obtain their satisfaction

Customer satisfaction is considered one of the important factors that help banks maintain their competitive advantage, so banks seek to provide the best electronic banking services with a focus on important elements such as cloud computing, digital security, and the quality of digital services provided, and all of this is available with the availability of appropriate infrastructure, and is achieved. Spending a lot of money to ensure that services continue to be provided in the best way to customers, while maintaining banking privacy and security by preventing hackers from penetrating customer information. Some banks apply the digital electronic signature, which is considered of great importance to enhance security and is based on encryption of electronic information [38].

H.5: There is relationship between user experience and customer satisfaction.

Adoption of use digital banking according to Technology Acceptance Model (TAM) Mobile banking application preferences, social factors, perceived risk and trust is affecting customer behavior whilst the easy of using, ease-of-use and utility are not significant [39], another study has been referred to as intrinsic, frictional, and transitional frames, depicting the cognitive progression of end-users when interacting with digital artefacts as well as negotiating the institutional complexity [40].

H.6 There is a relationship between the digital interaction and customer satisfaction.

4 Methodology

This study adopted the descriptive methodology, where data is collected through the distribution of an electronic questionnaire, the questionnaire questions were designed based on previous research, consisting of 21 items. The questionnaire is divided into two parts: The first section focuses on demographic information such as gender and qualifications, while the second section consists of 21 items. Responses to each item were scored on a five-point Likert scale [41], The questionnaire elements were translated from English to Arabic, their answers were based on a five-point Likert scale (strongly agree, agree, neutral, disagree, strongly disagree), and SPSS was used

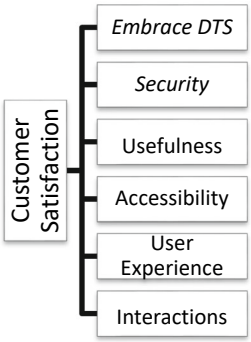

Fig. 1 Study model dependent versus independent variables

Table 1 Sample distribution according to independent study variable

Variable	Class	Frequency	Percentage %
Gender	Male	39	30.5
	Female	89	69.5
Qualification	Secondary	3	2.3
	Diploma	7	5.5
	B.A	49	38.3
	M.A and more	69	53.9
Total		128	100

to analyze the data statistically [42]. The population of the study bank customers in Palestine who use banking applications. The study sample have been chosen randomly in order to administrate the study tool as the reliability coefficient was calculated using the Cronbach alpha equation and its result was (89.1) which is acceptable.

The population in this research is 156 respondents, in Palestine, and the questionnaire was distributed using the random sampling method, but 28 questionnaires were excluded due to the respondents not using mobile banking services, so the final number of the sample is 128 respondents, customers in year 2023/2023. The background of male and female. Moreover, the respondents were varied in terms of qualification and the use of mobile in bank services as shown in Table 1.

5 Data Analysis

Descriptive statistical analysis was achieved through the researcher's use of descriptive tests. To analyze the results reached, the researcher relied on using the following scale to represent the estimated level of responses marked as high from 3.5 and more, moderate from 2.5 to 3.49 and low as less than 2.49°. Results of the questionnaire

Table 2 Shows that the total score for the impact of mobile banking services in improving the customer satisfaction

No.	Domain	Means	Standard deviations	Estimation level
1	Banks embrace digital transformation	3.67	0.62	High
2	Security	3.50	0.52	High
3	The useful of mobile apps	3.82	0.56	High
4	The accessibility	3.88	0.75	High
5	User experience	3.47	0.61	Moderate
6	Digital interaction	3.97	0.67	High
Total		3.72	0.47	High

related to the variables measured based on arithmetic means and standard deviations and estimated level according to customers' point of view in descending order as shown in Table 2.

The overall result from the customers' point of view reached (3.72). This shows that the level of appreciation is high, and the highest average was for the "Digital Interaction" field, where it received (3.97). The lowest average was for the "User Experience" field, which obtained (3.47).

5.1 Result Discussion

The total degree of the relationship between the degree to which banks embrace digital transformation and improved customer experience was (3.67) which suggests a high level of estimation. The highest mean was given to the item "The concept of mobile banking is concerned with the current and future interests of its users." which scored (3.83). On the other hand, the lowest mean was given to the item "The app has features tailored to me" which scored (3.32). The results mean that there is a relationship between the degree to which banks embrace digital transformation and improved customer experience.

The total degree of *digital security available in banking services affects the level of customer satisfaction* was (3.50) which suggests a high level of estimation. The highest mean was given to the item "All transaction confirmation details related to mobile banking (SMS or email) are sent within 24 h." which scored (3.83).On the other hand, The lowest mean was given to the item "Do you have any concerns about the security of online banking" which scored (3.27). The results mean that the level of digital security available in banking services affects the level of customer satisfaction.

The total degree of relationship between the mobile applications and customer satisfaction was (3.82) which suggests a high level of estimation. The highest mean was given to the item "Do you find that using mobile banking contributes to improving

your banking experience." which scored (4.16). On the other hand, the lowest mean was given to the item "Information and instructions related to mobile banking are easy to understand" which scored (3.60). The results mean that there is a relationship between the mobile applications and customer satisfaction….

The total degree of the relationship between the accessibility and customer satisfaction n. was (3.88) which suggests a high level of estimation. The highest mean was given to the item "Mobile APP can be accessed 24 h * 7 anywhere, anytime." which scored (4.03).On the other hand, The lowest mean was given to the item "I am aware of mobile banking by visiting its website and getting information about it" which scored (3.73). The results mean that there is a relationship between the accessibility and customer satisfaction.

The total degree of the relationship between the relationship between the experience and customer satisfaction it was (3.47) which suggests a moderate level of estimation. The highest mean was given to the item "The bank representative deals with customer complaints regarding the electronic service with respect." which scored (3.80). On the other hand, the lowest mean was given to the item "When you have a problem, the bank shows sincere interest in resolving it through chat on the app." which scored (3.28). The results mean that there is relationship between user experience and customer satisfaction.

The total degree of the relationship between the relationship between digital interaction and customer satisfaction it was (3.97) which suggests a high level of estimation. The highest mean was given to the items "Mobile banking enhances my effectiveness in utilizing the banking service and I feel satisfied when conducting online transactions in the online banking facility." which scored (3.97).The results mean that There is relationship between digital interaction and customer satisfaction.

6 Conclusion

In conclusion, this research highlights the significant positive impact of mobile banking services on improving the overall banking experience from the customers' perspective. The findings underscore the effectiveness and quality of mobile banking services in enhancing customer satisfaction, with a notable 73.8% of respondents acknowledging a high level of appreciation for these services. Despite concerns about the security of online banking, the study reveals that customers perceive mobile banking as a valuable tool for accessing banking services conveniently.

7 Recommendations

According to the study results, the following recommendations have been suggested, Banks must continue to enhance the provision of online banking services to ensure customer satisfaction, the design of the bank's application should be appropriate and

easy to use educate customers that using services Online banking is safe and they can train customers on that and more researches about the effect of mobile banking on improving banking experience should be conducted.

Examining the Relationship Between Hiring People with Disabilities and Customer Perspectives: Moderator Role of Physical Disability

Mohammad Abuhashesh, Alaa Adnan Awad, Ra'ed Masa'deh, and Shafig Al-haddad

Abstract This study aims to investigate the impact of hiring people with disabilities in Jordan's service sector on customer perspectives. The study utilized quantitative research methods to get the necessary data. The research sample was chosen through convenience sampling and consisted of 765 social media users from various age demographics. Several social media channels were utilized to distribute an online questionnaire for data collection. The results suggest that the preceding variable has a positive impact on the subsequent variables (brand image and loyalty), however, it does not have an impact on the desire to make a purchase or the act of categorizing someone based on stereotypes. Also, recruiting disabled individuals has the biggest effect on brand impression. The study's findings might potentially assist current and future entrepreneurs in building socially responsible, sustainable firms. In addition, scientists, governments, and politicians worldwide have focused on entrepreneurship. Entrepreneurship created new ideas, some of which are vital to corporate survival. Thus, social entrepreneurship evolved, and socially mature consumers demanded socially responsible businesses that benefit society.

1 Introduction

People with disabilities confront several obstacles that prohibit them from leading a normal life and actively engaging in the greater community in today's society. Each of humans' rights is universal, interrelated, interdependent, and reliant on each other. In 2021, the World Health Organization (WHO) reported that approximately 15% of the global population suffers from a handicap. Additionally, the Bureau of Statistics (BLS) reported that the unemployment rate for individuals with disabilities was 80.9% in 2021, while it was only 36.3% for those without a disability. The citation is from the Bureau of Statistics (BLS) in 2022. Consequently, the combination of low employment rates and poor pay leads to individuals with disabilities (PWDs) experiencing the individuals with disabilities have much higher poverty rates than those without disabilities. This is a result of their marginalized status as a discriminatory minority [29].

Along with a rise in public understanding of the rights of people with disabilities comes a surge in demand from socially conscious consumers for businesses to hire members of this marginalized group and to provide accessible facilities in the workplace [31]. Yet, and despite the efforts of business owners to include individuals with disabilities in their workforces, the inclusion of disabled persons in the workforce continues to be a societal challenge, especially for frontline staff [1, 55]. Employers' stigmas and biases against such groups of society are the primary causes of PWD underemployment. In addition, persons with disabilities face a number of obstacles that prevent them from reaching full social and economic participation. These obstacles include inaccessible physical surroundings, a dearth of assistive technologies, discriminatory attitudes, and stigmas [65]. Given the absence of strict restrictions or obligations to support the rights of disadvantaged individuals, this research is crucial for a society that aims to become more socially conscious and empower socially responsible consumers, businesses, and decision-makers [41]. Therefore, enabling the involvement of persons with disabilities (PWD) in the workforce will result in a reduction in poverty, and conversely, poverty reduction will contribute to increased engagement of PWD in the labor market [29]. This is due to the fact that individuals with disabilities will impose a reduced financial strain on their family and they will actively participate in society, making valuable contributions. Given the significance of incorporating persons with disabilities (PWDs) into the workforce and their influence on customers' perceptions, In order to fill the literature gap, Kalargyrou et al. [39] conceptual model was adjusted to meet this research's goals. The study hypothesis, theoretical framework, and research design will follow the model's discussion and literature review. Therefore, the authors came up with the following research questions:

1. What is the impact of being assisted by an employee with a disability on consumers' perceptions?
2. What is the influence of physical disability on the relationship between employers and customers?

3. Will the recruitment of individuals with disabilities as front-line personnel pose a challenge for firms in the hospitality sector in Jordan?

2 Literature Review

2.1 Customers' Perceptions on Hiring Disabled People

As stated by the Engel, Kollat, and Blackwell decision-making model, some aspects of a customer's outlook either before or after obtaining a service have been linked to subsequent actions [61]. To be more precise, the procedure for making decisions is difficult because it is based on intrinsic customer experience factors that are subsequently incorporated into a conclusive determination [10].

Although claims by proponents that every individual possesses the ability of working and the many advantages that employing individuals with disabilities can give to organizations, some businesses are wary of the prejudiced reactions they may get from customers [30]. Despite companies' good attitudes regarding disability, many continue to discriminate in their employment practices [20], Prior study has shown that both managers and employees generally hold negative opinions towards hiring individuals with disabilities (PWD) [37]. Furthermore, according to the literature, disability type had a significant effect in the employment of PWDs [19], Furthermore, it has been observed that individuals' opinions are shaped by the specific sort of handicap they have [54]. However, companies that have implemented disability inclusion in the workplace recognize that employing individuals with disabilities has had a beneficial effect on their organizations as a whole.

Consequently, the previous was countered by study that revealed consistently beneficial Impact of integrating disability inclusion on customers' attitudes. Previous study demonstrates that CSR has a positive effect on customers' behaviors [42],Several studies have demonstrated that a company's attitude toward its consumers improves when they hire persons with disabilities [22], Although the prices are rising, especially when human beings, as opposed to animals or the environment, are the intended recipients of the socially responsible actions. In addition, according to a survey conducted in the United States, According to a recent survey, 92% of consumers have a positive impression of businesses who hire individuals with disabilities because they are more likely to care about their workers [31]. This was proved by the fact that individuals were willing to support such groups [39].

2.2 Loyalty

According to some experts, loyalty is developed when a firm generates a sense of appreciation in the consumer's eyes, hence fostering long-term customer loyalty [12]. According to Thiruvattal [66] the production of value is an additional method

of gaining customer loyalty, when benefits are gained that go beyond the product's inherent qualities. Also, Petrick [59] had mentioned that five aspects of value creation suggest, organizational reputation is one method of producing value. Moreover, trust is essential in establishing the link between CSR and loyalty [4], and it has been shown to mediate the relationship between them [11]. According to Oliver [56], fostering loyalty between a company and its customers begins with the company providing information that helps customers understand the brand.

Although loyalty has received significant attention in marketing literature, it has been less explored in the context of consumers' attitudes toward employing PWDs. When examining the impact of CSR on loyalty, the literature presents mixed findings, with most studies indicating that CSR positively influences consumer loyalty [6, 51], confirming the favorable correlation between the two variables found in previous studies [12], CSR has been shown to boost customer loyalty, which has a favorable influence on customer retention, according to these studies [3] Moreover, González and Fernández [31] claimed that employing persons with disabilities would increase brand loyalty.

Others have proposed that a positive association exists due to the mediating influence of trust between businesses and their clients [4]. Although some research showed that CSR has no influence on the loyalty of brand [8], others determined that the association between CSR and loyalty is minimal. Based on the preceding material, we propose:

H1a Hiring individuals with disabilities has a statistically significant effect on consumer loyalty, with a significance level of ≤ 0.05.

2.3 Stereotyping

Stereotyping is the act of qualifying a particular behavior toward a group or identifying certain features with a certain group [62]. Persons with disabilities may suffer prejudgments attitudes comparable to religion, gender, age, nationality, and ethnic stereotyping. Many feel that disability is a calamity and that they be worthy sympathy. Those with normal physical abilities are socially expected to care for those who cannot care for themselves, and those who care for the disabled are seen as deserving recipients of pity and sympathy [50].

It is often assumed that disabled individuals will always have a low quality of life, contributing to the belief that they will be unable to raise a family, find suitable employment, or perform other duties. Conversely, some view people with disabilities as strong, brave, inspiring, and heroic, which places significant pressure on them to constantly make the most of their situation [50]. Additionally, some individuals fear people with disabilities, believing they are a sign of bad luck. People with disabilities, especially those with mental disorders, often face hostility and violence because they are perceived as dangerous. The aforementioned preconceptions have been etched in the minds of society by the continued exclusion of individuals with disabilities from significant communal activities [50].

Previous studies indicate that companies prioritize appearance over trainable skills in frontline workers [33]. Moreover, there's a hypothesis suggesting that physically attractive individuals have better employment prospects and higher incomes [28], (p. 233). Consequently, when a customer interacts with an employee with a visible disability, their perceptions of people with disabilities may be influenced by potential negative attitudes or emotional reactions. This could be attributed to the halo effect, where one characteristic influences perceptions of others [53]. Meanwhile, According to a study of hospitality employers, companies share similar concerns regarding the inability of people with disabilities to perform essential tasks or the need for additional nonspecific accommodation expenditures as defined by the Americans with Disabilities Act (ADA), even If such lodgings are not prohibitively costly. As a result, the following theory was devised:

H1b Hiring individuals with disabilities has a statistically significant effect on stereotyping in customers' behaviours, with a significance level of ≤ 0.05.

2.4 Brand Image

Being recognized for one's activities is an ongoing issue for businesses; hence, it is vital to communicate their image to the public, which is seen as a crucial factor in establishing a prosperous environment and a strategic marketing plan [68]. Corporate brand image, a crucial component in acquiring brand equity, is defined as the positive and negative qualities and attributes that society associates with a particular company [49]. Additionally, when people have a favorable perception of a brand, its communication has a stronger impact compared to its competitors [35], as it is considered a significant predictor of customers' purchasing behavior [21]. A brand with a positive public image enjoys a better market position, sustained advantage, and increased market share [64]. Customer satisfaction is also positively correlated with brand image [14]. Although few studies have examined the impact of employing individuals with disabilities on brand image, it is well established that CSR is crucial in developing a favorable brand image [32]. CSR can also be used as a differentiation strategy. Previous studies have supported this, indicating that CSR positively impacts brand image [68]. Moreover, it has been shown that brand image has a beneficial association with corporate philanthropy actions [60]. Philanthropic actions have also been shown to have a positive impact on brand image from both employee and employer perspectives [37], Although having a person with a disability serve you has been shown to improve a company's image [30]. Thus, the following hypothesis was formulated:

H1c Hiring individuals with disabilities has a statistically significant effect on brand image, with a significance level of ≤ 0.05.

2.5 Purchase Intention

According to Lakhan [43] buying intent has been defined as a customer's behavioral attitude and desire to buy a service or a product. Numerous studies have been done to see what effect CSR has on buying intentions. A substantial amount of material has been written on the impact of employing individuals with disabilities on customers' buying intentions. One sort of CSR is economic CSR, in which a corporation creates products or services that generate employment for people of society, allowing individuals to make a livelihood and the company to profit [52]. As per the findings of Lee and Lee [45], Firms are required to take part in economic CSR activities so that they can meet the buying demands of customers. This means that customers want to protect their resources, which means that customers have buying power.

Similarly, lawful CSR operations in which a company abides by local rules and regulations led to increased consumer inclination to make purchases [45]. Another sort of CSR is ethical CSR, in which a company respects the moral rights of its stakeholders [23]. Companies who ignored ethical concerns in the past saw their market share decline. As a result, ethical CSR actions by businesses are likely to favorably affect consumers' purchasing intentions [52]. Lastly, charitable CSR initiatives that increase the well-being and goodwill of others are predicted to strengthen consumers' purchasing intentions.

This is also consistent with the results of Alniacik et al. [9], demonstrating that corporate charitable efforts have a beneficial effect on consumers' purchase intentions, particularly when these actions are connected to customers' value views. So, the discussion above leads to the following hypothesis:

H1d The hiring of individuals with disabilities has a statistically significant effect on customers' intention to make a purchase, with a significance level of $\leq$ 0.05.

2.6 Physical Disability

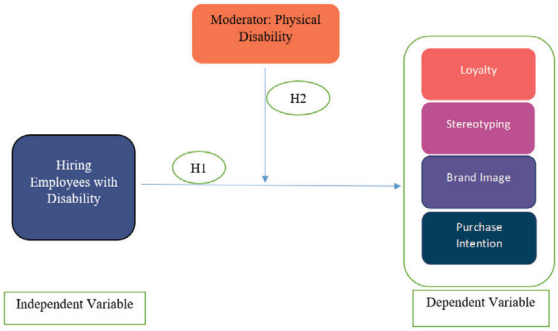
The effect of the kind of impairment has a significant part in how consumers see disability and how certain attitudes are therefore impacted. As a general rule, corporations find it more challenging to recruit persons with intellectual handicap and prefer to include those with physical disabilities [16]. People tend to concentrate more on the obstacles of employing a disabled person than on the potential advantages [16]. Each form of handicap necessitates individualized modifications to the work environment. Even though these reforms were linked with modest costs, companies continue to discriminate against disabled employees [7]. In 2007, thirty percent of Walgreens workers were disabled. This resulted in a 20% efficiency boost compared to facilities without disability accommodations (ibid). In addition, it was observed that the turnover rate for those with disabilities was half that of those without disability.

There are several forms of impairments, some of which are apparent and others of which are not. According to a list compiled by Aruma, this research will examine

the moderating influence of some of the most prevalent major categories of disability worldwide [15]. Considering the most common disability in Jordan. This research will mostly focus on physical disability. Physical disability refers to a condition that hinders a person's ability to move, perform motor tasks, or engage in physical activities [15]. Physical impairment was the second most prevalent form of disability in Jordan, affecting a total of 275,833 Jordanians. Hearing disability, the third most prevalent condition in Jordan with 182,318 Jordanians affected according to the, refers to a sensory impairment that results in a partial or complete inability to hear [15]. Individuals with physical disabilities are often subjected to greater rates of stereotyping because their presence makes others uncomfortable [39] Additionally, it is believed that individuals with lower physical attractiveness experience less social and personal acceptance. Hence, the following hypothesis is proposed:

H2a A physical disadvantage would have a moderating effect on the influence of hiring individuals with disabilities on consumers' loyalty, with a significance threshold of ≤ 0.05.

H2b Physical disability will moderate the impact of hiring people with disabilities on customers' stereotyping at a significance level of ≤ 0.05.



H2c Physical disability will moderate the impact of hiring people with disabilities on customers' brand image at a significance level of ≤ 0.05.

H2d Physical disability will moderate the impact of hiring people with disabilities on customers' purchase intentions at a significance level of ≤ 0.05.

3 Methodology

To evaluate this proposed model, a quantitative research approach was employed, utilizing convenient sampling and standardized instruments for data collection. Data was gathered through an online survey conducted via a questionnaire created using Google Forms. A 5-point Likert scale was used to assess all survey items, excluding demographic characteristics, with response options ranging from "1 = strongly disagree" to "5 = strongly agree." A practical sampling method was implemented. In Jordan, 275,833 individuals experienced physical hardships, with 184,443 facing minor difficulties, 73,584 severe difficulties, and 17,806 completely paralyzed. It was also noted that individuals with physical disabilities comprised the highest percentage of those with disabilities in the public sector workforce. The study's sample size included 820 respondents, but due to 55 uninterested responses, the final participant count was 765. Participants were Jordanians aged over 18. Demographic details included 409 single and 356 married participants. Age distribution was as follows: 18–20 years (100, 13.1%), 20–35 years (402, 52.5%), 36–50 years (155, 20.3%), 51–65 years (83, 10.8%), and over 65 years (25, 3.3%). Regarding education, 19.7% had a high school degree, 55.7% held a bachelor's degree, 13.7% had a master's degree, and 10.8% had a Ph.D. degree. In the data analysis technique for assessing observations, Excel 2016 and SPSS version were used. In this study, the Structural Equation Modeling (SEM) method was used. Cronbach Alpha was utilized to verify

Fig. 1 Research model

the measurement model as a confirmatory factor. The Cronbach Alpha value for the dependability of all constructions was 0.82.

3.1 Research Model

Figure 1 was nominated as the research model based on the preceding study and the observed gaps in the literature, as well as the hypotheses mentioned in the preceding section.

4 Data Analysis

4.1 Construct Reliability

The reliability of the constructs was examined using Cronbach's alpha coefficient and SPSS, and its results above the minimum required value of the cut point (0.7) [47], as shown in Table 1, which was documented to be statistically significant (0.82). The Cronbach Alpha coefficient was employed as a confirmatory factor to establish the validity of the measurement model. Reliability of all constructs was assessed, and the Cronbach Alpha coefficient yielded a score of 0.95. Furthermore, in order to evaluate the accuracy and coherence of the questionnaire items, the questionnaire was subjected to a pre-test conducted by four experts, including two professors from PSUT and two from another institution in Jordan. After reviewing their feedback, many questions were modified to simplify their language and content, which were initially complicated. The omission of one moderator (Speech and Language handicap) was done to simplify the questionnaire and the model.

Table 1 Construct reliability

Construct name	Cronbach alpha
Hiring people with disability	0.70
Dependent variables	0.92
Loyalty	0.85
Stereotyping	0.77
Brand image	0.88
Purchase intention	0.80
Types of disabilities	
Physical disability	0.84
All items Cronbach alpha	0.82

Table 2 Standardized estimates

			Std. Estimate	P
L	< –	H	0.169	***
S	< –	H	0.037	0.319
P	< –	H	0.052	0.238
B	< –	H	0.338	***

4.2 Model Testing

To test the hypothesis, AMOS was used to run the model. To determine the importance of each impact, it was important to take into consideration both the standardized estimate values and the *P* values. For H1a, estimates were ($\beta = 0.169$, p 0.05), showing that a substantial positive link is frequently believed to exist between employing persons with disabilities and consumer loyalty. Hence, H1a was accepted. In addition, the findings for Hypothesis H1b indicated that there was no significant relationship between employing persons with disabilities and stereotyping ($\beta = 0.037$, $p = 0.319$), hence Hypothesis H1b was rejected. Regarding the association between employing persons with disabilities and purchasing intention, H1d is rejected due to the lack of a significant impact ($\beta = 0.052$, $p = 0.238$). In conclusion, H1c is to be acknowledged since there was a substantial favorable relationship between employing persons with disabilities and brand image ($\beta = 0.338$, p 0.05). Thus, brand image has the highest correlation with employing persons with disabilities up to date.

In addition, as shown in Table 3, the impact of the interaction between each moderator was assessed for each distinct link between the dependent and independent variables, and the following findings were obtained:

There was a good correlation between employing individuals with physical disabilities and brand image, as well as buy intent; thus, H2c and H2d are approved. Additionally, although employing individuals with disabilities did not have a substantial influence on stereotyping in general, stereotyped behavior was seen against

Table 3 Moderator effect

Physical disability		
	Std. Beta	Sig
Loyalty	0.058	0.253
Stereotyping	0.083	0.035
Brand image	0.179	0.000
Purchase intention	0.254	0.000

persons with physical disabilities despite the belief that they were competent enough to execute their occupations; hence, H2b is rejected. Yet, there was no statistically significant effect of employing persons with physical disabilities on loyalty; consequently, H2a is rejected.

AMOS was utilized to run a multi-group test aimed at determining the impact of gender on the relationship between hiring individuals with disabilities and customer opinions. Regarding receiving a service from a handicapped individual, the research showed that there was no notable distinction between males and females, except for the connection between quality and female gender, which was statistically significant. Furthermore, a multi-group study was performed to examine a previous scenario in which participants were attended to by an individual with a disability. The results indicated that there was no statistically significant distinction between the experience of receiving a service from a person with a disability and the perceptions of consumers who were imagining a hypothetical scenario in which they would be served by an individual with a handicap. Finally, a multi-group analysis was performed to ascertain the variations in outcomes depending on the presence of a close friend or a family member with a handicap.

5 Discussion and Conclusion

The provided study studied the impact of employing persons with disabilities on the loyalty, buy intent, stereotyping, and brand image of several consumer segments. As a basis for the support of the employment of PWD, the model offered contributes to current and future entrepreneurial social intents. When a person with a disability served them, two dependent variables (loyalty and brand image) were positively influenced by a direct effect. Hence, the following hypotheses were confirmed:

H1a Hiring individuals with disabilities has a statistically significant effect on consumer loyalty, with a significance level of ≤ 0.05.

H1c Hiring individuals with disabilities has a statistically significant effect on brand image, with a significance level of ≤ 0.05.

Nevertheless, the standardized coefficient (β) was not the same for all three associations. The highest value was found for brand image ($\beta = 0.338$), and the lowest value was found for loyalty ($\beta = 0.169$) maximizing the effectiveness of the link

between the experience of obtaining a service from a member of staff who has a disability and the image of the brand.

These findings provide credence to previous studies that found a favorable influence on brand image resulted from the employment of individuals with disabilities [2, 26, 30, 34, 37, 54, 57], as well as other more studies that discovered a direct and positive correlation between brand recognition and CSR. [5, 13, 17, 32, 44], or the study by Poudyal and Yukongdi [60] This suggested a positive association between the image of the brand and the corporate philanthropy efforts of the company.

In addition, our findings align with previous research demonstrating that loyalty has a favorable relationship with business CSR actions in general [6, 12, 31, 51] claimed that increasing the proportion of employees with disabilities enhances consumer trust in the brand. Conversely, our findings contradict those of [8], who suggested no relationship between these variables, and [48], who found no relationship between CSR and loyalty.

Our findings about the link between stereotyping and employing disabled individuals ran counter to other studies that revealed unfavorable sentiments toward disabled people as they were seen as less capable, unreliable, and more likely to be stigmatized [46, 67], while this research finding were in line with Kalargyrou et al. [40] implying that there is no connection between the two. In this sense, the following theory is rejected:

H1b Hiring individuals with disabilities has a statistically significant effect on stereotyping in customers' behaviours, with a significance level of ≤ 0.05.

In contrast to prior research indicating a positive correlation between hiring people with disabilities and customers' purchase intentions, our study did not find such an effect [22, 38]. Likewise, other studies have suggested a moderate positive relationship between corporate social responsibility (CSR) and purchase intentions [18, 24, 25, 63]. Our results contradict the findings of Alniacik et al. [9], providing more evidence that corporate charitable acts have a beneficial impact on consumers' purchase intentions, especially when these actions align with customers' values. Therefore, the aforementioned hypothesis is rejected:

H1d The hiring of individuals with disabilities has a statistically significant effect on customers' intention to make a purchase, with a significance level of ≤ 0.05.

Finally, the multigraph analysis showed that there were no differences in the results obtained from male and female participants, with the exception of quality. While receiving service from an individual with a disability, women exhibited greater rates of perceived quality, which confirms the findings of earlier suggestions made by male participants [39]. This may be justified due to the common assumption that women are more emotionally bonding than males. This is because the idea of self-perception states that compassion is regarded a sense of self-other resemblance [27, 36, 58]. In the past, the fact that a handicapped person provided a service for you did not influence any of the factors in any way. In addition, the only individuals whose

perceptions of quality were altered were those who reported having a disabled close friend or family member.

5.1 Theoretical Implications

The model developed for this study holds significant importance as it expands current understanding of social entrepreneurship by incorporating four key variables—loyalty, stereotyping, purchase intention, and brand image—within the context of the hospitality sector in the Jordanian market. By comprehensively examining these variables, our study sheds light on crucial aspects of business dynamics in this specific industry. Moreover, our research addresses notable gaps in knowledge concerning the employment of individuals with disabilities within the hospitality sector. There is a scarcity of research studies focusing on this topic globally, and to the best of our knowledge, no study has explored this subject in the Jordanian context. Therefore, our study represents a pioneering effort in this area, paving the way for further exploration and understanding. The findings of our study will serve as a foundational platform for future research endeavors in Jordan, providing valuable insights into the dynamics of hiring individuals with disabilities in the hospitality sector. Furthermore, our research contributes to the broader global discourse on social entrepreneurship and inclusivity, offering insights that can inform policy-making and business practices worldwide. By filling these knowledge gaps and generating empirical evidence, our study aims to foster greater awareness and understanding of the benefits of employing individuals with disabilities, ultimately promoting inclusivity and social responsibility within the hospitality industry.

5.2 Practical Implications

Given the acknowledged significance of the hospitality industry to a nation's economic development, there has been notable attention from policymakers, researchers, and governments worldwide. The industry has continually evolved, introducing new concepts crucial for business survival. However, amidst this evolution, there's a growing demand from socially conscious consumers and advocates of social entrepreneurship. These individuals seek businesses committed to social responsibility and contributing to the well-being of society. In response to this societal shift, our research focuses on empowering current and future entrepreneurs to establish socially responsible businesses within the hospitality sector. By doing so, these businesses not only enhance their sustainability but also contribute positively to society. One crucial aspect of this endeavor is promoting fair work opportunities for individuals with disabilities and addressing the prevalent lack of understanding surrounding disabilities. Our study aims to broaden societal perspectives, particularly among entrepreneurs, to combat discrimination and foster inclusivity. By integrating

individuals with disabilities into future workforce planning, we can mitigate poverty rates among this demographic and empower them to become active contributors to society. Furthermore, our research will provide valuable insights into creating inclusive working environments, facilitating the integration of people with disabilities into the workforce.

Ultimately, our efforts seek to drive positive change within the hospitality industry, promoting social responsibility and inclusivity while redefining societal perceptions of disabilities. Through collaborative action and informed decision-making, we can create a more equitable and prosperous future for all individuals, including those with disabilities.

6 Conclusion

The goal of this study was to evaluate the influence of employing individuals with disabilities on customer perceptions in Jordan using a conceptual framework adopted from [39] research and then adjusted to match the objectives of this study. The established model examined the impact of employing individuals with disabilities on customer loyalty, stereotypes, brand image, and purchase intent. SPSS v.25 and AMOS v.26 were used to analyze the data, and the SEM method was applied to examine the relationship between the variables. Two variables (brand image and loyalty) were profoundly and favorably impacted by the experience of getting a service from a member of the service personnel who had a disability, indicating a strong relationship between hiring people with disabilities and these two variables. While the remaining variables were not significantly affected by the employment of individuals with disabilities. This study model is adopted for the first time in Jordan, hence, it may serve as a benchmark for future research. In addition, research indicate that employing individuals with impairments may not be as destructive to companies as some may fear. A lack of disability awareness may be responsible for adverse outcomes.

6.1 Limitations

Despite attempts, this study has limitations. The first was time. The researcher undertook two field trips to public sectors that should have relevant data on the stated issue, however it was discovered that such studies were not conducted until 2015 and were incomplete. This was a significant research constraint. Due to the researcher's restricted access to foreign and domestic sources on the subject, research was scant.

Another difficulty is the geographical restriction, since even with an online questionnaire, it was difficult to recruit volunteers from Jordan's other cities outside of Amman. Although their replies were crucial to the outcome of this study, the researcher also struggled to identify enough PWD to participate in the questionnaire

submission. The research was limited to the hotel business and excluded all sorts of handicap, preventing generalization.

Nevertheless, the notion that participants knew about the problem and the abilities of each handicap type precluded them from selecting which occupations disabled people could pursue. Future study will profile persons to exclude unqualified participants for more trustworthy outcomes.

Future research should incorporate field experiments to quantify real service encounters, offering better study settings. This will disclose the causes of crucial variables. A qualitative research technique employing PWD as a study sample would assist the literature understand the reason behind quantitate research's outcomes. To attain generality, future study may be imitation in other industries, distributing the sample across Jordan rather than focusing it on Amman. Finally, cultural studies on PWD reactions may assist professionals comprehend different cultures.

The Effect of Brand on Consumer's Purchase Decision: Mobile Phones as a Case Study

Iyad A. A. Khanfar and Ahmed Khozaimyah

Abstract This chapter tries to investigate the influence of brand factors, including brand logo, reputation, loyalty, product quality, and perceived value, on the purchasing behavior of Jordanian consumers in the mobile phone market. A sample of 453 consumers in Amman was randomly selected, and a questionnaire was administered to collect data. The researchers employed an analytical descriptive approach and utilized SPSS software for data analysis. The findings of the study revealed a significant and statistically meaningful relationship between the brand and the purchase decision of Jordanian consumers for mobile phones in Amman. Furthermore, the results indicated that perceived value exerted the strongest impact on the purchase decision. Based on these findings, it is recommended that mobile phone companies provide consumers with ample information to facilitate informed purchasing decisions. Additionally, it is advised that consumers stay updated on the latest advertisements and promotional materials released by these companies in Jordan to enhance their knowledge and improve their purchasing choices.

Keywords Brand · Purchase decision · Jordanian consumer · Mobile phones · Amman

1 Introduction

Research has validated the significance of mobile phone brands within technologically advanced societies, wherein these brands permeate multiple dimensions of economic, social, and cultural existence. Given its impact on the perceptions of

mobile phone consumers, the brand assumes a pivotal position within the realms of marketing and competition.

In the present day, the brand surpasses its mere designation or emblematic representation, instead serving as the essential component in the connection between the organization and its consumers, embodying their perspectives and comprehensions of the product and its efficacy. It offers strategic options for the brand to confront obstacles and rivalry. The expansion of the brand is regarded as an internal remedy for its advancement, although its implementation necessitates adherence to established criteria and sequential phases in order to attain triumph [2].

1.1 Problem Statement

With the advent of technological advancements and the availability of information, the telecommunications and mobile phone markets in Jordan have experienced a significant increase in competition among companies [4]. This has resulted in a wide range of well-established mobile phone brands flooding the Jordanian market, thereby complicating the decision-making process for consumers in Jordan. Therefore, the problem of the study lies in answering the following main question:

- Does the brand have an impact on the purchase decision of Jordanian consumers for mobile phones in Amman?

1.2 The Study Hypotheses

The main hypothesis:

- H0: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for the brand on the purchase decision of Jordanian consumers for mobile phones in Amman with its dimensions (brand reputation, brand quality, loyalty, brand logo, and perceived brand value)."

This leads to the following hypotheses:

- H01: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for the brand logo on the purchase decision of Jordanian consumers for mobile phones in Amman."
- H02: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for brand quality on the purchase decision of Jordanian consumers for mobile phones in Amman."
- H03: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for loyalty on the purchase decision of Jordanian consumers for mobile phones in Amman."

- H04: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for brand reputation on the purchase decision of Jordanian consumers for mobile phones in Amman."
- H05: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for perceived brand value on the purchase decision of Jordanian consumers for mobile phones in Amman."

2 Previous Studies

The importance of brands in consumer preferences has been backed up by various studies which point out to the need for this reason: [6] highlights that we must look at brand characteristics, that the positive influence can have on consumer preference needs be ascertained through the analysis of these traits. Similarly, Al-Amawi and Hussein's study [1] identifies internal branding as a key driver for bank performance and service quality, portraying it above mere cosmetic exercises but core determinants in delivery. Moreover, Attanahi's study [3] underlines brands' role not only in building trust with customers (who trust them already) but also acting as decision facilitators for consumers already willing to purchase. On top of this revelation, Nabli and Lamoushi's study [6] demonstrates positive relationships between attitudes taken by consumers and their decisions towards purchases which is an observation also made by [6], as well as Saraysh and Aish's work last year. These investigations bring into focus dimensions related to brand value whose direct impact not only on choice but even post-purchase satisfaction levels too.

3 Study Methodology

The primary aim of the research was to determine the effect of brand on consumers' purchasing behavior in Amman, Jordan especially in relation to mobile phones. The goal was achieved through use of a descriptive-analytical methodology to look into the hypothesis and its evaluation as presented in the study.

3.1 Study Population and Sample

The researchers decided to investigate users of mobile phone in the city of Amman to avoid challenges in getting an exact statistical sample. The sample size consisted of 500 individuals, which was chosen by following the methodology proposed for scientific research purposes. It is recommended a range between 300 and 500 individuals. Out of the 470 questionnaires received (a return rate of 94%), only 17 were

Table 1 Cronbach's Alpha coefficients and stability percentage (internal consistency of questionnaire items) variable of the study number of items Cronbach's Alpha

Variable of the study	Number of items	Cronbach's Alpha
Brand reputation	5	0.803
Brand quality	8	0.732
Brand loyalty	5	0.776
Brand logo	5	0.620
Perceived brand value	7	0.881
Jordanian consumer purchase decision	5	0.752
Overall instrument	35	0.911

incomplete and therefore not considered for analysis. As a result, 453 complete questionnaires (90% return rate) were used for the study, which is quite acceptable in the realm of scientific research.

3.2 Study Instrument Reliability

In order to assess the questionnaire's ability to accurately measure the intended factors and confirm its reliability, the researchers employed the internal consistency test, specifically by calculating Cronbach's alpha coefficient. This particular test was chosen due to its reliance on the consistency of individual responses across different questionnaire items, thereby indicating the strength of the correlation and coherence among these items. Moreover, the Cronbach's alpha coefficient offers an estimation of the questionnaire's reliability. This information is presented in Table 1.

The potential stability of the results obtained from the application of the questionnaire can be inferred from the data presented in Table 1. The stability degree, which reached 91.1%, surpasses the minimum acceptable threshold of 60% for Cronbach's alpha coefficient. This indicates that the values mentioned in the table are all greater than 60%, thereby supporting the generalizability of the results. It is worth noting that a percentage of 60% or higher is considered acceptable for humanities and social research [5, p. 268].

3.3 Statistical Methods Used in the Study

Upon gathering the data pertaining to the variables under investigation, a range of suitable statistical techniques were utilized through the SPSS statistical analysis software to analyze the data acquired during the field study. More specifically, the subsequent statistical methods were employed:

- **Cronbach's Alpha Coefficient**: The purpose of utilizing this approach was to assess the dependability of the research tool employed for data collection, specifically to evaluate the internal consistency of the questionnaire items.
- **Mean Calculation**: The purpose of this method was to ascertain the extent to which respondents in Amman evaluated the brand of mobile phones. This approach aided in gauging the respondents' ratings for each item of the study, enabling the distinction between high and low evaluations. Furthermore, it facilitated the organization of the items based on their highest mean scores.
- **Standard Deviation**: The aforementioned method was employed in order to ascertain the extent of variability among respondents' responses with respect to the average value.
- **Paired Sample t-test**: The goal of this chapter is to determine if there existed a statistically significant distinction between the brand and the purchasing choices of Jordanian consumers in relation to mobile phones.

4 The Results

4.1 Question One

- What is the level of assessment by the study sample individuals for the brand of mobile phones in Amman?

To answer the study's first question, the standard deviations and arithmetic means for the level of assessment by the study sample individuals for the brand of mobile phones in Amman were calculated as follows:

Brand Reputation

The findings presented in Table 2 highlight a notable upward trend in the average rating for the "Brand Reputation" aspect, which recorded a mean score of 4.23, accompanied by a standard deviation of 0.54. This mean score surpasses the predetermined benchmark of (3) out of (5) grades. Thus, these findings suggest that the participants in the study held positive evaluations regarding the "Brand Reputation" dimension of mobile phones in Amman, indicating a high level of satisfaction with the specific items comprising this dimension.

The findings are evident and captivating, revealing a strong reputation for the brands within the mentioned sector. The item that highlights the significance of established brands held a prominent position, whereas the item that prioritizes specifications was not as highly regarded by the buyers. These findings suggest that the reputation and recognition of a brand have a significant impact on consumer purchasing decisions, reflecting the trust and preference bestowed upon certain well-known brands.

Table 2 Standard deviations and arithmetic means calculated for brand reputation items (N = 453)

Item number	Items	Mean score	Standard deviation	Item rank	Assessment level
1	I gather information about mobile phone brands	4.16	0.69	4	High
2	I prefer choosing a mobile phone with a well-known brand	4.20	0.67	3	High
3	Mobile phone companies use brand names and sub-brands to serve different consumer segments, allowing the consumer to buy the most suitable one	4.28	0.73	2	High
4	When buying a mobile phone, I prefer brand reputation over its specifications	4.11	0.79	5	High
5	Mobile phones with well-known brand names are the most widespread	4.40	0.80	1	High
–	Brand reputation overall	4.23	0.54	–	High

Brand Quality

According to the data presented in Table 3, the average score for the "Brand Quality" dimension was found to be 4.09, with a standard deviation of 0.45. This value surpasses the specified threshold of (3) out of (5) grades. Consequently, it can be inferred that the respondents' evaluations of the items related to "Brand Quality" were predominantly positive, indicating a high level of satisfaction with mobile phones in Amman.

The findings of this study are both evident and captivating, as they reveal that a multitude of individuals believe that exposure to a wide range of brands aids them in making more informed choices. Moreover, it is apparent that the perceived high quality of a brand greatly influences consumers' purchasing decisions, as some individuals view high-quality branded smartphones as user-friendly. Consequently, these results suggest that the evaluation of brands in Amman was predominantly positive and held in high regard by the participants of this study.

Brand Loyalty

Table 4 data reveals a notably elevated average in the realm of brand loyalty, peaking at (4.12) with a deviation standard of (0.56). The benchmark set at (3) out of (5) points was exceeded by the mean value, an indication that respondents perceived their assessment positively with regards to items associated with brand loyalty for mobile phones in Amman. Their view on the evaluated dimension can thus be inferred as high from this context.

The findings reveal that the top-ranked item in this study was Item (15). This item obtained a mean score of 4.34 and a standard deviation of 0.70. Conversely,

Table 3 Standard deviations and arithmetic means calculated for items after brand quality (N = 453)

Item number	Items	Mean score	Standard deviation	Item rank	Assessment level
6	I consult experts about mobile phone brands before making a purchase decision	3.98	0.51	6	High
7	The wide variety of mobile phone brands in the Jordanian market enables me to make the best choice	4.32	0.65	1	High
8	The device I own has high specifications	3.97	1.02	7	High
9	The first thing I search for when buying a mobile phone is brand quality	4.18	0.78	2	High
10	Mobile phones with high-quality brands are easy to use	3.94	0.77	8	High
11	The brand of mobile phone provides diverse applications, encouraging me to purchase it	4.14	0.79	3	High
12	The presence of distinguished service centers for mobile phone brands affects my purchasing decision	4.13	0.68	4	High
13	The availability of spare parts for the mobile phone brand affects my purchasing decision	4.04	0.61	5	High
–	Brand quality	4.09	0.45	–	High

Table 4 Standard deviations and arithmetic means calculated for items after brand loyalty (N = 453)

Item number	Items	Mean score	Standard deviation	Item rank	Assessment level
14	Your mobile phone brand achieves the desired level of satisfaction	4.07	0.92	3	High
15	When asked by friends or relatives about a mobile phone, you recommend the brand you deal with	4.34	0.70	1	High
16	You prefer to change your mobile phone brand when it does not achieve the expected benefits	4.05	0.79	4	High
17	You prefer to replace your mobile phone by repeatedly purchasing the same brand you dealt with	3.99	0.84	5	High
18	You defend the mobile phone brand you deal with if someone speaks poorly of it	4.15	0.76	2	High
–	Brand loyalty	4.12	0.56	–	High

Item (17) ranked fifth and last with a mean score of 3.99 and a standard deviation of 0.84. An interesting point is that every average score related to these items has surpassed the evaluation standard set by the test of 3 out of 5 grades. It implies that those involved in the survey displayed favorable evaluations towards "Brand Loyalty" items, particularly with respect to mobile phones in Amman. As a result, we can deduce that the participants perceived the assessment level of this dimension as considerably high.

Brand Logo

The table reveals a noticeable rise in the average rating for the "Brand Logo" aspect depicted in Table 5. The mean score is 4.09, deviating by 0.47 points—notably exceeding the expected standard of three out of five grades. The result communicates that respondents have positively appraised the surveyed items on "Brand Logo" with regards to mobile phones in Amman. This suggests a keen evaluation specifically towards this element, implying distinctive satisfaction among the users surveyed for their perception regarding brand logos on their mobile phones within Amman's context.

Study results showed that Item (21) topped the list with an average score of (4.14) and a standard deviation of (0.74) while Item (19) landed in the fifth position, having an average score of (4.02) and a standard deviation of (0.52) as the last on the list. These numbers imply that all items' average scores in this dimension exceeded the benchmark value of three out of five, signaling positive evaluations from respondents on aspects related to 'Brand Logo' for mobile phones in Amman. The inference would

Table 5 Standard deviations and arithmetic means calculated for items after brand logo (N = 453)

Item number	Item	Arithmetic mean	Standard deviation	Item ranking	Assessment level
19	The brand logo expresses the characteristics and quality of the mobile phone	4.02	0.52	5	High
20	The brand logo of the mobile phone grabs my attention	4.08	0.88	3	High
21	Mobile phone companies choose the brand logo for their products in line with societal values	4.14	0.74	1	High
22	The brand logo matches the design of the mobile phone I purchased	4.04	0.78	4	High
23	The brand logo of the mobile phone reflects the social status of the consumer	4.13	0.71	2	High
–	After brand logo	4.08	0.47	–	High

then be that those who formed our sample perceived the assessment level for this dimension as high.

Perceived Brand Value

An increase in the mean score was seen with more clarity by all people. The category of "Perceived Brand Value" achieved an average collective score of 4.03, which has a standard deviation that amounted to 0.57. The result clearly indicates that the mean score has exceeded the expected benchmark of (3) out of (5) grades. Therefore, this implies that participants in the survey had a positive perception towards mobile phones in Amman. More specifically, it suggests that they viewed the brand value favorably, indicating their evaluation was significantly positive towards this aspect within the local market of Amman (Table 6).

Table 6 Arithmetic means and standard deviations calculated for items after perceived brand value (N = 453)

Item number	Item	Arithmetic mean	Standard deviation	Item ranking	Assessment level
24	The brand of the mobile phone I purchased achieves the expected benefits	4.15	0.69	1	High
25	Purchasing brands of mobile phones that match actual benefits generates a positive impression	3.92	0.83	7	High
26	The prices of mobile phones for different brands are commensurate with the benefits I receive	4.05	0.78	3	High
27	Mobile phones meet consumer needs, which encourages me to buy them	4.06	0.73	2	High
28	Mobile phones align with consumer desires, prompting me to purchase them	4.04	0.72	4	High
29	The availability of the brand of mobile phones at the right time influences my purchasing decision	4.02	0.72	5	High
30	The availability of the brand of mobile phones in the right place in the market influences my purchasing decision	3.96	0.78	6	High
–	After perceived brand value	4.03	0.57	–	High

Table 7 The calculated means and standard deviations for the dimensions of the mobile phone brand in the city of Amman (N = 315)

Dimension number	Brand dimensions of mobile phones in Amman (N = 315)	Arithmetic mean	Standard deviation	Relative importance
1	Brand reputation	4.23	0.54	1
2	Brand quality	4.09	0.45	3
3	Brand loyalty	4.12	0.56	2
4	Brand logo	4.08	0.47	4
5	Perceived brand value	4.03	0.57	5

The study findings point out that one of the items related to mobile phone brands, Item (24), scored the highest average at (4.15) with a standard deviation of (0.69). On the other hand, Item (25) was rated the lowest with an average score of (3.92) and a standard deviation of (0.83). These outcomes suggest that all item scores in this aspect were higher than the typical benchmark of (3) out of (5), meaning that respondents' evaluations towards these items post "Perceived Brand Value" were favorable and specific to mobile phones in Amman. Thus, it can be inferred that the assessment level of this dimension was perceived as high by the participants.

The relative importance of each dimension of the mobile phone brand was described. As shown in Table 7.

The findings presented in Table 7 provide a comprehensive overview of the perceived significance of different brand dimensions for mobile phones among the participants of the study. It is evident that Brand Reputation emerged as the most important dimension, occupying the top position in terms of priority. Following closely behind, Brand Loyalty secured the second position, while Brand Quality obtained the third rank. Brand Logo, on the other hand, occupied the fourth position, and Perceived Brand Value was ranked fifth and last in the hierarchy of importance as perceived by the study participants.

4.2 Question Two

- What is the level of evaluation by the study sample for the purchasing decision of Jordanian consumers for mobile phones in Amman?

To address the second research question, we computed the standard deviations and arithmetic means to assess the evaluations of the study participants concerning the level of evaluation of Jordanian consumers' purchasing decisions for mobile phones in Amman. The results stated in Table 8 reveal that the overall arithmetic mean for the variable "Jordanian consumer purchasing decision" was 4.20, with a standard deviation of 0.50. This value surpasses the test criterion of 3 out of 5 grades, indicating that the evaluations provided by the study participants regarding

the level of evaluation of the variable "Jordanian consumer purchasing decision" were positive. Thus, it can be inferred that the participants perceived the level of evaluation of this variable to be high.

The findings demonstrate that the item pertaining to the influence of brand quality on the decision to purchase a mobile phone (item 32) achieved the highest ranking, with an average score of 4.49 and a standard deviation of 0.59. On the other hand, the item regarding receiving more benefits from the mobile phone than expected (item 35) ranked fifth and last, with an average score of 4.04 and a standard deviation of 0.82. These results indicate that all the average scores for the items under this variable exceeded the threshold of 3 out of 5, suggesting that the participants in the study held positive evaluations regarding the level of assessment of the "Jordanian consumer purchasing decision" variable. Consequently, it can be inferred that the participants perceived this variable to be highly evaluated.

Table 8 The calculated standard deviations and means for the items of the variable "purchase decision" of Jordanian consumers for mobile phones in the city of Amman (N = 453)

Item number	Item	Arithmetic mean	Standard deviation	Item ranking	Assessment level
31	Brand Reputation influences the purchase decision for mobile phones	4.18	0.79	2	High
32	You find that the quality of the brand has a significant impact on your decision to purchase a mobile phone	4.49	0.59	1	High
33	You prefer to repeatedly purchase the same brand when replacing your mobile phone	4.10	0.79	4	High
34	The selection of brand logos by mobile phone companies helps me distinguish them from other brands, encouraging me to make a purchase decision	4.16	0.82	3	High
35	You get more benefits from the mobile phone than you expected	4.04	0.82	5	High
–	Jordanian consumer purchasing decision	4.20	0.50	–	High

5 Study Hypotheses Test

5.1 The Main Hypothesis

Stepwise Multiple Linear Regression Analysis was utilized to assess the validity of the main study hypothesis. However, prior to carrying out the test, we need to ensure that the multiple linear regression model is appropriate. This can be seen in Table 9 displayed here:

The findings presented in Table 9 demonstrate that the computed (F) value (193.545) surpasses the critical (F) value (2.37), and the statistical significance (.Sig) value of 0.000 is lower than the predetermined significance level ($\alpha = 0.05$). Consequently, the null hypothesis (H01) is rejected, and the alternative hypothesis (H1) is embraced, which asserts that there exists a statistically significant impact at the significance level ($\alpha = 0.05$) of the brand and its various dimensions (Brand Reputation, Brand Quality, Brand Loyalty, Brand Logo, and Perceived Brand Value) on the purchasing decision of Jordanian consumers for mobile phones in Amman. This affirms the reliability of the multiple linear regression model.

According to the findings presented in Table 10, the stepwise multiple linear regression approach can be employed to assess the influence of brand dimensions on the purchasing behavior of consumers in Amman, Jordan, specifically in the context of mobile phones.

The results in Table 10 indicate the following:

- The regression coefficients (β) for four brand dimensions (Brand Loyalty, Brand Reputation, Brand Quality, and Brand Logo) have been confirmed to be statistically significant, as indicated by their respective calculated (t) values (5.849, 5.275, 3.971, 2.525), all of which exceed the corresponding tabulated (t) value (1.96). Furthermore, the statistical significance (.Sig) values for these dimensions are below the significance level ($\alpha = 0.05$). Consequently, the null hypothesis (H0) is rejected, and the alternative hypothesis (H1) is accepted, demonstrating a statistically significant impact at the significance level $\alpha = 0.05$ for the aforementioned brand dimensions (Brand Loyalty, Brand Reputation, Brand Quality, and

Table 9 Analysis of variance table for regression, to test the validity of the multiple linear regression model regarding the study hypothesis

Source of variation (variance)	Sum of squares	Degrees of freedom	Mean square	Calculated (F) value	Statistical significance (.Sig)
Regression	70.761	4	17.690	193.545	0.000
Residual (error)	40.948	448	0.091		
Total	111.709	452	–	–	–

The critical F-value at degrees of freedom (4448) and a significance level ($\alpha = 0.05$) is 2.37

Table 10 Results of stepwise multiple linear regression analysis

Brand dimensions	Regression coefficients (β)	Calculated (t) value	Statistical significance	Standardized coefficients
Constant (β0)	0.612	4.452	0.000	-
Brand loyalty	0.279	5.849	0.000	0.317
Brand reputation	0.220	5.275	0.000	0.238
Brand quality	0.211	3.971	0.000	0.189
Brand logo	0.156	2.525	0.012	0.148

The critical t-value at degrees of freedom (448), a significance level ($\alpha = 0.05$) for a two-tailed test is 1.96, $R = 0.796$, and $R^2 = 0.630$

Brand Logo) on the purchasing behavior of consumers in Amman, Jordan, with regards to mobile phones.

- The dimension of Perceived Brand Value was omitted from the multiple linear regression model due to the findings of the stepwise multiple linear regression method, as its statistical significance value of 0.111 surpasses the predetermined significance level ($\alpha = 0.05$).
- With an adjusted coefficient of determination (R2) of 0.630, it can be inferred that the dimensions encompassed in the model, namely Brand Loyalty, Brand Reputation, Brand Quality, and Brand Logo, account for 63% of the variations in the purchasing decision of Jordanian consumers. The remaining 37% is attributed to other variables that were not considered in the multiple linear regression model.
- The standardized coefficients (Beta) of 0.317, 0.238, 0.189, and 0.148, respectively, suggest that enhancing the focus on each of the mentioned dimensions by one standard deviation unit will result in a corresponding increase in the purchasing decision of mobile phones by Jordanian consumers in Amman, with percentages of 31.7%, 23.8%, 18.9%, and 14.8%, respectively.

5.2 The Sub-hypothesis

Ho1

In order to assess the accuracy of the initial sub-hypothesis, a simple linear regression analysis was employed. Prior to conducting the analysis, it is imperative to ascertain the reliability of the simple linear regression model, as indicated in Table 11 provided.

According to the findings presented in Table 11, it is evident that the computed value of (F) (424.060) surpasses the critical value of (F) (3.84). Additionally, the statistical significance value (.Sig) of 0.000 is lower than the predetermined significance level ($\alpha = 0.05$). As a result, the null hypothesis H01 is rejected, and the alternative hypothesis H11 is accepted, signifying a statistically significant impact at the significance level $\alpha = 0.05$ for the brand dimension of Brand Reputation on

Table 11 Analysis of variance table for regression, to test the validity of the simple linear regression model related to the first sub-hypothesis

Source of variation (Variance)	Sum of squares	Degrees of freedom	Mean square	Calculated (F) value	Statistical significance (.Sig)
Regression	54.135	1	54.135	424.060	0.000
Residual (error)	57.574	451	0.128		
Total	111.709	452	–	–	–

The critical F-value at degrees of freedom (1451) and a significance level ($\alpha = 0.05$) is 3.84

the purchasing decision of Jordanian consumers for mobile phones in Amman. This confirms the credibility of the simple linear regression model.

The findings from the present study provide evidence that supports the utilization of the simple linear regression approach to assess the influence of the brand dimension of Brand Reputation on the purchasing behavior of consumers in Amman, Jordan, specifically in the context of mobile phone purchases, as indicated in Table 12.

The findings in Table 12 show the following:

- The regression coefficient (β) for the brand dimension of Brand Reputation demonstrates statistical significance, indicating that this dimension has a significant effect on the purchasing decision of Jordanian consumers for mobile phones in Amman. This is supported by the calculated (t) value of 20.593, which exceeds the tabulated (t) value of 1.96, and the statistical significance (.Sig) value for the brand dimension is lower than the significance level ($\alpha = 0.05$). Consequently, the null hypothesis H01 is rejected, and the alternative hypothesis H11 is accepted, confirming a statistically significant effect at the significance level $\alpha = 0.05$ for the brand dimension of Brand Reputation on the purchasing decision of Jordanian consumers for mobile phones in Amman.
- The coefficient of determination (R^2) value of 0.485 signifies that the dimension included in the model, Brand Reputation, accounts for 48.5% of the variations observed in the purchasing decision of Jordanian consumers. Conversely, the

Table 12 Results of simple linear regression analysis

Independent variable	Regression coefficients (β)	Calculated (t) value	Statistical significance	Standardized coefficient
Constant (β0)	1.470	11.024	0.000	–
Brand reputation	0.644	20.593	0.000	0.696
R	0.696			
R^2	0.485			

The critical t-value at degrees of freedom (451) and a significance level ($\alpha = 0.05$) for a two-tailed test is 1.96

remaining 51.5% can be attributed to other variables that were not incorporated into the simple linear regression model.

- According to the simple linear regression model, the standardized coefficient (Beta) value of 0.696 assigned to the dimension of Brand Reputation suggests that a one standard deviation increase in attention given to this dimension will result in a significant 69.6% enhancement in the purchasing behavior of Amman-based Jordanian consumers in relation to mobile phones.

H02

In order to assess the accuracy of the second sub-hypothesis, a simple linear regression analysis was employed. Prior to conducting the analysis, it is imperative to confirm the reliability of the simple linear regression model, as demonstrated in Table 13 provided.

The data presented in Table 13 demonstrates that the calculated F-value, which is (394.635), surpasses the critical F-value (3.84) associated with it. Furthermore, the statistical significance value (.Sig), which is (0.000), is lower than the predetermined significance level ($\alpha = 0.05$). As a result, the null hypothesis for the second sub-hypothesis (H02) is rejected, and the alternative hypothesis (H1) is accepted. This indicates a statistically significant impact of brand quality on the purchase decision of Jordanian consumers for mobile phones in the city of Amman, with a significance level of $\alpha = 0.05$. Therefore, the simple linear regression model employed in this study is validated.

With reference to the data presented in Table 14, the findings of this study provide support for the utilization of the simple linear regression approach in assessing the influence of brand quality on the purchasing behavior of Jordanian consumers in Amman specifically, in relation to mobile phone products.

The results in Table 14 indicate the following:

- The results highlight a statistically significant impact of the Brand Quality dimension on the purchasing behavior of consumers in Amman, Jordan, regarding mobile phones. The calculated (t) value of 19.865 exceeds the critical value of 1.96 at a significance level of $\alpha = 0.05$. Moreover, the statistical significance (.Sig)

Table 13 Analysis of variance table for regression, to test the validity of the simple linear regression model related to the second sub-hypothesis

Source of variation	Sum of squares	Degrees of freedom	Mean square	Calculated F-value	Statistical significance (.Sig)
Regression	52.132	1	52.132	394.635	0.000
Residual (error)	59.577	451	0.132		
Total	111.709	452			

The critical F-value at degrees of freedom (1451) and a significance level ($\alpha = 0.05$) is 3.84

Table 14 Results of simple linear regression analysis for assessing the influence of brand quality on the purchasing behavior

Independent variable	Regression coefficients (β)	Calculated (t) value	Statistical significance	Standardized coefficient
Constant (β0)	1.080	6.844	0.000	–
Brand quality	0.762	19.865	0.000	0.683
R	0.683			
R^2	0.467			

value is significantly lower than the specified significance level of 0.05. Consequently, the null hypothesis H02 is rejected, and the alternative hypothesis H12 is accepted, indicating a substantial influence of the Brand Quality dimension.

- The R^2 value, which stands for the coefficient of determination, is calculated to be 0.467. This value signifies that the Brand Quality dimension accounts for approximately 46.7% of the variances observed in the purchasing decisions made by Jordanian consumers in Amman when it comes to mobile phones. The remaining percentage, amounting to 53.3%, can be attributed to other factors that were not taken into consideration in the model.
- The coefficient (Beta) value of 0.683, which has been standardized, indicates that enhancing the emphasis on Brand Quality by one standard deviation unit will result in a notable enhancement in the purchasing decision of consumers residing in Amman, Jordan, specifically for mobile phones, by as much as 68.3%.

H03

In order to assess the accuracy of the third sub-hypothesis, a simple linear regression analysis was employed. Prior to conducting the analysis, it is imperative to confirm the reliability of the simple linear regression model, as indicated in Table 15 presented subsequently.

The analysis of the data presented in Table 15 reveals a significant relationship between brand loyalty and the purchase decision of Jordanian consumers for mobile phones in the city of Amman. This is supported by the calculated F-value of 522.400,

Table 15 Analysis of variance table for regression, to test the validity of the simple linear regression model related to the third sub-hypothesis

Source of variation	Sum of squares	Degrees of freedom	Mean square	Calculated F-value	Statistical significance (.Sig)
Regression	59.952	1	59.952	522.400	0.000
Residual (error)	51.757	451	0.115		
Total	111.709	452	–	–	–

The critical F-value at degrees of freedom (1451) and a significance level ($\alpha = 0.05$) is 3.84

which exceeds the critical F-value (3.84) at a significance level of $\alpha = 0.05$. Furthermore, the statistical significance value (.Sig) is considerably lower than the specified significance level (0.05). As a result, the null hypothesis of the third sub-hypothesis (H03) is rejected, and the alternative hypothesis (H13) is accepted, indicating a substantial impact of brand loyalty.

According to the results highlighted in Table 16, it is clear that the simple linear regression approach can effectively assess the influence of brand loyalty on the purchasing behavior of Jordanian consumers in Amman, specifically pertaining to mobile phones.

- The results highlighted in Table 16 demonstrate a statistically significant impact of brand loyalty on the purchasing decision of Jordanian consumers in the city of Amman. The calculated t-value for the regression coefficient (β) pertaining to this dimension is 22.856, surpassing the critical t-value (1.96) at a significance level of $\alpha = 0.05$. Moreover, the statistical significance value (.Sig) is considerably lower than the predetermined significance level (0.05). Consequently, the null hypothesis of the third sub-hypothesis (H03) is rejected, and the alternative hypothesis (H13) is accepted, signifying a substantial influence of brand loyalty.
- With an R^2 value of 0.537, it can be concluded that the dimension of brand loyalty accounted for 53.7% of the variances observed in the purchase decision of mobile phones among Jordanian consumers residing in Amman. The remaining 46.3% can be attributed to factors not incorporated within the model.
- According to the standardized coefficient (Beta) of 0.733, it can be inferred that a one standard deviation increase in brand loyalty will result in a significant enhancement, up to 73.3%, in the purchase decision made by consumers residing in Amman, Jordan, with regards to mobile phones.

Table 16 Results of simple linear regression analysis for the influence of brand loyalty on the purchasing behavior

Independent variable	Regression coefficients (β)	Calculated t-value	Statistical significance	Standardized coefficient
Constant (β0)	1.532	13.023	0.000	–
Brand loyalty	0.647	22.856	0.000	0.733
Correlation coefficient (R)	0.733			
Coefficient of determination (R^2)	0.537			

The critical t-value at degrees of freedom (451) and a significance level ($\alpha = 0.05$) for a two-tailed test is 1.96

H04

In order to assess the accuracy of the fourth sub-hypothesis, a simple linear regression analysis was employed. Prior to conducting the analysis, it is imperative to confirm the soundness of the simple linear regression model, as depicted in Table 17 provided.

Based on the findings displayed in Table 17, it is evident that the calculated F-value of 480.353 surpasses the critical F-value of 3.84. Additionally, the statistical significance value (.Sig) of 0.000 falls below the predetermined significance level ($\alpha = 0.05$). Consequently, the null hypothesis of the fourth sub-hypothesis (H04) is rejected, while the alternative hypothesis (H14) is accepted. These results indicate a statistically significant impact of the brand logo dimension on the purchasing decision of Jordanian consumers for mobile phones in the city of Amman. Thus, the validity of the simple linear regression model is confirmed.

According to the aforementioned information, it is possible to employ the method of simple linear regression to assess the influence of the brand logo dimension on the purchasing behavior of consumers in Amman, Jordan, specifically in relation to mobile phones. This analysis is further supported by the data presented in Table 18.

Table 17 Analysis of variance table for regression, to test the validity of the simple linear regression model related to the fourth sub-hypothesis

Source of variation	Sum of squares	Degrees of freedom	Mean square	Calculated F-value	Statistical significance (.Sig)
Regression	57.615	1	57.615	480.353	0.000
Residual (error)	54.094	451	0.120		
Total	111.709	452			

The critical F-value at degrees of freedom (1451) and a significance level ($\alpha = 0.05$) is 3.84

Table 18 Results of simple linear regression analysis, to measure the impact of the brand logo dimension on the purchase decision of Jordanian consumers for mobile phones in the city of Amman

Independent variable	Regression coefficients (β)	Calculated t-value	Statistical significance	Standardized coefficient
Constant (β0)	1.111	7.847	0.000	–
Brand logo	0.756	21.917	0.000	0.718
Correlation coefficient (R)	0.718			
Coefficient of determination (R^2)	0.516			

The critical t-value at degrees of freedom (451) and a significance level ($\alpha = 0.05$) for a two-tailed test is 1.96

- The analysis presented in Table 18 demonstrates a statistically significant impact of the brand logo dimension on the purchasing decision of Jordanian consumers in the city of Amman. The calculated t-value for the regression coefficient (β) associated with this dimension is 21.917, surpassing the critical t-value of 1.96 at a significance level of $\alpha = 0.05$. Moreover, the statistical significance value (.Sig) is considerably lower than the predetermined significance level of 0.05. As a result, the null hypothesis (H04) for the fourth sub-hypothesis is rejected, and the alternative hypothesis (H14) is accepted, providing evidence of a significant effect of the brand logo dimension on the purchasing decision.
- The model's brand logo dimension demonstrates a coefficient of determination (R2) of 0.516, signifying that it accounts for 51.6% of the fluctuations observed in the purchase decision of mobile phones among Jordanian consumers residing in Amman. The unexplained portion, amounting to 48.4%, can be attributed to additional variables that were not incorporated into the model.
- According to the standardized coefficient (Beta) of 0.718, it can be inferred that enhancing the focus on the brand logo dimension by one standard deviation unit will result in a considerable enhancement in the purchase decision of mobile phones among consumers in Amman, Jordan, with an estimated increase of 71.8%.

H05

In order to examine the accuracy of the fifth sub-hypothesis, a simple linear regression analysis was employed. However, prior to conducting the analysis, it is imperative to ascertain the soundness of the simple linear regression model, as depicted in Table 19 provided.

The findings presented in Table 19 demonstrate that the calculated F-value was below the critical F-value, and the statistical significance value (.Sig) exceeded the specified significance level ($\alpha = 0.05$). Based on these findings, the fifth sub-hypothesis (H05) was accepted, indicating that there is no statistically significant impact of the perceived value dimension of the brand on the purchase decision of Jordanian consumers for mobile phones in the city of Amman. Moreover, it appears that the simple linear regression model was inadequate in explaining the association

Table 19 Analysis of variance table for regression, to test the validity of the simple linear regression model related to the fifth sub-hypothesis

Source of variation	Sum of squares	Degrees of freedom	Mean square	Calculated F-value	Statistical significance (.Sig)
Regression	0.813	1	0.813	3.307	0.070
Residual (error)	110.896	451	0.246		
Total	111.709	452			

The critical F-value at degrees of freedom (1451) and a significance level ($\alpha = 0.05$) is 3.84

Table 20 Results of simple linear regression analysis, to measure the impact of the perceived value dimension on the purchase decision of Jordanian consumers for mobile phones in the city of Amman

Independent variable	Regression coefficients (β)	Calculated t-value	Statistical significance	Standardized coefficient
Constant (β0)	3.897	23.507	0.000	–
Perceived value	0.074	1.818	0.070	0.085
Correlation coefficient (R)	0.085			
Coefficient of determination (R^2)	0.007			

The critical t-value at degrees of freedom (451) and a significance level ($\alpha = 0.05$) for a two-tailed test is 1.96

between the perceived value of the brand and the purchase decision of Jordanian consumers (Table 20).

The study yielded results that indicate the absence of a statistically significant association between the perceived value aspect of the brand and the purchasing behavior of Jordanian consumers in Amman when it comes to mobile phones. This conclusion is drawn from the regression coefficient (β), which was found to be lower than the critical value, and the statistical significance value, which exceeded the predetermined significance level. Consequently, the acceptance of the fifth sub-hypothesis suggests that there is no statistically significant impact of the perceived value dimension of the brand on the purchase decision of Jordanian consumers.

6 Discussion of Study Hypotheses Results

- The findings from the application of multiple stepwise regression analysis validate the existence of a positive and statistically significant relationship between various brand dimensions (namely brand quality, brand reputation, brand loyalty, and brand logo) and the purchasing behavior of Jordanian consumers in the city of Amman when it comes to mobile phones. Among these dimensions, brand loyalty demonstrated the most substantial influence on the purchase decision, while the perceived value dimension did not exhibit a significant effect on the decision-making process.
- The findings validate the influential and statistically significant impact of the Brand Reputation aspect exclusively on the purchasing behavior of Jordanian customers when it comes to mobile phones within the urban setting of Amman.
- The findings demonstrate a notable and statistically significant impact solely attributed to the dimension of brand quality on the purchasing behavior of consumers in Amman, Jordan, specifically in relation to mobile phones.

- The findings pertaining to the third sub-hypothesis demonstrate a noteworthy and statistically significant impact of the brand loyalty dimension in isolation on the purchasing behavior of consumers in Amman, Jordan, specifically in relation to their choice of mobile phones.
- The findings suggest that the brand logo dimension, when considered in isolation, exerts a noteworthy and statistically significant impact on the purchasing behavior of Jordanian consumers residing in Amman with regards to mobile phones.
- The lack of significance of the perceived value dimension in influencing the purchase decision of mobile phones among consumers in Amman, Jordan, reflects its limited importance to users in this particular context.

6.1 Recommendations

- It is advisable to deepen the awareness of research participants about the perceived dimension of brand value, due to its importance, although it occupies the last place in their assessment scale.
- Recommendations should be aimed at improving study participants' understanding of certain items within the brand dimensions that ranked last, to ensure they have a correct and comprehensive understanding of these important aspects.
- Mobile phone users should make sure to pay attention to brands before making a purchase decision to ensure that they get the necessary information before purchasing.
- Users should regularly review bulletins and posters issued by telecommunications companies for new information that can help them make purchasing decisions.
- It is suggested that future research will focus on other variables as well as the use of different statistical indicators for a more comprehensive and accurate analysis of the data.

Integration of Artificial Intelligence Along with AR and VR Ensure Prosperous Future in Digital Marketing

Mai Mohammad Zakaria, Mohamed Doheir, and Norfaridatul Akmaliah Othman

Abstract If we consider 2023 was the year AI-driven marketing emerged, thanks to tools like ChatGPT, perhaps 2024 will be the year when companies start to use not only AI but also generative AI massively and fully integrate it into their digital marketing strategies. AI revolution has changed the direction of digital marketing as it enables customizable interactions, reduces repetitive operations, and offers valuable consumer data. Using chatbots, customized suggestions, and predictive behavior, it enhances user experience. Artificial Intelligence improves social media strategies through trend analysis, post scheduling, and reaction automation. Furthermore, it aids in the creation and optimization of content, including A/B testing and SEO. Forecasting and predictive analytics tools facilitate decision-making based on accurate information. AI also enhances the effective-ness of advertising campaigns by optimizing them through targeted pricing and placement. This paper shows and describes the current and potential relationship between two different scientific branches of marketing science and computer science. It expresses the interaction of digital marketing and artificial intelligence (AI) along with AR and VR and how these technologies could fit in several aspects in digital marketing area.

1 Introduction

Online or digital marketing is the promotion of goods or services via digital channels, such as digital media, by means of information technology. As social media, email, search engines, and other websites to establish connections with [1, 2] sinesses and companies function. Employing technology to promote your brand by employing strategies like chatbots, influence marketing, content marketing, SEO, and more. Artificial intelligence powered sophisticated technologies are needed to identify customer purchase trends, and simplify consumer prediction and decision making for businesses, merchants, and marketers [3, 4]. By employing modern technologies including artificial intelligence (AI), the Internet of Things (IoT), and robotics, digital evolution can help businesses in addressing a variety of issues and offering extra value to their clients. Price Waterhouse Coopers figure out a thorough study to determine which technologies will be crucial in the future. The use of artificial intelligence (AI) has been selected as one of the eight most important technologies for the future, besides augmented reality (AR), drones, the Internet of [5] Things (IoT), robotics, 3D printing (also called additive manufacturing) and virtual reality (VR), out of man promising future technologies [6]. As a result, in order to navigate the challenges of the full digital transformation process, both private companies and government institutions alike are currently implementing artificial intelligence-based solutions throughout a range of industries.

2 Method

This research is a conceptual paper. The goal of research utilizing a literature review is to identify different theories, concepts, or guiding principles that are applied in a specific field. A literature review is a good approach so that a study has clear visibility into the topic that has been discussed. This provides a comprehensive overview of the subject under study. This study attempts to investigate the use of AI, AR, and VR in the marketing process to discuss digital marketing activities in different eras and areas.

3 Literature Review on Artificial Intelligence in Digital Marketing

If artificial intelligence (AI) is integrated with the realm of digital marketing, it could have a bright future. By assisting with product development, delivering more relevant advertising, and deciphering audience data patterns, artificial intelligence (AI) can enhance digital marketing [7]. It can be applied to marketing campaigns at many phases, such as planning, designing, implementing, and evaluating them,

in order to efficiently track the performance of advertising campaigns, under-stand customer behavior, and tailor marketing content [8]. Businesses can gain from using AI in digital marketing by using it to boost productivity, efficiency, and accuracy. This is because it allows for better consumer targeting [9, 10] and the creation of more successful campaigns with higher conversion rates [11]. Research on the use of AI and data analysis in digital marketing is expanding, with an emphasis on brand management, customer loyalty, and long-term financial and competitive results [12]. The systematic review papers offer a thorough summary of the current state of research in the field of digital marketing, emphasizing AI's promise for a profitable future [13].

4 Overview of Strategies in Digital Marketing

"In the twenty-first century, either e-commerce or no business," remarked Bill Gates, the man who is widely known as the father of the global Internet. Industries employ online channels that will help them flourish, and digital marketing encompasses all marketing strategies [6, 4] and methods that use an electronic device or the internet to present, promote, and sell goods or services. The most famous strategies of online marketing are.

4.1 Content Marketing

Content advertising is a showcasing process of framing and transferring meaningful, applicable and predictable material to pull by and get an obviously described group of bystanders—with the thing of driving salutary customer exertion [14, 15]. Content upgrading is an advertising system, covering a wide compass of strategies and procedures. Firstly, substance and data requirements inclinations of designedly characterized target gatherings of people are broke down. Then content is made to serve these musts in arrangement with predefined showcasing objects and finally the made substance is made affordable, enriched and used to serve guests and business destinations in every single conceivable home of promoting, PR, deals enablement and so forth in a deliberate and incorporated way.

4.2 Search Engine Optimization (SEO)

Improving a website's design is the art (or science) of making it easier for search engines to see it. This ought to be achievable by increasing the volume of watchwords a website positions for or the positioning of a certain keyword. There are many different SEO strategies available [2, 9], ranging from specialized on-site research

and optimization to content production, outreach, blogging, and third-party linking. The list of skills is endless and includes creativity, inquisitiveness, and specialized skills**.**

4.3 Search Engine Marketing (SEM)

Web crawler marketing encompasses a range of activities focused on increasing the visibility of your website when someone uses a web index [4, 16]. In the unlikely event that someone searches for your company online, it is crucial that your website appears prominently in the search engine results pages; otherwise, it will never provide your company with the boost that the current market demands.

4.4 Social Media Marketing (SMM)

Online networking management involves managing a brand's image across multiple social media platforms, not only tweeting. That could be LinkedIn or Pinterest, but it could also be Twitter or Facebook. It also involves combining customer support, which strengthens the base end of the pipe, with proactive business improvement, which helps fill the top level of the business channel [17, 18]. Over the past few years, web-based social networking administration has grown more sophisticated and sophisticated, offering a wider range of informal groups and more notable disclosure tools. Mix mark awareness, client management, creativity, [19, 16, 20] and familiarity with how internet-networking measurements relate to other marketing measurements were among the aptitudes.

4.5 Email Marketing

It is one the most-quick strategy of digital advertising is email marketing. Database displaying is one of its components. It involves segmenting your clientele and sending targeted, personalized messages at the appropriate times [11, 12]. Email marketing has been increasingly personalized as it has developed, with companies like Tesco and Amazon sending messages that are unique to each customer and dependent on the purchase of designs. This require arranging the skills from database research and customer relationship management (CRM) to crafting the right message, drafting messages in HTML, and analyzing the results to take action.

4.6 Mobile Marketing

As a result of the ever growing of smartphones and other smart devices, mobile marketers have developed mobile-optimized websites, applications, SMS marketing, [6, 21] and consumer location-based targeting, all of them are focusing on reaching and interacting with clients through their smart devices.

4.7 Pay-Per-Click (PPC)

The sponsored advertising is well known as paid search, PPC, or pay-per-click. These sponsored advertisements are typically displayed above or to the side of the "natural" indexed listings. Depending on the strength of the catchphrase you are offering, each click can cost anything from one penny to fifty pounds [22, 16, 23]. Certain phrases, like "auto protection," have the potential to reach astronomical levels of search traffic, therefore managing your PPC campaign is closely related to growing your budget to maximize profits. The skills necessary are also rather broad: in addition to having an acute eye for detail in information, one must also be creative when creating advertisements and seeing trends in the data.

4.8 Affiliate Marketing

Associate show casing bears similarities to web-based advertising, except that the website hosting the advertisement will only get payment if a transaction is completed. This will result in a larger installment and encourage the website owner to push the advertisement even more strongly [24, 25]. Flag marketing isn't the only use for subsidiary showing. Many partners make money through direct relationships, email marketing, or even opening online stores with affiliate products. According to one viewpoint, companies should confer with partners to determine the best possible arrangement that would provide the best possible advancement while ensuring that costs are maintained to a minimum to ensure high margins [18]. Transaction, organizing, and information analysis are examples of aptitudes.

5 Artificial Intelligence (AI)

Artificial Intelligence, known as (AI) could be defined as the imitation of human intellect in computers that are designed to imitate cognitive processes including learning, problem-solving, reasoning, perception [9], and decision-making [10]. AI

technologies allow robots to carry out simple to complicated tasks that traditionally need human intelligence.

5.1 Artificial Intelligence and How It is Related to Digital Marketing

Artificial Intelligence (AI) as a part of computer wisdom that focuses on the progress of systems able of achieving tasks that generally need mortal intelligence. These tasks contain literacy, logic, and problem-solving, perception, and decision- timber. AI encompasses a wide range of ways and technologies, including machine literacy, natural language processing, computer vision, and robotics [26]. In the environment of digital marketing, AI refers to the use of AI technologies and algorithms to optimize marketing strategies, enhance client gests, and ameliorate overall crusade performance. AI has a profound impact on digital marketing in colorful ways Data Analysis and perceptivity AI enables marketers to dissect vast quantities of data from multiple sources to gain precious perceptivity into consumer gests, preferences, and trends. By using AI- powered analytics tools, marketers can make data-driven opinions and knitter their strategies more effectively [17]. Personalization AI algorithms can dissect stoner data to produce substantiated gests for consumers. This includes delivering targeted content, product recommendations, and offers grounded on individual preferences and actions. Customization raises the liability of conversion while improving client engagement. Robotization AI-powered robotization tools streamline repetitious marketing tasks similar as dispatch marketing, social media operation, and announcement crusade optimization. By automating these tasks, marketers can save time and coffers while perfecting effectiveness and scalability [2, 9, 27]. Prophetic Analytics AI enables prophetic analytics by assaying literal data and relating patterns to read unborn issues [21, 25]. Marketers can use prophetic analytics to anticipate client requirements, optimize marketing juggernauts, and allocate coffers more effectively. Chatbots and Virtual sidekicks AI- driven chatbots and virtual sidekicks give instant client support and backing across colorful digital channels. These AI- powered results enhance client service, ameliorate response times, and increase client satisfaction. Hunt Machine Optimization SEO [22] AI algorithms play a pivotal part in SEO [15, 10], by assaying hunt machine algorithms and stoner geste to optimize website content and ameliorate hunt rankings. AI-powered SEO tools help marketers identify applicable keywords, produce high- quality content, and enhance overall website visibility, announcement Targeting and Optimization. AI algorithms optimize announcement targeting [16, 14] and crusade optimization by assaying stoner data, prognosticating stoner geste, and conforming announcement placements and bidding strategies in real- time. This results in further effective announcement juggernauts and advanced ROI for marketers [1]. Voice Search Optimization With the adding fashionability of voice-actuated bias and virtual sidekicks, AI- driven voice hunt optimization has come essential for digital marketers. AI

technologies similar as natural language processing help optimize content for voice hunt queries and ameliorate overall hunt machine visibility. In summary, AI has a significant impact on digital marketing by enabling marketers to dissect data more effectively [23, 20], epitomize gests for consumers, automate tasks, optimize juggernauts, and enhance overall performance. As AI technology continues to advance, its influence on digital marketing is anticipated to grow, shaping the future of the assiduity.

6 Augmented Reality and Virtual Reality: An Overview

Artificial intelligence (AI), Augmented Reality (AR), Virtual Reality (VR), big data analytics, blockchain, cloud computing and Internet of Things (IoT) are the trends of 2024 and which are used excessively in businesses. These recant technologies, which we refer to as "digitalization". On one hand augmented reality (AR) overlays digital data, such as pictures [23, 20], videos, or three-dimensional (3D) models, on top of the actual environment In most cases, augmented reality (AR) systems use bias, like as smartphones, tablets, or AR glasses, to superimpose virtual content in real-time on the stoner's perspective of the outside world. AR operations offer immersive experiences and useful mileage in a variety of vibrant areas, spanning from gaming and entertainment to education [18, 15], retail, healthcare, and artificial training [24]. On the other hand, the term "virtual reality" describes a technology that immerses users in simulated environments for immersive experiences. Applications for this technology can be found in social media, education, training systems, entertainment, and medical simulations. Virtual reality systems combine innovative image processing techniques along with three-dimensional displays to give users a sensation of presence and immersion. The idea behind virtual reality is to create a realistically interactive digital world that improves users' technical and cognitive abilities [3, 18, 23]. Virtual reality websites that make use of WebVR and WebGL APIs to give users access to 3D settings for exploration using virtual reality headsets have been made possible by the advancement of virtual reality technology. As virtual reality, technology advances, new uses and discoveries are things in actual life could not be feasible [3, 19], and [15]. VR applications allow users to fully be taken in virtual experiences and storylines across enormous area of industries, including entertainment, gaming, education, training, simulation, treatment, architecture, and design.

6.1 Integration of Artificial Intelligence with AR and VR in Digital Marketing

One of the most productive directions for marketing in the future is the combination of Artificial Intelligence (AI) with Virtual and Augmented Reality (VR/AR) in digital marketing. According to research, this connection boosts customer engagement, speeds up decision-making, and changes marketing tactics to give customers immersive, interactive experiences [28, 29]. Businesses may improve consumer interactions; optimize marketing campaigns based on data-driven decisions, and extract useful insights from digital marketing analytics by combining AI models with AR and VR technologies [15, 20]. In addition to increasing the efficacy of marketing initiatives, this synergy supports the innovation and sustainability of the technology employed in digital marketing campaigns [30, 31]. The integration of AI, AR, and VR in digital marketing represents a revolutionary change toward more successful, tailored, and engaging campaigns. In addition, effective marketing strategies that bridge the gap between physical and digital worlds, ensuring a prosperous future for the field.

Some of the most recent research references have been used to support arguments and conclusions in new research. It provides a theoretical basis for the statements made by the researcher. By examining previous research, researchers can identify gaps in the literature that new research can fill. This helps in determining its relevance and uniqueness in its contribution to a particular field of knowledge. Here, the relevant research is related to the implementation of artificial intelligence, augmented reality, and virtual reality in digital marketing strategies (Table 1).

7 Future Directions and Potential of Integrating AI, AR, and VR in Digital Marketing

The current advancements in Artificial Intelligence (AI), Augmented Reality (AR), and Virtual Reality (VR) technologies are revolutionizing various industries [15]. AI is enhancing healthcare by improving care quality and patient outcomes through data-driven algorithms. AR and VR are being increasingly utilized in industrial settings to boost productivity, accuracy, and economic benefits through IoT integration and sophisticated algorithms. The combination of AI and AR is seen as a significant direction for future industrial applications [10], with the potential to optimize production processes, workforce training, error handling, and packaging in smart industries [28]. Furthermore, AR is making strides in education, with studies showing that AR smartphone apps can enhance student learning motivation and engagement [14, 15]. In the transportation sector, AI, AR, and VR are crucial components [28, 29] of Autonomous Vehicles (AVs), aiding in understanding the environment and decision-making for full automation.

Table. 1 Literature of some recent researches using AI, AR and VR technologies

No	Author	Title	Year	Findings
1	Ari Apriani, Indra Sani, Lia Kurniawati, Rahmat Prayoga, Helena Louise Panggabean	The role of artificial intelligence (AI) and its benefits in digital marketing strategy	2024	AI empowers marketers to navigate the complexities of the digital landscape with greater precision and efficacy
2	Zahid Hussain, Muhammad Zain Shaikh	Role of technology in marketing: AI, AR and VR	2023	AI, AR, VR tech transform relations, customize products, services based on preferences
3	Qodirova Gulira'no Isroiljon qizi	The role of artificial intelligence in personalized marketing	2023	AI entry into a new era of customer engagement and business growth
4	G. Priyanga	The effects of artificial intelligence on digital marketing	2023	AI provides new opportunities for businesses to enhance their brand quality
5	Charles Ntumba, Samuel Aguayo, John Kamau Maina	Revolutionizing retail: a mini review of E-commerce evolution	2023	The future of e-commerce promises to be dynamic in using AI, AR and VR
6	Dr. Sajan M. George, Dr. B. Sasikala, Gowthami T, Dr. P. Sopna, Dr. M. Umamaheswari, Dr. D. Paul Dhinakaran	Role of artificial intelligence in marketing strategies and performance	2024	Emerging technologies such as augmented reality (AR), virtual reality (VR), are expected to shape the future landscape
7	Nan, Z., Yuping, C., and Kongjue, Z	The future of marketing analytics: trends and emerging technologies	2024	AI, AR and VR become a crucial instrument for marketers to gain a deeper comprehension of customer behaviour, preferences, and trends

Several companies have successfully integrated AI, AR, and VR in their digital marketing strategies. For example, here are some case Studies:

1. **IKEA**: IKEA uses augmented reality (AR) in their "IKEA Place" app, which allows users to preview how furniture and home decor items would look in their own space. By leveraging AR technology, IKEA enhances the shopping experience and helps customers make more informed purchasing decisions.
2. **Sephora**: Sephora, a cosmetics retailer, utilizes AR in their "Virtual Artist" feature on their mobile app. Customers can use the app to virtually try on different makeup products and explore various looks [3], 6], providing a more personalized and interactive shopping experience.
3. **Nike**: Nike has integrated AI and AR technologies in their "Nike Fit" feature, which uses computer vision and machine learning to help customers find the

right shoe size. Customers can use their smartphone camera to scan their feet, and the AI system recommends the ideal shoe size for a perfect fit.

4. **Snapchat**: Snapchat, a popular social media platform, has incorporated AR filters and lenses into their app, allowing users to overlay virtual elements on their photos and videos. Brands can leverage these AR features to create engaging and interactive ad campaigns, enhancing their digital marketing efforts.
5. **Volvo**: Volvo has used virtual reality (VR) technology to provide immersive experiences to potential car buyers. With their "Volvo Reality" VR app, customers can take virtual test drives, explore car features, and visualize the interior and exterior of Volvo vehicles.
6. **Starbucks**: Starbucks has implemented AI in their mobile app to offer personalized recommendations and rewards to customers. The app uses AI algorithms to analyze customer preferences and behaviors, providing tailored offers and suggestions to enhance the customer experience.
7. **Coca-Cola**: Coca-Cola has used AR in their marketing campaigns to engage customers. For example, they launched an AR-powered Christmas campaign where users could scan special cans with their mobile devices to unlock virtual Santa Claus characters and other interactive elements.
8. **Audi:** Audi has incorporated VR technology in their showrooms. Customers can wear VR headsets to experience virtual tours of the car models [6], explore the interior and exterior features, and even take virtual test drives.
9. **Amazon**: Amazon, a global e-commerce giant, exemplifies a highly successful implementation of AI in marketing. The company leverages AI algorithms for personalized product recommendations, creating a seamless and engaging shopping experience for users. The recommendation engine analyzes user browsing history, purchase behavior, and demographic data to predict individual preferences accurately. As a result, Amazon's AI driven recommendations contribute significantly to customer satisfaction and account for a substantial portion of the company's sales [6, 27]. The success of Amazon's personalized recommendation system highlights the effectiveness of AI in tailoring marketing strategies to individual customer needs

These instances demonstrate how companies in different sectors have effectively incorporated AI, AR, and VR in their digital marketing plans to boost customer interaction, improve shopping experiences, and increase sales. These companies have utilized these technologies to develop creative and engaging marketing campaigns that connect with their desired customer base. Companies measure the success of AI, AR, and VR integration in digital marketing through various metrics and KPIs [3, 6], 9]. They track engagement metrics like app downloads, time spent, and user feedback. Conversion rates show how many users become customers. Sales and revenue influence measures sales before and after implementation. Customer satisfaction is assessed through feedback surveys. ROI is analyzed by comparing costs with benefits. Social media metrics show the reach of campaigns. Each company may use different metrics based on goals, industry, and audience. Customized metrics help evaluate the effectiveness of AI, AR, and VR in digital marketing strategies.

8 Ethical Considerations and Building Consumer Trust in AI, AR, and VR Marketing

Incorporating artificial intelligence, augmented reality, and virtual reality into digital marketing raises ethical issues. Included are topics such as consumer privacy, data security, manipulation and persuasion, informed consent, algorithmic bias, addiction and overconsumption, and social and economic impact [3, 5]. It is important for companies to focus on safeguarding consumer privacy, ensuring data security, preventing manipulation, obtaining consent, addressing bias in algorithms, and encouraging responsible use of immersive technologies [7, 19]. Some tasks that must be completed include performing privacy impact assessments, informing users, and enforcing ethical principles. Collaboration among technology developers, marketers, regulators, and consumer groups can help achieve the optimal balance between innovation and ethical considerations in digital marketing.

9 Conclusion

Digital marketing and artificial intelligence (AI) integrating with AR and VR must work together to ensure a profitable future. Businesses may optimize campaigns, improve overall efficiency, tailor content, and improve consumer experiences by incorporating AI technologies into their digital marketing efforts. Through data-driven decision-making, targeted advertising, and repetitive task automation made possible by this integration, market competitiveness and return on investment are raised. This supports the notion that combining AI with digital marketing side by side with AR and VR will stimulate growth and innovation, which will ultimately help companies operating in the digital market have a prosperous future.

10 Recommendations

Companies should embrace AI, AR, and VR technologies to customize their products, services, and messages to target audiences, based on specific preferences and needs. This can enhance customer-brand relationships and improve brand experiences. Marketers can leverage augmented reality (AR) to engage customers in personalized and relevant ways, leading to increased brand recognition and consideration. AI applications can be utilized in marketing to analyze data, detect fraud, and provide world-class customer relationship management, giving companies a competitive advantage. Businesses should consider the potential of VR advertising to bridge the gap between experience and action, offering virtual experiences that pro-mote products and services. Marketers should explore the use of AI, AR, and VR to create deeply customized and relevant experiences for customers, which may

not be possible through other channels, leading to increased customer engagement and satisfaction. Therefore, we advise companies, organizations out there to think out of the box, I think if we steer that productivity revolution very actively, marketers will invest their time in what they do best with more personalized content and ideas that are more productive. I believe not only marketing but also every function out there that is being impacted by this productivity revolution, need to grow one fast. Well this means that they need to strategically reskill and recognize to embed people that can build, use and diffuse predictive AI tools in the heart of decision-making. I intend to say, for marketing, building teams of marketing data scientists, marketing data engineers that build solutions.

11 Future Study and Directions

Future directions in integrating AI, AR, and VR in digital marketing include enhanced personalization, immersive social commerce, AI-driven content creation, ethical AI marketing frameworks, social impact and sustainability efforts, and multisensory experiences. Research opportunities include exploring the boundaries of personalization, leveraging social networks for immersive shopping experiences, analyzing the impact of AI content creation on creativity, developing ethical AI frameworks, promoting social causes through technology, and enhancing user engagement through multisensory cues.

Future research can focus on seamlessly integrating AI, AR, and VR experiences across digital marketing channels like websites, mobile apps, and social media. Real-time analytics powered by AI can provide insights for dynamic decision-making, and further exploration is needed to optimize marketing campaigns [20, 10]. Understanding user preferences in the context of AI, AR, and VR will be crucial for interface design. Integration with IoT devices presents exciting possibilities for personalized marketing experiences. These areas offer opportunities for future research in AI, AR, and VR-driven marketing strategies.

Business Intelligence in Construction Companies as a Competitive Advantage: Insights from a Literature Review

Qais I. Tanbour

Abstract The literature review delves into the realm of business intelligence (BI) in construction companies as a competitive advantage. The study focuses on exploring the potential of BI tools as a strategic resource for gaining a competitive edge in the construction industry. By defining BI tools and their relevance to construction companies, the review highlights how these tools can contribute to enhancing operational efficiency, decision-making processes, and overall project management. One of the key insights presented in the review is the transformative power of BI in enabling construction firms to make informed decisions, strategically plan their operations, and optimize their business processes. By leveraging BI tools effectively, companies can position themselves ahead of the competition and achieve long-term success in a dynamic and competitive market environment. The review emphasizes that BI is not just about winning projects but also about building a sustainable and thriving construction company. However, the review also sheds light on the challenges and limitations faced by construction companies when implementing BI solutions. Data quality and integration issues emerge as significant hurdles, with the need to ensure accuracy, consistency, and reliability of data from various sources such as schedules, budgets, material costs, and worker productivity. The lack of data integrity between sources poses a challenge for BI tools to provide meaningful insights for decision-making. Moreover, resistance to change within organizations is identified as another major challenge during the implementation of BI solutions. The review highlights how employees may resist adopting new technologies or methodologies, disrupting established workflows and processes. Overcoming this resistance and fostering a culture of data-driven decision-making are deemed essential for maximizing the benefits of BI in the construction industry. The review also touches upon the cost implications and expertise required for implementing BI solutions, emphasizing that these factors can pose challenges for construction companies. By addressing these challenges and leveraging BI tools effectively, construction firms can enhance their competitiveness, improve project outcomes, and drive sustainable growth in the industry.

https://doi.org/10.1007/978-3-031-87584-7_19

Keywords Business intelligence · Construction company · Construction project management · Competitive advantages

1 Introduction

The concept of measuring competitiveness in the business and competition literature, spot the light on the significance of understanding and assessing competitiveness in the construction sector [1]. This mean that construction company compete in competitive market where factors such as project delivery, cost efficiency, quality, and innovation are very important in determining success and market positioning.

Furthermore, the literature discusses the subject of competitive intelligence's role in strengthen project management endeavors, emphasizing the imperative for construction firms to remain abreast of market dynamics, competitor tactics, and industry trends to gain a competitive edge. Through cautious monitoring the competitive market, these firms can detect opportunities, anticipate barrier, and enact strategic maneuvers to augment market competitiveness and foster sustained growth [1].

In essence, the competitive market of the construction industry is affected by several factors, influenced by factors such as technological advancements, regulatory changes, market demand, and the competitive strategies of industry players. Construction companies must navigate this competitive market by adopting data-driven insights, adopting innovative practices, and focusing on operational excellence to succeed in a challenging and dynamic industry environment [2].

The escalating significance of data-driven decision-making in construction projects mirrors a larger trend within the industry, where the utilization of data and analytics is becoming increasingly pivotal in steering informed decisions and elevating project performance. Integrating business intelligence into strategic management underscores its profound impact on organizations, highlighting the intrinsic value of data-driven methodologies in refining project results and attaining competitive edges [3].

Data-driven decision-making in construction projects encompasses the methodical gathering, scrutiny, and elucidation of project-centric data to extract actionable understandings and enhance project results. Through the utilization of data drawn from diverse origins including project management systems, IoT devices, sensors, and historical project data, construction enterprises can attain a more profound comprehension of project intricacies, discern patterns, and anticipate prospective hazards and openings [2].

Embracing data-driven decision-making in construction projects unlocks a myriad of advantages. Initially, it equips construction enterprises with tools to refine project planning and scheduling through the utilization of data analytics, thereby optimizing resource allocation, streamlining workflows, and augmenting project efficiency. Secondly, data-driven insights play a pivotal role in risk management, enabling early detection of potential issues and facilitating proactive measures to mitigate risks, thereby safeguarding project success. Moreover, data-driven decision-making

empowers construction firms to monitor project performance in real-time, track key performance indicators, and enact timely adjustments to ensure the attainment of project objectives [4].

Additionally, data-driven decision-making protect evidence-based decision-making frameworks, alleviates uncertainties, and enhances transparency within project management initiatives. Through the integration of data-driven methodologies, construction enterprises can ignite innovation, cultivate heightened collaboration among project stakeholders, and ensure project delivery aligns with stringent quality standards, predefined timelines, and budgetary parameters [5].

The literature underscores the utmost significance of data-driven decision-making in construction projects, seamlessly aligning with current industry trends that prioritize leveraging data and analytics to enhance project outcomes, reinforce operational efficiency, and gain competitive edges within the construction domain [6].

The imperative of data-driven decision-making in construction projects is further underscored by the dynamic and fiercely competitive nature of the construction sector. The influence of business intelligence on organizational dynamics when integrated into strategic management underscores the pivotal role of leveraging data for informed decision-making. Moreover, the role of data collection, analysis, and validation in meeting information requirements and enhancing project outcomes through diverse information sources is underscored [3].

Furthermore, the advantages of data-driven decision-making in construction projects, including the increase of project planning, risk management, and performance monitoring through the analysis of project-specific data, are emphasized [3]. Thus, maintaining competitiveness within the industry.

Scope of the Literature Review: This literature review concentrates on probing the potential of using business intelligence tools as a resource for gaining competitive edge for construction company by starting on the definition of BI tools and how to contribute with construction company also the literature reviewed about construction company and how they compete in construction industry market and how and what resources that can be used to cover its deficit or to put the one step forward from their competition.

Also, this literature will discuss the challenges and future orientation in implementing BI tool in the construction companies and lastly, we will discuss where future research must go through to cover the uncovered aspect of implementing BI tools at construction company.

2 Literature Methodology

The methodology outlined describes the process used to conduct a literature review on the use of business intelligence tools as a strategic resource to gain competitive advantages for construction company. Here's a breakdown of the key steps:

1. Search Engine and Publication Date: The literature review utilized Google Scholar as the search engine and focused on papers published after 2018. This approach ensured that the review centered on the most recent research in the field, capturing the latest developments and insights related to use of business intelligence tools as a strategic resource to gain competitive advantages for construction company.
2. Search Terms: Specific search terms such as "Business intelligence," "construction company," "competitive advantages," and "Project based company" were employed to identify relevant literature. By using these targeted terms, the review aimed to gather comprehensive and specific information related to the application of business intelligence at construction company.
3. Screening Process: The search results were screened based on their relevance to the research topic and their publication date. This step involved assessing the papers to ensure they were pertinent to the focus of the review and met the requirement of being published after 2018. This screening process aimed to select high-quality, recent literature for inclusion in the review.
4. Inclusion Criteria: Only peer-reviewed papers published in reputable journals were included in the review. This criterion ensured that the selected literature met rigorous academic standards, enhancing the credibility and reliability of the review's findings.
5. Analysis and Organization: The selected papers were read and analyzed to identify key themes and findings related to the use of business intelligence at construction company. These themes, such as construction company, project-based company, and competitive advantages, formed the basis for organizing the literature review into distinct sections. This approach facilitated a structured presentation of the implementation of business intelligence at construction company to gain a competitive advantage.
6. Highlighting Benefits and Challenges: The review also emphasized the potential benefits and challenges associated with the use of business intelligence at construction company. By addressing both the advantages and limitations, the review provided a balanced assessment of the technology's impact on the construction companies.
7. Need for Further Research: Lastly, the review acknowledged the need for continued research and development to address the challenges and limitations identified. This recognition of ongoing areas for exploration and improvement underscored the dynamic nature of the field and the potential for future advancements in implementation of business intelligence at construction companies.

The methodology employed a semi systematic and comprehensive approach to identify, analyze, and present the latest research using business intelligence at construction company to gain a competitive advantage, contributing to a well-rounded understanding of the topic.

3 Business Intelligence in Construction

Imagine construction projects where everything runs like clockwork. Budgets stay within assumption, delays are a thing of the past, and you can spot problems before they even happen. This isn't a dream for any construction project manager—it's the future powered by a tool called Business Intelligence (BI) [5, 7].

Think of BI as a super-powered organizer for your construction company. It takes all the information you collect every day—schedules, budgets, materials, and more—and turns it into something amazing: clear and helpful insights. It's like having a mystery eye that can guide you towards better project management, lower costs, fewer risks, and even happier clients [8].

Here's how BI can completely change the way you build:

From Messy Data to Smart Decisions: BI isn't just about gathering information. It's about going deep and finding patterns and trends you might miss on your own. Imagine uncovering ways to save money on materials, or spotting potential delays before they happen. BI can be your secret weapon for making smarter choices, quicker than ever before [9].

Seeing is Believing: This is where BI's magic trick comes in—data visualization. It takes all those numbers and figures and turns them into easy-to-understand infographic charts. Suddenly, everyone involved in the project, from the managers to the clients, can see exactly what's going on. This clear picture leads to better communication and teamwork, which means a smoother project from start to finish.

More Than Just Saving Money: Sure, BI is great at helping you save money on projects by keeping track the expenses (and that's definitely a plus!). But it can do so much more. BI can help you identify potential safety hazards before they become accidents, keep your clients happy by always giving them updates, and build a reputation for being reliable and efficient [1, 10].

Think of BI as your own personal advisor, always looking at the data and whispering helpful tips in your ear. It empowers you to make decisions based on real information, use your resources wisely, and navigate the complexities of any construction project with confidence.

All the industries in the world including the construction industry are moving towards a more digital future, and BI is no longer an optional extra—it's becoming essential for success at the information age. So, implementing BI tools at construction company are the perfect way to unlock the power of BI. By implementing BI systems that focus on collecting, analyzing, reporting, and visualizing data, you can take your construction company to the next level and achieve success in a competitive market [3].

4 Competitive Advantage Through BI

The construction industry is a competitive landscape, and having a valuable resource is crucial for success. That's where Business Intelligence (BI) comes in. It's like a secret weapon that helps construction companies gain a clear advantage [11, 12].

Here's how BI helps you outsmart the competition:

Data Drives Decisions: Imagine having a crystal ball that shows the company how to win bids, allocate resources perfectly, and plan projects flawlessly. BI does just that! By analyzing competitor info, market trends, and project performance, BI gives you valuable insights to make data-driven decisions at every stage. So the companies will never have to guess again—BI empowers construction company to make smart choices that lead to winning projects [5, 13].

Spotting Trends, Boosting Efficiency: BI tools are powerful so they sniff out patterns and trends hidden in your data. like showing how Did a certain approach save time on past projects. BI can reveal these hidden gems. By analyzing historical data, BI helps the companies identify areas for improvement and optimize their workflow. This translates to better efficiency, higher productivity, and a clear edge over competitors who are still relying on outdated methods [5, 12].

In a substantially, BI gives you the power to make informed decisions, plan strategically, and streamline your operations. It's like having a built-in advisor constantly analyzing data and whispering winning strategies for a company. By leveraging BI tools effectively, the company can stay ahead of the curve, optimize their construction business, and achieving long-term success in a competitive market [5].

Remember, BI isn't just about winning projects—it's about building a sustainable and thriving construction company.

5 Challenges and Limitations

Based on the information provided in the literature, the challenges faced by construction companies when implementing Business Intelligence (BI) solutions can be significant. These challenges can impact the successful adoption and utilization of BI tools within the construction industry [14, 15].

Data quality and integration issues:

The biggest hurdle construction companies face when implementing BI is getting their data in order [2]. Construction projects are data factories, pumping out information from schedules, budgets, material costs, worker productivity, and more. The catch? All this data needs to be accurate, consistent, and reliable to be truly useful for BI.

The problem is, this data comes from multiple sources—different software programs, spreadsheets, and even handwritten notes. Wrangling all this information into one system that paints a clear picture of a project for analysis can be a real challenge, and it takes time. This non integrity between data sources makes it

tough for BI to do its job: giving you the insights you need to make smart decisions [16, 17].

Resistance to change within the organization:

Resistance to change is another significant challenge that construction companies encounter during the implementation of BI solutions. Employee for any company will almost not like the new technology because they used to do the old ones, and introducing BI tools can disrupt established workflows and processes. Resistance from staff members who are hesitant to adopt new technologies or methodologies can hinder the successful implementation and utilization of BI within the organization. Overcoming this resistance and fostering a culture of data-driven decision-making is essential for maximizing the benefits of BI in the construction industry.

Cost and expertise required for implementing BI solutions:

The cost contribution with implementing BI solutions and the expertise required to effectively utilize these tools can subject challenges for construction companies. Investing in BI technologies, infrastructure, and training programs can very expensive, especially for smaller firms with limited resources [2]. Additionally, acquiring the necessary expertise to implement, configure, and maintain BI systems can be a barrier for organizations lacking in-house technical skills. Ensuring that employees are adequately trained to use BI tools and interpret data insights is crucial for realizing the full potential of BI in driving competitive advantage within the construction sector.

Lastly, overcoming these challenges through effective data management strategies, organizational change management, and investment in training and development can enable construction firms to leverage BI effectively, make informed decisions, and gain a competitive edge in the industry [18, 19].

6 Future Trend and Opportunity

Based on the information provided in the literature, the evolution of Business Intelligence (BI) in the construction industry is expected to follow several key trends and opportunities that can shape the future of data-driven decision-making and competitive advantage within the sector.

Integration of Big Data and advanced analytics:

The future of BI in the construction industry is likely to involve the integration of Big Data and advanced analytics capabilities. With the increasing volume and variety of data generated by construction projects, including sensor data, IoT devices, and project management systems, construction companies can harness Big Data technologies to extract valuable insights and trends. By combining traditional BI tools with advanced analytics techniques such as predictive modeling, machine learning, and data mining, construction firms can gain a deeper understanding of project performance, identify patterns, and make more informed decisions to optimize operations and mitigate risks.

The rise of AI and machine learning for predictive insights:

Artificial intelligence (AI) and machine learning are about to become the ultimate construction BI sidekicks. Think about AI algorithms studying past projects to forecast future outcomes, like identifying potential delays before they even disrupt your schedule. This kind of foresight empowers construction companies to be proactive, taking preventative measures and optimizing workflows. With AI as a partner, construction firms can anticipate challenges, continuously improve processes, and deliver projects with laser focus.

Emerging opportunities for construction companies to leverage BI for further competitive advantage:

The evolving landscape of BI presents emerging opportunities for construction companies to leverage data-driven strategies for further competitive advantage. By embracing BI tools that incorporate real-time data analytics, visualization techniques, and collaborative platforms, construction firms can enhance transparency, communication, and decision-making processes. Leveraging BI for benchmarking performance, identifying market trends, and optimizing resource utilization can enable construction companies to differentiate themselves in a competitive market environment, deliver projects more efficiently, and meet client expectations effectively.

In conclusion, the future of Business Intelligence in the construction industry is expected to revolve around the integration of Big Data and advanced analytics, the rise of AI and machine learning for predictive insights, and emerging opportunities for construction companies to leverage BI for further competitive advantage. By embracing these trends and technologies, construction firms can unlock new possibilities for innovation, efficiency, and sustainable growth in a dynamic and data-driven industry landscape [10, 20–22].

7 Conclusion:

In conclusion, this paper we presented a brief discussion of the Business Intelligence stands as a cornerstone for construction companies seeking to excel in a competitive market landscape. However, while the specific mention of Business Intelligence as a key tool for competitive advantage is not explicitly provided in the literatures, the importance of data-driven decision-making in construction projects is highlighted throughout various sections, emphasizing the value of leveraging data and analytics to optimize project outcomes and drive operational excellence in the construction industry. The strategic utilization of BI tools enables firms to monitor projects in real-time, employ predictive analytics for risk management, optimize supply chain operations, and track key performance indicators for continuous improvement. Embracing BI not only enhances operational efficiency and project success but also positions construction companies to adapt to industry trends, capitalize on emerging opportunities, and secure a sustainable competitive advantage [6, 8].

As construction companies navigate the dynamic challenges and opportunities within the industry, the strategic integration of Business Intelligence remains imperative for driving innovation, fostering growth, and maintaining a competitive edge. By harnessing the power of BI technologies and insights, construction firms can make data-driven decisions, optimize resource allocation, and enhance project outcomes, ultimately positioning themselves as industry leaders in a rapidly evolving construction landscape [11].

Business Intelligence (BI) plays a pivotal role as a strategic tool for construction companies aiming to attain a competitive edge in the industry. By leveraging BI effectively, construction firms can convert data into valuable insights, facilitate informed decision-making, and optimize project performance. The incorporation of BI into construction project management processes empowers companies to enhance efficiency, mitigate risks, and elevate overall project outcomes [7].

Finally, this field need further more future research to cover all its pivot to be an acceptable tool for company to adopt and these pivots can be summarized by:

Ethical Considerations in BI Implementation: There is a need for research focusing on the ethical implications of Business Intelligence implementation in construction companies. Exploring issues related to data privacy, security, and transparency in BI usage could help companies navigate ethical challenges and ensure responsible data practices in the construction sector.

Impact of AI and Machine Learning: Future studies could delve into the impact of Artificial Intelligence (AI) and Machine Learning algorithms on BI applications in construction. Understanding how AI-driven predictive analytics and automation tools can optimize project planning, risk assessment, and performance evaluation may offer new avenues for enhancing competitiveness and innovation in the industry.

BI Adoption in Small and Medium-Sized Enterprises (SMEs): Research could focus on the adoption of Business Intelligence tools in small and medium-sized construction enterprises. Exploring the challenges, benefits, and best practices for BI implementation in SMEs could provide valuable insights for enhancing the competitiveness and sustainability of smaller construction firms.

Long-Term Effects of BI on Project Success: Investigating the long-term effects of Business Intelligence utilization on construction project success and company performance could be a fruitful area for future research. Analyzing how BI-driven decision-making impacts project outcomes, client satisfaction, and overall business growth over extended periods can offer valuable insights for strategic planning and performance evaluation [23].

Banks Profitability Determinants: Empirical Evidence from Developing Countries

Muath Asmar, Hasan Farhood, and Safaa Jerab

Abstract This paper examines the profitability bank determinants in developing countries. Using balanced panel data from 22 operational commercial banks in Palestine and Jordan between 2011 and 2021, a linear model between the theoretically stated characteristics of commercial banks and their profitability is computed. The study reveals that the non-debt tax shield, tangibles, inflation, capital sufficiency, and leverage of commercial banks in Palestine and Jordan have a negative impact on their return on asset. By delivering actual evidence from a developing nation environment, the paper contributes to the body of knowledge and provides guidance to bank managers and policymakers on how to improve financial performance in emerging markets. The findings highlight how crucial it is to keep up strict regulatory frameworks and responsible management techniques in order to guarantee the stability and financial success of banks in these countries.

Keywords Banks' profitability · Developing countries

1 Introduction

A bank functions as a pivotal institution dedicated to managing financial and monetary activities, encompassing deposits, loans, investments, and currency exchange. Its multifaceted roles are integral to the economy, encompassing the provision of essential financial services, fostering economic expansion, optimizing resource allocation, minimizing transaction expenses, fostering liquidity, facilitating investment economies of scale and reducing financial risks. Given the critical significance of this sector, ensuring its sustained effectiveness is imperative.

Optimal financial performance not only enhances the market value of a particular organization but also fosters industry-wide growth, thereby contributing to the overall economic success. By driving efficiencies, fostering innovation, and enhancing competitiveness, superior financial performance plays a pivotal role in advancing not just individual firms but the collective prosperity of entire economies [1, 2].

Bank performance has been a significant concern for several decades because of its strong connection to the economy [3]. As a form of financial middleman, banks are absolutely necessary for the continued growth and development of an economy [4]. Banks constitute a cornerstone of any country's financial system and actively participate in its financial markets. In an era marked by globalization, the repercussions of a significant bank failure transcend national borders. As the global financial crisis of 2008 demonstrated, the consequences of such failures can spread quickly and widely across international borders in addition to impeding development and economic growth inside the afflicted nation [5].

Several studies that attempted to investigate profitability of bank determinants in developing countries [e.g., 6–9. Although these studies focused on the bank's profitability determinants in emerging countries, however determinants of bank profitability in developing countries of Palestine and Jordan receive less attentions. Palestine has particular political and economic circumstances [10–12] in addition to high rates of unemployment [13]. Jordan has tremendous difficulties and economic problems due to a variety of causes, including as high unemployment, strain on natural resources, and regional instability [14]. Furthermore the banking sector is considering as the largest financial intermediaries and play an important role in the economic cycle in these countries [15].

This paper has the potential to greatly assist decision-makers in improving financial and managerial effectiveness as well as preventing underperformance. Through figuring out what the main variables affecting banks' profitability are, this study can furnish valuable insights for strategic decision-making aimed at enhancing overall bank performance. Moreover, the findings of this research can serve as a comparative framework for other scholars, facilitating cross-country comparisons between the variables affecting bank profitability in Jordan, Palestine, and other nations.

The rest of this paper is structured as flowing: the next section shows a background and literature review. Section 3 delineates our chosen variables and research methodology, elucidating the framework within which our analysis is conducted. In Sect. 4, we present the findings derived from our empirical analysis, shedding light on the factors that significantly impact bank profitability. These findings are then synthesized and interpreted to draw meaningful conclusions in Sect. 5. Additionally, we offer actionable suggestions based on our findings, providing practical recommendations for stakeholders in the banking industry to optimize performance and foster sustainable growth.

2 Literature Review

Academic scholars have focused a lot of emphasis on bank profitability determinants since the 1970s. Several studies focused on the bank specific factors [4, 9] while other studies seeks to examine the macroeconomic determinants of bank performance [16, 17]. A research by Kanapiyanova, Faizulayev [18] intends to investigate the factors that influence banking stability in emerging nations, with a particular emphasis on social and governmental responsibility factors. Ren et al. [19] have considered the effects of digital transformation on bank profit efficiency, while Djalilov and Piesse [6] Analyze the variables that affect bank profitability in the early transition countries of Central and Eastern Europe (CEE) and the late transition countries of the former USSR. The majority of these studies were conducted on private conventional banks. Recent studies have focused on Islamic banks [20, 21]. Other studies have focused on the public sector banks [22].

The factors influencing banks' profitability hold significant theoretical and practical relevance. Despite this, limited research has delved into unraveling the precise determinants of profitability within the banking sector. Moreover, existing studies present a mosaic of findings, lacking consistency. This study aims to scrutinize key factors highlighted in previous research [2, 23–26]. Previous studies have mostly focused on internal variables like size, liquidity, leverage, and that are under management's authority. Furthermore, the effects of outside factors on the profitability of banks have been examined, such as inflation and GDP growth. The non-debt tax shield, tangibility, and bank capital adequacy are also included in this analysis as potential contributing factors.

2.1 Non-debt Tax Shield (NDTS)

The use of non-debt financing as a tax shield is a fundamental concept in finance theory. Essentially, when a company takes on debt, it incurs interest payments which are tax- deductible expenses. This implies that the business can lessen its tax burden by reducing its taxable revenue by deducting the interest it has paid on its loan [27].

The non-debt tax shield (NDTS) refers to the tax benefits that companies, including banks, can obtain without increasing their debt level. By utilizing various provision and deductions available in the tax laws, companies can reduce their taxable income and increase their after-tax profits. The profitability of banks may benefit from the non-debt tax shield [27].

Based on Feld, Heckemeyer [27] in this paper the authors investigate the factors that influence corporate tax avoidance specifically within the banking sector. Through empirical analysis, the authors examine various determinants such as bank size, profitability, leverage, regulatory environment, financial structure, and international operation to understand the dynamics of tax planning strategies employed by banks. The study sheds light on how banking regulations, tax low, and financial structures

impact tax avoidance behavior, providing valuable insights into the complexities of tax management within the banking industry. For instance, Graham et al. [28] proposes analyzing the conservatism of debt policies by evaluating if loss carryover, investment tax credits, and depreciation are included in non-debt tax shields.

It is crucial to remember that the effect of non-debt tax shields on bank profitability can differ based on a number of variables, including the bank's size, the applicable tax jurisdiction, and the particular tax laws. Additionally, tax laws and regulations are subject to change, requiring banks to adopt their strategies accordingly to optimize their tax positions and profitability.

Overall, non-debt tax shields provide opportunities for banks to reduce their tax burdens and increase their after- tax profits. By effectively utilizing these tax benefits and implementing sound tax planning strategies, banks can enhance their profitability in a tax efficient manner [29]. Thus, the following hypothesis is formulated:

H_1: Bank profitability in Palestine and Jordan has a relationship with Non-Debt tax shield.

2.2 Tangibility

Previous research has repeatedly demonstrated a favorable correlation between profitability of a company and the assets tangibility. Ahmeti and Iseni [30] found that their findings validated the theory regarding the connection between physical assets and the performance of insurance businesses in Kosovo. The positive tangible asset coefficient, which shows a positive link between tangible assets and the success of insurance enterprises, lends credence to their theory. However, it is noteworthy that this relationship deemed statistically insignificant [28]. Additionally, Dhiab's [29] analysis revealed a favorable connection between profitability and tangibility in the Saudi insurance market. Isayas [2] recognized a positive association between tangibility and profitability in banks within the Ethiopian context.

Numerous studies have revealed a negative association between tangibility and business profitability. For instance Yadav et al. [31] shown that in the Asia-Pacific markets, tangibility and profitability had a negative connection. Furthermore, Gharaibeh and Khaled [32] determined that, particularly in the Jordanian context, elements that negatively affect profitability include debt to assets, company risk, and tangible assets. As a result, the second hypothesis is:

H_2: Bank profitability in Palestine and Jordan has a relationship with tangibility.

2.3 Capital Adequacy

Of the numerous research projects examining the connection between capital sufficiency and organizational profitability, Weersainghe and Perera [33] revealed a negative relationship between profitability and capital adequacy. Also Serwadda and Isah [34] found that there was a negative correlation between profitability and capital

sufficiency. On other hand Căpraru and Ihnatov [24] show that in a selected Central and Eastern European nations, capital adequacy and profitability were positively correlated [24]. Also Menicucci and Paolucci [25] found that the European banking industry's capital adequacy and profitability were positively correlated. Farkasdi et al. [35] found that profitability and capital adequacy from Germany were positively correlated. Accordingly, the third hypothesis follows:

H_3: Bank profitability in Palestine and Jordan has a relationship with Capital adequacy.

2.4 Size

Of the numerous research examining the connection between corporation profitability and size, Derbali [36] carried a research that showed a strong correlation between Moroccan banks' size and profitability. Koroleva et al. [37] found that there was a favorable correlation between Chinese enterprises' profitability and size. Saif-Alyousfi [5] found that, in 47 Asian nations, there was a favorable relationship between the size and businesses profitability. In addition, Neupane [38] indicate that the size and profitability of Nepalese commercial banks were positively correlated in their research. On other hand Vera-Gilces et al. [39] revealed that their research, carried out in a developing nation that has adopted the dollar, showed a negative relationship between size and profitability. Thus, the fourth hypothesis states that:

H_4: Bank profitability in Palestine and Jordan has a relationship with size.

2.5 Liquidity

Isayas [2] revealed that there is a positive correlation between profitability and liquidity in Ethiopian banks, which is in line with the other studies that have investigated the relation between corporate profitability and liquidity. In their Bangladeshi study. Rahman et al. [40] found a favorable correlation between profitability and liquidity. In their Zimbabwean study, Sanderson and Le Roux [41] revealed a favorable relationship between profitability and liquidity. Furthermore, in their study carried out in Malawi, Lipunga and Accounting [42] found a favorable association between profitability and liquidity. However, Almaqtari et al. [43] found that there was a negative correlation between profitability and liquidity in Indian commercial banks. Petria et al. [26] found that there was a negative relationship between profitability and liquidity in the banking systems of the member states of the European Union.

H_5: Bank profitability in Palestine and Jordan has a relationship with liquidity.

2.6 Leverage

Among the myriad of research investigating the connection between corporate profitability and leverage, Isayas (2022) revealed a positive connection between leverage and profitability in Ethiopia [2]. Also Saber Said Al-Delawi and Change [44] discovered a positive connection between leverage and profitability among Iraqi Private Commercial Banks in their research. On other hand Farooq et al. [45] identified a negative connection between leverage and profitability in Pakistan. Alarussi and Gao [23] reported a negative connection between leverage and profitability in China. Nguyen and Nguyen [46] documented a negative connection between leverage and profitability using data from Vietnam. The sixth hypothesis is:

H_6: Bank profitability in Palestine and Jordan has a relationship with leverage.

2.7 External Factors

The inflation and gross domestic product (GDP) are two examples of external variables that impact bank profitability [2].

Gross domestic product

Isayas [2] revealed a positive association between GDP and profitability in Ethiopia. Furthermore, in their cross-country research, Le and Ngo [47] revealed a positive relationship between GDP and profitability. From 47 Asian nations. Saif-Alyousfi [5] discovered a positive relationship between GDP and profitability. A positive connection between GDP and bank profitability was also discovered by Athari [1]. The following is the seventh hypothesis:

H_7: Bank profitability in Palestine and Jordan has a relationship with gross domestic product.

Inflation

Athari [1] discovered a positive connection between inflation and bank profitability in Ukraine, which is consistent with the other research investigating the connection between business profitability and inflation. Furthermore, Saif-Alyousfi [5] discovered a positive connection between 47 Asian nations' inflation and profitability. However, in their cross-country research, Le and Ngo [47] found a negative connection between inflation and profitability. Furthermore, Isayas [2] discovered a negative connection between Ethiopian profitability and inflation. The last supposition is:

H_8: Bank profitability in Palestine and Jordan has a relationship with inflation.

3 Research Methodology

The collection of data, sampling strategy, research model, measurement of variable, and analysis are the main topics of this section.

3.1 Data

Data is gathered from banks' annual reports, which include an income statement and statement of financial situation, and are available on the websites of the Jordan Stock Exchange and the Palestine Stock Exchange between 2011 and 2021. Based on the data that was available, twenty-two banks were considered appropriate for the research. A balanced panel data set with 234 observations makes up the final data set.

3.2 Measurement of Variables

This paper components were measured using previous literature as a guide. The independent and dependent variables are shown in Table 1.

Table 1 Measurement of variables

Type of variable	Variables	Variable Measurement
Dependent	Profitability measured by (ROA)	Net income divided by total assets
	Profitability measured by (ROE)	Net income divided by total equity
Independent variables	Non-debt tax shield (NDTS)	Annual depreciation expense divided by total assets
	Tangibility (TAN)	Fixed tangible assets divided by total assets
	Capital adequacy (CA)	Total equity divided by total asset
	Size	Total asset natural log
	Liquidity (LIQ)	Current assets divided by Current liabilities
	Leverage (LEV)	Total debt divided by total assets
	Gross domestic product (GDP)	Growth of the economy for a country. World Bank indicators
	Inflation (INF)	Annual change in the consumer price index. World Bank indicators
	Country dummy (CD)	1 if the company located in Jordan, 0 otherwise

The research's hypotheses are examined by the estimate of the subsequent linear model.

$$\begin{aligned} profitability = {} & B_0 + B_1 NDTS + B_3 TAN + B_4 CA + B_5 size \\ & + B_6 LIQ + B_7 LEV + B_8 GDP + B_9 iINF \\ & + B_{10} CD + \in \end{aligned} \tag{1}$$

where

e: error term
NDTS: Non-Debt tax shield
TAN: Tangibility
CA: Capital adequacy
Size: size of banks
LIQ: Liquidity
LEV: leverage
GDP: Gross domestic product
INF: Inflation rate
CD: Country dummy.

In this study, we employed a conventional ordinary least square framework (OLS) to estimate the results using random effect or fixed effect based on the Hausman Test results.

4 Finding

This section contains the study's conclusions. The findings of correlation analysis and descriptive statistics are first shown, and then the topic of model estimation is covered.

4.1 Correlation Analysis

Table 2 displays correlation coefficients that shed light on the relationships between several sets of data. According to the table, Return on Assets (ROA) exhibits a positive correlation with Capital Adequacy, Liquidity, GDP, and Inflation, while displaying a negative correlation with Non-Debt Tax Shield, Tangible Assets, Size, and Leverage. Moreover, the relationships among the independent variables generally demonstrate low magnitudes, suggesting the absence of multicollinearity issues in subsequent regression analyses.

Table 2 Pairwise correlations

	ROA	ROE	NDT	TAN	CA	SIZE	LIQ	LEV	GDP	INF	COUNT
ROA	1										
ROE	0.526	1									
NDT	− 0.104	− 0.286	1								
TAN	− 0.193	− 0.310	0.962	1							
CA	0.034	− 0.574	0.523	0.505	1						
SIZE	− 0.028	0.314	− 0.730	− 0.727	− 0.500	1

LEV	− 0.053	0.569	− 0.344	− 0.345	− 0.873	0.399	− 0.474	1			
GDP	0.115	0.174	0.039	0.099	0.029	− 0.144	− 0.067	− 0.071	1		
INF	0.032	0.092	− 0.082	− 0.076	− 0.026	0.058	− 0.117	− 0.079	0.428	1	
COUNT	0.043	0.064	− 0.345	− 0.422	− 0.144	0.531	− 0.238	− 0.026	− 0.098	0.289	1

4.2 Descriptive Statistics

For the return on assets (ROA) and return on equity (ROE) which are dependent variables, Table 3 presents descriptive statistical measures such as standard deviation, mean, maximum, median, and minimum. It also includes several independent variables, such as non-debt tax shield, tangibility, capital adequacy, bank size, liquidity, leverage, GDP growth, and inflation.

The ROA range for commercial banks in Palestine and Jordan is − 0.074 to 0.082 at the highest, while the ROE runs from − 0.085 to 0.082 at the minimum during the observed period. The mean ROE is 6.8%, whereas the mean ROA is 1%. Furthermore, the average leverage is around 5.681 and the average capital adequacy is 25.3%. These descriptive data shed important light on the financial makeup and operations of the commercial banks that are the subject of the investigation.

Table 3 Descriptive Statistical variables of the study

	Mean	Median	Maximum	Minimum	Std. Dev	Observations
ROA	0.010	0.011	0.082	− 0.074	0.011	234
ROE	0.068	0.077	0.164	− 0.085	0.047	234
NDT	0.003	0.002	0.032	0.001	0.004	234
TAN	0.057	0.023	0.962	0.005	0.127	234
CA	0.253	0.141	0.910	0.075	0.252	234
SIZE	21.092	21.295	24.042	16.246	1.439	234

LEV	5.681	6.073	12.401	0.099	3.143	234
GDP	0.054	0.047	0.166	− 0.093	0.049	234
INF	0.019	0.016	0.048	− 0.009	0.019	234
COUNT	0.658	1	1	0	0.475	234

4.3 Estimation Results

Table 4 shows regression results from different model of the study, with four variants outlined. Models 1 and 3 employed Panel Least Squares, while Models 2 and 4 utilized Cross-section random effects.

The R-squared values indicate that the models account for approximately 27.4 to 48.9% of the total variability in both Return on Assets (ROA) and Return on Equity (ROE). These findings suggest that the selected independent variables collectively contribute to explaining a substantial portion of the variation observed in the dependent variables across the Palestinian and Jordanian commercial banks studied.

The observed positive relationship between bank size and Return on Equity (ROE) align with prior research findings by Derbali [36] and Koroleva et al. [37]. These scholars attribute this relationship to factors influencing profitability within the banking sector. Similarly, the negative relationship between Capital Adequacy and profitability resonates with the findings of Lanka [33] and Serwadda [34], who offer explanations rooted in profitability determinants.

Furthermore, the negative and significant relationship between leverage and ROE echoes the conclusions drawn by Khan [45] and Alarussi [23]. Conversely, the lack of significance for Non-Debt Tax Shield, Tangibility, and inflation in their negative impact on profitability relationship with the findings of Yadav et al. [31] and Le [47].

Moreover, the positive and significant relationship between liquidity, Gross Domestic Product (GDP), and profitability are in line with the research outcomes of Isayas [2], Abdeljawad and Bahlaq [48] and Rahman et al. [40], highlighting the consistent influence of these factors on enhancing profitability within the banking industry. Use random effect for model 2 and model 4 because prop is Correlated Random Effects—Hausman Test 1.000 as presented in Table 5.

Table 6 illustrates the relationships between various factors and profitability for both Palestine and Jordan separately. In Palestine, a negative and significant relationship exists between Non-Deferred Taxes (NDTs) and asset tangibility with the return on assets (ROA). Conversely, firm size, liquidity, and GDP exhibit a positive and significant relationship with both ROA and return on equity (ROE).

In Jordan, leverage and current assets (CA) demonstrate a negative and significant relationship with both ROA and ROE. On the other hand, GDP shows a positive and significant relationship with overall profitability.

5 Conclusions

This study delved into the determinants shaping the profitability decisions of commercial banks in Palestine and Jordan. It found that factors such as Tangibility, Capital Adequacy, Leverage, Non-Debt Tax Shield, and inflation exhibit an inverse relationship with profitability among Palestinian and Jordanian commercial banks. Conversely, the size of banks, Liquidity, and Gross Domestic Product (GDP) demonstrate a positive relationship with profitability.

Moreover, the findings underscore the significance of information asymmetry as the primary driver influencing financing decisions within commercial banks. The study suggests that firm boards and policymakers should prioritize efforts to enhance information dissemination and foster trust in disclosed information to mitigate the impact of this asymmetry on profitability outcomes.

It is essential to recognize the limitations of the study, including its small sample size, which impedes the findings' capacity to be applied outside of Palestine and Jordan. Future research endeavors could address this limitation by broadening the scope of the study to encompass a more diverse range of countries, thereby providing a comprehensive understanding of how various variables impact the profitability of commercial banks on a global scale.

Fintech and Financial Inclusion: A Bibliometric Analysis and Insights

Islam Abdeljawad, Bilal Aqel, and Muiz Abu Alia

Abstract This study aims to review the bibliometric and main themes of the publications on FinTech and financial inclusion. Financial inclusion aims to enhance the accessibility, speed, security, and cost-effectiveness of financial services. Financial technology (FinTech) plays a pivotal role by integrating modern technology and innovations into financial services, striving to improve efficiency and competitiveness. The COVID-19 pandemic emphasized the urgency of digital financial inclusion, particularly for underserved populations, necessitating cost-effective digital solutions tailored to marginalized communities. This study utilized a bibliometric analysis for 1206 documents from the Web of Science database spanning 2019 to 2023. The analysis identified primary themes related to financial inclusion elements, the impact of emerging financial technology, and the FinTech-inclusion nexus. Identified gaps in the literature provide avenues for future research and underscore the evolving FinTech landscape's contribution to financial inclusivity. This study enhances understanding among financial institutions and policymakers regarding FinTech's pivotal role in financial inclusion, offering insights for academic research and policy development in this evolving domain.

Keywords FinTech · Financial inclusion · Economic development · Digital finance · Sandbox

1 Introduction

Financial inclusion has emerged as a critical issue in research in the last two decades with a strong interest by financial institutions and central banks. Financial inclusion, defined as individuals and businesses having access to valuable and affordable financial products and services, aims to make financial services, such as credit facilities, payments, and insurance, more accessible, faster, secure, and cost-effective than

traditional services [1]. Moreover, these services should be delivered in a responsible and sustainable manner [2, 3]. Significant progress has been made towards financial inclusion, as account ownership increased by 50% globally between 2011 and 2021, from 51 to 76% of adults worldwide [4].

Despite advancements, a sizable portion of the global population still has difficulty accessing basic financial services. FinTech aims to address these challenges by lowering costs, increasing efficiency, and raising financial service awareness [5, 6]. Financial technology (FinTech) is important in this landscape because it incorporates modern technology and innovations into various financial service domains such as banking, finance, insurance, investment, and electronic payments [7–9]. FinTech pioneers new applications such as online banking, smart banking, instant money transfers, electronic payments, crowdfunding, and digital currencies to improve and streamline financial operations for both individuals and businesses, making financial services more efficient, secure, and competitive [10].

In the past five years, the COVID-19 pandemic and the proliferation of artificial intelligence in the financial sector have both underscored the critical nature of expanding digital financial inclusion. Due to the rise in online shopping enabled by e-payment capabilities, COVID-19 heighten interest in financial technology. This emphasizes the necessity of deploying affordable digital platforms that offer alternatives to traditional financial services to the underbanked population. It is the responsibility of service providers to meet the needs of all marginalized members of a society by customizing their offerings and ensuring their delivery is sustainable, cost-effective, and dependable.

This research builds on the need to enhance our comprehension of the relationship between financial technology (FinTech) and financial inclusion through an examination of academic works published within the past five years. The primary aims of this research are as follows: to conduct a bibliometric analysis of the scholarly works that have been published concurrently with the emergence of the COVID-19 pandemic; and to identify the primary trends and developments in this body of work. With a specific focus on the challenges and opportunities associated with FinTech's role in financial inclusion, as well as the factors that propel its ability to enhance financial inclusion. This research enhances the comprehension of policymakers and financial institutions regarding the contribution of FinTech to financial inclusion. Moreover, it establishes a foundation for future research in these domains through the identification of possible deficiencies in the existing body of literature.

2 Methodology

This study explores the role of FinTech in enhancing financial inclusion in the context of COVID-19 by conducting a thorough analysis of previous research using a bibliometric approach. In order to carry out this review, the Web of Science (WoS) database was searched for relevant keywords such as "FinTech", "financial technology", and "financial inclusion". We initially incorporated all documents spanning from 2019

to 2023, resulting in a total of 1462 documents. We eliminate studies that are not in the English language and any documents that are of an editorial nature. Additionally, we assess the title and abstract to exclude studies that are not relevant to our research. The final 1206 documents obtained from WoS, as shown in Table 1, served as the foundation for conducting a bibliometric analysis using the Bibliometrix R application. This analysis aimed to identify and examine different aspects pertaining to the publications in the field.

Next, an analysis of the content of chosen articles was carried out to identify the primary themes regarding the elements of financial inclusion, the influence of emerging financial technology, and the connection between FinTech and inclusion. The goal was to acquire a comprehensive understanding of the various aspects of this dynamic interaction. Moreover, the analysis of the literature uncovered deficiencies in the current knowledge base, creating possibilities for future research endeavours and serving as a basis for proposing recommendations in areas and subjects that show promise for academic research.

Table. 1 Main information about the dataset analysed

Description	Results	Description	Results	Description	Results
Main information about data		*Document contents*		*Document types*	
Timespan	2019–2023	Keywords plus (ID)	1602	Article	868
Sources (Journals, Books, etc.)	586	Author's keywords (DE)	3102	Article; book chapter	15
Documents	1206	Authors		Article; early access	110
Annual growth rate %	39.37	Authors	2938	Article; proceedings paper	7
Document average age	2.36	Authors of single-authored docs	131	Book	1
Average citations per doc	10.84			Book review	5
References	51,948	Authors collaboration		Proceedings paper	76
		Single-authored docs	188	Review	114
		Co-authors per doc	3.14	Review; book chapter	1
		International co-authorships	32.75	Review; early access	9

3 Bibliometric Analysis

In accordance with the previously outlined methodology for reviewing selected articles, the main information about the dataset obtained from the Web of Science is presented in Table 1.

The main journals publishing on relevant topics are categorised in Fig. 1. Sustainability published 58 documents, followed by Environmental Science and Pollution, whereas Sage Open is the last in line.

Analysis of the retrieved articles reveals a steady, high growth of about 40% per year in the number of publications during the study period. Moreover, China stands out as a leading country in publications about FinTech for financial inclusion, as indicated in Figs. 2 and 3.

Examining the top ten frequent keywords, Fig. 4 reveals that "financial inclusion" was the most frequent, followed by "mobile money," and "mobile payment" was the last on the list. We see that payment technologies were extensively researched during this period due to the needs emerged. Figure 5 presents the co-occurrence of

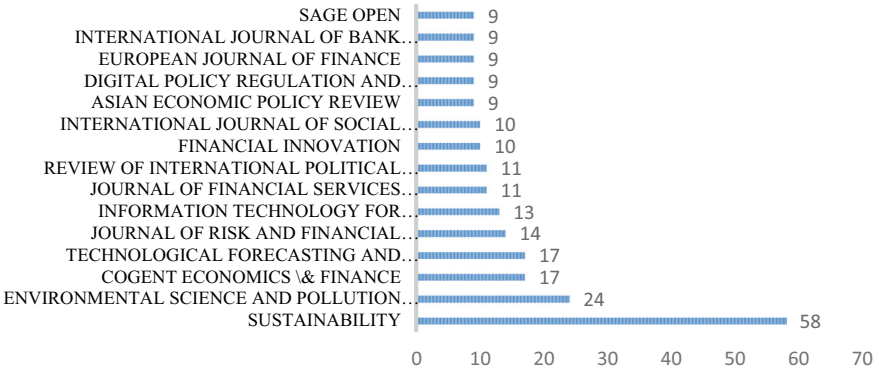

Fig. 1 Main journals publishing on FinTech and financial inclusion

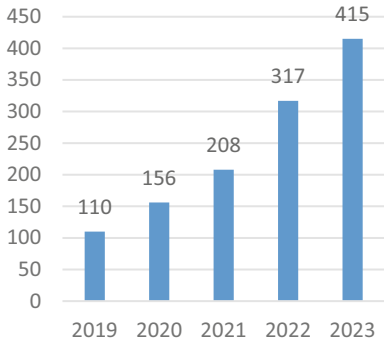

Fig. 2 Articles published per year

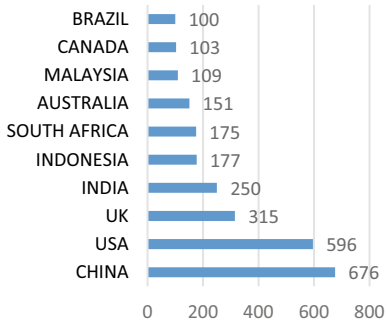

Fig. 3 The top ten countries where articles are published

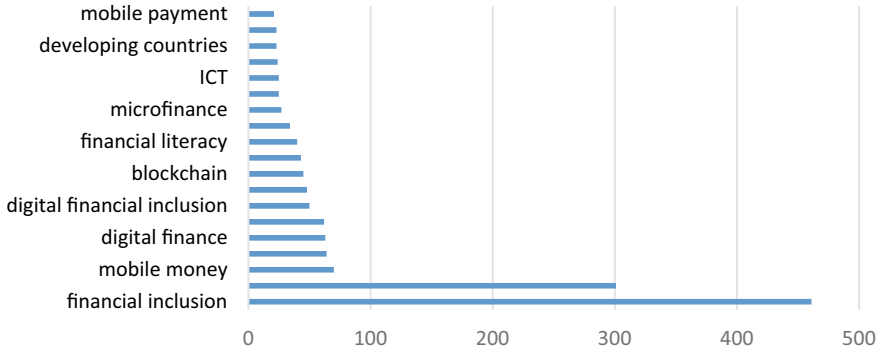

Fig. 4 Occurrences of the top ten keywords

keywords that underscore the multifaceted impact of FinTech. These keywords reveal the interaction of FinTech and financial inclusion with various dimensions, such as COVID-19, poverty reduction, mobile money services, financial development, economic growth, artificial intelligence, the role of microfinance, entrepreneurship, and inequality reduction. The next analysis provides an overview of the diverse subjects covered in the literature, emphasising the intricate relationships between FinTech, financial inclusion, and broader economic development.

4 Main Themes in the Literature

4.1 Financial Inclusion

Recently, financial inclusion has emerged globally as a critical topic attracting attention from financial institutions and central banks [11]. This emergence has been further fuelled by the electronic facilitation of financial transactions using user-friendly methods, primarily through devices like smartphones, with a focus on

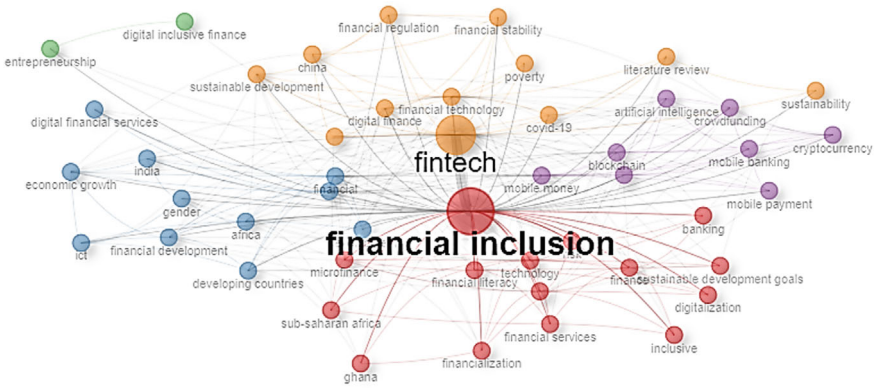

Fig. 5 Co-occurrence of the diverse keywords covered in the literature review

reaching a broad audience at minimal costs. Financial inclusion involves providing opportunities to all segments of society, especially those with lower incomes, to manage their finances and secure their savings through accessible financial services. It extends beyond the mere act of opening a bank account, emphasizing access to financial services [12]. Notable dimensions of financial inclusion encompass cultural and religious products offered by banks and financial institutions, regulatory frameworks, control mechanisms, infrastructure, and technology [13].

The success of financial inclusion strategies depends on a combination of factors, including infrastructure, innovative services, and societal culture. Education levels, perceived security, and trust play pivotal roles in determining the implementation levels of financial inclusion [14]. Financial inclusion is a holistic approach to ensuring that diverse communities can effectively leverage financial services to enhance their economic well-being.

4.2 Financial Technology

FinTech signifies the application of innovation in the financial industry, marking a departure from traditional banking and insurance practices [15]. In regions with fewer bank branches and financial institutions, FinTech serves as an alternative solution, promoting financial inclusion by improving accessibility [16], adoption of digital banking services, and supporting the entrepreneurial ecosystem [17]. FinTech accelerates financial inclusion via the use of socio-credit profiles via social media and customer behaviour [18] and by providing users with easy access to financial services anywhere, anytime [19].

The adoption of FinTech not only transforms financial landscapes but also interlinks with societal dynamics, influencing perceptions, behaviours, and inclusivity. Understanding these interconnections is essential for crafting effective strategies

that leverage technology to enhance financial inclusion. FinTech innovations are reshaping the landscape of financial institutions, particularly in banking, offering novel solutions, promoting financial inclusion, and influencing the future path of the financial sector.

4.3 Fintech and Financial Inclusion in the Era of COVID-19

Reviewing the literature indicates an increasing focus on academic investigations into various facets of FinTech, including innovation, strategic management, and technology adoption [20]. Studies indicate that financial technology plays a pivotal role in promoting financial inclusion, relying on customer intention and behaviour [21]. The rise of FinTech may intensify competition among banks to offer competitive prices for products and services, as the new models of financial services may have a significant impact on traditional bank financing [22]. A study in China suggests that the expansion of digital financial services poses high financial risks from a legal perspective [23].

While financial technology significantly supports financial inclusion, investigating this matter requires careful consideration of social factors, as they are integral to financial inclusions [24]. Amid the COVID-19 pandemic, studies have revealed a growing interest among young people in financial technology, leading to increased online shopping facilitated by e-payment facilities. This shift has resulted in an expansion of financial inclusion during these challenging times [25].

4.4 Financial Inclusion-Fintech Nexus and Economic Growth

The relationship between income inequality and financial inclusion underscores the crucial role played by FinTech in granting access to financial services [26]. Financial institutions leveraging FinTech can facilitate private sector investments and promote and provide opportunities for individuals, especially those with lower incomes, thereby elevating the level of financial inclusion [27]. The widespread adoption of financial technology significantly contributes to expanding the financial inclusion landscape, leading to a remarkable increase in the share of individual income in terms of Gross Domestic Product (GDP) per capita [28]. The impact of financial technology extends beyond individual finances to contribute to overall economic development. A study conducted in China highlights that indicators such as insurance, electronic payments, and credit facilities are linked to economic development as a result of the application of financial technology [21], these factors are instrumental in determining the trajectory of financial inclusion [29].

Governments are playing a vital role in fostering digital transformation and implementing regulations conducive to economic development [30]. Governments, in collaboration with financial institutions, may foster a digital economy by investing in infrastructure and digital identity solutions. These initiatives facilitate the transformation process, ultimately contributing to both economic development and sustainability [30]. As financial technology evolves, it can serve as a catalyst for sustainable practices and inclusive financial services, FinTech emerges as a key driver of economic growth, bridging gaps in financial inclusion, fostering private sector collaborations, and contributing to overall economic development.

4.5 Social Aspects of Financial Inclusion-FinTech Nexus

In regions with prevalent internet and ICT availability, rural areas now can access financial services, especially with the decreasing number of physical bank branches due to digital banking transformation [31]. The rapid revolution in financial technology, coupled with the widespread use of smartphones by 67% of the world's population, signifies that financial inclusion can now encompass individuals in all areas, fostering awareness among all end-users [7]. As FinTech continues to evolve, it presents an unparalleled opportunity to bridge gaps and promote inclusive financial services globally. However, the knowledge and accessibility of technology are deemed important for increasing finance in rural communities [5].

Income inequality, which is one of the socio-economic factors that will promote expansion of inclusion, is a force that FinTech will reduce the differences in the distribution of income [32]. Gender, as an important social factor, largely determines the extent of financial inclusion and access to financial services in the course of digital banking. Women, being central to the materiality of financial inclusion, are more involved in FinTech financial transactions [33]. The positive correlation between female employment and financial inclusion highlights the pivotal role of women's employment in enhancing the overall degree of financial inclusion [34].

The utilization of e-banking establishes a positive and significant relationship with entrepreneurs and start-up businesses. This opens avenues to assess credit positions, but it may also have social implications, potentially affecting employment in banks, particularly in credit and finance facility departments [35]. Entrepreneurs engaging with financial technology play a crucial role in enhancing financial inclusion [36]. The utilization of e-banking contributes to increased financial inclusion, emphasizing the importance of perceived trust in financial transactions [37]. Advanced internet banking specifically designed for segments with inadequate income or low-level payment capacities further improves financial inclusion [38]. Moreover, Information and communication technology (ICT) significantly influence the development of the insurance industry, particularly in the life insurance sector for individuals [39].

In summary, FinTech emerges as a catalyst for improving financial inclusion across various sectors, ranging from microfinance and entrepreneurship to banking

applications and insurance. The positive trends observed underscore the transformative potential of financial technology in expanding access to financial services for diverse segments of society. Future research endeavours should focus on understanding how business strategy, digital services, and microfinance collectively drive financial inclusion [40].

4.6 Enabling Ethical, Sustainable and Green Finance

Financial technology plays a significant role in facilitating efficient green finance, particularly in the context of energy. Green finance and sustainability initiatives contribute to investments in renewable energy [41]. However, the impact of this role on financial inclusion is less pronounced, especially in developing countries [42].

In the realm of Islamic finance, interaction with advisory systems facilitates decision-making, fostering innovative financial solutions that comply with shariah laws and standards. Technology plays a pivotal role in offering these solutions to the Islamic finance sector [43]. Despite concerns that digital transformation might initially reduce bank profitability, the gradual expansion of digital services is expected to increase performance, thereby expanding the customer base and ultimately boosting financial inclusion rates in the long term [44]. The competition between Islamic finance and traditional conventional finance in terms of payment settlement, fees, and advancement necessitates the utilization of financial technology [45].

4.7 Fintech Regulation

Governance in FinTech fosters trust in digital banking services, even for customers who were previously underserved. This stresses the fundamental objective of financial inclusion [46]. A systematic literature review conducted by Afjal spanning selected studies from 2016 to 2023 recommends regulatory bodies focus on the challenges and opportunities posed by digital transformation [47]. The factors influencing financial inclusion across countries include education, customer intentions to use electronic payments, regulatory supervision, and economic development [48]. To foster innovation and financial technology, central banks or regulatory authorities are urged to promote and establish legal procedures. This involves the implementation of special regulatory frameworks such as sandboxes and innovation centers [49]. Consequently, there has been a notable increase in government initiatives aimed to fostering collaboration through programs such as regulatory sandboxes and business incubators [50].

In conclusion, FinTech regulation plays a pivotal role in shaping the readiness of financial institutions for the ongoing FinTech revolution. Recommendations

highlight the importance of addressing digital transformation challenges, implementing suitable regulations, and actively fostering innovation through collaborative initiatives.

4.8 International Perspective on Fintech and Financial Inclusion

FinTech offers significant opportunities for achieving high levels of financial inclusion in different countries. A study indicates that Vietnam, Laos, and Colombia have substantial potential for developing financial inclusion through FinTech initiatives [51]. In Vietnam, households are increasingly utilizing saving accounts and automated teller machines, contingent on the availability of financial inclusion services [52]. In India, research emphasizes the foundational role of Information and Communication Technology (ICT) in promoting financial inclusion. Granting access to financial services is identified as the initial step crucial for achieving comprehensive financial inclusion [53]. Awareness and knowledge of financial services significantly contribute to financial inclusion in India, playing a role in sustainable economic development [24]. In China, another study elucidates that the implementation of financial technology leads to a rise in household consumption, contributing to a reduction in income inequality—an essential objective of financial inclusion [54].

Studies conducted in Arab countries highlight the transformative impact of open trading and financial technology. These innovations bring previously unbanked customers into the financial fold, positively influencing financial inclusion [10]. These international assessments underscore the varied ways in which FinTech contributes to financial inclusion across different regions, paving the road for positive socioeconomic impact globally.

4.9 Recent Trends in Financial Technology and Financial Inclusion

FinTech represents a transformative force within the digital economy, representing new ideas, like artificial intelligence, data analysis, cryptocurrencies, and blockchain technology [11] that are reshaping the financial sector. Technological advancements in artificial intelligence (AI), Internet of Things (IoT), and blockchain technology are deeply influencing digital financial inclusion efforts, particularly in areas concerning risk detection and mitigation [55]. These technologies are instrumental in addressing issues related to information asymmetry, particularly within sectors such as microfinance, insurance, and cash transfers [56].

Consumer-centric innovations such as mobile payments, digital wallets, and direct insurance coverage are facilitating new models of deposits and lending, exemplified

by Peer-to-Peer (P2P) lending and crowdfunding platforms, these platforms are open avenue for decentralized finance (DeFi), offering individuals greater independence and opportunities for participation in the financial ecosystem [16].

4.10 Challenges and Opportunities

Despite the evolution of financial technology, significant challenges remain in the context of financial inclusion. Key among these challenges are concerns regarding job displacement, user acceptance, privacy breaches, and the complexities associated with adoption and implementation [25]. Additionally, the introduction of new business models may create dilemmas in aligning business strategies while protecting the human touch in financial interactions. Moreover, ensuring consumer protection remains dominant in fostering a society with significant well-being [37].

Addressing these challenges necessitates collaborative efforts among stakeholders to advance both fintech innovation and financial inclusion objectives. Exploring potential partnership models between fintech firms, traditional financial institutions, and governments [57, 58]. By fostering collaboration, the stakeholders can work together to develop solutions that promote inclusive access to financial services while safeguarding consumer interests.

5 Conclusion

In this study, we aimed to do a bibliometric analysis of publications related to the role of FinTech in promoting financial inclusion and identify the main themes within these publications. FinTech's positive impact on financial inclusion is highlighted through cost reduction, expanded access to financial services in rural and remote areas, and increased efficiency in offering competitive and high-quality products by financial institutions. FinTech plays a crucial role in promoting financial inclusion and contributing to overall economic development.

FinTech's reach extends beyond traditional banks to include insurance companies, e-wallet providers, and emerging models like open finance, crowdfunding, and microfinance companies. We also recognized the challenges in implementing FinTech, emphasizing the need for organized technology frameworks to ensure consumer rights protection. Achieving digital enablement, facilitated by internet access, PCs, and smartphones, requires cultural change and awareness.

Our study provided recommendations to enhance financial inclusion via FinTech, urging policymakers and stakeholders to adopt programs that support entrepreneurs and start-ups investing in financial technology, along with providing training and incentives. We advocate for encouraging financial institutions to utilize financial technology, providing government support to FinTech start-ups, developing appropriate legislation, and expanding the scope of national financial inclusion plans. For

future studies, we recommend exploring additional dimensions in assessing the role of FinTech in financial inclusion and evaluating the effectiveness of the regulatory framework.

In conclusion, our study underscores the transformative potential of FinTech in reshaping the landscape of financial inclusion. We urge collaborative efforts from governments, policymakers, and the private sector to realize its full potential and ensure inclusive financial services for all segments of society.

The Effect of Human Capital Disclosure in Integrated and Sustainable Reports on the Financial Performance of Companies Listed in a Stock Exchange

Abdulnaser I. Nour, Taimaa Kharoub, and Aya Yahya

Abstract "The purpose of this study" was to (analyze the effect of "HC dis-closure" in integrated and sustainable reports on the financial performance of companies). The study examined 30 joint stock companies listed on the Palestine Stock Exchange from 2018 to 2022 using SPSS and Excel. The findings revealed that improved disclosure of HC information significantly reduces a firm's cost of capital and enhances its firm value. With a WACC of 6.9% and TQ at 75.09%, the results indicate efficient financing management. However, the results indicated that the disclosure more information about HC has a significant and weak effect on a firm's "cost of capital". This implies that improving HCDL can lower the perceived investment risk in a company among investors, leading to a lower cost of capital and thus there is a noticeable positive effect on company value due to increased levels of high-risk disclosure. This suggests that better HC disclosure is associated with improved access to external financial resources, thus enhancing firm value. Based on the results, the researchers recommend improving the quality of HC disclosure, which leads to reducing the "cost of capital" and increasing value of the company. It is recommended to improve the quality and transparency of this type of disclosure and enhance the competitive environment.

1 Introduction

The possession of information and the emergence of knowledge economies highlight the significance of intangible assets in generating wealth and achieving critical success factors [1, 2]. As the business environment transitions from the industrial age to the information age, knowledge and effective communication with customers become increasingly important. HC, which encompasses the organization's (knowledge volume, technical skills, creativity, and experience), is now recognized as a valuable asset rather than a costly one [3]. To stay competitive and meet financial goals, companies must capitalize on the expertise and abilities of their employees [4, 5]. Therefore, strategic management and protection of intangible assets are indispensable for organizations to maintain their market position and excel in the competitive business landscape [6].

HC is recognized as a crucial component of intellectual capital [7, 8], comprising the knowledge, skills, creativity, and experiences of a company's employees, which significantly contributes to its economic value [9]. It is viewed as a key resource that can foster "a sustainable competitive advantage" and influence a company's success [10]. The uniqueness and rarity of a company's HC distinguish it from competitors [11]. Increasing emphasis on HC underscores the importance of employee engagement and loyalty for a company's competitiveness and financial performance [12–14]. However, traditional financial reporting's failure to account for intangible assets like human resources has led to a push for voluntary disclosure [15, 16]. This movement seeks to offer "a more comprehensive view of a company's value" and performance by including information on its intangible assets, thereby providing investors, analysts, stakeholders with a clearer understanding of its strategic value drivers and business model [17, 18].

Integrated Reporting (IR) and sustainability reporting have emerged as means to fulfill stakeholders' needs for social and environmental information [19], incorporating both financial and non-financial aspects to highlight future value creation [20, 21]. These reports, encouraged by the International Integrated Reporting Council (IIRC), cover a range of capitals including financial, manufacturing, intellectual, human, social, and natural [22]. The practice, adopted across both public and private sectors [23], aims to showcase how investments in HC contribute to a company's performance and financial value, enhancing its appeal to investors and shareholders interested in the human elements driving success [24].

This research investigates the effect of HC disclosure on a (company's value and financial performance), emphasizing its importance in sustainable and integrated reporting. It explores how disclosing HC information can enhance a company's competitiveness, profitability, and attractiveness to investors by demonstrating the strategic management and investment in HC [25, 26]. The study aims to provide insights on the financial benefits of HC disclosure, advocating for practices that improve transparency, stakeholder understanding, and trust, while also addressing the challenges of balancing confidentiality. It underscores the role of HC in achieving sustainable development and enhancing corporate financial value [27]. This research

contributes to directing future research and practices in the field of HC disclosure and its role in achieving sustainability and financial success of companies.

2 Theoretical Aspect, Previous Studies and Developing Hypotheses

The study [11] on the National Insurance Corporation of Eritrea, involving all 73 employees at the company's headquarters, identified challenges in implementing Strategic Human Resource Management (SHRM) practices due to the lack of a formal strategic plan and a shortage of qualified staff, alongside a need for better employee motivation strategies. The study [28], which surveyed 397 employees across various departments in eight Nigerian banks, revealed that HRM practices, especially in reward and employee performance management, significantly influence (the non-financial performance of banks, while employee resourcing had minimal impact. It suggests banks should enhance their reward and performance management strategies to improve non-financial performance).

The study [29] highlighted the critical role of human resources in giving companies a unique competitive advantage in Mogadishu-Somalia, focusing on the "effects of recruitment, selection, and compensation on organizational performance", and found a positive influence of organizational performance on HC. Study [30] examined the influence of HC on the return on equity (ROE) of commercial banks in Jordan using the VAIC model from 2010–2015, revealing HC as a major component of IC but found no significant impact on ROE, suggesting banks to prioritize HC. Study [31] explored the concept of "human capital" in integrated and sustainability reports, proposing a theoretical model for its presentation and developing specific public disclosure indicators, emphasizing the importance of HC in corporate reporting.

The study [32] explores how disclosing intellectual capital (IC) quality affects firm value, based on 110 companies. It reveals a positive link between IC components (structural, human, social/relationship) and firm value, emphasizing the significance of IC disclosure for entities, investors, regulators, and managers in firm evaluations. Meanwhile, study [33] investigated the adoption of Integrated Reporting (IR) in Malaysia, following the MCCG 2017 guidelines, to enhance corporate governance and investor relations. It proposed a framework to explore the role of sustainability reporting in improving IR adoption, aiming to reduce information asymmetry and enhance transparency and value creation among the largest Malaysian public companies.

The study [34] demonstrated that disclosing human capital (HC) information in integrated reports significantly lowers a company's cost of capital and enhances its value, based on an analysis of 375 observations from 125 firms between 2017 and 2019. This suggests that better HC disclosure can mitigate investor risks and improve financial resource access. Study [35] found a significant positive relationship between human capital investment and the sustainable performance of institutions

in M'sila, Algeria, highlighting HC's importance in ensuring institutional success and sustainability, based on feedback from 110 administrative workers across twelve institutions.

Human capital (HC)

The human element "is one of the most important components of intellectual capital (IC)", highlighting the economic value of employees' collective knowledge, skills, and experiences, traces its roots back to Adam Smith's 1776 work, The Wealth of Nations. The term gained prominence in the 1960s with American economists demonstrating HC's direct contribution to income growth [36]. HC is essential for an organization's competitiveness and economic value [37], marked by education, experience, and skills that enhance performance and competitive market advantage [38]. HC is also seen as a strategic, difficult-to-imitate resource, highlighting its importance in leveraging economic resources and driving success [39, 40]. Investing in HC through skill and knowledge development leads to increased productivity, better adaptation to economic and technological changes, and higher profits [41, 42]. Incorporating HC information into sustainability reports, using both financial and non-financial indicators, offers insights into its impact on organizational sustainability and growth, underlining HC's role in economic and social development [43].

Therefore, Sustainable performance indicators can improve a company's financial performance by making it more appealing to investors and customers, reducing risks, and enhancing sustainable returns [44]. The relationship between HC and financial performance is crucial, as it boosts employee commitment, productivity, reduces costs, and increases revenues, leading to better financial outcomes. Integrating financial with sustainable performance grants companies a competitive edge. Transparency in sustainability reporting, especially regarding human capital, can attract sustainability-focused investors and customers, contributing to a company's long-term success and sustainability goals [45].

In summary, the research emphasizes the importance of integrating HC and financial performance data into sustainable reports to enhance transparency and support social, environmental, and financial objectives. HC, highlighting the collective skills, knowledge, and abilities of individuals, "plays a crucial role in economic development and organizational success". The study aims to explore how effectively disclosing HC information can boost investor confidence, increase company valuations, and ultimately improve financial performance, underscoring HC growing significance in achieving sustainability and future growth.

Study problem

However, the main problem is accurately measuring the financial consequences of such disclosure. If these consequences are not carefully evaluated, they may result in additional costs for companies, including costs for developing human capital management systems and training employees. It is also important for companies to understand the impact of such disclosure on the stock market and their relationship with investors, as inappropriate disclosure may reduce confidence and investment.

Therefore, companies must carefully consider the balance between the potential benefits and financial costs of exposing HC [41].

Accordingly, the problem of the study can be formulated through the following main question: "What is the effect of disclosing HC in integrated and sustainable reporting on the financial performance of companies Listed in Palestine Stock Exchange?".

Study hypotheses

H0: There is no statistical significance about the effect of disclosing HC in integrated and sustainable reports on the financial performance of "companies Listed in Palestine Stock Exchange" at the significance level (0.05).
H1: There is no effect between WACC and HCDL at the significance level (0.05).
H2: There is effect between TQ and HCDL at a significance level (0.05).

3 Methodology

Study population and sample

The study population includes (joint-stock) companies listed on the Palestine Stock Exchange. The study sample was 30 companies selected. Financial companies represented in different sectors were excluded, noting that the study will take place over a period of five years (2018–2022). However, Table 1 shows that 5 companies were taken from (the insurance sector and 4 from the banking sector, 6 from the services sector, 8 from the industrial sector, and 7 from the investment sector).

Measuring variables

First: Independent variables:

In this study, the "independent variable" is identified as the level of disclosure of human capital (HCDL), which is quantified using a manual content analysis approach. Krippendorff [46] content analysis is defined as a methodological approach utilized in research for drawing valid and reliable conclusions from data, taking into account the context of the data.

Thus, identifying elements that represent more specific and precise elements, that is, if the level of disclosure about HC that the joint stock companies disclose within the integrated reports is measured. The identified elements were sorted and analyzed, resulting in the removal of certain items and the consolidation of others

Table 1 Selected sample

Total	Investment sector	Industry sector	Insurance sector	Services sector	Banking sector	Year
30	7	8	5	6	4	2022–2018

to prevent duplication. This evaluation was conducted using a binary system, minimizing subjectivity in the assessment of our "independent variable" and facilitating comparison with other studies on HC detection for each element [46Scores are assigned a value of 1 if an element is present and 0 if it is absent [47, 48]. Consequently, HCDL scores may vary from 0 to 30, as illustrated in Table 2, As shown in Table 2, the survey list was developed from a study referenced as [34]. The researchers adapted it to better fit the Palestinian context. They selected 30 companies to observe over a period of 5 years, indicating that there should be a total of 150 observations.

Second: Dependent variables:

The study utilized "two (dependent variables): the Cost of Capital (WACC) and the TOPIK (TQ)", which represents that the (cost of capital) is a measure used to calculate the average "cost of capital" for a company, and it includes both the cost of debt and the cost of equity. WACC is commonly "applied as the discount rate for assessing the viability of future investments or projects". It is a way to measure the cost a company incurs to finance its assets. WACC is calculated as follows (Table 3).

WACC represents the total capital cost for a company, calculated by "averaging the costs of debt and equity capital", weighted according to the proportions used in previous research methodologies [49].

(Tobin's Q) is a gauge used in financial analysis to evaluate companies. It was developed by James Tobin, Nobel Prize winner in economics. This measure compares a company's total market value to the total book value of its assets. This measure was introduced [13] as an indicator of a company's future investment activities. The TQ law calculates the ratio of the total market value to the total book value of physical assets [13].

Third: Control variables:

See Table 4.

Statistical analysis

In order to reach the results of the study and test the validity of the hypotheses, the statistical package program Spss and Excel was used, by analyzing the data available in the "financial statements of stock companies listed in the Palestine Stock Exchange".

- Descriptive analysis of study variables

Table 5 shows "the arithmetic means and standard deviations for the study variables". The dependent variables are the WACC of 6.9% and the TQ of 75.09%. These results are consistent with previous studies [52, 54–56]. As for the independent variable HCDL, the average value is 11.3, and the minimum ranges from 7 to the maximum of 15. As for the (control variables), the "average values" for LNTA are 16.78, MTA is 1.18, DA is 11.3%, SG is 13.81%, and ROA is 3.97%. Thus, the WACC indicates that the company is obtaining financing at a relatively low cost, which reflects efficiency in managing its financing structure. On the other hand, a TQ of 75.09% indicates that the market values the company as being worth less than

Table 2 HC

value of 0.713, while the correlation coefficient between HCDL and WACC with a value of 0.205 is a "weak positive relationship". As for the control variables, the relationship between HCDL and the control variables is very weak, while the relationship between TQ and MTB is strong at 0.662 and the rest of the variables are very weak, while the relationship between WACC and ROA is strong at 0.630 and the rest of the variables are very weak.

Regression analysis and hypothesis testing

To test the "validity of the study hypotheses" and to know the impact of disclosing the level of HC disclosure as part of integrated and sustainable reports, a simple and multiple linear regression model was used, and the results of the regression analysis were as follows:

First hypothesis: There is no effect between WACC and HCDL at the significance level (0.05).

Whereas Tables 7 and 8 shows the effect of a relationship between the WACC and disclosure of the level of HC. The results of the statistical analysis showed that (there is no statistically significant effect between WACC and HCDL), as the correlation coefficient reached 0.205 at the significance level (0.05), that is, there is no effect between WACC and HCDL. The correlation between the two variables is weak.

The adjusted R square was 0.042, meaning that disclosure of the level of HC explains 4.2% of the WACC. The value of the degree of influence (the slope of the regression equation β) was -0.045. This means that the beta value is very small, and

[a]"Dependent Variable": WACC

this influences the reduction of capital costs via disclosure through the level of risk in estimating its impact on investors' preferences and information asymmetry. The value of F reached – 0.589, which is not significant at the significance level (0.05 > a), and this is confirmed by the fact that Sig F equals 0.557, and this "value is greater than the level of significance (0.05 > a)", so it confirms that acceptance of the hypothesis.

The following model measures these variables:

$$\mathrm{H1}: \mathrm{WACC} = \alpha 0 + \alpha 1\,\mathrm{HCDL} + \alpha 2\,\mathrm{LNTA} + \alpha 3\,\mathrm{DA} + \alpha 4\,\mathrm{MTB} + \alpha 5\,\mathrm{ROA} + \varepsilon$$

Second hypothesis: There is effect between TQ and HCDL at a significance level (0.05).

Whereas Tables 9 and 10 shows the effect of (a relationship between Tobin's Q and disclosure of the level of HC). The results of the statistical analysis showed the presence of a statistically significant effect between TQ and HCDL, as the correlation coefficient reached 0.713 at a significance level of (0.05), meaning that the relationship is strong between the two variables.

The "adjusted R square" was 0.509, meaning that disclosure of the level of human capital explains 50.9% of TQ. The value of the degree of influence (the slope of the regression equation β) was 0.495. This means that managers use HC to improve and

Table 9 The strength of the connection between TQ and HCDL

	SG	0.013	0.075	0.008	0.170	0.865

[a]Dependent Variable: TQ

enhance the value of the company and thus reduce TQ through non-diversifiable risks to estimate and enhance investors' outlook regarding the company's earnings potential and expansion. F reached a value of 8.493, which is A function at a significance level of (0.05 > a), and this is confirmed by the fact that Sig F equals 0.000, and this value is less than the significance level of (0.05 > a), so it confirms that accepting the hypothesis. These results are consistent with previous studies [55, 57, 58].

The following model measures these variables:

$$H2 : TQ = \alpha 0 + \alpha 1\, HCDL + \alpha 2\, LNTA + \alpha 3\, DA + \alpha 4\, SG + \alpha 5\, ROA + \varepsilon$$

4 Conclusion

This research demonstrates the importance of disclosing HC as part of integrated reports and sustainability reports in improving investors and stakeholders' understanding and appreciation of the role of HC in achieving the success and sustainability of joint stock companies in Palestine. By analyzing the financial and economic consequences of such disclosure, we find that there is an opportunity to enhance transparency and build trust between companies and all stakeholders. Striking the balance between maintaining confidentiality and disclosing sensitive information remains an ongoing challenge. However, "companies can benefit from the guidance of this research to develop better and sustainable disclosure practices that contribute to enhancing the financial value of the company".

The Weighted Average Cost of Capital (WACC) standing at 6.9% suggests that the company is able to obtain financing at a relatively low cost, reflecting an efficient management of its financing structure. Conversely, Tobin's Q ratio at 75.09%

indicates that the market values the company lower than the replacement value of its assets. This discrepancy could signal a conservative market stance towards the company's growth prospects or overall market valuation.

A significant positive correlation has been identified between TQ and HCDL with a coefficient of 0.713, illustrating a strong relationship. However, the correlation between HCDL and WACC is relatively weak, with a coefficient of 0.205, indicating only a slight positive association. Other study variables show no significant relationship, highlighting their weak impact within this context.

The research reveals that increased transparency in human capital information significantly lowers the firm's (cost of capital). This phenomenon suggests that by enhancing HCDL, companies can reduce the perceived risk among investors, leading to a decrease in capital costs.

Furthermore, the study notes "a positive impact on the company's value" associated with higher levels of risk disclosure. This observation suggests that improved disclosure regarding HC correlates thus improving the company's value by facilitating greater access to external financial resources.

The financial advantages of HC disclosure prompt firms to offer more comprehensive details on their HR within integrated reporting. This practice not only lowers the cost of capital but also increases the company's value, supporting the broader adoption of integrated reporting.

These findings underscore the importance of interconnectedness in preparing integrated and sustainable reports. They highlight how such reporting can aid in understanding (the value creation process and improve decision-making among investors).

Finally, the study offers empirical evidence that transparent and comprehensive reporting on HC serves as a mechanism to mitigate investment risks and enhance the company's value. It posits that HC disclosure transcends corporate transparency, carrying significant financial implication.

Based on the findings of the previous study, researchers have made several recommendations to enhance "the financial performance and sustainability" of companies through improved HC disclosure. They suggest that companies should enhance the transparency of their integrated reports by offering detailed and clear information about human capital. This includes insights into training and development, well-being, organizational culture, and other relevant areas.

There is an emphasis on increasing both internal and external training courses for employees at all job levels to develop their knowledge and keep them updated on new developments in their work fields. The recommendations extend to banks, advising them to invest in HC by employing competent and experienced individuals and providing training for current employees. Moreover, it is suggested that financial rewards be given to experienced employees who possess practical and scientific competencies capable of supporting company objectives, thereby enhancing productivity and positively influencing financial performance, which is foundational for sustainable growth and achieving strategic goals. Improving the quality of HC disclosure is identified as crucial since such disclosure can lead to reduced capital costs and increased company value. Companies are encouraged to provide more

detailed and specific data regarding employee development, training, organizational culture, and other HC aspects to improve investors' and stakeholders' understanding. Linking HC information directly "to the company's financial performance is recommended to demonstrate how HC contributes to the company's financial and competitive success". Additionally, companies are urged to underscore the role of HC in governance strategies and its contribution to achieving sustainability and corporate social responsibility goals.

Finally, the use of modern technology for analyzing and presenting HC data is advocated to offer deeper and more accurate insights, facilitating a more comprehensive understanding of HC impact on company performance and value.

Improving Marketing Mix Elements with Artificial Intelligence: A Comprehensive Review

Hanady Al-Zagheer, Qais Hammouri, Ayad Fadhil Altememi, and Ibrhim Abu Nahleh

Abstract Artificial intelligence (AI) is closely linked to economic and administrative development, as artificial intelligence plays an important role in shaping and transforming various aspects of the national and international economy and administrative and marketing practices at all levels and in all types of business establishments. Integrating AI technologies and methods into marketing methods and systems has the potential to stimulate and drive innovation, enhance productivity and market share, improve decision-making processes, and create new opportunities for growth and sustainable marketing development. The current paper aims to propose a model link between the artificial intelligence tools and the marketing mix elements in order to be used by all types of companies. It also aims to identify the impact of these technologies on reaching the target audience, improving user experience and customer interaction, and measuring their impact on marketing using social media.

Keywords Artificial intelligence · Marketing mix · Big data · Tools

1 Introduction

Today, the world is going through the fourth industrial revolution, also known as the digital transformation phase, It adopts digital technologies in all fields, and artificial intelligence is one of the most important of these in the process of digital transformation, although it was developed several years ago, over the course of those many years it has become one of the most important modern trends in the field of marketing,

and one of the most important technologies that must be used in order to survive and continue [1]. Its application is not limited to, it applies to companies concerned only with the field of technology, but also with all specializations, without being restricted by size. Artificial Intelligence is on the cusp of a major transformation in the world of marketing, by automating processes, promoting personalized marketing, and significantly changing the way ideas are generated, paving the way for a new era of marketing capabilities [2].

The facility's goal can be considered cheaper, faster, more accurate, and more efficient than the human factor because it has a positive impact on gaining customer satisfaction by providing products that compatible with their needs and desires, and it is also expected that there will be a breakthrough and rapid growth in the customer service sector of 31% until 2026, especially since the time of the pandemic of Corona, with closures and home quarantine, forcing customers to rely on internet tools-especially the artificial intelligence one such as automated conversations to obtain information and make decisions about purchasing products and making choices between brands [3].

As a result of the importance of that role provided by practices artificial intelligence for online store owners and with the continuous increase in the number of people dealing with them, the current paper is interested in showing the importance of improving marketing mix elements with artificial intelligence.

On other hand, there are several potential drawbacks resulting from utilizing AI in digital transformation. Such challenges include lack of authenticity, which is considered as one of the main ethical concerns surrounding AI in marketing is the potential erosion of authenticity. With the advent of AI-generated content, it has become difficult for audiences to distinguish between real and artificial influencers. Blurring the lines can lead to a loss of trust and credibility in the influencer marketing industry. Moreover, deceptive practices is one of the main challenges resulting from AI in digital transformation field, where AI-powered influencer marketing can also lead to deceptive practices, such as deepfakes. Deepfake technology involves using artificial intelligence algorithms to manipulate or manufacture videos or images that appear realistic but are completely artificial. This technology can deceive audiences by creating fake endorsements or testimonials from influencers without their knowledge or consent. Also, loss of human connection is another ethical implication of AI in influencer marketing and advertising is the potential loss of human connection and real interaction. As AI algorithms become more sophisticated, they can mimic human behavior and engagement, making it difficult for audiences to differentiate between AI-generated content and human-generated content. The last challenge is unfair competition, where the use of AI in influencer marketing and advertising can create an unfair competitive landscape, especially for micro-influencers or content creators who do not have access to advanced AI technologies. AI algorithms can create content at a rapid pace, target specific demographics and improve engagement, giving brands an unfair advantage in reaching and influencing audiences. For example, if a brand uses AI-generated influencers to promote its products, it could potentially dominate the market by flooding social media platforms with personalized content. This can make it difficult for human influencers to compete on equal

footing, as their authenticity and creativity may be overshadowed by AI-generated influencers with superior reach and engagement metrics.

2 Literature Review

Big data, AI (Internet of things), and intelligent artificial things have all seen remarkable technical advancement, which has a significant impact on how businesses function [4]. In comparison to more conventional approaches, these technological advancements allowed for the development of cutting-edge digital solutions that gave businesses an edge in the marketplace by attracting and retaining customers. When it comes to AI in particular, it is thought to be the most impactful technology on these businesses [2].

Businesses have found ways to use AI in their marketing campaigns to better understand their customers, make predictions about their actions, and ultimately satisfy their wants and needs [5]. There is a plethora of current uses for artificial intelligence. In contrast to its lethal uses in wars, whether through military robots or drones, there are security and military applications, such as programs that can distinguish and recognize faces [6]. These programs can also deal with electronic attacks and even launch attacks that penetrate opponents' cyber systems. On the other hand, there are medical applications, like those not only can these apps detect and remove cancers, but they are also integrated with social media platforms [7]. These applications have started to make their way into the artificial sector, and they've already accomplished a lot, from mundane office and factory duties to things that humans just can't do.

Humans are capable of doing it, for example, in space or the oceans. An additional area where AI has proven useful is in accurately predicting product demand and supply [8]. More precise sales volume and consumer trend forecasting, as well as the opportunity for greater storage operations management, can be achieved with the use of artificial intelligence approaches. With the right combination of smart robots and efficient logistics, AI can assist marketing professionals in seeing the future [9]. For example, cutting-edge text analysis tools and the technological roadmap for the future of the business additionally, several industries make use of machine learning algorithms to analyze client data and pinpoint the most suitable target audience, including online shopping, finance, and tourism [10]. When compared to humans, artificial intelligence is better able to handle massive amounts of data. Considering every conceivable scenario, the AI system is programmed to keep an eye on its surroundings and respond accordingly. By analyzing a machine's past performance, artificial intelligence may foretell when it might break down, allowing us to plan accordingly [11]. Brainpower differs. When compared to traditional automatic systems, which are able to carry out the same mundane tasks over and over again, artificial intelligence systems are able to learn from their mistakes and adapt to new situations without requiring any further programming [12].

However, there are several challenges and limitations resulting from the adoption of AI in marketing mix including data accuracy and availability, where cost model simulators rely heavily on accurate and reliable data. Ensuring the availability of such data can be a challenge, especially when dealing with complex and dynamic cost structures. Companies need to invest in data collection, integration, and verification processes to overcome this challenge. The second challenge is model complexity, where cost model simulators can be complex, and require a certain level of expertise to run effectively. This complexity may pose a challenge for companies with limited resources or technical knowledge. Investing in training and internal capacity building can help overcome this constraint. Thirdly, assumption sensitivity where cost model simulations depend on certain assumptions and inputs. The results obtained are sensitive to these assumptions, which may change over time or in response to market dynamics. Regularly reviewing and updating assumptions is critical to maintaining the accuracy and appropriateness of simulations. Fourthly, Integration with existing systems, where integrating the cost model simulator with existing systems and software can be difficult. Compatibility issues, data transfer complexities, and the need for IT support may arise. Working closely with IT teams and seeking vendor support can help overcome these integration challenges. Finally, cost and resource Investment were implementing and using a cost model simulator requires an investment in terms of cost, time, and resources. This investment may be a disadvantage for small businesses or those with limited budgets. Conducting a cost-benefit analysis and exploring cost-effective options can help overcome this limitation.

2.1 Artificial Intelligence

The combination of the words "intelligence" and "artificial" yields the term "artificial intelligence," which means the capacity to comprehend novel contexts [13]. Intelligence is evolving and novel, says Webster's. The definition of the word "artificial" is anything that is the product of deliberate and intentional human intervention, whether that is the creation of an object or the execution of an action. Artificial intelligence (AI) is defined as a subfield of computer science [14].

As a field of study, artificial intelligence (AI) relies on creating gadgets and computer programs that can mimic human thought processes, including learning, decision-making, and action-simulation [15]. Hence, AI is the study of how computers can mimic human intelligence. This is achieved by studying human behavior in controlled environments, recording how people react, think, and handle these challenges. The goal then is to develop AI systems that can mimic human intelligence. Intricate computer system. Therefore, AI-defined machines and programs learn, gather data, analyze it, and make decisions based on these analyses in a manner that is like human thought processes [16]. The field known as "artificial intelligence" studies how to program computers to mimic human intelligence. Acting is innate to

the human condition and touches on many different areas, such as handling conversational language, robotics, identifying voice, advanced neural networks, and expert systems [17].

The retail trade, healthcare, education, financial services, manufacturing, and energy sectors are among those that have been significantly impacted using artificial intelligence [18]. By constantly analyzing and learning from both historical and real-time data, machines equipped with AI can, for instance, evolve into self-improving production systems that optimize their own operations [15]. Cites the usage of AI in retail trade as another example, specifically in the areas of electronic customer care and order processing, where the technology helps businesses gather and understand consumer wants and needs [19].

AI was first proposed in the 1940s and eventually reached Artificial intelligence skills that were previously impossible owing to a lack of data are now a reality because of numerous factors, one of which is the availability of vast quantities of big data from a variety of sources. Furthermore, numerous facets of AI have been advanced because of the presence of open-source communities on various social media platforms that create and share AI tools and applications [20]. By developing B computer programs that can mimic intelligent human behavior, the field of artificial intelligence seeks to comprehend the essence of human intelligence. The capacity of a computer program to choose the best course of action to take to resolve an issue or arrive at a conclusion given only a description of the problem or circumstance is what this term refers to. We will likely have to take 80% of the time off in many circumstances when computers can do some repetitive or hard work, according to scientists. This will happen within the next several years. Possible options: The greatest challenge humanity has is formulating moral guidelines for computers. Now, UNESCO is putting an emphasis on a worldwide consensus regarding the ethical aspects of AI in the fields of education, the natural sciences, the social sciences, and the humanities. When it comes to AI, UNESCO follows the guidelines laid out by culture, communication, and information [21]. Under the United Nations' framework for the universality of the Internet and the so-called "Rome Principles," which assert that the four pillars upon which knowledge societies are built—being rights-based, being open, being available and accessible, and being multi-stakeholder—digital transformation and digital governance in general should be governed. The development of artificial intelligence is guided by UNESCO's vision of knowledge societies [22].

2.2 Artificial Intelligence and Marketing Mix

In today's business world, firms across all industries rely on various forms of artificial intelligence. AI is widely recognized by both academics and practitioners. Given the rapid technological advancement that has linked the entire planet into a single network, businesses will be guided by the technologies of the future [23]. However, it should be mentioned that gaining a competitive edge is not just about knowing the

client and what he wants; it's also about making solutions that meet those wants and needs so that the customer is happy and loyal to the business [12].

2.3 Artificial Intelligence in Product Management

Discovering and identifying the most suitable product for the consumer, considering his needs and preferences, is made much easier with the use of market analysis approaches based on artificial intelligence. Providing a product that meets the customer's expectations is the company's success [24]. The marketing team can better understand the consumer's wants and needs and create a product that caters to them thanks to the tracking of the specific artificial intelligence aspects that the customer searched for and their unique attributes [12]. All things considered; AI enables the business to match product needs with client wants.

2.4 Artificial Intelligence in Distribution Management

Availability and the simplicity of purchasing the product and its components are two of the most essential factors for customers. There are a lot of routine, repetitive, automated tasks that make up the supply chain and are a part of distribution. Consequently, AI becomes crucial in assisting the company's management, who oversee overseeing the distribution activity and its ancillary tasks using various technological means [25]. Things include deploying drones, depending on robots to figure out the best way to package things, command, and control of transportation systems, as well as consumer-facing equipment and robots services provided by the government, for example, can be more adaptable and rely on machine learning, which boosts consumer satisfaction [26].

2.5 Artificial Intelligence in Promotion Management

Advertising campaigns and promotional content need careful planning and scheduling to be successful. The rise of digital marketing and social media marketing has revolutionized traditional advertising strategies by moving them online. Where things shifted various positions: these days, it's all up to the buyer in terms of when, when, and what he purchases [27].

2.6 Artificial Intelligence Application in Marketing

There are several AI applications utilized to support marketing activities, the first application is Chatbots. This term refers to computer programs that are designed to assist online customers with a variety of tasks, including answering their inquiries, providing support, and facilitating the completion of purchases [28]. In which cases, websites and social media profiles can incorporate chatbots. Chatbots make it easier for customers to engage with the brand and provide better service overall. These bots can handle a high volume of customers simultaneously, and support is available at all hours of the day and night [29]. Because of chatbots' low cost and effectiveness for clients, many firms have begun to rely on them [30]. The second application is Surfer SEO app, which refers to a comprehensive tool designed to assist content creators and digital marketers in optimizing their content for search engines. It provides analysis and insights based on key SEO factors like keyword usage, content structure, and the density of terms within the content. By analyzing over 500 on-page signals, Surfer SEO helps users align their content with ranking factors that are correlated with higher positions in SERPs. The application offers a user-friendly interface that recommends real-time adjustments for written content, making it more competitive and relevant to a target audience. It also has features for audit and content planning, which are instrumental in crafting an effective SEO strategy. With Surfer SEO, users can streamline their SEO efforts, ensuring that their digital content is not only high-quality but also fully optimized for better visibility and ranking on search engines [31, 32]. Moreover, using identifier tags, engagement, search history, and other digital actions, artificial intelligence systems can assess the customer's profile. Products' prices are thus calculated mechanically. Use of this technology allows hotel booking sites, travel agencies, and airlines to automatically adjust prices based on factors such as room occupancy rates, tourist season, past bookings, customer experience, and statistics. The third application is promotional personalization, using information about a user's location, age, gender, and other personal characteristics gleaned from their browser cookies and history, AI can provide highly personalized advertising [33]. You can see this in adverts on Google and social media platforms like Facebook and YouTube. In contrast, YouTube advertisements typically relate to what you were searching for or viewing on Google if you conduct a search and then visit the video-sharing website. In this scenario, algorithms powered by artificial intelligence examine a user's online behavior and search history to provide targeted adverts based on his interests and requirements [34, 35].

3 The Proposed Model

With the increase of the Internet, the number of products being marketed electronically with technology increases Internet pages; Artificial intelligence technology has emerged as one of the most important modern technologies that represents for,

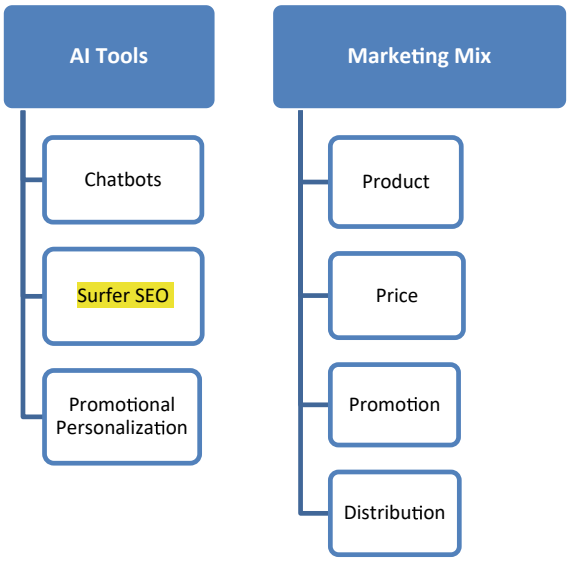

Fig. 1 The proposed model

which have been widely used in the field of marketing, through technology Companies and institutions to increase the effectiveness and success of their marketing process. With increasing development Technology: The world is moving towards investing in modern technologies, especially those related to intelligence. The enormous benefit and impact of applying artificial intelligence and the value it represents, considering AI on the domestic product is added to the companies that exploit it in all fields, in addition to the impact on global production. Because of the need to study and try to develop a model that links artificial intelligence tools and the elements of the marketing mix. The following figure represents a proposed model that can be used in all types of companies, regardless of whether they are local or international companies—as shown in Fig. 1.

4 Discussion

There are now only a few pilot projects using generative AI in marketing, and they are all quite simple to incorporate into current systems. Companies can now develop targeted marketing campaigns, reply, and connect with client feedback more efficiently, and produce content and graphics faster with the help of these technologies. On the other hand, these resources assist businesses cope with AI and build their AI skills for future usage, freeing up workers to concentrate on higher-priority activities. When compared to other technologies that could necessitate investments over

an extended period before they start to provide observable benefits, artificial intelligence's capacity to produce rapid and concrete outcomes is a major selling point for its inclusion in the marketing mix.

Because of artificial intelligence (AI), personalized marketing efforts are now a reality. Using AI to sift through unstructured client data has many advantages, not the least of which is the fact that specialized marketing stands to gain more from more precise analyses of consumer habits.

The scope of marketing process automation has expanded beyond its earlier incarnations. One of the most important things marketers do is help different parts of a company work together more effectively. More and more chances arise in today's businesses to automate interactions between marketing, sales, R&D, product development, and other departments, including legal reviews, thanks to modern technology. One use case for AI is helping direct-to-consumer retailers streamline processes like order processing and customer service. Using AI, tasks like automating data retrieval from the backend, making necessary adjustments, and reacting to clients in a manner consistent with the brand may be accomplished. A four-minute decrease in average issue resolution time and an eighty percent decrease in initial response time. Additionally, AI frees up the customer care crew to concentrate on more intricate interactions with clients. Media plans, quarterly reviews, strategic plans, and meeting agendas are just a few examples of the many marketing materials that could benefit greatly from being produced more efficiently.

To find new chances and ideas, businesses are turning to AI technology. Methods include researching market trends, polling customers, and evaluating potential new items. This method helps shorten the time it takes to bring new items to market, make testing more effective, and improve the efficiency of new products overall. Data mined from millions of online comments, images, and videos can help many businesses find untapped niches in the market and inspire new product developments.

As more and more businesses investigate the possibilities presented by AI, it's crucial that these initiatives align with their overall marketing goals. It can be challenging to effectively implement lessons learned when a multitude of AI-related projects are adopted without a sound plan, which can result in high costs and trouble tracking without reaching the desired outcomes. On the contrary, businesses would do well to zero in on a handful of use cases where the current state of artificial intelligence (AI) capabilities can have the most noticeable effect.

5 Conclusion and Recommendations

Insights generated by AI marketing tools provide valuable information about customer behavior, preferences, and trends, enabling businesses to make informed decisions and create targeted marketing strategies that resonate with their audiences. By harnessing the power of AI tools, companies can improve their marketing efforts, stay ahead of the competition, and build long-term customer relationships, artificial intelligence tools in marketing general and to use in improve the marketing mix is

considered a door that provides the opportunity for small business establishments, their services at the local and global levels, so these institutions must be developed Enabled by using communications technology and information. For companies and indirect electronic transactions and the necessary direct support for trade preparation. Rules, regulations, procedures, and wages to convert to electronic systems. The beneficiary shall serve the user 24 h a day during the design of the aviation companies' website, And 7 days in the week. Considering the conclusions we reached, we decided to use artificial intelligence tools to enhance the elements of the marketing mix.

To benefit from this, the researchers recommend the following recommendations:

Enhancing employees' awareness of modern tools and techniques for developing work. Requiring users of electronic marketing systems to use modern technology to quickly respond to customer services. Providing legislation and laws to govern artificial intelligence tools to ensure that personal data is not stolen and is Property rights. Providing all financial and material requirements in terms of the technologies used in companies. Benefiting from previous experiences that were applied in some developed countries. The training program for employees makes them more efficient in using advanced artificial intelligence techniques used in companies to enhance and increase the marketing mix. However, there are some ethical challenges still face us when using artificial intelligence in the marketing mix, including: high cost, deep technical expertise required, training data biases, inability to generalize, reducing the number of human-based jobs and increasing unemployment rates.

Examining How the Quality of E-Government Services Influences Beneficiary Satisfaction: SANAD Application as a Case Study

Zakaria Azzam and Ayser Abu Ghazaleh

Abstract The purpose of the research is to examine the effect of electronic government services' quality on satisfaction of the beneficiaries through field study on "SANAD" application in Jordan. In order to achieve the objectives of the study, a descriptive-analytical approach is employed. A questionnaire consisting of 62 items was purposively distributed to 500 beneficiaries of the SANAD application, resulting in 450 responses that were used for analysis. The researchers utilized SPSS & Amos software to appropriately analyze the collected data using statistical methods. The findings of the study revealed that the dimensions of electronic government service quality, including ease of use, reliability, responsiveness, trust, privacy, and data security, have a significant impact on beneficiary satisfaction. Based on these findings, several recommendations are made. These include the need to enhance the quality of electronic government services across all dimensions, provide training programs and workshops for SANAD application operators to improve their skills in delivering high-quality electronic government services, establish transparent information provision to build trust between users and government entities, improve communication mechanisms with beneficiaries to better understand and meet their needs, and invest in technology development and necessary infrastructure to support the effective and secure delivery of electronic government services.

Keywords Electronic service quality · Electronic government services · SANAD application · Jordan

1 Introduction

The advent of Information and Communication Technology (ICT) has brought about a significant transformation in the realm of information, serving as the principal benchmark for assessing a nation's advancement in the twenty-first century. This swift progress has resulted in a shift in conventional notions regarding modes of interaction between nations and organizations, enabling the surmounting of temporal and spatial constraints [1]. Consequently, ICT has assumed a crucial and impactful role in facilitating the execution of transactions and services at the national, organizational, and individual levels [5].

In order to enhance their services and ensure accessibility for beneficiaries, government organizations are increasingly recognizing the necessity of implementing electronic transformation [7]. This comprehensive program not only involves the integration of technology within the organization, but also encompasses the delivery of services to the target audience. Moreover, electronic transformation facilitates the interconnection of various government sectors, allowing for flexible collaboration and joint operations. The growing urgency for organizational electronic transformation can be attributed to the rapid advancement of information and communication technology (ICT) tools, which have become integral in both governmental and private transactions.

Government electronic services have dual benefits for both the government and its citizens. From the government's standpoint, these services offer significant advantages by saving time, money, and eliminating geographical limitations, thereby contributing to cost reduction [10]. On the other hand, citizens benefit from electronic services as they save time, effort, and money [2]. In recent years, the evaluation of electronic government services from the perspective of beneficiaries has emerged as a prominent area of interest for scholars and professionals. It is crucial to increase the number of beneficiaries utilizing electronic government services in order to ensure their effectiveness and success [7].

The SANAD application in Jordan functions as a conduit for individuals to access digital government services. It offers the convenience of using a single username and password, eliminating the need for multiple passwords. Moreover, it facilitates the establishment of a digital identity, allowing users to access government documents, apply for both governmental and private services, retrieve personal records, electronically sign documents, and make bill payments. Despite the impressive download count of 3.25 million, only 0.81 million beneficiaries have activated their digital identities.

The decline in the number of individuals benefiting from government electronic services may be attributed to the overall quality of these services across various dimensions such as ease of use, reliability, responsiveness, trust, privacy, and data security, as highlighted in a study conducted by [21]. A went further into detail, explaining that user satisfaction with e-government services is essentially a psychological yardstick. It is based on how users cognitively evaluate their past interactions with the government's electronic platform. Consequently, the present study primarily

focuses on assessing the quality of government electronic services provided through the Sanad application as an indicator of beneficiary satisfaction with these services.

1.1 The Problem of the Study and Its Questions

The "Sanad" application serves as a portal for individuals in Jordan to access various government electronic services. By using a single username and password, users can conveniently log in without the need for multiple passwords. This platform allows individuals to establish a digital identity, granting them access to government electronic documents, the ability to apply for both government and private sector services, view personal records, electronically sign documents, and make bill payments. However, according to a report by the United Nations Economic and Social Commission for Western Asia (UNESCWA) in 2022, the utilization rate of the service and overall satisfaction among beneficiaries was only 56.09%. This ranking places Jordan fifth out of the 19 Arab countries assessed. There are certain technological challenges that stand as barriers to the e-government setup in Jordan: a dearth of shared standards between departments and their infrastructural compatibility, stifling coordination. It is not just that though; there is also this looming cloud of doubt when it comes to privacy and security for those who stand to benefit [5]. These obstacles seem to be scaring people off from using the Sanad application despite an impressive pool of over 6 million possible users (Sanad, 2024). These challenges have led to a decrease in active participants on Sanad, even with such an enormous potential user base.

Several researchers including [10, 17, 18] have pointed out the various dimensions of e-government service quality that could majorly affect the satisfaction of the recipients. These dimensions include ease of use, reliability, response time, trust, privacy and data security.

Based on the above, the research problem can be formulated with the following questions:

Main question: What is the impact of the quality of Jordanian e-government services through the Sanad application on beneficiary satisfaction?

1.2 Study Objectives

The study aims to identify:

1. The impact of the quality of Jordanian e-government services through the Sanad application on beneficiary satisfaction.
2. The impact of the ease of use of Sanad application services on beneficiary satisfaction.

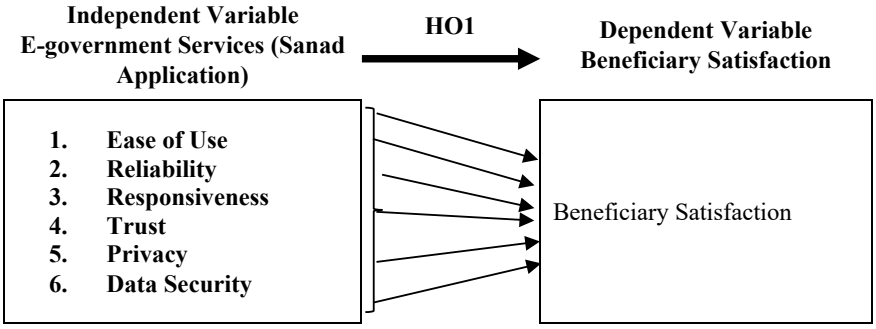

Fig. 1 Study model

3. The impact of the reliability of Sanad application services on beneficiary satisfaction.
4. The impact of the responsiveness of Sanad application services on beneficiary satisfaction.
5. The impact of trust in Sanad application services on beneficiary satisfaction.
6. The impact of privacy in Sanad application services on beneficiary satisfaction.
7. The impact of data security in Sanad application services on beneficiary satisfaction.

1.3 Study Model

Based on the findings of [1, 3, 5, 9–14, 9–14, 21], and after making adjustments suitable for the current study, the study model has been designed as shown in Fig. 1.

1.4 Study Hypotheses

The study hypotheses can be formulated as follows:

- Main Hypothesis (H01): "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) of the quality of Jordanian e-government services through the Sanad application on beneficiary satisfaction."

2 Theoretical Framework

- **Service Quality**

Beneficiary satisfaction, as defined, is the culmination of beneficiaries' assessment of the service institution's performance in relation to their expectations. This assessment involves comparing their perceived needs with the actual service provided. The operational definition of beneficiary satisfaction in the context of the Sanad application is the variance between the anticipated service prior to usage and the experienced service after usage. This variance is gauged using a scale consisting of 45 statements.

- **E-government**

According to Joghi and Atiya (2020), e-government refers to the utilization of information and communication technology, such as computers, communication networks (specifically the internet), software, and other related tools, to deliver government services and engage in democratic interactions with citizens (p. 157). In the context of Jordan, e-government is operationally defined as the initiatives undertaken by the relevant authorities to provide government services through the Sanad application, with the aim of enhancing efficiency, reducing resource expenditure, and saving time for the beneficiaries.

- **Beneficiary Satisfaction**: The assessment of service quality is determined by the degree to which the beneficiary's desires are met, as they evaluate the obtained outcomes against their initial expectations [15], In the context of the Sanad application, service quality is operationally defined as the level of satisfaction experienced by beneficiaries in relation to their specific needs and desires. This measurement is based on a range of statements, spanning from 45 to 62.
- **Ease of Use**: The idea being looked at is introduced by [18] and focuses on people's skill level in using e-government portals regardless of age and educational backgrounds (p. 1446). Features in the operational definition of this term are the features and services available in the Sanad application that provide easy access and navigation, and are rated for differences in instructions ranging from one to four.
- **Reliability**: According to [18] this "ability to engender trust among users through the provision of services" is fundamental to an e-government portal. This capability is operationally measured as the degree to which it enables beneficiaries to transact with the government through the Sanad application, measured on a five-point scale and aggregated across five statements.
- **Responsiveness**: A very important feature of an effective e-government portal is its ability to provide the service to the user in a timely manner [16, 21]. This idea is defined in practice as how well the Sanad application can deliver its services without any delay to the beneficiaries which is determined by various statements covering items 14–20.
- **Trust**: The accurate and reliable provision of services by an e-government portal is a crucial factor [3, 4, 10, 15]. In this study, the operational definition of this factor refers to the extent to which beneficiaries of the Sanad application perceive that it effectively fulfills the objectives of the service. This perception was measured using a set of statements ranging from 21 to 29.

- **Privacy**: The concept being discussed pertains to the ethical practice of refraining from utilizing the personal information and transactional behaviors of beneficiaries in electronic transactions for any purposes beyond those related to business activities. In operational terms, this refers to the degree to which the Sanad application preserves the data of beneficiaries without engaging in any secondary utilization, and this is assessed through the examination of statements ranging from 30 to 37.
- **Data Security**: The concept of cybersecurity refers to the capacity of electronic services to effectively safeguard against unauthorized access, particularly in relation to financial information. In this study, cybersecurity is operationalized as the level of challenge encountered by potential intruders when attempting to breach the Sanad application and access users' data. This measure is assessed using a range of statements, specifically from item 38 to item 45.

3 Study Methodology

The methodology employed in this study is descriptive and analytical in nature. It involves the utilization of a model derived from existing research, which is then assessed through the development of a questionnaire designed to measure the variables represented by the model. This questionnaire is subsequently administered to a representative sample. To test the hypotheses formulated in this study, statistical software such as SPSS (version 22) and AMOS (version 23) will be employed. The following section provides a comprehensive overview of the key elements comprising the adopted methodology and the tools utilized within it.

3.1 Study Population and Sample

The scope of this study encompasses individuals who utilize e-government services in Jordan. Enumerating the entire study population presents a challenge; therefore, following the guidelines of [20] was observed; they suggest a sample size ranging from 30 to 500. This study will adopt a purposive sampling approach to select a sample size of 500 e-government service beneficiaries in Jordan.

3.2 Study Instrument

In order to accomplish the objectives of the study, a comprehensive review of previous research studies [2, 7] was conducted. Subsequently, a tool was developed to assess the influence of e-government service quality on beneficiary satisfaction. The measurement instrument comprises three primary dimensions. To establish the

Table 1 Cronbach's alpha reliability coefficient

Study variables	Number of items	Cronbach's alpha reliability coefficient
Ease of use	4	0.823
Reliability	9	0.895
Responsiveness	7	0.860
Trust	9	0.893
Privacy	8	0.887
Data security	8	0.889
Beneficiary satisfaction	17	0.942

reliability of the instrument, Cronbach's alpha coefficient was employed for each variable in the study. The obtained results are presented in Table 1.

The reliability coefficients of all study variables, as shown in Table 1, exceed the threshold of 0.70. This suggests that the instrument is appropriate for attaining the study objectives and can be effectively applied [20].

3.3 Descriptive Analysis of the Study Sample

450 responses were obtained, which is an impressive 90% response rate out of the needed sample size. We have created Table 2 to show the demographics and general characteristics of the participants, including gender, age, education level, residence, and service type. The table presents the frequencies and percentages of these details. This data was collected to provide an accurate representation of the general information within our study sample without any bias or misrepresentation, ensuring that all numbers depicted are truthful reflections on those surveyed.

3.4 Description of Study Variables

In detail, to comprehend the study sample's responses regarding each dimension item by using mean scores and standard deviations as follows:

E-Government Services

- **Ease of Use**: The arithmetic means and standard deviations of the sample's responses to the "Ease of Use" dimension items were calculated, arranged in descending order of mean scores, as shown in Table 3.

The descending order of paragraphs in the "Ease of Use" dimension, as determined by the study sample, is presented in Table 3. The paragraph that ranked first in terms of ease of use is "It is easy for me to identify the services provided by the Sanad

Table 2 General information of the study sample

Item	Description	Frequency	Percentage (%)
Gender	Male	270	60.0
	Female	180	40.0
	Total	450	100.0
Age	Less than 25 years	36	8.0
	25 to less than 35 years	93	20.7
	35 to less than 45 years	126	28.0
	45 to less than 55 years	117	26.0
	55 years and above	78	17.3
	Total	450	100.0
Education	Secondary or less	42	9.3
	Diploma	114	25.3
	Bachelor's degree	150	33.3
	Postgraduate studies	144	32.0
	Total	450	100.0
Residence	Rented	87	19.3
	Owned	243	54.0
	With family	84	18.7
	Other	36	8.0
	Total	450	100.0
Service type	Personal data	156	34.7
	Financial services	84	18.7
	Inquiries	108	24.0
	Other	102	22.7
	Total	450	100.0

Table 3 Arithmetic means and standard deviations of the study sample's responses to items on the ease of use dimension

Item	Paragraph	Mean	Standard deviation	Rank
1.	It is easy for me to identify the services provided by the Sanad application	4.15	0.815	1
2.	There is ease in navigating the Sanad application	4.06	0.819	3
3.	The Sanad application is compatible with all types of mobile phones	4.07	0.831	2
4.	The Sanad application requires minimal data effort to log in	3.81	0.949	4
Ease of use		4.02	0.691	

application," with an arithmetic mean of 4.15 and a standard deviation of 0.815. Conversely, the paragraph that ranked last in terms of ease of use is "The Sanad application requires minimal data effort to log in," with an arithmetic mean of 3.81 and a standard deviation of 0.949. For "Ease of Use" dimension, it is determined that the overall arithmetic mean is 4.02 while the deviation is 0.691.

- **Reliability:** To evaluate the dimension of "Reliability," responses from the study sample paragraphs were analyzed for their mean and standard deviation using a methodology that ensured clear presentation. After organizing these values in a descending order with respect to the arithmetic means, they were tabulated as shown in Table 4.

Based on responses from the study sample, the paragraphs are presented in descending order of their rank in the "Reliability" dimension as shown in Table 4. The paragraph identified as "Sanad application effectively meets the needs of beneficiaries" garnered the highest position with an average of 4.07 and a standard deviation of 0.768. Conversely, the paragraph denoted by "Effective technical support is provided to beneficiaries to resolve any technical issues that may arise while using the Sanad

Table 4 Arithmetic means and standard deviations of study sample responses to paragraphs in the reliability dimension

Item	Paragraph	Mean	Standard deviation	Rank
1.	Sanad application is a suitable alternative for delivering government services	3.93	0.889	6
2.	Sanad application provides timely services to beneficiaries	4.02	0.861	3
3.	Sanad application provides effort-saving services to beneficiaries	4.05	0.868	2
4.	Sanad application provides cost-effective services to beneficiaries	3.95	0.868	5
5.	Sanad application effectively meets the needs of beneficiaries	4.07	0.768	1
6.	Sanad application is regularly updated to improve performance and ensure continuity of service provision	3.89	0.835	7
7.	Sanad application features an innovative and advanced user interface that facilitates interaction and engagement with services	4.01	0.788	4
8.	Modern technologies are available in the Sanad application to prevent unexpected technical interruptions	3.85	0.893	8
9.	Effective technical support is provided to beneficiaries to resolve any technical issues that may arise while using the Sanad application	3.75	0.904	9
Reliability		3.94	0.629	

application" acquired the lowest rank having an average of 3.75 and a standard deviation of 0.904. The total mean value for the "Reliability" dimension was computed at 3.94 along with a standard deviation of 0.629.

- **Responsiveness:** To evaluate the "Responsiveness" aspect, arithmetic means and standard deviations were computed for the sample responses to the paragraphs. The values were then sorted in a descending order according to the arithmetic means which can be seen in Table 5.

The results of the study sample's feedback indicate that Table 5 displays the paragraphs in the "Responsiveness" dimension in descending order. The paragraph with the highest rating was "Services of the application can be utilized at any time," scoring an average of 4.07 and a standard deviation of 0.802—placing it at the top position based on respondents' evaluations. On the other hand, the paragraph "Sanad

Table 5 Arithmetic means and standard deviations of study sample responses to paragraphs in the responsiveness dimension

Item	Paragraph	Mean	Standard deviation	Rank
1.	Services of the application can be utilized at any time	4.07	0.802	1
2.	Connectivity to the service remains uninterrupted during the use of the Sanad application	3.85	0.847	3
3.	Any inquiries about Sanad application services can be responded to promptly	3.84	0.858	4
4.	Sanad application provides outstanding customer service, where inquiries from beneficiaries are handled efficiently and quickly	3.84	0.850	5
5.	Sanad application offers online training courses to enhance beneficiaries' skills in using the application	3.74	0.935	7
6.	Sanad application is regularly updated based on beneficiaries' feedback to meet their expectations and improve their experience	3.89	0.830	2
7.	Instant notifications and updates are provided to beneficiaries when there are updates or changes in Sanad application services	3.81	0.901	6
Responsiveness		3.86	0.635	

application offers online training courses to enhance beneficiaries' skills in using the application" obtained the lowest ranking with an arithmetic mean of 3.84 and a standard deviation of 0.850. The overall arithmetic mean for the "Responsiveness" dimension was 3.86, with a standard deviation of 0.901.

- **Trust:** In order to assess the "Trust" dimension, the research team calculated the arithmetic means and standard deviations of the participants' responses to the paragraphs in the study sample. These values were then organized in descending order based on the arithmetic means, as presented in Table 6.

In accordance with the study responses, the descending order of paragraphs within the "Trust" dimension is presented in Table 6. The paragraph that received the highest

Table 6 Arithmetic means and standard deviations of study sample responses to paragraphs in the trust dimension

Item	Paragraph	Mean	Standard deviation	Rank
	The information I receive from the Sanad application is accurate	4.21	0.822	1
	I trust conducting financial transactions through the Sanad application	3.99	0.861	3
	Transactions through the Sanad application are conducted accurately	3.93	0.889	4
	Strong identity verification mechanisms are provided on the Sanad application, enhancing trust in sensitive operations such as financial transactions	4.03	0.876	2
	Transparent details are provided about the security procedures and encryption used in the Sanad application to protect beneficiaries' data	3.84	0.834	9
	The Sanad application demonstrates commitment to security standards and obtains necessary certifications to confirm compliance	3.93	0.818	5
	Beneficiaries are given the ability to manage access permissions and control the sharing of their data on the Sanad application	3.73	0.878	9
	Regular updates are provided about the security measures taken in the Sanad application to address security threats	3.81	0.893	7
	The Sanad application enhances beneficiaries' awareness about the importance of adopting strong security measures while using the application	3.81	0.847	8
Trust		3.920	0.629	

rank, with an average score of 4.21 and a standard deviation of 0.822, is "The information I receive from the Sanad application is accurate." On the other hand, the paragraph that obtained the lowest rank is "Transparent details are provided about the security procedures and encryption used in the Sanad application to protect beneficiaries' data," with an average score of 3.73 and a standard deviation of 0.878. The "Trust" dimension achieved an average score of 3.92, with a standard deviation of 0.629.

- **Privacy:** The statistical means and standard deviations of the survey responses were computed and arranged in descending order to determine the rankings for the "Privacy" dimension. The findings are displayed in Table 7.

According to the responses of the study sample, the paragraphs related to the Privacy dimension were ranked in descending order as shown in Table 7. The paragraph that ranked first with an average score of 3.96 and a standard deviation of

Table 7 Arithmetic means and standard deviations of the study sample's responses to the privacy dimension items

Item	Paragraph	Mean	Standard deviation	Rank
	The Sanad application maintains the confidentiality of the information provided by the beneficiaries	3.96	0.909	1
	My personal data is kept from being shared with other parties	3.92	0.907	3
	I believe that the Sanad application respects the privacy of the beneficiaries	3.93	0.878	2
	Clear notifications are provided to the beneficiaries about any changes in the privacy policies on the Sanad application	3.85	0.831	5
	Data sent and received through the Sanad application is encrypted to maintain the confidentiality of personal information	3.81	0.898	7
	The Sanad application allows beneficiaries to control their privacy settings and choose the extent of sharing their data	3.87	0.847	4
	The technical support team is trained to protect the privacy of the beneficiaries and handle privacy-related inquiries sensitively	3.85	0.821	6
	Additional measures are taken to protect the data of the beneficiaries in case of breaches such as security breaches	3.79	0.814	8
	The Sanad application maintains the confidentiality of the information provided by the beneficiaries	3.87	0.909	1
Privacy		3.87	0.645	

0.909 was "The Sanad application maintains the confidentiality of the information provided by the beneficiaries." On the other hand, the paragraph that ranked last with an average score of 3.79 and a standard deviation of 0.814 was Additional measures are taken to protect the data of the beneficiaries in case of breaches such as security breaches. The Privacy dimension had an average score of 3.87, with a standard deviation of 0.645.

- **Data Security:** The arithmetic means and standard deviations of the study sample's responses to the paragraphs pertaining to the "Data Security" dimension were computed and organized in a descending order based on the arithmetic means, as illustrated in Table 8.

Table 8 Arithmetic means and standard deviations of the study sample's responses to the paragraphs related to the "Data Security" dimension

Item	Paragraph	Mean	Standard deviation	Rank
	I believe that the Sanad application cannot be penetrated by external parties	3.77	0.889	7
	Sophisticated programs are used to protect the data of beneficiaries from the Sanad application	3.84	0.834	3
	It is difficult for anyone to access my account on the Sanad application without my knowledge	3.81	0.847	4
	Regular security audits and continuous scans are conducted to verify the Sanad application and ensure compliance with the highest security standards	3.85	0.831	1
	Regular security updates are provided for the Sanad application to counter new security threats and improve protection effectiveness	3.79	0.875	5
	Strict security measures are implemented when transferring data between components of the Sanad application to prevent interception or manipulation	3.85	0.855	2
	Data storage policies on the Sanad application are enhanced to maintain the confidentiality of information and reduce security risks	3.79	0.892	6
	Advanced intrusion detection systems are deployed on the Sanad application to detect any unauthorized attempts to breach the system	3.77	0.777	8
Data security		3.80	0.638	

Based on the responses from the study sample, the "Data Security" dimension was analyzed and ranked in descending order, as shown in Table 8. The paragraph that received the highest mean score of 3.85 and a standard deviation of 0.831 was "Regular security audits and continuous scans are conducted to verify the Sanad application and ensure compliance with the highest security standards." On the other hand, the paragraph with the lowest mean score of 3.77 and a standard deviation of 0.777 was "Advanced intrusion detection systems are operated on the Sanad application to detect any unauthorized attempts to breach the system." Overall, the average mean for the "Data Security" dimension was 3.8, with a standard deviation of 0.638.

3.5 Comparison of Mean Scores for Independent Variable Dimensions

Upon careful examination of the participants' responses to various aspects of the independent variable, namely electronic government services, a comparative analysis was conducted to ascertain the rankings of these dimensions based on the mean scores derived from the study sample. The corresponding findings are presented in Table 9.

According to the responses of the study sample, the dimensions of the E-Government Services axis are presented in descending order in Table 9. The dimension "Ease of Use" obtained the highest rank with a mean (arithmetic average) of (4.02) and a standard deviation of (0.691). Conversely, the dimension "Data Security" obtained the lowest rank with a mean (arithmetic average) of (3.9) and a standard deviation of (0.571). The E-Government Services axis had a mean (arithmetic average) of (3.9) and a standard deviation of (0.571).

Beneficiary Satisfaction

The researchers computed the arithmetic means and standard deviations of the participants' responses in the study sample pertaining to the adjusted variable, namely

Table 9 Mean scores and standard deviations of the study sample responses on the axis of electronic government services

No.	Dimension	Mean (Arithmetic Average)	Standard deviation	Rank
1.	Ease of use	4.02	0.691	1
2.	Reliability	3.94	0.629	2
3.	Responsiveness	3.86	0.635	5
4.	Trust	3.92	0.629	3
5.	Privacy	3.87	0.645	4
6.	Data security	3.80	0.638	6
E-government services		3.90	0.571	

Beneficiary Satisfaction. These values were then organized in a descending order based on the arithmetic means, as illustrated in Table 10.

According to the responses of the study sample, Table 10 presents the items of the Beneficiary Satisfaction axis in descending order. The item that received the highest ranking was "I recommend my family and friends to use the Sanad app," with a mean (arithmetic average) of (4.24) and a standard deviation of (0.878). On the other hand, the item "I can easily transfer my data in the Sanad app from one mobile phone to another" received the lowest ranking, with a mean (arithmetic average) of (3.81) and a standard deviation of (0.878). The mean (arithmetic average) for the Beneficiary Satisfaction axis was calculated to be (3.96), with a standard deviation of (0.590).

4 Testing Study Hypotheses

The study employed a tool that was constructed based on a series of hypotheses, with four fundamental hypotheses being put forth. The data analysis was conducted using the Structural Equation Modeling (SEM) technique, following a methodology that adheres to the statistical significance criterion ($\alpha \leq 0.05$). The subsequent section provides an elucidation of the findings derived from the hypothesis testing.

4.1 Testing the Main Study Hypothesis

- H01: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of the quality of Jordanian e-government services of the Sanad app on beneficiary satisfaction." The results of the hypothesis testing are shown in Table 11.

From Table 11, we conclude the following:

- The coefficient of correlation, which measures the extent of the association between the quality of e-government services and beneficiary satisfaction, was determined to be 0.872.
- The coefficient of determination (R2), representing the proportion of the variance in beneficiary satisfaction attributed to the quality of e-government services, was found to be 76.1%
- The hypothesis testing (ANOVA) utilized the F value to assess the influence of the collective dimensions of e-government service quality on beneficiary satisfaction. The obtained F value was (235.033), surpassing the critical value of (2.0986). Moreover, the p-value was determined to be (0.00), indicating statistical significance at a significance level of ($\alpha \leq 0.05$). Therefore, it can be concluded that the quality of Jordanian e-government services provided by the Sanad app has a statistically significant impact on beneficiary satisfaction.

Table 10 Arithmetic means and standard deviations of the study sample responses on the items of the beneficiary satisfaction axis

No.	Dimension	Mean (Arithmetic Average)	Standard deviation	Rank
1.	I recommend my family and friends to use the Sanad app	4.24	0.8780	1
2.	I know well the advantages of using the Sanad app	3.95	0.8120	9
3.	The Sanad app has helped me interact more with government services	3.97	0.8410	5
4.	The Sanad app is a convenient way to benefit from government services	3.93	0.8930	11
5.	All the data provided by the Sanad app is up-to-date	4.03	0.8130	4
6.	The general appearance of the Sanad app is easy on the eyes	3.96	0.8000	6
7.	The Sanad app is suitable for all mobile phone sizes	3.93	0.8100	12
8.	I can easily transfer my data in the Sanad app from one mobile phone to another	3.81	0.8780	17
9.	Overall, I am satisfied with the services of the Sanad app	3.95	0.9200	10
10.	The customization features in the Sanad app effectively meet the needs and preferences of beneficiaries	3.93	0.8390	13
11.	The Sanad app contributes to providing simplified government services available 24/7, enhancing user comfort	4.05	0.8440	3
12.	The Sanad app offers up-to-date and accurate content, enhancing user satisfaction with the quality of information provided	3.90	0.8630	15

(continued)

Table 10 (continued)

No.	Dimension	Mean (Arithmetic Average)	Standard deviation	Rank
13.	The design of the Sanad app is suitable for various screen sizes on mobile devices, improving user experience	3.96	0.8160	7
14.	The Sanad app enhances the inclusiveness of government services, enabling users of different age groups and educational levels	3.90	0.8320	16
15.	Customer support on the Sanad app is exceptional, effectively and promptly addressing user inquiries and issues	3.96	0.7740	8
16.	The Sanad app is flexible and integrable, allowing users to benefit from a wide range of government services	3.92	0.7880	14
17.	The features of the Sanad app contribute to improving the efficiency of users in utilizing government services more effectively	4.09	0.7570	2
Beneficiary satisfaction		3.96	0.5900	

Table 11 The results of the hypothesis testing

Model summary		ANOVA		Dimensions of the independent variable	Unstandardized coefficients	Standardized coefficients	Regression weight	
R	R^2	F	P-value		B	Beta	C.R	P-value
0.872	0.761	235.033	0.000	Ease of use	0.131	0.154	4.034	0.000
				Reliability	0.247	0.263	5.677	0.000
				Responsiveness	0.143	0.154	3.177	0.0010
				Trust	0.204	0.217	4.596	0.000
				Privacy	0.037	0.041	0.909	0.363
				Data security	0.135	0.146	3.227	0.001

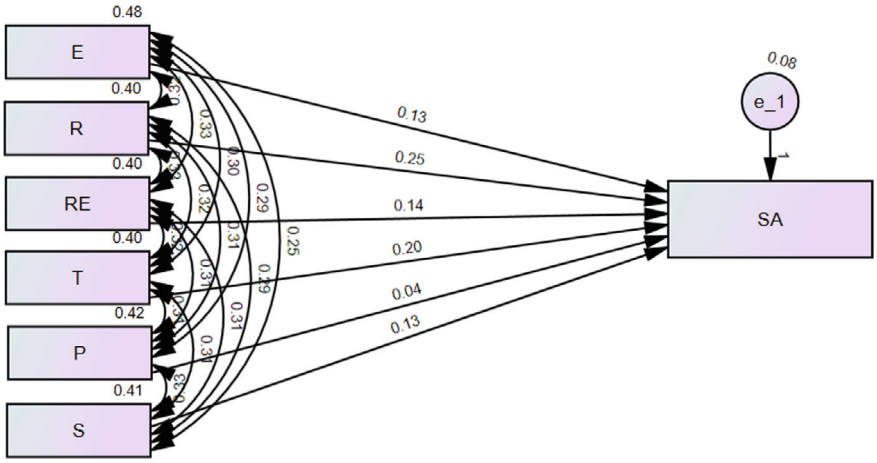

Fig. 2 Main hypothesis testing model

- The findings from the variance analysis indicate a significant association between the composite dimensions of e-government service quality, encompassing Ease of Use, Reliability, Responsiveness, Trust, Privacy, and Data Security, and the level of satisfaction experienced by beneficiaries.
- Based on the critical ratio (C.R) analysis, it was found that the combined dimensions of e-government service quality, including Ease of Use, Reliability, Responsiveness, Trust, and Data Security, exhibited calculated values that exceeded the tabulated value of 1.96. This suggests a significant effect of these dimensions when considered together. However, the Privacy dimension yielded a calculated C.R value of 0.909, which is lower than its tabulated value. This indicates that this dimension does not have a significant impact when evaluated alongside the other dimensions. However, it is possible that its influence may become apparent when examining the sub-hypothesis associated with it. The model for testing the main hypothesis is illustrated in Fig. 2 where E = ease of use, R = reliability, Re-responsiveness, T = trust, P = privacy, S = datasecurity.

5 Study Recommendations

Based on the previous findings, the study recommends the following:

- Efforts should be made to improve the quality of government e-services in all dimensions, including ease of use, reliability, responsiveness, trustworthiness, privacy and data security, through the development of training programs and workshops for employees to enhance their skills in delivering high-quality services. High-quality e-government services.

- Steps should be taken to increase trust between users and government entities by providing comprehensive and transparent information about their electronic services and operations by improving communication mechanisms with beneficiaries to understand and better meet their needs.
- Investment in technology development and the necessary infrastructure should be increased to support the efficient and secure delivery of e-government services by continuously improving security and data protection systems to ensure beneficiary privacy and information security.
- Targeted awareness and education campaigns for users should be developed on the use and benefits of e-government services through the Sind application, and educational materials on personal data protection and digital security practices should be disseminated to users.
- More incentives and incentives should be provided to beneficiaries to use the "Sind" application by enhancing their experience and providing quality services by providing more electronic government services and facilitating access to them according to the needs of beneficiaries.

Navigating Digital Banking Transformations: Insights from a Systematic Literature Review

Belal Yousef Aqel and Rani Shahwan

Abstract This study addresses the existing gap in the literature by investigating digital banking transformation and exploring the key factors and effective strategies essential for its implementation. The research aims to contribute valuable insights for future research directions. The comprehensive analysis conducted in this study examines the factors and strategies that influence digital banking, providing crucial insights for banks, Fintech companies, and policymakers. Through a systematic review, this study identifies fundamental changes in digital transformation components, including the redefinition of business processes leading to the creation of new business models. Furthermore, an in-depth analysis of factors influencing digital banking adoption by banks reveals both internal and external factors. Internal factors encompass technological infrastructure, investments in technology, and the development of digital banking applications and services. External factors include economic conditions, competition between banks, and government regulations. However, customers remain central to both internal and external factors, with considerations such as awareness, cultural knowledge, and the advantages of digital banking services being integral to quality service provision. Additionally, factors such as risks, security, trust, and user-friendly interfaces are crucial for fostering customer adoption.

Keywords Digital transformation · Banking · Business models · Fintech · Technology

1 Introduction

In recent years, there has been a noticeable shift towards financial technology, significantly altering the traditional landscape of banking operations across various services in tandem with modern technologies and business models. The concept of banking has evolved beyond the confines of designated branches that customers visit to access banking services. Instead, banking services have become readily accessible through electronic channels, including Automated Teller Machines (ATMs), Interactive Teller Machines (ITMs), Interactive Voice Response (IVR) systems, and Mobile Apps [1]. Digital banking encompasses a range of services offered online through these electronic channels, encompassing account management, financial services, and payments. The popularity of digital banking among customers has surged due to factors such as the widespread availability of the internet and smartphones, as well as shifts in customer purchasing behaviors.

Numerous studies have delved into the factors influencing the adoption of digital banking and user acceptance of technology [2]. Encouraging individuals and businesses to utilize these digital tools enhances their ability to access financial services efficiently, reducing costs and saving time amidst the rapid global technological advancements [3]. However, challenges persist, including limited technological infrastructures, low awareness and cultural acceptance of digital banking, and the high costs associated with digital banking investments [4].

Digital Banking Transformation (DTS) has emerged as a prominent concept worldwide, aiming to transition banking business models to digital platforms to maintain a competitive edge and provide superior customer experiences by digitizing products and services [5]. DTS involves integrating information technology into business processes and converting transactions into electronic formats, with the goal of realizing both short-term and long-term benefits. These benefits include enhanced customer service, the ability to meet customer expectations, and improved consistency across all channels [6].

Recent years have seen a rapid expansion of digital banking services, attracting customers of all ages and economic backgrounds. This growth can be attributed to many factors, including the spread of the internet and smartphone devices, technological advancements in digital banking, and shifts in consumer purchasing behaviors. This study seeks to provide a comprehensive analysis of the factors and strategies contributing to the adoption of digital banking transformation.

The primary objective of this study is to conduct a systematic literature review aimed at identifying best practices for implementing digital banking strategies by comprehensively understanding the factors that influence digital banking adoption. The research seeks to address the gap in literature of studies up to date which is the real factors and effective strategies in implementing digital banking transformation offer essential recommendations to stakeholders involved in promoting digital banking, including financial institutions, Fintech companies, and policymakers.

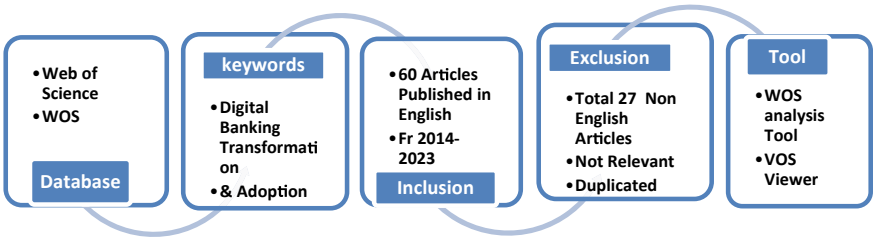
Despite the global spread of digital banking, there exists a notable lack of understanding regarding the complex factors and strategies that influence its adoption.

This study aims to address the following key questions. What are the components of digital banking transformation? What are the key factors and strategies that impact the adoption of digital banking transformation?

2 Research Methodology

To conduct the systematic literature review, relevant keywords were searched in the Web of Science database (WOS) to identify studies and previous research related to digital banking transformation. Subsequently, a set of selected articles were analyzed using Web of Science tools and VOS Viewer software, focusing on addressing the main research questions: What are the components of Digital Transformation Systems (DTS), and what are the factors and strategies that influence digital banking transformation?

Following the identification of articles relevant to factors and strategies influencing digital banking transformation, the search for publication articles was limited to the period from 2014 to 2023 within the Web of Science portal, managed by Clarivate. The search was conducted using the main keywords or expressions, "Digital Banking Transformation" and "Adoption," which yielded 87 documents. After reviewing and assessing the contents, 27 articles were excluded, resulting in 60 articles retrieved and analyzed to explore the components of digital banking transformation. From these, 21 documents were identified as exploring the factors and strategies influencing digital banking transformation. It is important to note that only articles published in English were considered, while others were excluded. Additionally, articles presenting similar ideas were not included to avoid duplication in the analysis as shown in Fig. 1.



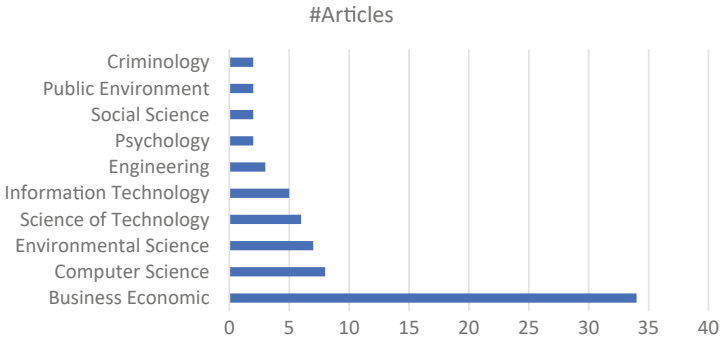


Fig. 1 Phases of systematic literature review

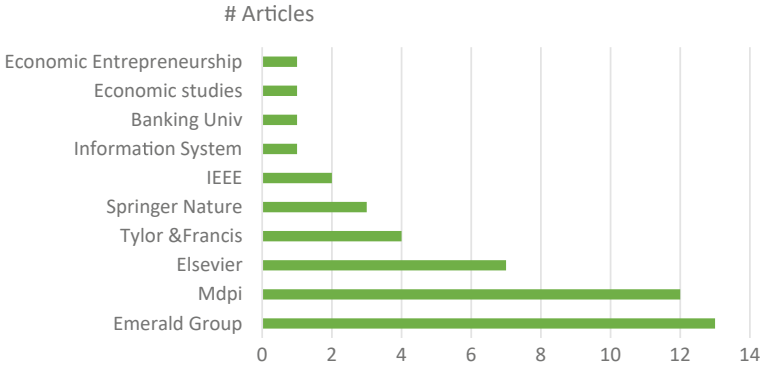

2.1 Bibliometric Analysis

The search in web of science core collections showing that research articles for digital banking transformation distributed based on area of research, years, publisher and country as shown in Fig. 2a, b and 3.

Keywords meet threshold as per below figure concluded that digital transformation adoption determinants by innovation & technology which encompasses mobile banking, internet banking while the factors and impact of this acceptance of information technology based on usefulness and trust, meanwhile the management performance is main part of adopting digital banking transformation as shown in Fig. 4.

(a) Distribution of articles according to area of researches .

(b) Distribution of articles according to publisher.

Fig. 2 **a** Distribution of articles according to area of researches. **b** Distribution of articles according to publisher

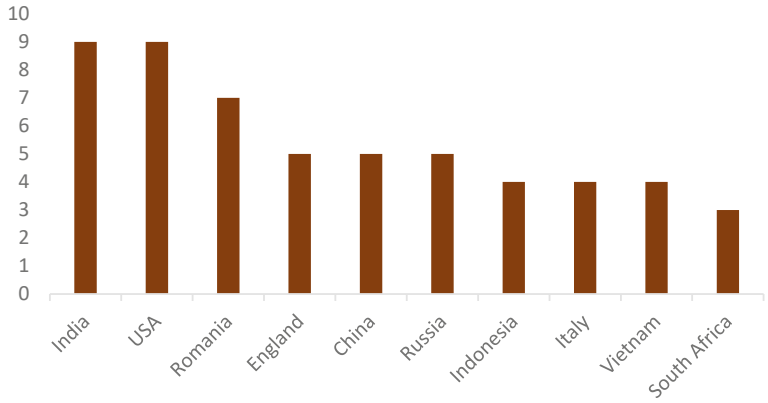

Fig. 3 Distribution of articles according to number of articles and country wise

3 Literature Review

The most valuable outcomes of digital transformation encompass a range of dimensions, including operational efficiency, enhanced customer experience, risk management, strategic decision-making and ultimate cost efficiency [7].

Senior managers from both business and information technology domains collaborate in driving digital transformation initiatives. They prioritize customer-centric approaches, resource fulfillment, innovation, and effective governance to ensure success [8]. Strategies focused on convenience, security, trust, and ease of use are

essential for catering to senior clients, as per the Technology Acceptance Model, thereby enhancing the e-banking experience [9].

Digital banking transformation is recognized as a crucial factor in fostering economic development [10]. Senior management policies are key success factors in supporting digital transformation implementation, encompassing people, processes, and innovative products and services [11]. Digital banking transformation reflects bank performance, future sustainability, and net profit outcomes, particularly in the post-COVID-19 pandemic context [12], Banks using AI to determine if the purchase was made the customer by analyzing and identifying unfamiliar patterns [13].

According to an article published by Naimi, financial institutions require clear organizational structures and cultures aligned with digital transformation strategies, supported by adequate resources and capabilities [14]. Another study has referred to intrinsic, frictional, and transitional frames, depicting the cognitive progression of end-users when interacting with digital artifacts and navigating institutional complexity [15].

Emerging trends in digital technology usage bring forth new risks related to processes, competition among banks, and market efficiency [16]. Increased customer demand for automated and self-services drives digital economy development, with factors such as risk and security, ease of use, and cost influencing digital banking transformation [17]. Banks heavily involved in digital transformation efforts intensify their competitive positions and achieve greater profitability [18].

4 The Components of Digital Banking Transformation

According to literature review conducted the components has been drafted as below shown Table 1 according to specific titles followed by academic articles assigned to each headline.

5 Navigating Factors and Strategies in Digital Banking Transformation: Insights and Implications

The factors that affect the adoption of digital banking by customers include risks, ease of use, usefulness, cost, and security. However, customers are particularly concerned about cybersecurity risks and trust, while features such as reliability and realty also influence their adoption of digital services [43]. The enhancement of mobile banking applications' usage by customers depends on various factors, including ease of use, security, rewards & risk, [23]. Another study confirms that customer expectations, security, privacy, infrastructure, competent employees, competition, regulation,

Table. 1 The components of digital banking transformation

Components	Description	Academic articles
Customer centric	Customer satisfaction with digital banking transformation as the services are available 24/7, Factors influencing the adoption of mobile banking include perceived usefulness, perceived ease of use and social influence opinions of friends/relatives. Additionally, the use of mobile banking applications is built on trust and quality service, which adds value to users and encourages recommendations to others	[19] [20] [21] [22]
Human resources employees relation	Employees hold positive beliefs toward digital transformation; however, additional training is required for acquiring skills and information, especially for handling customers and converting them to e-channels. Digital banking transformation impacts internal processes of human resource management (HR), providing opportunities for banks to adopt strategies such as remote work and online training, contributing to organizational sustainable performance. It influences productivity, institutional performance, and profitability while ensuring continuous learning for staff	[23] [24] [25] [26]
Customer experience	Ease of use and useful advantages are significant for maintaining customers' trust in e-channels. The role of bank branches is to convert bank customers to e-channels by referring customers and educating them, which shows a positive significant impact towards digital banking transformation. The impact of digital banking can be measured via social media or ranking the services, with transactions being processed immediately	[27] [28]
Regulatory compliance	Government support is crucial for placing policies and determining the implementation and improvement of ICT. Regulatory requirements can be met by implementing Fintech into banking systems for disclosure, reporting, and supervision. International standards regarding compliance, credit, and operational risk standards can be adhered to through the digitization process, facilitating easy exchange of information and updates. This may reduce corruption as more governance standards are automated, limiting the shadow economy	[29] [30] [31] [32]
Process automation	FinTech offers financial solutions for operational transactions, credit, and finance, providing predictability in processes and acting by offering innovative products. However, customer readiness and awareness play a crucial role in adopting financial technology	[33]

(continued)

Table. 1 (continued)

Components	Description	Academic articles
Artificial intelligence	Chatbots are responsive to customer inquiries, complaints, and follow-ups, replacing the traditional contact center. However, they may offer less support to clients, especially in countries with multiple languages and accents, with the possibility of improvement through machine learning. Artificial intelligence plays a pivotal role in mobile banking applications for service delivery and data security. However, metaverse financial services do not show positive support for digital banking, and the Internet of Things is considered a future pillar of AI. Cryptocurrency has become conventional in financial systems as part of digital transformation, leading to extensive settlement of payments. The blockchain component and banking business are involved in payments and settlements	[34] [35] [36] [37]
Innovation products & services	The adoption of digital banking transformation (DTS) has a significant relationship with green finance and environmental sustainability. SME adoption of digitalization may create synergy with banks offering digital services, utilizing bank products and services. ERP systems support the role of third-party logistics for guaranteeing credit, payments, and indirectly linked accounting functions such as reconciliation statements and fund transfers	[38] [39] [40] [41] [42]

financial resources, trust, top management support, and government support all influence digital banking adoption [44]. There is a coefficient relationship between financial technology and education as a social characteristic; whenever the education level increases, Fintech adoption becomes higher and implementation becomes easier [45]. It is not surprising that customer segments, such as patients, prefer digital banking services, with features such as ease of use, facilitation conditions, and personalization being particularly attractive [46].

The exchanges between strategy and dynamic capabilities do not always lead to highly successful digital transformation, while synergy determines market direction to achieve competitive advantage [47]. Digital banking transformation, towards competitive advantage, is focused on customer satisfaction as central by providing unique products and services [48]. Mobile banking applications represent the bank interface system, and the importance of factors affecting customer usage of mobile apps differs among societies. Risk and trust are positive towards perceiving, while social factors, ease of use, and usefulness are not significant towards acceptance of mobile banking apps [49]. All banks adopting digital transformation must ensure the maintenance of existing customers through factors influencing the acceptance of digital services, with concerns about privacy, cybersecurity & fraud [35]. For

any corporations adopting digital transformation, the focus should be on three components: competencies, learning, and capabilities [50].

The indicators of digital banking transformation show that financial technology does not employ significant business banking functions due to the resistance of people performing transactions using mobile apps, preferring face-to-face connections [51]. Key factors affecting digital banking transformation include customer perception, usefulness, bank willingness, and capabilities based on the future of automation and technology change strategy [52]. Exploring the strategy of digital banking involves analyzing the landscape of customer perception, how rivals are acting, selecting service providers, and customer segmentation, then starting building blocks of transformation of the process, including basic transactions such as account services, account balances, account statements, The exchange between traditional banking and digitalization for customers relies on promoting digital services, which is very important by expanding customer awareness of the benefits and wide range of electronic channels available 24/7 [53].

Digital banking transformation is useful tool in repetitive decision-making as management reviews and analyzes the effects of the use of digital technologies on bank net sales and revenues [54]. Developed strategies by adopting investment in information technology impact banks performance in two sides of financing, learning, and growth, which add value to organizations [55]. Banks adopting DTS will be more agile based on management decisions and may become more reliant for any events and business continuity. DTS influences productivity performance, profitability; however, the readiness of staff for this change is crucial [56]. Post-COVID-19 pandemic, the importance of digital banking is more significant, especially in uncertain conditions and became a main part of banks' strategies [57]. The strategy of developing a new business model through reviewing the current process and designing a new customer journey creates operational efficiency, adding value to achieve competitive advantage [58, 59].

6 Discussion

Upon revisiting the research questions, it is evident that digital banking transformation encompasses various systems and applications supporting banking operations, requiring infrastructure, legal considerations, and the disruption of norms. By revisiting the entire process and converting it using management information systems, accessibility and compatibility can be ensured as part of a comprehensive management strategy. This involves enhancing e-channels and digital services. Gaps related to previous studies include internal resource and capability limitations, as well as issues with external resource outsourcing from service providers, particularly concerning sensitivity information and privacy data sharing in the cloud. Clear strategic decisions are needed regarding product differentiation versus cost reduction, considering the high investment amount and rapid technological changes. A combination of strategies may be necessary to achieve a competitive advantage.

Based on the retrieved studies, customer preferences emerge as the focal point, emphasizing the experience in using digital services through platforms familiar to end-users. Mobile apps are identified as a top priority for normal customers, influencing their primary judgment about digital banking. Various definitions of digital mobility exist across studies, all pointing towards institutional strategy and business model development through investments in technology and software. This enables financial institutions to provide innovative services and gain a strong competitive advantage at reduced costs.

Digital banking have the potential to increase investment and promote financial inclusion, which reflects in economic growth and stability. Dynamic capabilities are employed to compete in the financial services industry, especially amidst the evolution of the internet and technology. The adoption of a digitalization framework by management as a strategy for the future in the banking industry involves embracing new business models tied with quality and governance, leading banks to success. However, customer intention to use digital services remains a primary factor influencing acceptance, necessitating caution due to increasing cybersecurity risks and fraud. Future models such as the Internet of Things, blockchain, and artificial intelligence leverage businesses and enhance the private sector's transformation as part of the digital economy. Regulatory bodies play a crucial role in fostering these activities.

7 Conclusion

In conclusion, the systematic review of digital transformation reveals fundamental changes and redefined business processes leading to the creation of new business models. This transformation necessitates the adoption of model standards and the redesign of information technology architecture to capitalize on innovative technologies and address challenges posed by traditional banking norms.

Further analysis to highlights internal factors influencing digital banking adoption by banks, including technological infrastructure, investment in technology, and the development of digital banking applications and services. External factors such as economic conditions, competition between banks, and government regulations also play significant roles. However, the customer remains central to both internal and external factors, with awareness, cultural knowledge, and the advantages of digital banking services being crucial for quality service provision.

Moreover, digital banking transformation involves two key functions: digital data entry and process digitization. Success in this transformation requires a focus on understanding and mapping digital behavior and customer expectations. This understanding must align with the vision of how digital initiatives can achieve competitive advantages, often through partnerships with Fintech companies. Additionally, the cost benefits of investing in banking digitization should be carefully considered to ensure effective implementation.

In summary, embracing digital banking transformation involves a holistic approach that encompasses technological advancements, customer-centric strategies,

and effective partnerships to drive innovation and competitiveness in the banking industry.

8 Limitation and Implications

Banks must incorporate digital transformation strategies into their operations and ensure that factors influencing the adoption of digital transformation are adequately addressed. According to data retrieved from Statista, investment spending on digital transformation technologies and services worldwide is projected to increase from $0.96 trillion USD in 2017 to $3.4 trillion USD in 2026 [60]. This significant increase underscores the importance of digital banking as a strategic imperative from a management perspective.

However, this study has limitations, primarily stemming from the use of the Web of Science database. While it provides a comprehensive source of academic literature, it may not capture all relevant studies on digital banking transformation. Additionally, the implications of this study are twofold. From an academic perspective, it adds value by creating existing literature on digital banking transformation. This provides a consolidated source of information for researchers and scholars interested in this field. From a business leadership perspective, the study offers ready results from accredited journals, aiding decision-makers in understanding the factors and strategies influencing digital banking transformation.

In conclusion, while this study contributes valuable insights into digital banking transformation, further research may be needed to explore additional factors and strategies that could impact the adoption and success of digital transformation initiatives in the banking sector.

The Impact of Individual's Characteristics and Access to the Telecommunication Infrastructure on Digital Financial Inclusion

Duha Farouq Tanbour

Abstract I investigate the impact of individual characteristics and access to telecommunication infrastructure on digital financial inclusion in Palestine. I employ the probit estimation model on the 2021 World Bank global Findex database to analyze the association between individual characteristics and access to telecommunication infrastructure with digital financial inclusion indicators. The results indicate that the status of digital financial inclusion is low, but according to the percentages of access to telecommunication infrastructure, status can be improved. Furthermore, the indicators of digital financial inclusion in Palestine are negatively affected by being female, less educated, poorer, and not working. On the contrary, they are positively influenced by better access to the telecommunications infrastructure. Policymakers measures should be focused on digital financial literacy, and financial institutions should understand the financial behavior of beneficiaries and develop digital financial services that are appropriate to different individual characteristics' needs and preferences at an affordable cost.

Keywords Digital financial inclusion · Digital financial services · Individual characteristics

1 Introduction

The process by which the formal financial system is accessible, available, and utilized by all members of an economy is referred to as financial inclusion [1].

The term "financial inclusion" has become significantly important since the early 2000s [2], as many studies have been proved the significance of financial inclusion for the economic growth, employment and the reduction of poverty rates [3].

According to the acceleration of technological advancement around the world and the opportunity of using technology to facilitate our daily life processes, attention

A. M. A. Musleh Al-Sartawi et al. (eds.), *Business Resilience and Business Innovation for Sustainability*, Studies in Systems, Decision and Control 587,
https://doi.org/10.1007/978-3-031-87584-7_26

has shifted toward employing technology to achieve higher percentage of financial inclusion.

In Palestine, a mere 38.5% of those aged fifteen and above possess a formal financial institution account, a mobile money account, or both. Mobile phone ownership stands at 85.9%, while internet access is available to 75.6% of the population.[1] The data presented indicates that while the proportion of individuals in Palestine with bank accounts is relatively low, the substantial number of individuals with mobile phones and internet access provides financial institutions with a substantial opportunity to expand their service offerings through digital channels.

Therefore, it is important to take advantages of the telecommunication infrastructure, and employing financial technology to accomplish financial inclusion process in Palestine. Particularly, as it is considered a special case due to its political circumstances with Israel occupation and checkpoints distributed among the cities [4]. One of the biggest problems that financial institutions encountered in Palestine to provide financial services are checkpoints and the restriction imposed on Area C. This issue led to an attempt to implement digital financial inclusion to enable marginalized individuals in Area C and Gaza strip to be able to get access to and usage of financial services [5].

Digital financial inclusion is defined as "the digital access to and use of formal financial services by excluded and underserved populations." These services should be suitable to the beneficiaries' needs and provided at affordable cost for both the beneficiary and the service provider [6].

Given the political situation in Palestine and the recent development of digital financial services provided by financial institutions, which is authorized and encouraged by Palestinian Monetary Authority (PMA), I will use the World Bank's Global Findex database to in this paper to assess the determinant of digital financial inclusion in Palestine.

My contribution is to bridge the data gap by utilizing latest World Bank global Findex database using the recently added indicators that is related to access to and usage of digital financial services.

Following this structure, I conducted the remainder of this study: Peruse the pertinent literature on digital financial inclusion and financial inclusion in the "Literature Review" section. Data, variables, models, and methodologies are detailed in the "Methods" section. To present and analyse the empirical findings, refer to the "Results and Discussion" section. The study will be concluded in the "Conclusions" section.

2 Literature Review

Financial inclusion is characterized as steady, affordable, and convenient access to a variety of financial services [7].

[1] Author's calculation relied on data from World Bank Global Findex database 2021.

The significant focus devoted to financial inclusion can be attributed, in part, to the numerous studies that demonstrate its direct correlation with poverty alleviation [8–13].

The Alliance for Financial Inclusion (AFI) provides a summary of the financial inclusion dimensions of access, usage, and quality [14] in order to quantify financial inclusion. On the contrary, numerous researchers employ the aforementioned dimensions—namely, account ownership in a formal financial institution, borrowing and saving in a formal financial institution within the previous 12 months as primary indicators of financial inclusion [15–17]. Additionally, examine the level of financial inclusion in specific countries within the region and analyze the relationship between financial inclusion dimensions and individual characteristics.

A comparative analysis of the degree of financial inclusion in China and other BRICS nations revealed that China has a notably high level of financial inclusion. Additionally, the study revealed that men who tend to possess higher levels of education, and the advanced age are correlated with increased utilisation of formal accounts and credit [15].

The financial inclusion of individuals residing in Afghanistan, Pakistan, the Middle East, and North Africa was examined in a comparable study. Being poor and female decreases the likelihood of being included in financial system, whereas education level enhances financial inclusion, according to the findings [16].

Exclusion in Egypt is associated with a lack of confidence in financial institutions, low income, low education, and advanced age, according to another study [18].

The correlation between individual attributes and the impact of Islamic banking in MENA nations of varying degrees of development was examined in a recent study. Its findings revealed that being male, wealthy, and older positively affects financial inclusion in MENA. In addition, Islamic banking plays a significant role in promoting financial inclusion, particularly among those who are deeply devoted to their religious convictions [17].

An investigation illustrated this point by establishing a correlation between financial inclusion and personal attributes including but not limited to youth, affluence, enhanced educational attainment and employment prospects, urban residency, and a more conducive environment for accessing financial services. Innovation in technology, business models, and channels of service delivery can therefore contribute to the enhancement of financial inclusion [19].

The impact of socioeconomic and demographic variables on the adoption of online banking in Germany was investigated in a separate study. The likelihood of utilising an online bank account increases with age, education, and income, according to the study's findings. In addition, it was discovered that internet and financial literacy as well as population size positively influence the utilisation of online bank accounts [20].

Males with higher levels of education, age, income, and employment status are more likely to adopt digital financial services, according to a similar study. Additionally, the study revealed that mobile money adoption is greater among individuals with advanced degrees and a propensity for conducting online transactions. There is

a greater likelihood that affluent males will be engaged in the utilisation of digital financial services [21].

Others, on the other hand, sought to determine the extent to which the adoption of technology by government authorities in the Middle East and North Africa contributes to the expansion of financial inclusion and the provision of digital payment processes to a variety of individuals. Their research confirmed that the government's cashless policy has a significant impact on the advancement of financial inclusion [22].

Financial inclusion has garnered considerable attention in the literature review, primarily because of its substantial influence on poverty alleviation and economic expansion. Furthermore, scholars have transitioned their focus from conventional to digital financial inclusion due to the latter's potential to engage a more extensive demographic.

3 Methods

3.1 Data

The information used in this study pertains to one thousand adults residing in Palestine and was extracted from the World Bank Global Findex Database 2021 edition. During the COVID-19 pandemic, this edition contains results from representative surveys of approximately 128,000 adults in 123 economies. The survey comprises inquiries pertaining to various aspects of personal characteristics, internet access, mobile money accounts, internet banking, internet access and usage indicators for digital financial inclusion, and mobile phone ownership [23].

3.2 Variables

I have benefited from the study variable of [24] that provide valuable perspectives on the usage of financial technology in our life. I added an independent variable "has an account", that is considered the main key to be financially included (Table 1). The table includes the explanatory and dependent variables of the study, their definitions, and descriptive statistics.

The table shows that only 38.5% of Palestinian individuals older than the age of fifteen have an account at a formal financial institution or mobile money account or both of them, 85.9% owns a mobile phone, and 75.6% has internet access, 33.5% of individuals use mobile or internet to check account balance, and 15.2% use internet to buy something on line. These statistics demonstrates that although the percentages of owning a mobile phone and internet access are high in Palestine, the indicators of digital financial inclusion are bad.

Table 1 Main variables in the estimation

Variables	Obs.	Mean	St. dev.
Explanatory variables			
Female	1000	0.565	0.496
Age	1000	38.066	17.044
Age2	1000	1739.232	1521.674
Income_poorest 20%	1000	0.185	0.388
Income_second 20%	1000	0.186	0.389
Income_third 20%	1000	0.19	0.392
Income_fourth 20%	1000	0.202	0.402
Income_richest 20%	1000	0.237	0.425
Primary education	1000	0.221	0.415
Secondary education	1000	0.59	0.492
Tertiary education	1000	0.189	0.392
Work force participation	1000	0.441	0.497
location	1000	0.095	0.293
Access to telecommunication infrastructure			
• Owns a mobile phone	1000	0.859	0.348
• Internet access	1000	0.756	0.430
Dependent variables			
Account	1000	0.385	0.487
Access dimension sub indicators			
• Used mobile phone or internet to access financial institution account	346	0.116	0.320
• Mobile phone or internet to check account balance	346	0.335	0.473
Usage dimension sub indicators			
• Use mobile phone to pay for a purchase in-store	1000	0.076	0.265
• Made bill payments online using the Internet	1000	0.035	0.184
• Bought something online using the Internet	1000	0.152	0.359

Source Author's own calculations. Data obtained from World Bank 2021 Global Findex database

3.3 Model and Methodology

The main objective of the paper is to understand how individual characteristics of 1000 Palestinian adults and their access to telecommunication infrastructure affect digital financial inclusion in Palestine. In this paper, I use a probit estimation to explain the measures of access and usage of financial technology as indicators for digital financial inclusion and applied the model that was used by [24]:

$$\begin{aligned} \text{DFI} = \alpha + \beta_1 * \text{gender}_i + B_2 * \text{education}_i + B_3 * \text{age}_i + B_4 * \text{income}_i \\ + B_5 * \text{location}_i + B_6 * \text{workforce}_i + B_7 * \text{owning a mobile}_i \\ + B_8 * \text{internet access} + \varepsilon_i \end{aligned} \quad (1)$$

where DFI is a binary variable, and denotes one of the following each time:

1. Has an account.
2. Access dimension:
   A. "Used mobile phone or internet to access financial."
   B. "Mobile phone or internet to check account balance."
3. Usage dimension:
   A. "Used mobile phone to pay for a purchase in-store."
   B. "Made bill payments online using the Internet."
   C. "Bought something online using the Internet."

I added "has an account" as dependent variable because it's the main key of financial inclusion.

The explanatory variables (gender, income, education, workforce, location, owning a mobile, access to internet) are dummy variables. (age) is number of years, and (age2) is squared age to consider possible nonlinearity in the relation between age and digital financial inclusion.

4 Empirical Result and Discussion

The marginal effects for the probit estimation are displayed in Table 2. The dependent variables utilised in this analysis are the "has an account," "access dimension," and "usage dimension."

The findings presented in Table 2 indicate that there is a negative correlation between being female and possessing a financial institution account, a mobile money account, or both, as well as checking the account balance via mobile phone or the internet within the previous year (access). However, there is a positive correlation between being female and making an online purchase via mobile phone or the internet within the past year (usage). In the context of the negative relationship between owning a formal traditional account and being female is in line with the results of [15–18], and with result of [21] regarding the negative relationship with mobile money in order to make online transaction and with [24] regarding accessing digital financial services.

The results also show a positive relationship between age and "has an account" which mean that as individual get older he/she will be more likely to have an account, but until certain age because the sign of age2 is negative. And this is the case for the effect of age2 on checking the account balance using mobile phone or internet (access) although the effect of age is not significant. The findings is consistent with the findings of [15–18, 22, 24].

Table 2 Determinants of digital financial inclusion (has an account, access and usage determinants) in Palestine: the marginal effects for the probit estimation

	Has an account	Access dimension		Usage dimension		
		Used mobile phone or internet to access financial institution account	Mobile phone or internet to check account balance	Use mobile phone to pay for a purchase in e-store	bill payments online using the Internet	Bought something online using the Internet
Female	− 0.178***	0.001	− 0.172***	0.021	− 0.008	0.062***
Age	0.031***	− 0.010	0.017227	− 0.00001	− 0.0003	− 0.0009

Concerning the income level, I find that the effect of income level on having an account, access and usage in general is become negative as the level of income decreases. The result of having an account in formal institution is also along with results of [15–18], while it is related to findings of [20–22, 24] regarding digital financial services.

Similarly, the lower the level of education is the less likely that individual has an account, and get access to financial technology for digital services [25, 26]. However, the usage is only significant and negatively affected by primary education. That's mean, the individual who has completed primary education or lower, is less likely to have an account, access or usage of phone or internet to benefit from digital financial services. Again the findings of my paper support those of [15, 16, 18, 20–22, 24].

Employment increases the probability of possessing a bank account, utilizing a mobile device to make in-store purchases, paying bills, and conducting online purchases via the Internet. This bring into line with [21] who found that the individual who in workforce is more likely to adopt digital financial services.

A negative but insignificant correlation is observed between location (rural) and the utilization of financial technology for bill payment, online or e-store shopping, checking account balances via mobile phone or the internet, and paying accounts.

Lastly, possessing a mobile phone and having access to telecommunication infrastructure increase the likelihood of opening a mobile money account or a financial institution account, which can subsequently be utilized to make online purchases or pay for e-commerce transactions [27]. Therefore, possessing a mobile phone may be regarded as an initial stride towards achieving digital financial inclusion. Moreover, internet connectivity enhances the likelihood of accessing and utilizing digital financial services.

5 Conclusion

This study examines the influence of personal attributes and telecommunication infrastructure accessibility on various aspects of digital financial inclusion. The research sample comprises one thousand Palestinian citizens. By utilizing the World Bank's global Findex database and the recently added indicators, I attempted to fill in the data gap regarding Palestine. The indicators I utilized are from the 2021 edition, which pertains to the utilization and accessibility of digital financial services.

In terms of account ownership, access to digital financial services, and usage thereof, Palestine has a low level of traditional and digital financial inclusion, according to a descriptive statistical analysis of World Bank global Findex data. However, this also suggests a significant potential for improving digital financial inclusion, given the substantial proportion of individuals who possess mobile phones and internet connectivity.

An examination of the relationship between access to telecommunication infrastructure and individual characteristics and digital financial inclusion reveals the following:

Possession of a mobile phone, employment, male gender, higher education, greater wealth, and advanced age all contribute to an increased likelihood of possessing a formal financial institution account or a mobile money account, which serves as an initial milestone towards achieving financial inclusion.

Additionally, there is a positive correlation between higher education, being male, older, and wealthier, and having internet access. This correlation enhances the ability to utilize digital financial services through mobile phones or the internet, such as checking account balances or accessing financial institution accounts.

However, there is a positive correlation between being female, having a higher income, being employed, and having internet access with the likelihood of utilizing digital financial services. This includes activities such as making bill payments via mobile phone, purchasing items in an e-store, and conducting online shopping. Furthermore, those with a primary education or less are less likely to possess, utilize, have access to, or maintain an account for digital financial services, according to the findings.

Owning a mobile phone and having internet connectivity boosts the chances of having an account, which is a crucial step in promoting digital financial inclusion. This enables access to use of digital financial services. However, the extent of digital financial inclusion depends on individual characteristics.

Policymakers must carefully consider specific measure to boost digital financial literacy. As providers of digital financial services, institutions should understand each beneficiary's unique financial behavior and design cost-effective services tailored to their needs and preferences.

Examining the Determinants of Postgraduate Students' Behavioral Intentions in Utilizing MOOCs for Advanced Learning

Qais Hammouri, Mohamad Ahmad Saleem Khasawneh, Hanady Al-Zagheer, and Ibrahim Lewis Mukattash

Abstract This study aims to investigate the factors influencing postgraduate students toward using Massive Open Online Courses (MOOCs) for advanced learning. A research model is proposed to examine the use of learning techniques during times of risk and whether MOOCs can facilitate lifelong learning outside of the classroom. The model includes four constructs: perceived usefulness, perceived benefit, perceived ease of use, and perceived risk, to measure the usage behavior of postgraduate students in utilizing MOOCs as a learning tool. By exploring the predictors of utilizing MOOCs among postgraduate students', this study is expected to enrich the literature in the open education and personalized learning areas. In addition, the proposed model will provide insights into how MOOCs can support postgraduate students in their learning endeavors.

Keywords MOOCs · Risk management · TAM · Perceived benefit · Perceived risk · Usage behavior

1 Introduction

MOOCs refers to a combination of information and communications technology and educational programs. MOOCs have emerged as a means of offering global communication and education opportunities to both urban and rural societies, using Internet services [1]. In 2012, MOOCs were developed as part of e-learning, with the goal of providing widespread access to education [2]. Applications such as Future Learn, Udacity, XuetangX, edX, and Coursera have enabled learners to support their

academic pursuits by offering small online courses at a low cost or even for free, often in collaboration with high-ranking universities [3].

Recently, MOOCs provided a significant influence in the field of education and learning [4]. With self-development now valued more than diplomas and degrees, and universities seeking to attract less-costly learners, MOOCs have emerged as a means to meet these needs [5]. These portals offer online lectures by some of the world's best educators and are widely accessible through the internet at any time and place. According to recent data, there are currently 11,400 MOOCs available to support millions of learners [6]. This paper aims to design a research model to investigate whether postgraduate students are utilizing the proper tools, methods, and learning models to become creative and independent learners during risks. Additionally, the study seeks to determine if MOOCs help postgraduate students engage in lifelong learning beyond the classroom.

Online education has gained tremendous popularity in recent years, with massive open online courses being a prominent form of online learning. The COVID-19 pandemic further accelerated the adoption of online education, as higher education institutions had to transition to remote learning. Despite the growing popularity of online education, there is still limited research on the determinants of postgraduate students' behavioral intentions in utilizing MOOCs for advanced learning. However, several studies have explored factors influencing students' perception and adoption of online learning in general [7, 29]. Given the limited research on postgraduate students' behavioral intentions in utilizing MOOCs for advanced learning, it is vital to explore the specific determinants that influence their decision to engage with MOOCs.

2 Theoretical Background

2.1 Massive Open Online Courses (MOOCs)

MOOCs are a form of distance learning that allows students to interact and access learning contents over the internet. MOOCs provide a wide range of courses, taught by instructors from universities and institutions. MOOCs typically offer course materials such as video lectures, readings, and assessments, and are often free or available at a low cost. MOOCs aimed to be accessible to a broad range of learners, with no prerequisite knowledge or qualifications required. One of the defining features of MOOCs is their scalability—they can accommodate tens of thousands of students. Several MOOC platforms like Coursera, edX, and Future Learn are considered as one of the most used platforms of MOOCs that offer courses in different fields. In the last few years, the popularity of MOOCs has increased due to their accessibility and affordability features and making high-quality education available to anyone with an internet connection. They are also useful for professionals looking to expand

their skills and knowledge without having to take time off from work or enroll in a traditional degree program.

2.2 TAM Model

Perceived ease of use and perceived usefulness are the main constructs of Technology Acceptance Model that mostly utilized to examine the adoption of different technology [7, 8]. Perceived usefulness refers to the extent to which a user thought that using a technology will enhance their performance when adopting a technology [9]. The perceived user-friendliness is also crucial to measure the acceptance and usage through its mediating role in perceived usefulness [10]. However, MOOCs users are not solely motivated by utility and value other factors beyond usefulness and ease of use [5]. Perceived ease of use refers to the degree to which a person believes that using a technology is effortless [11]. To enhance the learning process of users, easy-to-use and usable MOOCs must be provided [12]. Moreover, it is important to consider perceived ease of use to achieve a function, but it is not sufficient to evaluate usefulness alone [13]. In addition, [14] discovered that perceived ease of use did not have a direct significant influence on actual program usage and that its utility determines its usage.

2.3 Perceived Benefits

According to [15], gender is a specific factor that influences intention-fulfillment, along with the value of MOOC benefits. In addition, [16] discovered that self-regulated learning, the quantity of short exams accessed, participation duration, and perceived usability are key predictors of intention-fulfillment. [17] reported that participants' previous experience with MOOCs platforms and the significant they assigned to the benefits of MOOCs indirectly affect their intention-fulfillment indirectly by influencing both the number of short exams accessed and perceived usefulness of the course. [18] also found that participants who set goals for their online learning and understood the advantages of taking the MOOCs were more inclined to report higher level of contentment with the course.

2.4 Usage Behavior

The initial wave of MOOC research revealed different populations of students in terms of location, ethnicity, and engagement in course [19]. MOOCs attract many learners from different backgrounds and motivations, resulting in varying levels of engagement with the course [20, 21]. The diversity of participants, their attitudes, and

motivations has made MOOCs an ideal platform for investigating gaps in teaching and learning [22]. Additionally, older, and more experienced learners have demonstrated a greater understanding and utilization of effective learning strategies [23]. MOOCs and other types of open online education offer participants the opportunity to select their preferred learning behavior in terms of direction and schedule [24].

2.5 Perceived Risk

Perceived risk is a multifaceted construct often related to users' concerns when adopting a new technology, such as MOOCs. It encompasses several dimensions, including but not limited to financial, performance, social, psychological, and time risks. In the context of MOOCs, perceived risk can affect a learner's decision to enroll, participate, and complete a course [25, 26]. The literature highlights the importance of considering various perceptions of risk when adopting technological innovations [27]. Although personalized learning approach has some obstacles, exposing differences in group attitudes, behaviors, and motivations may be a step towards achieving it [28–31]. MOOC learners come from diverse backgrounds and experiences, and variations in their learning strategies and satisfaction have been observed, depending on factors such as age and academic performance [14, 22]. Therefore, learning techniques and analytics can use utilized such variables as input to expect at-risk students, recommend appropriate learning paths, or provide targeted support [19, 21].

Moreover, time investment, data privacy, relevance of content, and return of effort are factors that can be utilized to evaluate the potential risks toward using MOOCs. If students perceive the risk level to increase, their response or usage behavior might be affected through several ways like decreased engagement, lowered motivation, preference for traditional learning, demands for better support, and selective usage where some students may become more selective in the MOOCs they choose to pursue, favoring courses from reputable institutions or those with higher peer ratings, to minimize perceived risks [26].

3 Conclusion

This study proposed a model to investigate whether postgraduate students use various learning techniques during risky situations, as shown in Fig. 1. The goal is to determine if MOOCs can assist postgraduate students in becoming independent and innovative learners, while also enabling them to learn beyond the traditional classroom environment. The research model comprises four constructs, which assess students' usage behavior, including perceived usefulness, TAM model constructs and perceived risk. MOOCs provide a useful platform for postgraduate students, with appropriate tools, methods, and learning models during times of uncertainty. By utilizing MOOCs, students can become creative and independent learners, while

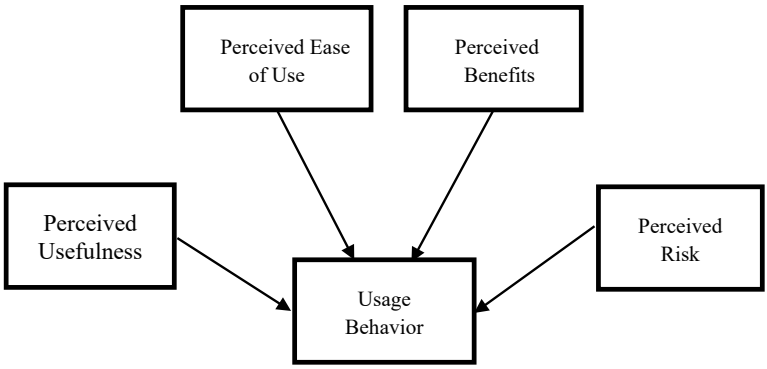

Fig. 1 The proposed model

also overcoming educational obstacles. Moreover, it can be concluded that MOOCs have a potential role in enhancing risk management strategies among postgraduate students. Perceived risk is an important factor that affects the acceptance and usage of MOOCs among learners.

MOOCs offer a diverse range of learning experiences, catering to learners' different backgrounds and motivations. The availability of personalized learning paths and support through learning analytics algorithms can help in identifying at-risk students and providing timely interventions. Furthermore, MOOCs can be used to develop specific risk management skills and competencies among postgraduate students, preparing them for real-world situations [28, 29]. Therefore, the integration of MOOCs in postgraduate education can contribute to the development of effective risk management strategies among learners.

The Impact of Marketing Mix Elements on the Purchase Decision: Flower Consumers as a Case Study

Iyad A. A. Khanfar and Osama Muhammad Ibrahim

Abstract This chapter seeks to investigate the influence of various marketing mix elements on the purchasing decisions made by flower consumers in Amman, Jordan. The research encompassed and independent variable, the marketing mix, represented by its four dimensions, namely product, price, promotion, and distribution. The dependent variable focused on the purchase decision of flower consumers. To collect the necessary data, a descriptive-analytical method was employed, utilizing a questionnaire as the primary tool. A random sample of 420 flower consumers in Amman, Jordan, was selected, and subsequent analysis was conducted on 400 valid questionnaires using appropriate statistical techniques with the aid of SPSS software. The findings of the study highlight that the mean scores for the marketing mix elements were generally high, with the product element receiving the highest score, followed by price and distribution. Conversely, the promotion element received the lowest score. Moreover, the study reveals a statistically significant positive impact of the marketing mix elements (product, promotion, price, distribution) on the purchase decision of flower consumers in Amman, Jordan. Based on these findings, the study recommends the continuation and improvement of the current distribution policy implemented by flower sellers, while also emphasizing the need for continuous development to adapt to market fluctuations. Additionally, the study suggests the intensification of promotional campaigns for flowers across various advertising channels to enhance consumer awareness regarding their significance and quality.

Keywords Marketing mix elements · Purchase decision · Consumers · Flower consumers · Amman · Jordan

1 Introduction

In order to address challenges, competition, and maintain long-term viability in the market, organizations must prioritize marketing. It involves using a wide variety of strategies and methods to understand what consumers need and want, and ultimately ensure their satisfaction and approval.

The marketing mix is known as a set of tools adopted by individuals, with the end goal of evoking a response desired by the target market. This concoction consists of four main ingredients: product, price, promotion, and distribution (Isoraite 2018). The consumer's decision-making process is swayed by a myriad of factors that weave together their choices at the point of purchase. These factors are like pieces in a puzzle, personal, demographic, psychological, social, and cultural elements, all playing a part. Among these factors is the marketing mix which is considered an effective toolin accomplishing a competitive advantage and fostering customer loyalty [11].

The analysis of consumer selections is critical to crafting effective marketing strategies. It helps unveil consumer needs, wants and consumption behavior. The study aims to grasp how different elements of the marketing mix impact the buying actions of cultivated flowers consumers in Amman [4].

1.1 Problem Statement and Research Questions

Marketing in today's world seeks everlasting relationships with customers where if pleased, they will show loyalty by coming back and recommending others to the establishment. The marketing mix is a set of controllable tools that can be used to produce the response desired from the target market. Marketing has significant effects on consumer purchases as pointed out by past studies like the one done by Khalifa and Al-Agha [9] showing that promotional ads have an impact on shoppers' decisions towards products in Kurdistan Region.

The success of cultivated flowers production projects holds significant potential by the application of marketing mix components. Consequently, the aim of this chapter is to thoroughly investigate and assess the influence exerted by the elements of the marketing mix on the purchasing choices made by consumers of cultivated flowers in the urban center of Amman. By doing so, it is anticipated that this research will contribute to the enhancement of marketing strategies and the subsequent augmentation of demand for these products within the local market.

The primary inquiry examined in this study pertains to the influence of the marketing mix components on the purchasing behavior of cultivated flowers consumers residing in the urban locale of Amman.

1.2 Hypotheses

Based on the problem statement and objectives of the study, the following hypotheses were formulated:

- **Main Hypothesis (H0)**: "There is no statistically significant effect at the significance level (0.05α ≤) for the marketing mix elements on the purchasing decisions of cultivated flowers consumers in the city of Amman."

From the main hypothesis, the following sub-hypotheses are derived:

- **H01**: "There is no statistically significant effect at the significance level (0.05α ≤) for the product element on the purchasing decisions of cultivated flowers consumers in the city of Amman."
- **H02**: "There is no statistically significant effect at the significance level (0.05α ≤) for the price element on the purchasing decisions of cultivated flowers consumers in the city of Amman."
- **H03**: "There is no statistically significant effect at the significance level (0.05α ≤) for the promotion element on the purchasing decisions of cultivated flowers consumers in the city of Amman."
- **H04**: "There is no statistically significant effect at the significance level (0.05α ≤) for the distribution element on the purchasing decisions of cultivated flowers consumers in the city of Amman."

2 Previous Studies

Abu Samra [1] conducted a study that revealed a noteworthy impact of various components of the green marketing mix on the purchasing choices of consumers of electric cars in Amman, with the exception of the distribution element. This study also identified significant variations in the effects based on demographic factors such as gender, age group, and monthly income.

Hussein [7] conducted a study that revealed a statistically significant impact of social factors and marketing mix elements on the purchase intention of self-service vending machine users within the private university student population in Jordan. Conversely, Bakkar [6] found no positive correlation between flower marketing and purchasing decisions among women in Sudan. Nevertheless, a positive association was observed between brand image and peer influence in relation to purchasing intentions among women.

In a study conducted by Khunfur [10], it was observed that the pharmaceutical marketing mix elements had a significant influence on the purchasing behavior of patients who frequented pharmacies in Amman. The findings revealed a positive correlation between factors such as pharmaceutical product, price, distribution, promotion, and the decision to purchase locally manufactured drugs.

3 Study Methodology

This research was designed based on specific goals, so a descriptive analytical methodology was used. Descriptive analysis is about presenting scientific description of phenomena or scientific problems, and then providing logical interpretations that are supported by evidence and proof. Through this approach, the researchers can define frameworks to address the problem identified in a specific manner [3]. The issue at hand in this chapter is focused on uncovering the impact of marketing mix elements towards purchasing decisions made by cultivated flowers consumers in Amman. To meet this end, the researcher came up with a questionnaire design.

3.1 Study Population

The population under study includes all individuals who purchase cultivated flowers within Amman, a city situated in Jordan.

3.2 Study Sample

The sample of the study is limited to a group of people who buy cultivated flowers in the city of Amman, located in Jordan. This group consisted of a total of 400 individuals, who were carefully selected through an appropriate sampling technique from the broader study population.

3.3 The Study Instrument: Validity and Reliability of

Validity of the Questionnaire

To ascertain the face validity of the questionnaire, the researchers sought the evaluation of a panel of esteemed professors hailing from Jordanian universities. These experts were tasked with assessing the appropriateness of the questionnaire's content and the accuracy of its language.

Reliability of the Questionnaire

In order to ascertain the dependability of the scale utilized in the study, the researchers employed Cronbach's alpha test on the sample population, with the purpose of calculating the internal consistency reliability coefficient for each individual item within the scale. The values are shown in Table 1.

Table 1 Result of Cronbach's alpha test

Item	Cronbach's alpha value
Product	0.895
Price	0.870
Promotion	0.799
Distribution	0.860
Purchasing decision	0.710

Table 2 The statistical standard for interpreting the arithmetic means of estimates of individuals in the study sample for each item of the scale

Arithmetic mean	Degree of agreement
1.00–2.33	Low
2.34–3.67	Moderate
3.68–5.00	High

From Table 1, it is evident that the reliability coefficients for the study scale items ranged from (0.799–0.895), which are considered high and sufficient for conducting the study.

3.4 Statistical Standard Used in the Study

To interpret the arithmetic means of the variables' items in the study, the statistical standard shown in Table 2 was used.

Where the range of each category was calculated by dividing the difference between the largest and smallest values by the number of categories, resulting in (1–5)/3 = 1.33.

3.5 Statistical Methods Used in Data Analysis

1. **Descriptive Statistics**: It is used to describe the characteristics of the tested sample and respond to its hypotheses.
2. **Cronbach's Alpha Coefficient**: Its purpose is to demonstrate the internal consistency of the scale for both independent and dependent research variables (Consistency Reliability).
3. **Frequencies and Percentages**: It is used to demonstrate the demographic characteristics of the surveyed sample.

4. **Means and Standard Deviations**: It is used to present average responses to survey items and axes, as well as to show the degree of dispersion of responses around their average.

3.6 Description of Study Variables

- Main Question: What is the impact of the marketing mix elements on the purchasing decision of cultivated flower consumers in Amman city?

In the attempt to answer this question, the means and standard deviations of the marketing mix elements were calculated. The following Table 3 illustrates this.

Based on the data presented in the aforementioned table, it is evident that the marketing mix elements displayed a range of means from 4.187 to 4.383, indicating a substantial level of agreement among respondents. Specifically, the product element obtained the highest mean, closely followed by the price element with a mean of 4.359. Conversely, the promotion element garnered the lowest mean. Overall, the total scale mean was calculated to be 4.311.

This main question leads to the following sub-questions

- Sub-Question 1: What is the impact of the product element on the purchasing decision of cultivated flower consumers in Amman city?

In order to address this particular sub-inquiry, the statistical calculations of the means and standard deviations were conducted on the items pertaining to the product element, with a specific focus on their influence on the purchasing behavior of cultivated flower consumers within the city of Amman. The following Table 4 illustrates this.

The data presented in Table 4 reveals that the average scores for the product element items varied between 4.202 and 4.483, indicating a high level of agreement among respondents. Item (1) obtained the highest ranking, followed by "There is a variety of high-quality flowers in the market." Conversely, the item "There is information accompanying flowers about their nature and care methods" received the lowest ranking.

Table 3 Means and standard deviations of marketing mix elements ranked descendingly by means

Rank	Item no	Marketing mix element	Mean	Standard deviation	Degree of agreement
1	1	Product	4.383	0.509	High
2	2	Price	4.359	0.553	High
3	4	Distribution	4.316	0.530	High
4	3	Promotion	4.187	0.552	High
		Total scale	4.311	0.450	High

Table 4 Means and standard deviations of product element items ranked descendingly by means

Rank	Item no	Item description	Mean	Standard deviation	Degree of agreement
1	1	Attractive appearance and display method of flowers	4.483	0.596	High
2	5	There is a variety of high-quality flowers in the market	4.478	0.617	High
3	2	I like the display and arrangement of flowers	4.422	0.663	High
4	3	There is diversity in types of flowers in terms of shape, color, and size	4.370	0.655	High
5	4	There is diversity in flower marketing strategies (bunches, arrangements, packages)	4.345	0.669	High
6	6	There is information accompanying flowers about their nature and care methods	4.202	0.777	High
		Total product	4.383	0.509	High

- Sub-Question 2: What is the impact of pricing decisions on the purchasing decision of cultivated flower consumers in Amman city?

In order to address this specific sub-inquiry, calculations were performed to determine the means and standard deviations of the items within the price element, as well as their influence on the purchasing behavior of cultivated flower consumers residing in the city of Amman. The following Table 5 illustrates this.

The data presented in Table 5 reveals that the price element items exhibit a range of means, varying from 4.243 to 4.455, indicating a high level of agreement among respondents. Among these items, item 9 received the highest ranking. Item 7 ranked second. Lastly, item 11obtained the lowest ranking among the respondents.

- Sub-Question 3: What is the impact of promotional activities on the purchasing decision of cultivated flower consumers in Amman city?

In order to address this sub-inquiry, the researchers computed the means and standard deviations of the items pertaining to the promotion element, as well as their influence on the purchasing behavior of cultivated flower consumers in the city of Amman. The following Table 6 illustrates this.

Table 5 Means and standard deviations of price element items ranked descendingly by means

Rank	Item no	Item description	Mean	Standard deviation	Degree of agreement
1	9	High-quality flowers are offered in the market at reasonable prices	4.455	0.636	High
2	7	Price offers, discounts, and appropriate flower prices are provided	4.453	0.706	High
3	10	Price changes and discounts on flowers are considered	4.395	0.660	High
4	8	Competitive and diverse prices are provided for flowers in the market	4.307	0.764	High
5	12	Flowers are offered at low prices	4.302	0.716	High
6	11	Discounts are offered based on the quantity of flowers sold	4.243	0.768	High
		Total Price	4.359	0.553	High

Table 6 Means and standard deviations of promotion element items ranked descendingly by means

Rank	Item no	Item description	Mean	Standard deviation	Degree of agreement
1	13	There is credibility in the advertisements published for flowers	4.423	0.652	High
2	17	I believe that the seller's personality and method of dealing are good	4.390	0.689	High
3	14	Comprehensive information about flowers is provided	4.188	0.699	High
4	18	Flowers or free samples are provided	4.177	0.879	High
5	15	The influence element is provided in cultivated flowers ads such as color, design, or sound	4.130	0.765	High
6	16	There is repetition in cultivated flowers ads	3.815	0.956	High
		Total promotion	4.187	0.552	High

Upon examination of Table 6, it becomes apparent that the promotion element items exhibited a range of means from 3.815 to 4.423, indicating a high level of agreement among respondents. The item that garnered the highest ranking was item 13. This was closely followed by item 17. Conversely, item 16 received the lowest ranking.

- The fourth sub-question: What is the impact of distribution on the purchasing decision of flower consumers in Amman?

In order to provide an answer to this inquiry, we extracted the arithmetic means and standard deviations of the distribution element paragraphs, and evaluated their influence on the purchasing choices made by flower consumers in Amman. The following Table 7 illustrates this.

According to Table 7, the distribution element paragraphs exhibited a range of arithmetic means, from 4.128 to 4.470, indicating a significant level of agreement. Among these items, item 24 ranked the highest with an arithmetic mean of 4.457. Following closely behind was item 21. The subsequent position was held by item 22. Lastly, paragraph 20 obtained the lowest ranking.

Table 7 Arithmetic means and standard deviations of distribution element paragraphs arranged in descending order according to the arithmetic means

Rank	Item no	Item description	Arithmetic mean	Standard deviation	Degree of agreement
1	24	Flowers are delivered on time and within a short period	4.470	0.640	High
2	21	Flowers are delivered without defects	4.457	0.616	High
3	22	Appropriate methods and means are used to preserve flowers	4.348	0.642	High
4	19	I am provided with various types of flowers	4.257	0.680	High
5	23	Order tracking services for flowers are available	4.235	0.772	High
6	20	Flower products are available permanently	4.128	0.780	High
	Overall		4.316	0.530	High

4 Testing Study Hypotheses

In this section, statistical tests (simple linear regression and multiple regression analysis) were used. Here is a summary of that:

- Main Hypothesis: "There is no statistically significant effect at the significance level ($0.05\alpha \leq$) for the marketing mix elements on the purchasing decision of flower consumers in Amman."

In order to validate this hypothesis, the impact of the independent variables (marketing mix) on the purchasing decision was assessed through the utilization of a multiple linear regression analysis. Here's a presentation of that:

Testing the Significance and Interpretability of the Used Multiple Linear Regression Model.

Linear Correlation Test (Multicollinearity)

To ascertain the absence of excessive correlation among the independent variables, the variance inflation factor (VIF) and tolerance test were employed. It was imperative that the VIF values remain below 10, while the tolerance test values surpass 0.05 for every independent variable. Table 8 shows this.

Based on the findings presented in Table 8, it is evident that the Variance Inflation Factor (VIF) values for all independent variables are below 10, and the tolerance test values exceed the threshold of 0.05. These results indicate the absence of any significant correlation issues among the independent variables, thereby confirming their suitability for inclusion in the model. Subsequently, a multiple linear regression analysis was conducted using the Stepwise method, incorporating the independent variables (Product, Price, Promotion, and Distribution). This analysis successfully identified the independent variables that exhibited a statistically significant impact on the dependent variable (purchasing decision), accompanied by the corresponding percentage of this influence.

Analysis of Variance (ANOVA)

Upon inputting the independent variables (Product, Price, Promotion, and Distribution) into the equation, an analysis of variance was conducted to assess the effects of these variables. The ensuing results have been presented in Table 9.

Table 8 Results of the VIF and tolerance tests for the independent variables (product, price, promotion, distribution)

Independent variables	Tolerance test allowed variance	Variance inflation factor (VIF)
Product	0.522	1.917
Price	0.556	1.800
Promotion	0.431	2.322
Distribution	0.453	2.208

Table 9 ANOVA results to verify the strength and significance of the multiple linear regression model

No	Source of variation	Sum of squares	Degrees of freedom	Mean square	F value	Statistical significance
1	Regression	50.953	1	50.953	489.045	0.000b
	Residual	41.467	398	0.104		
	Total	92.419	399			
2	Regression	64.284	2	32.142	453.525	0.000c
	Residual	28.136	397	0.071		
	Total	92.419	399			
3	Regression	69.491	3	23.164	400.064	0.000d
	Residual	22.928	396	0.058		
	Total	92.419	399			
4	Regression	71.042	4	17.761	328.174	0.000e
	Residual	21.377	395	0.054		
	Total	92.419	399			

*Statistical significance at the significance level ($0.05 \geq \alpha$)
b: Independent variable (distribution)
c: Independent variables (distribution, price)
d: Independent variables (distribution, price, product)
e: Independent variables (distribution, price, product, promotion)

The analysis of Table 9 reveals that the statistical significance values of the variables are below the predetermined significance level ($0.05 \geq \alpha$), thus indicating a noteworthy and explanatory relationship between the independent variables and the dependent variable. A concise overview of the multiple linear regression model is provided in Table 10.

From Table 11, the following can be observed:

Table 10 Summary of the multiple linear regression model

Model	Correlation coefficient	Determination coefficient	Adjusted determination coefficient	Standard Error of the Estimate
1	0.743a	0.551	0.550	0.32278
2	0.834b	0.696	0.694	0.26622
3	0.867c	0.752	0.750	0.24062
4	0.877d	0.769	0.766	0.23264

a: Independent variable (distribution)
b: Independent variables (distribution, price)
c: Independent variables (distribution, price, product)
d: Independent variables (distribution, price, product, promotion)

Table 11 Significance of coefficients for standardized and unstandardized multiple linear regression equation

Model	Multiple linear regression model	Unstandardized	Standardized	t Value	Statistical significance
	Constant	B	Std. error	Beta	
1	Constant	1.494	0.133		11.271
	Distribution	0.674	0.030	0.743	22.114
2	Constant	0.746	0.122		6.104
	Distribution	0.448	0.030	0.494	14.921
	Price	0.395	0.029	0.454	13.715
3	Constant	0.366	0.117		3.119
	Distribution	0.325	0.030	0.358	10.801
	Price	0.298	0.028	0.343	10.666
	Product	0.304	0.032	0.322	9.484
4	Constant	0.327	0.114		2.877
	Distribution	0.246	0.033	0.271	7.539
	Price	0.254	0.028	0.292	9.005
	Product	0.270	0.032	0.286	8.531
	Promotion	0.172	0.032	0.197	5.354

* Statistical significance at the significance level ($0.05 \geq \alpha$)

- Main Hypothesis: "There is no statistically significant effect at the significance level ($0.05\alpha \leq$) for the marketing mix elements on the purchasing decision of flower consumers in Amman."
- The value of the correlation coefficient for the independent variable (distribution) is 0.743, with a coefficient of determination (R^2) of 0.551 and an adjusted coefficient of determination of 0.550, which indicates that the independent variable (Distribution) was able to explain 55.0% of the variance in the dependent variable (Purchase decision).
- The value of the correlation coefficient for the independent variables (distribution, price) is 0.834, with a coefficient of determination (R^2) of 0.696 and an adjusted coefficient of determination of 0.694, which indicates that the independent variables (distribution, price) were able to explain 69.4% changes in the dependent variable (purchase decision).
- The value of the correlation coefficient for the independent variables (distribution, price, product) is 0.867, with a coefficient of determination (R^2) of 0.752 and an adjusted coefficient of determination of 0.750, which indicates that the independent variables (distribution, price, product) were able to explain 75, 0% change in the dependent variable (purchase decision).
- The value of the correlation coefficient for the independent variables (distribution, price, product, promotion) is 0.877, with a coefficient of determination (R^2) of 0.769 and an adjusted coefficient of determination of 0.766, which indicates that

the independent variables (distribution, price, product, promotion) were in able to explain 76.6% of the changes in the dependent variable (purchase decision).

In order to ascertain the variables within the marketing mix elements that exert a statistically significant impact on the dependent variable (purchasing decision), significance tests were undertaken on the coefficients of the multiple linear regression equation, both in standardized and unstandardized form. Table 11 illustrates this.

From Table 11, the following can be observed:

- The standardized and unstandardized multiple linear regression equations in the four proposed models demonstrate a significant statistical effect for the coefficients associated with the independent variables (product, price, promotion, distribution). This suggests a positive influence of these variables on the dependent variable (purchasing decision). As a result, we reject the primary hypothesis, which asserts that there is no statistically significant effect, at a significance level of 0.05 or greater, for the marketing mix elements on the purchasing decision of flower consumers in the city of Amman.

From the main hypothesis, the following sub-hypotheses emerge

- Sub-hypothesis 1: There is no statistically significant effect (at a significance level of 0.05) of the product element on the purchasing decision of flower consumers in the city of Amman.

To verify Sub-hypothesis 1, a simple linear regression test was conducted for the product variable on the purchasing decision. Table 12 illustrates this.

The analysis presented in Table 12 reveals a clear positive linear association between the product element and the purchasing decision, as indicated by a correlation coefficient of 0.738. The results of the simple linear regression test confirm that the product element has a statistically significant impact on the purchasing decision, with a significance level below 0.05. Furthermore, the product element accounts for 54.4% of the variability in the purchasing decision, as evidenced by the explained variance. Notably, the regression coefficient (β) of 0.697 indicates a strong positive effect of the product element on the purchasing decision. Consequently, Sub-hypothesis 1, which posits no statistically significant effect of the product element on the purchasing decision of flower consumers in the city of Amman, is refuted.

Table 12 Results of simple linear regression test for the product element and its impact on the purchasing decision

Correlation coefficient value	Explained variance	F value	Statistical significance of F	Regression coefficient value (β)	t Value	Statistical significance
0.738	0.544	476.585	0.00*	0.697	21.831	0.00*

*Statistical significance at the significance level ($0.05 \geq \alpha$)

- Sub-hypothesis 2: There is no statistically significant effect (at a significance level of 0.05) of the price element on the purchasing decision of flower consumers in the city of Amman.

To verify Sub-hypothesis 2, a simple linear regression test was conducted for the price variable on the purchasing decision. Table 13 presents these results:

The findings presented in Table 13 demonstrate a clear and positive linear relationship between the price element and the purchasing decision. This is supported by a correlation coefficient of 0.724, indicating a moderate to strong correlation. The results of the simple linear regression analysis further confirmed the significance of the price element, with a p-value below 0.05. The price element accounted for 52.4% of the variance in the purchasing decision, as indicated by the explained variance. Additionally, the regression coefficient (β) of 0.631 suggests a strong positive effect of the price element on the purchasing decision. Consequently, Sub-hypothesis 2, which posits that there is no statistically significant effect of the price element on the purchasing decision of flower consumers in the city of Amman, is refuted.

- Sub-hypothesis 3: There is no statistically significant effect (at a significance level of 0.05) of the promotion element on the purchasing decision of flower consumers in the city of Amman.

To verify Sub-hypothesis 3, a simple linear regression test was conducted for the promotion variable on the purchasing decision. Table 14 illustrates this:

The data presented in Table 14 demonstrates a clear positive linear relationship between the promotion element and the purchasing decision, as indicated by a correlation coefficient of 0.733. The results of the simple linear regression analysis provide evidence of a statistically significant impact of the promotion element on the purchasing decision, with a significance level below 0.05. Furthermore, the

Table 13 Results of simple linear regression test for the price element and its impact on the purchasing decision

Correlation coefficient value	Explained variance	F value	Statistical significance of F	Regression coefficient value (β)	t Value	Statistical significance
0.724	0.524	439.590	0.00*	0.631	20.966	0.00*

*Statistical significance at the significance level ($0.05 \geq \alpha$)

Table 14 Results of simple linear regression test for the promotion element and its impact on the purchasing decision

Correlation coefficient value	Explained variance	F value	Statistical significance of F	Regression coefficient value (β)	t Value	Statistical significance
0.733	0.537	461.439	0.00*	0.639	21.481	0.00*

* Statistical significance at the significance level ($0.05 \geq \alpha$)

Table 15 Results of simple linear regression test for the distribution element and its impact on the purchasing decision

Correlation coefficient value	Explained variance	F value	Statistical significance of F	Regression coefficient value (β)	t Value	Statistical significance
0.743	0.550	489.045	0.00*	0.674	22.114	0.00*

* Statistical significance at the significance level ($0.05 \geq \alpha$)

promotion element accounts for 53.7% of the variance in the purchasing decision, as reflected by the explained variance. The regression coefficient (β) of 0.639 further confirms a strong positive effect of the promotion element on the purchasing decision. Consequently, Sub-hypothesis 3, which suggests no significant influence of the promotion element on the purchasing decision of flower consumers in the city of Amman, is refuted.

- Sub-hypothesis 4: There is no statistically significant effect (at a significance level of 0.05) of the distribution element on the purchasing decision of flower consumers in the city of Amman.

To verify Sub-hypothesis 4, a simple linear regression test was conducted for the distribution variable on the purchasing decision. Table 15 presents these results.

Based on the data presented in Table 15, it is clear that there exists a direct and positive relationship between the distribution element and the purchasing decision. This relationship is supported by a correlation coefficient of 0.743, indicating a strong association. Furthermore, the results of the simple linear regression analysis demonstrate a statistically significant impact of the distribution element on the purchasing decision, as evidenced by a significance level below 0.05. The distribution element accounts for 55% of the variance in the purchasing decision, as indicated by the explained variance. Additionally, the regression coefficient (β) of 0.674 further confirms the substantial positive effect of the distribution element on the purchasing decision. Consequently, Sub-hypothesis 4, which posits that there is no statistically significant effect of the distribution element on the purchasing decision of flower consumers in the city of Amman, is unequivocally rejected.

5 Discussion of Results

In the study, it was observed that there were significant levels of agreement among respondents regarding the various components of the marketing mix. Notably, the highest average agreement score was observed for the product element, followed by price, and the lowest for promotion. When examining the individual items within the product element, it was found that there were high agreement scores for the arithmetic means. Specifically, the item pertaining to the emphasis on the visually appealing aspect of freshly harvested flowers and the manner in which they are

displayed received the highest ranking. Conversely, the item relating to the provision of information about the characteristics of the flowers and the accompanying care methods received the lowest ranking.

Likewise, there was a notable consensus among respondents regarding the arithmetic means of the price element items, with the statement "High-quality flowers are available at affordable prices" receiving the highest ranking, while "Discounts are offered based on the volume of flower purchases" received the lowest ranking. In terms of the promotion element items, respondents also demonstrated a high level of agreement, with the statement "There is credibility of the flowers promotion advertised" receiving the highest ranking, and "There is repetition in the advertising of recently harvested flowers" receiving the lowest ranking.

In terms of the distribution aspect of the items, there was a notable consensus among respondents, with the item "Flower orders are delivered on time and within a short period" receiving the highest agreement score, while the item "Flower products are available in limited quantities" received the lowest score. Furthermore, the study reveals a statistically significant positive impact of the marketing mix elements, including product, price, promotion, and distribution, on the purchasing behavior of consumers who buy freshly picked flowers in Amman.

The significance ascribed to the components of the marketing mix stems from their capacity to effectively identify marketing channels and enhance profitability by implementing strategies that align with evolving market demands. The examination of these elements plays a pivotal role in market analysis, competitor analysis, and the development of value propositions that align with customer pricing expectations. The marketing mix plan serves to strike a harmonious balance between financial gains and customer satisfaction, bolster brand equity, and facilitate the delivery of the product.

In order to maximize their profits, farmers are driven to present freshly harvested flowers in local markets, leading them to increase production and employ various promotional strategies to distribute their products. These findings are consistent with the research conducted by Khanfar [10], which revealed a correlation between the elements of the pharmaceutical marketing mix (product, price, distribution, and promotion) and the purchasing decisions of patients in Amman's pharmacies. Similarly, Ajman's [2] study demonstrated that the marketing mix significantly influences the purchase decisions of pharmacists, with price exerting the greatest influence. Furthermore, Abu Samra's [1] study emphasized the impact of green marketing mix elements (product, pricing, promotion) on the purchase decision of electric cars in Amman. Lastly, Attri and Jain's [5] study identified several factors that influence online purchasing, including customer personality, marketing and advertising, timing, and in-store presentation.

5.1 Recommendations

1. Maintaining product quality is essential to ensure that it is consistent with consumer preferences and needs. This ensures customer satisfaction and loyalty.
2. Highlight the elements of the marketing mix and constantly develop them to increase the attractiveness of consumers and influence their purchasing decisions about services and products.
3. Flower sellers should create brochures and leaflets detailing the types of flowers available, their prices, care instructions and distribution channels. These materials can be distributed to consumers to encourage them to make a purchase decision.
4. Flower sellers should continue their current distribution policies and work on continuous improvement to adapt to changing trends and consumer demands.
5. Increase promotional campaigns for freshly picked flowers across various advertising channels to raise consumer awareness of their importance and quality.
6. The researchers recommend more research and future research using new variables that may influence purchasing decisions in different sectors.

Enhancing Profitability Through Sustainability: Unveiling the ESG-Financial Performance Nexus in European Firms

Aladdin Dwekat, Mohammad N. Yaaqbeh, and Zeena Mardawi

Abstract This research examines the influence of Environmental, Social, and Governance (ESG) practices on the financial outcomes of European companies, particularly those listed on the STOXX Europe 600 index during the period from 2012 to 2018. The objective is to understand the strategic significance of ESG practices and their correlation with financial outcomes. By analyzing a sample of diverse European firms, the study provides a comprehensive overview of the influence of ESG criteria in a unique economic and regulatory context. The research methodology includes a regression analysis to examine the relationship between ESG scores and Return on Equiry (ROE), while controlling for variables such as firm size, leverage, operational efficiency, and sales growth. The findings reveal a significant positive relationship between ESG performance and ROE, indicating that higher ESG scores correlate with improved financial performance. This result supports the growing body of literature suggesting that sustainable and responsible business practices are not just ethical imperatives but also contribute to financial success. Additionally, the study contributes to the existing literature by offering a multi-country European perspective, contrasting with previous research predominantly focused on single-country analyses. This approach provides new insights into the relationship between ESG practices and financial performance across different national contexts within Europe, a region recognized for its leadership in sustainability and corporate governance. The findings have practical implications for business leaders, investors, and policymakers, emphasizing the importance of integrating ESG practices into corporate strategies for long-term financial success. The study also suggests areas for future research, including the exploration of specific ESG components and their individual impacts on financial performance.

1 Introduction

In an era marked by heightened awareness of corporate responsibility and sustainability, the incorporation of Environmental, Social, and Governance (ESG) criteria into corporate strategies has gained substantial importance [15, 30]. This shift reflects a broader recognition by various stakeholders, including investors and regulators, of the long-term benefits and risks associated with ESG practices [5]. The influence of these practices on financial performance has become a focal point in business research. Studies by [9, 10, 17, 29] have highlighted the strategic benefits of transparent ESG practices, linking them to enhanced financial stability and investor confidence. This growing body of research, including the work of Khanchel et al. [21], suggests that comprehensive ESG practices can lead to tangible financial benefits for firms.

Despite these insights, a noticeable gap in the literature remains. This gap is particularly regarding the specific impact of ESG practices on financial performance within the European context. While research like that of Broadstock et al. [8] and Sandberg et al. [35] has begun to explore this relationship, there is a need for more detailed analysis focusing on European firms. This is especially pertinent given the unique economic, regulatory, and cultural landscape in Europe, which could influence the ESG-financial performance nexus differently than in other contexts. Additionally, existing studies often aggregate ESG scores, potentially obscuring the individual influences of ESG factors.

Addressing this gap, the current study aims to analyze the effect of ESG practices on the financial performance of European firms, focusing on those listed on the STOXX Europe 600 from 2012 to 2018. By disaggregating the ESG score and considering various control variables, this research provides a more nuanced understanding of how different ESG aspects affect financial outcomes.

Furthermore, this study makes a significant contribution by adopting a European-level approach, encompassing 17 countries and contrasting with most studies that focus on single-country analyses. Considering the diverse national contexts within Europe, which [13, 16] suggest can influence CSR and ethical practices, this broader approach offers new perspectives and enriches the existing literature. Moreover, given that European companies are often regarded as pioneers in ESG reporting [14, 22, 39], by concentrating on the European market, this study delivers critical insights into the connection between ESG practices and financial performance, highlighting a region recognized for its leadership in sustainability and corporate governance.

2 ESG and Financial Performance

The incorporation of ESG disclosure into corporate strategy has become a focal point in the European business landscape, with a growing body of empirical research underscoring its positive influence on financial performance. This essay synthesizes

these academic findings, illustrating how ESG disclosure is not merely a regulatory compliance or ethical choice but a strategic avenue leading to enhanced financial outcomes.

Initiating this discourse, Buallay [9, 10] identified a significant correlation between ESG disclosure and key financial metrics like ROA and ROE in the European banking sector. This foundational research established the premise that transparency in sustainability practices directly contributes to a company's financial stability and attractiveness to investors [9, 10]. Building on this premise, Liu and Lin [29] extended the understanding of ESG's impact by focusing on risk mitigation. Their study highlighted that clear and effective ESG reporting reduces information asymmetry between internal management and external investors, thereby enhancing corporate transparency. This increased transparency plays a crucial role in fostering investor confidence and preventing financial malpractices, thereby bolstering financial performance [1, 29].

Delving deeper, Khanchel et al. [21] explored the specific impact of the social and governance dimensions of ESG, alongside green innovation, on financial metrics. Their findings are pivotal in demonstrating the direct financial benefits of adopting comprehensive and holistic ESG practices, revealing that such practices lead to tangible improvements in a company's financial metrics [21]. In the same vein, Gholami et al. [18] provided an industry-specific perspective, particularly in the financial sector. In detail, they posited that ESG awareness not only contributes to economic development but also directly benefits borrowers, underlining the role of sustainability in the financial ecosystem's health [18, 32].

Further aligning ESG disclosure with established economic theories, Schiehll and Kolahgar [36] connected their findings with agency theory, indicating that ESG practices play a critical role in enhancing corporate governance, thereby improving overall performance. This alignment illustrates that ESG practices are integral to sound business strategy, extending beyond mere ethical considerations [36]. Additionally, the association between ESG disclosure and stock performance has been a significant area of research, revealing a strong positive link between ESG ratings and stock returns. This correlation suggests that the market perceives companies with robust ESG practices as more valuable, thereby positively influencing their stock prices and overall financial performance [9, 10, 29].

Furthermore, the link between ESG disclosure and a firm's cost of capital has garnered attention, with research indicating that firms with transparent ESG reporting experience lower costs of capital. This phenomenon is likely due to the reduced risk perception among investors, highlighting the financial benefits of sustainability and governance transparency [18, 21]. Moreover, the influence of ESG disclosure on credit ratings has emerged as a notable area of research. Companies with higher ESG ratings typically receive more favourable credit ratings, leading to lower borrowing costs and improved access to capital, significantly influencing their financial performance [2, 36].

In sum, the convergence of these studies paints a robust narrative of the positive effect of ESG disclosure on financial performance. By enhancing transparency, reducing risks, improving governance, and promoting sustainability, ESG practices

offer a multifaceted advantage to companies, leading to substantial financial improvements. This positive link between ESG disclosure and financial performance reflects a paradigm shift in corporate success measurement and achievement. Particularly in Europe, where regulatory and cultural landscapes are conducive to ESG integration, companies are increasingly recognized not just for their financial achievements but also for their commitment to sustainable and ethical practices.

Conclusively, the collective body of research posits that ESG disclosure is a strategic tool that can significantly enhance a company's financial performance. European Companies effectively integrating ESG practices into their operations have aligned with contemporary ethical standards and positioned themselves for financial success. This trend is expected to continue, making ESG disclosure an integral part of corporate strategy, driving innovation, governance, and financial performance across industries. Drawing from the above discussion, we will articulate our hypothesis as follows:

H1: *There is a statistically significant and positive association between ESG disclosure and the financial performance of European companies listed in the EU STOXX 600 index.*

3 Methods

3.1 Data and Sample

In our study, we analyze European firms listed on the STOXX Europe 600 index from 2012 to 2018, focusing on a sample that exemplifies leadership in ESG and sustainability practices, as noted by Martínez-Ferrero et al. [40] and Simnett et al. [39]. The STOXX Europe 600, a subset of the STOXX Global 1800 Index derived from the broader STOXX Europe Total Market Index, comprises 600 companies representing a wide range of capitalizations in 17 European stock markets, including but not limited to the Eurozone. These markets span countries such as Finland, Belgium, Italy, Luxembourg, Austria, Portugal, France, Spain, Poland, Denmark, Germany, Norway, Sweden, Ireland, Switzerland, the Netherlands, and the United Kingdom. This diverse sample, accounting for around 90% of the free-float market capitalisation in the region, offers a comprehensive view of European corporate practices in ESG and sustainability. The data for this study were meticulously collected from the Refinitiv Eikon database, known for its extensive and reliable financial and corporate information. The selection of this period, 2012–2018, is crucial as it captures a critical phase in the integration of ESG considerations into corporate strategies across Europe, thereby providing a robust framework for examining trends and practices in this domain. Moreover, the period targeted in the current study is limited to the period from 2012 to 2018 to eliminate any potential bias caused by the Covid 19 pandemic which started in the year of 2019.

4 Study Variables

This study aims to examine the influence of ESG performance on financial performance, specifically focusing on ROE as the dependent variable. Within this framework, ESG performance, as measured by the score obtained from the Refinitiv Eikon database, stands as the sole independent variable of interest. Specifically, the Refinitiv ESG index serves as a socially responsible benchmark commonly utilized by investors to evaluate companies' performance in environmental, social, and governance areas [33]. The comprehensive environmental pillar score of the Refinitiv ESG index is derived from three categories: (i) resource utilization; (ii) emissions; and (iii) innovation ([34], p. 3).

In addition to this primary focus, several control variables are incorporated to ensure a comprehensive analysis. These control variables include firm size, leverage, operational efficiency, innovation capacity, and sales growth.

ROE, our dependent variable, is employed as a key indicator of a firm's profitability and efficiency in generating returns from shareholders' equity. The study's independent variable, ESG score, is central to understanding how a firm's commitment to environmental, social, and governance factors influences its financial performance. This alignment with ESG criteria is increasingly recognized as a determinant of a firm's long-term success and resilience.

To account for other factors that might affect the financial performance, the study introduces several control variables. Firm size is measured as the natural logarithm of total assets (LnTA), providing an understanding of the scale of operations. Leverage, calculated as the ratio of total debt to total assets (LEV), helps in assessing the financial risk and capital structure of the firms. The efficiency of operations is gauged through the ratio of cash flow from operations to total assets, offering insights into the firm's managerial effectiveness.

Innovation capacity, indicated by the natural logarithm of research and development expenditures (Ln R&D), reflects a firm's investment in future growth and technology, which is critical in today's rapidly evolving business landscape. Lastly, the study considers sales growth, measured by the percentage change in sales revenue, to understand market performance and expansion capability.

This selection of independent variable (ESG score) alongside relevant control variables allows for a targeted analysis of the impact of ESG practices on financial performance, particularly in the context of European firms listed on the STOXX Europe 600 index. The operational definitions of each of these variables are detailed in Table 1, providing a clear foundation for the empirical analysis to follow.

5 Regression Model

To test hypotheses and to examine the effect of ESG score on financial performance, this study used the following regression model

Table 1 Measurement of variables

Variable	Label	Operational definition
Financial performance	ROE	Net income divided by total equity
ESG performance	ESG	ESG score obtained from Refinitiv Eikon database
Firm size	LnTA	Natural logarithm of total assets
Leverage	LEV	Total debt divided by total assets
Operational efficiency	CFO	Cash flow from operating activities divided by total assets
Innovation capacity	R&D	Natural logarithm of research and development expenditures
Sales growth	Salesgrowth	Percentage change in sales revenue from one period to the next

$$\begin{aligned} \text{ROE} = \alpha + \beta 1\text{ESG} + \beta 2\text{LnTA} + \beta 3\text{LEV} \\ + \beta 4\text{CFO} + \beta 5\text{R\& D} + \beta 6\,\text{Salesgrowth} + \varepsilon. \end{aligned}$$

The dependent and independent variables and the error term (ε) and regression coefficients (βk), are as defined in Table 1.

6 Results and Discussion

6.1 Descriptive Statistics and Correlation

The descriptive statistics shown in Table 2 provide essential insights into the variables under investigation. The mean ROE across the sampled firms is 14.195, indicating a moderate level of profitability on average. The ESG score, a crucial variable in this study, shows an average value of 58.216. This suggests that the firms in the sample generally have a moderate-to-high commitment to ESG standards.

Table 2 Descriptive statistics

Variable	Mean	Std. Dev.	Min	Max
ROE	14.195	14.108	− 16.050	46.520
ESG	58.216	19.199	1.240	95.250
LnTA	15.293	1.335	12.893	17.818
LEV	0.205	0.145	0.090	0.501
CFO	0.097	0.127	− -0.486	2.803
R&D	10.968	1.987	1.946	16.496
Salesgrowth	0.186	3.896	− -1.000	239.748

The mean value for the natural logarithm of Total Assets (LnTA) is 15.293, reflecting the substantial size of the firms within the STOXX Europe 600 index. The average leverage ratio (LEV) stands at 0.205, indicating that, on average, around 20.5% of the firms' assets are financed by debt. This points to a relatively moderate level of financial leverage among the sampled firms.

Operational efficiency, measured as Cash Flow from Operating Activities to Total Assets (CFO), has an average value of 0.097. This figure suggests that the firms, on average, manage to generate around 9.7% of their total assets in operational cash flow. The mean value for Research and Development (R&D) expenditures, logged for scaling purposes, is 10.968. This indicates a substantial investment in R&D among the firms, reflecting their focus on innovation and future growth.

Lastly, the mean Sales Growth (Salesgrowth) for the sampled firms is 0.186. This value, although positive, indicates a relatively modest growth in sales, on average, which can be reflective of the varied economic contexts and market conditions experienced by the firms in different European countries over the study period.

To assess multicollinearity in our study, we analyzed the Pearson's correlation coefficients between the variables, as detailed in Table 3. The findings indicate moderate correlations without any significant multicollinearity concerns. The highest correlation observed is 0.645 between LnTA (Log of Total Assets) and ESG (Environmental, Social, and Governance score), which, while noteworthy, does not pose a serious multicollinearity issue. Other correlations, such as between ROE and CFO, are moderate and within acceptable ranges. The lower correlations between variables like LEV (Leverage), R&D (Research and Development expenditures), and Salesgrowth with ESG further suggest a minimal risk of multicollinearity. Overall, the correlation matrix confirms that the variables in the proposed model are suitably independent for our regression analysis.

Table 3 Matrix of correlations

Variables	(1)	(2)	(3)	(4)	(5)	(6)	(7)
(1) ROE	1.000						
(2) ESG	0.235	1.000					
(3) LnTA	0.071	0.645	1.000				
(4) LEV	− 0.031	0.177	0.285	1.000			
(5) CFO	0.533	− 0.087	− 0.216	− 0.168	1.000		
(6) R&D	0.067	0.441	0.505	− 0.080	− 0.010	1.000	
(7) Salesgrowth	0.030	− 0.107	− 0.029	− 0.057	0.027	− 0.043	1.000

7 Regression Analysis

Before conducting the regression analysis, we undertook preliminary tests to determine the most suitable model for our data. Initially, the Hausman test was employed to decide between fixed effects and random effects models. The results of this test showed a p-value greater than 0.05, indicating that the random effects model is more appropriate for our study. This suggests that the unobserved individual effects are uncorrelated with the independent variables.

Furthermore, to determine the appropriate model between the random effects model and pooled ordinary least squares (OLS), we performed the Breusch-Pagan Lagrange Multiplier test. The results of this test indicated a preference for the random effects model over the pooled OLS, thereby affirming the suitability of the random effects approach for our analysis.

Table 4 presents two models utilizing the random effects framework. The first model includes all the variables without controlling for year, country, and industry effects. This model provides a baseline understanding of the relationships between the variables. The second model, however, incorporates controls for year, country, and industry, offering a more refined analysis by accounting for potential confounding effects due to temporal, geographical, and sectoral differences.

Additionally, to address potential heteroscedasticity issues in the data, both models employ robust standard errors. This adjustment ensures that the standard errors are reliable and the statistical inferences drawn from the models are valid, despite the presence of heteroscedasticity. The use of robust standard errors is particularly important in panel data analysis, where heteroscedasticity and serial correlation are common concerns.

The regression analysis in Table 4, particularly model 2, offers significant insights into the relationship between ESG performance and financial performance, as represented by ROE. This model, which controls for year, country, and industry factors and employs robust standard errors, reveals some key findings.

ESG score exhibits positive and statistically significant impact of ESG score on ROE ($\beta = 0.224, p < 0.05$) in our study strongly supports the hypothesis that enhanced ESG performance contributes to improved financial performance. This finding is a testament to the strategic value of integrating ESG criteria into corporate practices, a perspective increasingly recognized in contemporary research.

The rationale behind this positive correlation is multifaceted. Firstly, ESG-focused practices often lead to operational efficiencies and risk mitigation. Emphasizing sustainability allows companies to decrease expenses linked to energy usage, waste disposal, and adherence to regulations. Studies by [9, 10, 29] in the European banking sector illustrate that firms with higher transparency in sustainability practices not only experience financial stability but also gain increased investor confidence due to perceived lower risks.

Moreover, ESG practices align with consumer and investor values, particularly in the current socio-economic climate where there is growing awareness and demand for sustainable and socially responsible business operations. This alignment often

Table 4 Regression analysis

	(1)	(2)
Variables	Random effect	Random effect
ESG	0.180**	0.224**
	(0.0846)	(0.0958)
LnTA	3.990**	2.855**
	(2.718)	(3.057)
LEV	− 1.390**	− 3.475*
	(25.73)	(26.98)
CFO	161.8***	163.5***
	(25.72)	(24.72)
R&D	8.75e−07	1.49e−06
	(1.65e−06)	(1.82e−06)
Salesgrowth	0.417*	0.502*
	(0.410)	(0.395)
Constant	53.25	21.84
	(38.15)	(41.48)
Year	NO	YES
Country	NO	YES
Industry	NO	YES
Observations	2,543	2,543
Adj-R-squared	0.095	0.115

Robust standard errors in parentheses
*** $p < 0.01$, ** $p < 0.05$, * $p < 0.1$

translates into stronger brand loyalty, enhanced reputation, and access to new market segments, all contributing to financial performance.

Khanchel et al. [21] further emphasize the direct financial benefits of ESG practices, indicating that companies that actively engage in environmental stewardship, uphold social responsibilities, and maintain robust governance standards often experience improved profitability and market valuation. This could be attributed to the fact that these practices enhance a company's capability to attract and retain top talent, stimulate innovation, and improve long-term strategic planning.

Furthermore, integrating ESG principles can lead to better access to capital. Investors and financiers are increasingly considering ESG factors in their investment decisions. Companies with strong ESG practices often benefit from lower capital costs and improved investment returns, as evidenced by Broadstock et al. [8] and Sandberg et al. [35]. This is particularly relevant in the context of sustainable investing, which has witnessed significant growth over recent years.

Finally, there is an aspect of regulatory compliance and foresight. Companies that proactively adopt ESG standards are often better prepared for future regulatory

changes, thereby avoiding potential fines and penalties. This proactive approach can also position companies as industry leaders, setting them apart from competitors.

Concerning control variables, Cash Flow from Operations (CFO) shows a substantial positive relationship with ROE ($\beta = 163.5$, $p < 0.01$). This finding is consistent with previous research emphasizing the pivotal role of CFO in enhancing a firm's profitability [23]. Efficient management and generation of operational cash flow are crucial in predicting future earnings and ensuring financial stability.

The positive influence of firm size (LnTA) on financial performance ($\beta = 2.855$, $p < 0.05$) supports the idea that larger firms tend to have better financial outcomes. This is in line with research by Halid et al. [19] and Lisin et al. [41], which indicates that larger firms, due to their resources and capabilities, engage more effectively in ESG activities, thereby enhancing their ESG scores and financial performance.

Conversely, financial leverage (LEV) demonstrates a negative relationship with ROE ($\beta = -3.475$, $p < 0.1$). This supports findings by Alareeni and Hamdan [4] and Lee [25], suggesting that high financial leverage can impede a company's ability to engage in ESG initiatives. High levels of debt may constrain resources that could otherwise be allocated to sustainable practices, impacting both ESG performance and profitability. Similarly, Shobhwani [38] noted that high leverage negatively impacts ESG disclosure, as companies prioritize meeting debt obligations over investing in ESG activities. Adeneye et al. [3] also observed that high leverage might hinder maintaining strong ESG practices due to financial constraints.

In conclusion, our regression analysis elucidates the complex interplay between ESG performance, operational efficiency, firm size, financial leverage, and financial performance. It highlights the strategic importance of ESG practices in enhancing financial outcomes, while also underscoring the potential constraints posed by financial leverage on ESG performance and disclosure. These findings contribute to the growing body of literature that emphasizes the multifaceted benefits of ESG integration in corporate strategy, particularly in the European context.

8 Conclusion

In conclusion, this study significantly contributes to the understanding of the relationship between ESG practices and financial performance, focusing on European firms listed on the STOXX Europe 600 from 2012 to 2018. The study's outcomes, which align with [9, 10, 29], underscore the positive connection between ESG performance and ROE, suggesting substantial practical implications.

For corporations, these results emphasize the strategic benefit of integrating ESG practices into their operational models. Firms are encouraged to enhance their ESG performance as a means to improve financial performance, which is consistent with the observations made by Khanchel et al. [21] about the direct financial benefits of comprehensive ESG practices. This insight should motivate corporate strategists and sustainability officers to consider ESG initiatives as integral to value creation.

The findings also have significant implications for investors and asset managers. The beneficial relationship between ESG factors and ROE indicates that integrating ESG criteria into investment strategies is essential, aligning with the sustainable investing trend and echoing the insights from Broadstock et al. [8] and Sandberg et al. [35] on ESG's influence on financial performance.

From a policy standpoint, these results support the development of robust ESG reporting and compliance frameworks, aligning with the regulatory trends observed by Halid et al. [19] and Lisin et al. (2022) regarding larger firms' inclination towards ESG activities.

However, the study has limitations. The reliance on ROE as a primary measure of financial performance could be broadened in future research by incorporating Tobin's Q, offering a market valuation perspective as suggested by studies like Adeneye et al. [3]. Additionally, examining the specific impacts of environmental, social, and governance components separately could provide a more nuanced understanding, as indicated by research trends noted in Alareeni and Hamdan [4] and Lee [25]. Moreover, extending the study's timeframe and incorporating a more current data set would also address the limitation of the study's period and capture the evolving nature of ESG practices post-2018.

Application of Artificial Intelligence in Insurance Companies: A Bibliometric Review and Content Analysis

Muath Asmar and Mohammad Jaradat

Abstract In the insurance industry, artificial intelligence (AI) has become a disruptive technology with several uses. This report examines the advancements made in AI application development within insurance businesses between January 2015 and March 2024. The study uses a hybrid methodology that combines text analysis and bibliometrics to show the current research trend of AI applications in insurance businesses. We obtain 291 documents from the Scopus database, which we then examine with VOSviewer. A bibliometric analysis provides an inclusive analysis of significant trends, research themes, and citation patterns within the field of AI applications in insurance. It offers insights into the development and present status in this particular field of research. The content analysis provides a detailed overview of AI applications in insurance including, claims processing, underwriting and risk assessment, fraud detection, customer service and predictive analytics. The content analysis as well provides a detailed challenges and limitations, future directions and implications, of AI applications in insurance. The study's conclusions show that there is a growing body of academic literature analyzing various AI technologies—such as machine learning, natural language processing, and predictive analytics—used by insurance firms. These technologies are being investigated for their potential applications in underwriting, claims processing, risk assessment, and customer service within the insurance companies. Practitioners, policymakers and researchers can benefit from the insightful findings of this study to effectively harness the potential of AI in order to promote innovation and facilitate transformation within the insurance industry.

Keywords Artificial intelligence · Machine learning · Deep learning · Insurance companies

1 Introduction

The insurance industry has experienced a significant change in recent years due to advancements in artificial intelligence (AI) technologies. AI refers to a computer system that can learn, comprehend, sense its environment and act based on what it is learning [1]. AI includes machine learning, natural language processing, and other cognitive computing methods, has become a significant driver of innovation and change in multiple industries. AI is a growing technology that is being progressively employed in insurance technology for various back-end functions, including algorithmic trading, financial search engines, blockchain analytics, and fraud detection [2]. For instance, A deep learning model has been suggested for the purpose of detecting automotive insurance fraud. This model utilizes Latent Dirichlet Allocation based text analytics [3]. Further Palacio [4] propose an approach utilizing semi-supervised methods for the purpose of detecting insurance fraud. Kose et al. [5] have developed an interactive machine learning-based framework for detecting fraud and abusive behaviors in the healthcare insurance industry. Baudry and Robert [6] have present a nonparametric and flexible approach for estimating outstanding liabilities using a machine learning based technique. Neumann et al. [7] have presents an approach for forecasting a car driver's decision about the acquisition of a replacement vehicle subsequent to a vehicular collision, employing machine learning techniques.

The aforementioned examples of AI's use in insurance operations show how AI is changing the insurance sector. The number of scientific publications on AI's application in the insurance industry has significantly increased recently. Using bibliometric methods such as VOSviewer, the aim of this study is to investigate global trends and advancements in the application of AI in insurance research. These technologies identify new trends, map collaboration networks among the research community, and uncover key scientific concepts using natural language processing and data visualization. Furthermore, the current study provides a thorough review of AI's applications in the insurance sector by using a content analysis. These applications include risk assessment, underwriting, claims processing, fraud detection, and customer support.

AI can enhance insurance operations, increase risk ratings, adapt client interactions, and prevent fraud. Insurance businesses must employ AI to be competitive and sustainable in the digital age due to rising competition, changing client expectations, and complex risk conditions. Thus, the goal is to identify new research opportunities and knowledge gaps in this field. This information will help researchers and policymakers stay current and guide future research, resulting in more appropriate AI tools for the insurance business.

2 Methodology and Bibliometric Analysis

In this study, the bibliometric technique suggested by Cobo et al. [8] makes use of tools for performance analysis and scientific maps to analyze the research domain, identify important regions, and illustrate theoretical subfields.

Using a bibliometric review approach, the main resource for reviewing research and scientific publications was the Scopus database. Using this platform's targeted keywords, we were able to identify earlier research on the subject of our investigation. The research was then improved and sifted. The goal of this painstaking procedure was to get the study closer to the main idea.

A total of 291 document references, including keywords, abstracts, and citation metrics, were consulted in Scopus. These references were gathered from the database. This was accomplished by using the search terms "insurance," "artificial intelligence," "machine learning," and "deep learning" while looking through various document article categories and choosing English-language publications.

Keywords

The most common terms in the re-search are shown in the accompanying figure, which also gives an idea of the themes that are often discussed. This provides us with a first understanding of the patterns seen by the researchers in this area (see Fig. 1).

One of the most occurring keywords is "machine learning", as it is the fundamental technology in most AI applications in the insurance sector, it include complex algorithms that work on fraud detection [9], claims prediction [10], and more. The following keyword is "insurance", which is the sector that adopts and uses these technologies to improve the performance and efficiency of its activities. The term "artificial intelligence" is the fourth keyword, followed by "health insurance", which

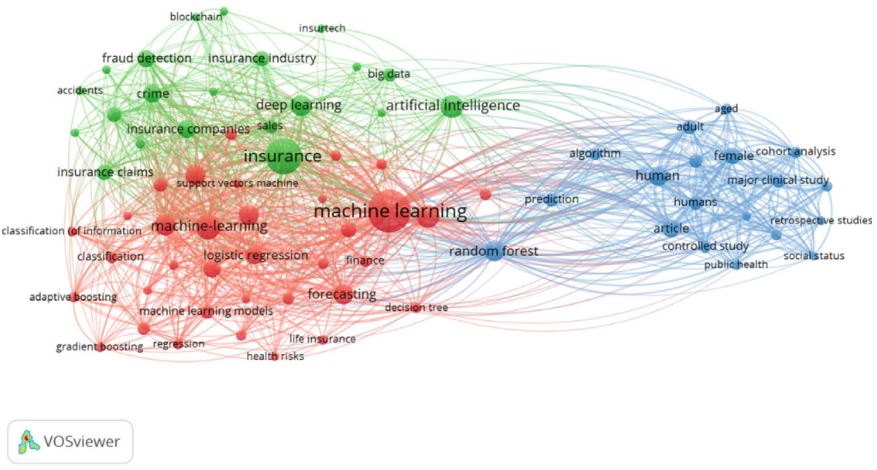

Fig. 1 Keywords linkage between articles

Table 1 Keywords occurrence in articles

Keywords	Occurrence
Machine learning	166
Insurance	122
Machine-learning	58
Artificial intelligence	50
Health insurance	48
Deep learning	43
Decision tree	42
Learning systems	38
Forecasting	38
Learning algorithms	38
Random forest	37

is the most expansive area in insurance due to its diverse cases and broad scope, allowing the application of AI in various ways. Then comes "deep learning", which is the most advanced technology of machine learning, incorporating more sophisticated technologies capable of speech and image recognition and understanding. Table 1 present the ranking of words based on their occurrence in the research.

Countries

The majority of the document and cited research was attributed to India with a total of 78 documents and 502 citation, these articles may be attributed to the increasing population as well as being a developing country that seeks to embrace such technologies to develop its economy, followed by United state with 44 documents and 319 citation, where it holds one of the largest insurance markets in the world, in addition to being an advanced country leading in the use of technology such as AI, and several other countries contributing as well. Table 2 illustrate the countries number of citation and total link strength. Additionally, there are links between the research papers in these countries Fig. 2. Present the linkage between countries.

Number of Articles Based on years

It seems that research on the application of AI in the insurance sector with the technologies like machine learning and deep learning began to emerge in the late twentieth century and expanded slowly until 2018, which witnessed the beginning of widespread adoption in this field. Figure 3 shows the number of articles based on years it published.

Table. 2 Countries number of citation and total link strength

Countries	Documents	Citation
India	78	502
United states	44	319
China	35	367
South Korea	18	123
United kingdom	12	53
Taiwan	10	234
Egypt	10	82
Australia	9	85
Germany	9	36
Malaysia	9	12
Canada	8	76
France	8	82
Italy	8	54

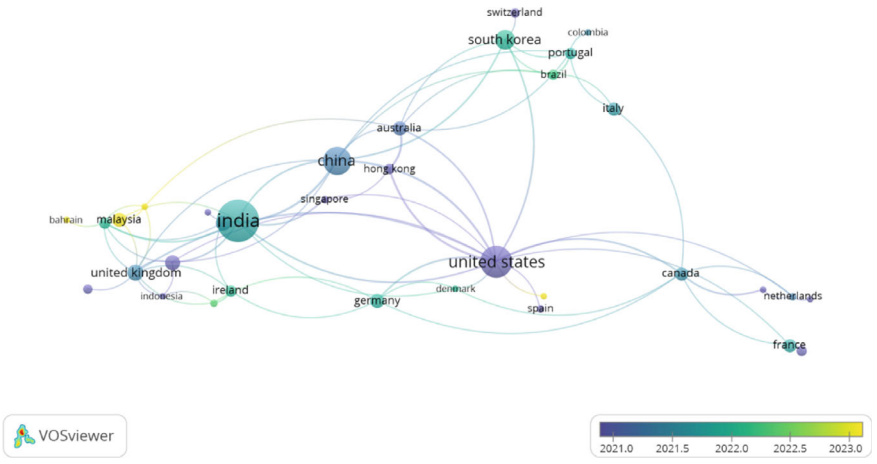

Fig. 2 Linkage between countries

3 Overview of AI in Insurance

AI is a broad term that lacks a universally agreed-upon definition, but several concepts are commonly used to define it. Some define it as an analytical tool for dealing with complex challenges [11], while others describe it as a computer system programmed to simulate human characteristics while efficiently and effectively completing tasks beyond human capability. Its recognized characteristics include sensing and understanding its environment, learning from it, and making decisions based on the entrusted tasks [1].

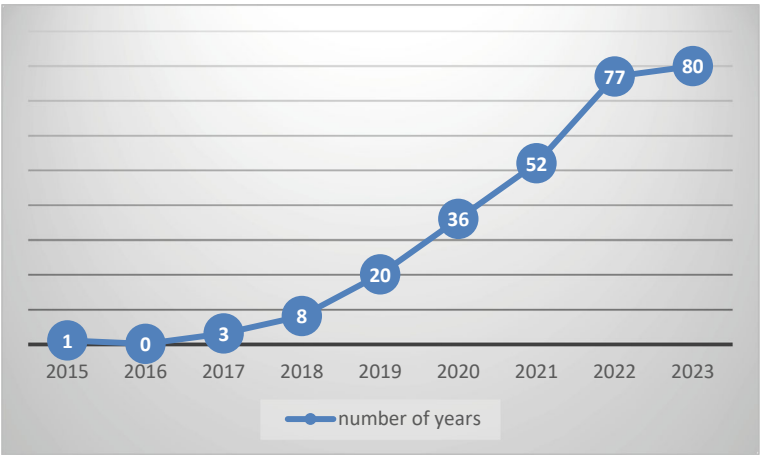

Fig. 3 Number of articles based on years it published

The expansion of AI encompasses various concepts and technologies that clarify its characteristics and capabilities. Among these is XAI (explainable AI), which involves human involvement in decision-making stages using AI [12]. In addition to AI expansions, there are technologies like machine learning technology [13], which uses models to evolve and provide a deeper understanding of data. What makes it the most popular technology is its ability to continuously evolve by continuously adding variables [14], and artificial neural network (ANN) technology, which simulates the human brain and aids in discovering connections [15]. In addition, other technologies are adopted by various sectors, such as the financial sector (FinTech) and the insurance sector (InsurTech) [16].

The evolution of AI has transformed it from simple capabilities to a technology with a multitude of capabilities, thanks to advancements in machine learning and deep learning algorithms, as well as the availability of big data. AI is now capable of pattern analysis, speech recognition, natural language generation, and image recognition [17], and has entered various applications such as chatbots that emerged in the 1950s and 1960s and evolved due to technological advancements and people's inclination towards using social media applications, especially messaging apps [2].

As with any evaluation in any institution, the adoption of any development is assessed based on a cost–benefit analysis. AI technologies are cost-saving techniques achieved through the use of additional customer insights to personalize interactions, which is a major driver for revenue growth [17]. In addition to their efficiency in various activities such as investments, where they reduce risks [13], AI also deals with uncertainty resulting from data unreliability and its lack of full relevance [18].

4 Applications of AI in Insurance Companies

Predicting claims is the most important challenge facing the insurance sector, which is why it is important to use AI techniques in claims prediction. These technologies address the problems faced by traditional methods, such as missing values in data. Technologies like machine learning have been able to predict claims in car insurance [19], and more accurate technologies like deep neural networks, which are among the most important machine learning methods, have been used to predict claims in travel insurance [20].

Processing current claims involves using technologies in two directions. The first direction focuses on evaluating repair costs, such as home and commercial property insurance claims as well as car claims, through image recognition technology [21]. The second direction involves verifying the accuracy of these claims by detecting fraud. The accuracy of these claims is not only limited to fraudulent repair costs that are avoided but also affects the subsequent recommendations suggested by recommendation engines, which are influenced by these claims [17].

This insurance activity has utilized a variety of analytical technologies, including predictive analysis through big data, to enhance the assessment of insurance risks [22]. Based on this, subsequent decisions and other uses were built, where smart damage identification systems were developed, proving their efficiency in insurance cases, especially small ones, which accounted for 72.22% according to data from the China Banking and Insurance Regulatory Commission Office [23]. Risk assessment is just one part of a series of activities performed by these systems, including investigating the accident, using vehicle image reading techniques, understanding the damages incurred, estimating these damages, and determining whether they are fraudulent or not.

Using machine learning and deep learning technology, fraud detection has become easier through algorithms developed by storing data and documents related to customer policies, creating customer behavior profiles, and training algorithms on them to become capable of pattern detection to identify patterns, trends, and preferences [24]. Another approach is to utilize the reinforcement learning method through the deep Q-network to detect fraudulent or illegitimate insurance claims [25].

Fraud can be detected either through signatures and handwriting in documents using image and video recognition [24] or by using these technologies on images such as vehicles involved in accidents. The technologies then understand the damages, estimate them, and determine whether they are fraudulent or not [23]. However, continuous development of these capabilities is necessary to ensure accuracy and prevent algorithmic bias that could lead to false fraud accusations [21].

Through the development of precise algorithms that engage intelligently with customers, several AI applications have been created for customer interaction. Among these applications, there are those focused on artificial interaction, such as conversation agents [26] and chatbots, which provide automated recommendations for services and products. To enhance the security of this interaction, in complex

cases, there may be a mechanism to redirect customers to real employees [24]. ChatBots technologies rely on various AI capabilities such as speech recognition, natural language generation, text analysis, and language processing [17]. These capabilities aid in understanding and interpreting texts, converting them into datasets for algorithm development, and using them to generate outputs. Through machine learning and AI, some InsurTech companies have developed models. Their primary goal is to enhance enrollment and claim settlement processes [13].

Additionally, emotion and sentiment detection capabilities from written and spoken words are employed for specific goals within contract administration and customer service activities. These goals include increasing customer service efficiency by sorting and categorizing customer messages for appropriate handling [17], responding appropriately to customers after reading their written or spoken words, and analyzing their emotions, which aim to improve customer satisfaction and retention.

Among other applications similar to ChatBots are Robo-Advisors, which focus on supporting customers with automated advice by suggesting individual policy recommendations. The requirements for such applications include implementing precise algorithms to enhance intelligent interaction with customers. Another application is smart contracts, which heavily rely on blockchain technology to enable automated contracts. The goal is to reduce costs, and overall, Robo-Advisors and Smart Contracts serve as back-office functionalities [24].

AI technologies predict future outcomes using various methods and models by utilizing datasets. For instance, in life insurance risk prediction, historical data is used through the XGBoost machine learning method to enhance risk prediction models and classify risks. XGBoost performs well in handling missing values in the data [27]. On the other hand, other algorithms like Random Forests utilize hydrological and socio-demographic data for predicting and classifying insurance data against floods [28].

Predictive analytics extends beyond risk estimation to encompass other activities like marketing. We have developed special models for marketing activities related to telemarketing calls, which some find annoying. Predictive models help reduce customer complaints [29].

5 Challenges and Limitations of AI in Insurance

The presence of ethical problems is a major reason for customers stepping back from dealing with companies that adopt the use of AI applications. Mullins et al. [21] have developed a hierarchical ethics model of AI and big data in insurance markets, dividing it into four levels to illustrate the ethical issues that undermine trust in insurance companies embracing AI technologies.

In the first level, the problem arises from constructing complex algorithms using massive databases, leading to difficulties in understanding them for non-experts. This is why there is a shift towards explainable AI (XAI), which provides a better

understanding of AI technologies like machine learning [30], allowing for a more transparent and understandable relationship between humans and machines in various activities such as claims management, contract writing, and pricing [12].

In the second level, which involves data used in image recognition, voice recognition, and analytics technologies, it includes personal data that customers do not consent to being used for purposes other than insurance calculations. The relationship between the insured individual and private or public insurance companies is based on trust [31].

At the third level, based on algorithmic bias, discrimination due to statistical evidence among equally risky individuals, whether direct discrimination, differential treatment, or even indirect discrimination, even if its solution reduces the accuracy of predictions [32], is an ethical issue.

While the fourth level, which is privacy violation, specifically involves technologies related to the Internet of Things that access individuals' private data, it serves as a reference for determining the validity of insurance claims.

6 Future Trends and Opportunities in AI in Insurance

The most significant advancements in AI have come through machine learning and deep learning techniques [17]. Deep learning, in particular, stands out for its ability to interpret outputs such as images and speech, among others. It is used in image processing to detect fraudulent claims in car accidents [33]. Additionally, it is utilized in the field of digital currencies to predict currency prices characterized by price volatility [34]. Deep learning also constructs effective marketing models for sales forecasting and analysis [35]. Furthermore, it finds applications in various activities within the insurance sector and beyond, such as optimal reinsurance, investments, and dividend strategies [36].

The core machine learning technologies utilize algorithms developed using big data to predict fraud in insurance [9]. These technologies can read patterns and trends, thereby predicting recurring claims in insurance [10].

Data from telematics and IoT devices is used through algorithms, AI technologies, and machine learning to predict insurance amounts such as health insurance [37], and data extracted from driving behavior, which has a stronger causal relationship with accidents, effectively assists in predicting risks for car insurance pricing [38]. Some systems used in prediction monitor various aspects such as driving speed and safety measures like seat belts, door locks, airbags, and hand brakes. In addition to their benefits for insurance, they also help in sending alerts such as low fuel warnings and insurance reminders [39].

Insurance companies seek to customize insurance policies and provide them with special pricing using AI technology, specifically neural network technology that can read telematics data and unstructured data [40]. However, pricing adjustment remains a prevalent issue as insurance companies aiming to increase revenues see the only way to do so is by raising the value of insurance renewals, which contradicts their

vision of attracting new customers [41, 42]. Aside from the ethical problems that arise from pricing through this technology, insurance companies also resort to excluding less profitable segments [21].

7 Future Directions and Implications

These developments pave the way for integrating the Internet of Things in homes, vehicles, and even the healthcare sector, enhancing the customization of products for customers. The existence of these technologies reduces insurance risks by reducing human errors in determining the validity of claims and the estimated compensation amount, and that risk are the most significant challenges in the insurance sector.

Internal management within insurance institutions is as important as customer insurance management. It bears many risks, including internal decisions, employees, and other factors. The emergence of systems based on AI algorithms in areas such as employee retirement management imposes costs on these institutions equal to the risks insured [14]. This opens up a broader scope for studying internal systems in the insurance sector and developing AI technologies, such as machine learning, in these areas.

It is possible to explore other approaches in the future to address the issue of insurance pricing [41]. One of the available avenues to study is integrating internet of things (IoT) technology with insurance contracts, which could lead to risk reduction. Instead of insurance companies focusing on increasing returns, the emphasis should be on reducing costs by mitigating risks and incorporating internet of things (IoT) technology as a regulatory component for insurance company clients.

It is also better to try to develop smart systems and increase the accuracy of their results, or explore ways to share tasks with human elements if it becomes impossible to improve their accuracy. This can be done by relying on AI for specific cases only, after studying its results for different cases individually.

8 Conclusion

The primary goal of using AI technologies is to better understand and assess risks, leading to the development of services and more suitable insurance pricing. However, this understanding of risks has brought to light other risks related to ethics and customer privacy. This does not mean that technological advancement has been fundamentally harmful, but rather that its rapid development has outpaced the evolution of the regulations and laws governing it [21]. As for the areas that have shown promise for the development of the insurance sector and IoT technologies in particular, they are still in the early stages of study and have not been sufficiently addressed in scientific research. They touch on high-risk matters that need to be developed for

high accuracy, in addition to studying their impact on different markets as they carry different characteristics regarding the acceptance of new technology.

And the differences between countries in their adoption of AI technologies were more closely related to the development of technological infrastructure and awareness of using this type of technology, in addition to the regulations and laws that need to be developed more quickly to govern the use of these technologies and allow for their broader application.

Of course, both insurance companies and customers need to consider the benefits of AI technologies, as well as their issues and adoption barriers. These technologies assist insurance institutions by analyzing patterns [17] and discovering connections [15] in claims to detect fraudulent claims, which are one of the biggest problems they face. Additionally, AI accelerates the process of verifying vehicle damage in auto insurance. Some of the smart systems developed perform the functions of many insurance company employees. By capturing images of the accident, these systems verify the accident and estimate damages, then provide recommendations for repair lines and costs. This speeds up the process of investigating accidents, benefiting both the insurance institution and customers [23], however, these systems are not accurate enough to be fully used in damage investigations. One system developed in China proved to be 72.22% effective, which calls for reconsidering the trust in AI technologies at this time [23].

Does Internal Auditing Impact the Achievement of Sustainable Development in the Banking Industry?

Kayed M. Tanbour and Abdulnaser I. Nour

Abstract "The focus of this study was to look at the impact of internal auditing practices within banks listed on the Palestine Exchange on the attainment of sustainable development goals". The study sample comprised 60 individuals selected randomly from the internal audit departments of the banks. To fulfill the study's aims, a descriptive methodology was employed. A questionnaire, designed explicitly to address the study's objectives, was utilized. Additionally, after conducting data analysis, the findings demonstrated a significant influence for each of the (internal audit's independence, objectivity, and professional care) on achievement of sustainable development, therefor, the study recommended that it is It is imperative to persist in improving the expertise Sure! Here is the text rewritten: "Enhancing the skills and knowledge of internal auditors is essential expanding and diversifying training programs focused on sustainable development in banks". This will equip them with updated skills in these areas.

Keywords Internal audit · Sustainable development · Banks sector

1 Introduction

The banking industry faces increasing pressure from stakeholders to address sustainability issues and demonstrate their commitment to corporate social responsibility. "It is therefore essential that the issue of sustainability and the implementation of CSR into core activities in banking operations gain the confidence of stakeholders" [1].

Achieving sustainable development poses a challenge for banks in terms of their ability to preserve their systems, transactions, and operations across various economic, social, and environmental levels. Banks must incorporate sustainability Integrating risks associated with climate change into their risk management strategies to mitigate such risks, environmental degradation, and social inequality. They must also develop sustainable lending and investment practices to promote sustainable and inclusive growth. Banks must encourage the adoption of sustainable business practices among their clients. In recent years, the importance of sustainable development and corporate social responsibility has been increasingly recognized by various industries, including the banking industry [2].

One of the theories associated with institutional governance is agency theory, which is an economic and management theory that focuses on the relationship between agents (employees or managers) and principals (owners or shareholders) in organizations or companies. This theory assumes that there is a potential conflict between agents and principals due to differences in their goals and interests, illustrates how conflicting interests and asymmetric information can lead to agency problems [3]. The presence of multiple stakeholders in a bank lead to a rise in agency conflicts, while the intricacy of its operations results in significant information asymmetry, thus heightening the challenges associated with monitoring processes [4].

Therefore, internal auditing can help alleviate agency problems. Where internal audit plays a crucial role in promoting sustainable development within the banking industry as one of its governance mechanisms. By focusing on compliance with environmental regulations, social and ethical responsibilities, risk management, and transparency and accountability, internal auditors contribute to improving the bank's sustainability performance. By doing so, internal audit strengthens the banking industry's overall contribution to sustainable development [5].

Internal audits help banks identify and address potential risks and opportunities associated with their operations. They can provide the bank with insight into its financial performance and corporate governance. Furthermore, internal audits can also provide feedback on the bank's sustainability efforts [6].

Furthermore, internal audit contributes to reporting accuracy and transparency by assessing the reliability of sustainability-related data. They ensure that sustainability metrics align with relevant regulations and frameworks, such as ESG (Environmental, Social, and Governance) reporting. This commitment to accuracy helps foster trust in the organization's sustainability efforts and promotes accountability to stakeholders [7].

The banking sector offers a significant framework for our study, with a substantial amount of research focusing on the influence of internal audit on the attainment of sustainable growth in non-banking organizations. Nevertheless, there is a dearth of literature examining this correlation within banking institutions, especially in the context of Palestine. The primary objective of this article is to bridge this gap and enrich the current body of knowledge by presenting empirical proof regarding the impact of internal audit on the achievement of sustainable growth in the banking sector of Palestine. This inquiry leads us to ponder whether internal audit contributes

to the realization of sustainable development. The research endeavors to address the ensuing pivotal query:

Does internal audit impact the achievement of sustainable development in the banking industry?

This study aims to identify the potential impact of internal audit practices (the internal audit's independence, objectivity, and professional care) on achieving sustainable development goals. Specifically, the study will explore how internal audit functions can contribute to sustainable development in areas such as environmental sustainability, social responsibility, and economic stability. This study will investigate the internal audit factors that impact the achievement of sustainable development in the banking industry and quantify sustainable development achievement in Palestinian Banks.

Accordingly, **the significance of the study,** assisting bank management boards in recognizing the contribution of internal auditing to sustainability in the banking industry, and providing the Palestinian Monetary Authority with an incentive to focus on enhancing the competencies of internal auditors in banks, highlights its importance as an addition to existing literature on the reality of internal auditing and its role in achieving sustainability in banks.

This study stands as the sole examination delving into the influence of internal audit activities on the attainment of sustainable development within the banking sector. Furthermore, it represents the pioneering effort to gauge the extent of sustainable development achievements within banks listed on the Palestine Exchange. Consequently, the paper contributes significantly and innovatively to scholarly literature on the accomplishment of sustainable development.

2 Literature Reviews and Development Hypotheses

2.1 Literature Reviews

The banking sector plays a vital role in the economic development of countries and has a significant impact on sustainable development initiatives. The role of internal audit in promoting and ensuring sustainable development of banks has become an interesting topic in the literature. Several studies have explored the relationship between internal auditing and sustainable development in the banking industry.

Research [8] shows that the quality of the internal audit system directly affects the financial performance of banks. An effective internal audit function has been found to mediate the relationship between corporate governance and sustainability reporting practices, thereby improving the level of sustainability disclosures. Furthermore, sustainability assurance, internal controls and audit errors have a significant impact on audit practice, demonstrating the interconnectedness of these factors in promoting sustainability in the banking industry, the study [9] emphasizes the multifaceted impact of internal audit on sustainable development within the banking industry.

Firstly, the quality of internal audit is intrinsically linked to financial performance, as it ensures robust risk management and effective internal control systems. This, in turn, contributes to the long-term sustainability of banks by mitigating risks and bolstering overall performance. Secondly, the moderating role of internal audit functions in corporate governance and sustainability reporting practices underpins the significance of internal audit in fostering transparency and accountability, which are fundamental pillars of sustainable development.

As well, a study [10] has shown that despite the positive impact of internal audits on sustainable development in the banking industry, there are potential debates regarding the extent of its influence. Some may argue that other factors, such as external market forces or regulatory requirements, play a more significant role in driving sustainable development. However, it is essential to recognize that internal audit functions act as a critical internal mechanism for ensuring compliance with external regulations and aligning organizational practices with sustainable development goals. A previous study [11] demonstrated a favorable correlation between independent internal audit and risk management governance, leading to improved evaluations of external audit risks. Moreover, effective risk management governance was found to have a direct positive influence on external audit risk assessments, further augmented by its indirect positive impact on risk evaluation.

The results of study [12] "revealed that both independence and competence significantly affected the effectiveness of internal auditing. Moreover, it was observed that top management support indirectly influenced internal audit effectiveness through its effects on competence and independence. However, the direct impact of top management support on internal audit effectiveness did not show statistical significance". The results of study [13] "emphasized the significant impact of resources on integrity, which subsequently influenced the effectiveness of internal auditing. Furthermore, it was noted that senior management support contributed to enhancing integrity, objectivity, and moral courage, thereby bolstering the effectiveness of internal audit". Study [14] "findings unveiled that the competence and objectivity of internal auditors, alongside management support, play a crucial role in determining the effectiveness of the internal audit function. Additionally, it was observed that the competence and objectivity of internal auditors, as well as the effectiveness of the internal audit function, have a significant impact on the quality of financial reporting". Furthermore, research [15] shows "that competence, objectivity and independence have a significant impact on the effectiveness of internal auditing. Furthermore, management support moderates the effects of competence, objectivity, and independence on internal audit effectiveness". The study [16] reached several conclusions, "the most important of which is the lack of causal relationship between internal audit's agile working methods and the sustainability reporting of the sample banks. This confirms the research hypothesis and suggests that there is no statistically significant causal relationship between internal audit agile working practices and sustainability reporting".

The conclusion drawn from study [17] was "that internal audit and corporate governance have a substantial impact on the real estate sector, given their positive correlation with the industry's sustainable development. Estate Industry", while the

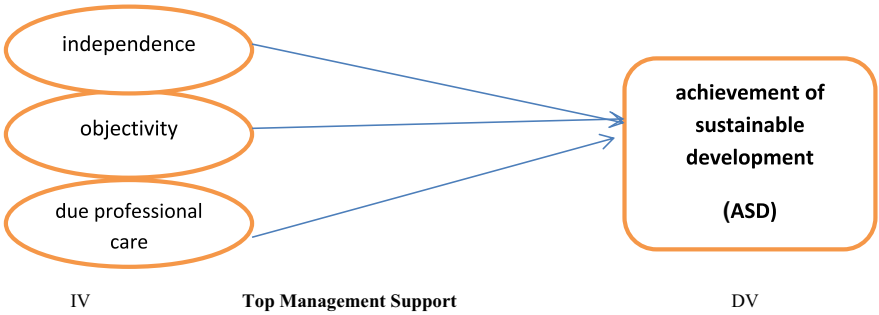
study [18] the major that "the auditor plays when auditing the sustainable development and sustainability reports has been identified in achieving the requirements of sustainable development, in addition to that there are several auditing standards that can guide the performance of the audit of sustainable development". While a study [19] showed "Internal auditing positively affects the firm's long-term value and performance, indicating its role in promoting sustainable business practices and contributing to the achievement of sustainable development goals".

In conclusion from the above, internal audits significantly impact the achievement of sustainable development in the banking industry. The empirical evidence supports the notion that internal audit quality is positively associated with financial performance and sustainability reporting practices. As such, fostering effective internal audit systems is essential for promoting sustainable development in the banking sector, ultimately contributing to the stability and resilience of the financial industry.

How Is the Current Study Different?

What sets the current study apart is its focus on examining the impact of internal auditing on the attainment of sustainable development within the banking industry, with a particular emphasis on previously unexplored independent factors such as independence, objectivity, and due professional care. Moreover, it introduces a mediating factor in the form of top management support. This study is conducted in Palestine, making it unique as it is the first of its kind to investigate the relationship between internal auditing and sustainable development achievement within the banking sector in this context.

2.2 Development Hypotheses: Based on Previous Studies and Agency Theory. The Following Hypotheses Were Formulated



H1: "There is a positive impact of internal audit on the achievement of sustainable development in the banking industry".

The first hypothesis branches into the following hypotheses:

1. There is a positive influence of internal audit independence on the achievement of sustainable development in the banking industry.
2. There is a positive impact of the internal auditor's objectivity on the achievement of sustainable development in the banking industry.
3. There is a positive impact of due professional care on the achievement of sustainable development in the banking industry.

H2: "There is a positive impact of internal audit on the achievement of sustainable development in the banking industry, by mediating role of top management support".

3 Model of the Study

Control Variables: Environmental Internal Audit, Compliance Audit, Environmental Management System Auditing, Environmental Financial Auditing, Governance, Risk Management.

4 Theoretical Framework

Internal Auditing: "Internal auditing obtains an available, impartial assurance and consultation process intended to enhance an organization's performance. It contributes to the achievement of organizational goals by applying a methodical, disciplined approach to assessing and enhancing the efficacy of risk management, control, and governance systems Internal auditors provide assurance to the Board of Directors and executive management that the organization's internal controls are working effectively". They also help to identify weaknesses in these internal controls and provide recommendations for improving them, helping the organization to become more efficient and effective [20, 21].

Sustainability Development in Bank Industry: Sustainable development refers to development that is carried out in an environmentally responsible manner, focusing on expansion and promoting overall well-being within an ecologically sound framework. It involves implementing practices that go beyond financial, ecological, and social barriers and are aimed at meeting the needs of the present without jeopardizing the requirements of future generations. Sustainable development aims to achieve economic growth while considering social equality and environmental preservation. It emphasizes the satisfaction of human needs, social equality, and respect for environmental limits as the foundation for prioritizing economic issues [19].

Top Management Support: Management support refers to the actions and behaviors of senior management in an organization that demonstrate their commitment to and endorsement of a particular initiative, project, or process. In the context of internal audit, management support can take the form of providing resources, setting clear expectations, promoting a culture of accountability and transparency,

and actively engaging with auditors to ensure their independence and objectivity. Effective management support is essential for the success of internal audits, as it helps to create an environment in which auditors can perform their duties with confidence and effectiveness [15].

5 Methodology

5.1 Data Collection

"Data for the study was collected from primary sources using questionnaires as the primary research instrument. The questionnaire was developed based on previous research examining the relationship between internal auditing and sustainability". Additionally, "data were collected from secondary sources such as books, journals, and relevant online resources".

5.2 Population and Sample Study

The study's population comprises seven banking institutions that are publicly traded on the Palestine Stock Exchange. Specifically, the study's participants are internal auditors employed within these financial institutions. A simple random sampling method was employed to select 60 individuals out of a total of 78, representing 77% of the population. Subsequently, questionnaires were disseminated to these selected employees, all of which were accurately completed.

Table 1 illustrates that all the specimens consist of individuals working as staff members within the internal audit divisions, occupying different positions. These individuals have obtained specific academic credentials in the fields of finance and management and have acquired expertise in the domain of internal audit. Nonetheless, 73% lack official certifications in the field of auditing. Consequently, the group of subjects selected for this research is deemed to be a suitable representation of the original demographic.

5.3 Tool of the Study

In order to accomplish the research aims, data will be gathered through the utilization of a self-constructed questionnaire in English and Arabic (generated online via Google). Respondents were requested to provide responses to inquiries regarding the research and assess their hypotheses within the questionnaire. The questionnaire, which functioned as the main instrument for data collection in the study, comprised

Table 1 Description of the study sample

Factors	"Categories"	"Frequency"	"Percentage%"
Job title	"Director of the department"	6	10
	"Head of the department"	14	23
	Internal auditor	40	67
	Total	***60***	***100***
Educational background	Advanced degree	40	67
	Bachelor	20	33
	Intermediate diploma	0	0
	Total	***60***	***100***
Years of experience	Less than 5 years	6	10
	"5–15 years old"	34	57
	"More than 15 years"	20	33
	Total	***60***	***100***
Obtaining professional certification in auditing	Yes	16	27
	No	44	73
	Total	***60***	***100***

multiple sections outlining the study objectives and the anticipated responses from the participants. Moreover, a Likert scale methodology with five dimensions was employed to assess the comparative significance of each answer. Subsequently, the data underwent collection, input into a computer system, and underwent statistical analysis utilizing the SPSS software. The research was carried out during the initial quarter of 2024, covering the period from January 1, 2024, to March 31, 2024. The instrument was devised based on existing theoretical literature and prior investigations.

The questionnaire is the main research tool and consists of four parts:

The first section: "The demographic information of the study participants is outlined based on four criteria: position, academic background, years of experience, and professional certification in auditing".

The second section: "The measure of the impact of each (the internal audit's independence **(IND)**, objectivity **(OBJ)**, and Due professional care **(DPC)**) on achievement of sustainable development across (12) paragraphs gauge".

Third section: "It assesses the level of Top Management Support (TMS) for internal auditing practices in banks listed on the Palestine Exchange, spanning across six comprehensive paragraphs".

Fourth section: "The gauge of the grade of the achievement of sustainable development **(ASD)** in the banks registered on the Palestine exchange included (7) items to represent the gauge".

Answers between (1 and 5) on a five-point Likert scale are as follows:

1. Belief level (5). 2. Acceptance: Level (4). 3. Balance: Level (3). 4. Objection: Level (2). 5. Strongly inclined to level (1).

Therefore, the final form of the questionnaire (research instrument) consisted of 25 items on a 5-point Likert scale.

5.4 Data Examinations

5.4.1 "According to the descriptive statistics results: Use the following table to explain the results":

1. "Very good: Greater than 4.2, Very good: Greater than 3.4 but less than 4.2, Medium: Greater than 2.6 but less than 3.4, Low: Greater than 1.8 but less than 2.6, Very low: Below 1.8".

5.4.2 "According to the interpretation of the results, if the p-value is close to 5% and statistically significant, the hypothesis is accepted. Conversely, if the p-value exceeds 5% and is not statistically significant, the result is rejected".

5.5 The Reliability of the Study Tool

The Cronbach's Alpha test utilized in evaluating the questionnaire's internal consistency yielded a result of 0.95. Given that this value exceeds the 0.70 threshold, it suggests that the research instrument is reliable, and the data gathered is suitable for assessing variables, providing a dependable basis for conducting statistical analysis [22].

6 Statistical Analysis of Data

"A series of statistical methods were employed to analyze the data and test the hypotheses of the study. These methods include".

6.1 Data Analysis and Discussion

1. **Descriptive Statistics Measure**

The statistical examination of the study included applying frequency and percentage calculations to characterize the research participants, along with evaluating the data using mean and standard deviation to interpret the participants' answers. The demographic details of the study group were displayed in Table 1, while Table 2 outlined

the average values and the spread of the responses for the items on the survey that relate to the study's key themes. The analysis revealed that the average score for each section and component of the research exceeded 3, indicating their general acceptance. The standard deviation values, being under 1, reflected the responses' concentration and the credibility and acceptance of the data's distribution [23].

Table 3 **illustrates that:**

1. A review of the standard deviation ratios revealed a high degree of consistency among the opinions of the study participants. The percentage of agreement within the sample ranged from 85 to 90%, signifying a notable uniformity in their responses.
2. The effectiveness of internal audit practices, coupled with its independence, the objectivity of internal auditors, and the exercise of due professional care, significantly contribute to the attainment of sustainable development within the banking industry.
3. The level of support from top management for the internal audit activity in banks is high.
4. The level of achievement of sustainable development in banks is high.

2. **Inferential Statistics**

"The data analysis was conducted using the Statistical Program for Social Sciences (SPSS) as follows":

1. **Correlation Matrix**

"The correlation matrix in Table 3 demonstrates a significant positive relationship between the independent variables (the internal audit's independence, objectivity, and professional care), the mediator (Top Management Support), and the dependent variable (the achievement of sustainable development) at a significance level of 1%. This indicates a statistically significant and strong relationship. The researcher interprets this as internal audit playing a crucial and effective role in achieving sustainable development in the banking and Multiple Linear Regression analysis was employed to examine the effects of independent variables on the dependent variables in Palestine".

1. "Multiple Linear Regression test to test the effects of independent variables on the dependent variable" [24].

Table 4 details the outcomes of the statistical examination for the conceptual model of the study, incorporating an independent variable, internal audit, defined by attributes such as independence, objectivity, and due diligence, against a single dependent variable, reflecting the attainment of sustainability within banks listed on the Palestine Stock Exchange. A substantial correlation is evidenced by an R-value of 0.678, implying a strong link between the various aspects of internal auditing and the achievement of sustainable development in these banks. The results also demonstrate a significant influence of the internal audit on the achievement of sustainable development, with an F. Sig value of 0.00, which falls below the 0.05 threshold.

Table 2 The arithmetic mean and standard deviation of the questionnaire responses provided valuable insights into the participants' opinions

#	Paragraph	Mean	Std. deviation
Independent variable (internal audit)		*4.18*	*0.43*
Independence		*4.30*	*0.41*
1	"The internal audit department within the bank maintains functional independence from the executive management team"	4.26	0.52
2	"The director of the internal audit department confirms the organizational independence of internal audit activity to the board of directors on an annual basis at least"	4.13	0.56
3	"The director of the internal audit department within the bank functionally reports to the board of directors or the audit committee, ensuring a direct line of communication and accountability"	4.56	0.49
4	"The director of the internal audit department communicates directly with the board of directors"	4.33	0.54
5	"The selection and performance evaluation of the director of the internal audit department fall under the purview of the board of directors or the audit committee"	4.16	0.58
Objectivity		*4.17*	*0.48*
6	Internal auditors uphold their neutrality by refraining from any activities that could potentially compromise their impartial evaluation	4.10	0.60
7	The internal auditor discloses all known facts that, if not disclosed, could distort their reports on the activities being audited	4.23	0.49
8	The internal auditor rejects anything that could compromise their professional judgment	4.20	0.60
Due professional care		4.04	0.54
9	Employees in the internal audit department are enrolled in specialized professional courses	4	0.58
10	The internal auditor at the bank possesses communication, dialogue, and teamwork skills	4.06	0.63

(continued)

Table 2 (continued)

#	Paragraph	Mean	Std. deviation
11	The internal auditor at the bank is enhanced with knowledge of information technology	4	0.68
12	The internal auditor at the bank possesses reasonable experience in local financial systems and regulations	4.10	0.65
Top management support		*3.99*	*0.59*
13	The senior management at the bank provides sufficient support for internal audit in the field of sustainability	3.96	0.60
14	The senior management at the bank provides sufficient support for internal audit in the field of sustainability	4	0.58
15	Effective communication between the senior management of the bank and the internal audit department is maintained to align with the pursuit of sustainability goals	3.93	0.63
16	Senior management at the bank demonstrates a commitment to enhancing the skills of employees within the internal audit department, particularly in the domain of sustainability	4.03	0.60
17	The senior management at the bank is interested in utilizing the internal audit team and technology to monitor and evaluate key sustainability elements (environmental, social, governance)	4.03	0.60
18	Senior management at the bank values the recommendations of the internal audit team, focusing on enhancing the integration of sustainability principles with the financial objectives of the bank	4.03	0.59
Dependent variable (achievement of sustainable development)		*3.91*	*0.501*
19	Integrating environmental, social, and governance (ESG) topics into its operations with the aim of creating added value for stakeholders	3.9	0.60
20	The bank is committed to driving sustainable social development forward	3.9	0.60

(continued)

Table 2 (continued)

#	Paragraph	Mean	Std. deviation
21	The bank consistently engages with stakeholders (customers, shareholders, employees, etc.) to understand their needs and aspirations, which constitute the essence of sustainability goals, and strives to meet them	3.63	0.71
22	Developing, updating, and evaluating business continuity management plans and providing recommendations	4.03	0.48
23	Compliance with relevant legal and regulatory requirements related to achieving sustainable development	4.03	0.53
24	Ensuring that the risk management infrastructure is aligned with environmental, social, and economic changes	4	0.57
25	The bank is committed to integrating environmental, social, and governance (ESG) issues and managing them within the bank's governance framework	3.93	0.50

Table 3 Correlation matrix

Variables	ASD	IND	OBJ	DPC	TMS
ASD	1	0.535**	0.502**	0.775**	0.489**
IND	0.535**	1	0.768**	0.740**	0.535**
OBJ	0.502**	0.768**	1	0.693**	0.736
DPC	0.775**	0.740**	0.693**	1	0.670**
TMS	0.489**	0.666**	0.736**	0.775**	1

** The correlation is statistically significant at the 0.01 level, indicating a strong relationship between the variables

Moreover, the coefficient of determination, R2, stands at 0.460, indicating that the different dimensions of internal audit account for 46% of the variation in sustainable development.

"The coefficient of (t) between the independent and dependent variables is statistically significant at the one percent level, as presented in Table 4. This indicates that the mediation effect is both statistically significant and partial, resulting from the influence of the independent variable on the dependent variable. As shown in Table 4, the regression line equation may be utilized to describe the value of the internal auditing correlation coefficient with the support of top management":

Table 4 The multiple regression test

Model	Unstandardized coefficients		Standardized coefficients	T	Sig.
	B	Std. error	Beta		
(Constant)	1.252	0.443	0.678	2.827	0.007
Internal auditing	0.779	0.111	0.335	7.023	0.000
Independence	0.640	0.133	0.502	4.816	0.000
Objectivity	0.523	0.118	0.775	4.424	0.000
Due professional care	0.713	0.076	0.624	9.330	0.000
Top management support	0.720	0.065		9.176	0.003

Factor	R	R square	F value	Sig
Internal auditing	67.8%	46%	49.319	0.000

[a] Dependent Factor: achievement of sustainable development
Significant at (0.05) $\geq \alpha^*$

ASD = 1.252 + 0.779Internal auditing + 0.640 Independence + 0.523 Objectivity + 0.713 due professional care + 0.720 Top management support + e.

6.2 Hypotheses Testing

"To test the theories, the researchers used basic linear regression analysis".

H1: There is a positive impact of internal audit on the achievement of sustainable development in the banking industry.

Table 5 illustrates a significant relationship between internal audit and the achievement of sustainable development within the banking industry, exhibiting a correlation coefficient of 67.8%. The independent variable accounts for 46% of the variance observed in the dependent variable, while 54% of the variance remains attributed to other factors. The statistical analysis validates the statistical significance of the relationship between these two variables, providing support for the acceptance of the alternative hypothesis.

1. There is a positive influence of internal audit independence on the achievement of sustainable development in the banking industry.

Table 5 demonstrates that there is a significant relationship between internal audit independence and the attainment of sustainable development within the banking industry, with a correlation coefficient of 53.5%. The independent factor accounts for 28.6% of the variance observed in the dependent factor. Moreover, 71.4% of the variance in the dependent factor is explained by other factors. The statistical analysis confirms that the relationship between these two factors is statistically significant, thus supporting the acceptance of the alternative hypothesis.

Table 5 Analyzing "the impact of internal auditing on the achievement of sustainable development" using simple linear regression

Factor	R (%)	R square (%)	F value	Sig
Internal auditing	67.8	46	49.319	0.000
Internal audit independence	53.5	28.6	23.199	0.000
Internal audit objectivity	50.2	25.2	19.571	0.000
Due professional care	77.5	60	87.054	0.000
Internal auditing, top management support	67.9	46.1	24.415	0.000

The researchers argue that the independence of internal auditing is a crucial element in achieving sustainable development in the banking industry, as it contributes to building trust, improving management and operations, addressing risks, and enhancing transparency and accountability.

2. There is a positive impact of the internal auditor's objectivity on the achievement of sustainable development in the banking industry.

Table 5 illustrates a "significant relationship between internal audit objectivity and the achievement of sustainable development" within the banking industry, exhibiting a correlation coefficient of 50.2%. The independent variable accounts for 25.2% of the variance observed in the dependent variable, while 74.8% of the variance is attributed to other factors. The statistical analysis validates the statistical significance of the relationship between these two variables, providing support for the acceptance of the alternative hypothesis.

The researchers emphasize the pivotal role of internal auditor objectivity in driving sustainable development within the banking industry. By upholding objectivity, internal auditors build trust, facilitate sound decision-making, enhance internal processes, and ensure compliance with regulations.

3. There is a positive impact of due professional care on the achievement of sustainable development in the banking industry.

Table 5 illustrates a strong relationship between due professional care and the achievement of sustainable development within the banking industry, exhibiting a correlation coefficient of 77.5%. The independent variable accounts for a substantial 60% of the variance observed in the dependent variable, while the remaining 40% of the variance is influenced by other factors. The statistical analysis validates the statistical significance of the relationship between these variables, providing support for the acceptance of the alternative hypothesis.

The researchers emphasize the critical role of internal auditor professionalism in driving sustainable development within the banking sector. By exhibiting professionalism, internal auditors deliver quality reports, mitigate risks, ensure compliance with legal standards, and bolster the reputation of the organization, thereby contributing to its long-term sustainability.

H2: There is a positive impact of internal audit on the achievement of sustainable development in the banking industry, by mediating role of top management support.

Table 5 illustrates that in the presence of the mediating factor, top management support, "the relationship between internal audit and the achievement of sustainable development is 67.9%. The independent factor accounts for 46.1% of the variance observed in the dependent factor, while 53.9% of the changes are attributed to other factors. Furthermore", the statistical analysis confirms a significant relationship between these factors, thus supporting the acceptance of the alternative hypothesis.

7 Conclusion and Recommendation

"The study revealed that internal auditing has a positive impact on achieving sustainable development in the banking industry". It also indicated a significant influence of the internal audit's independence, objectivity, and professional care on achieving sustainable development in the banking industry. This implies that internal auditing represents a vital element in supporting and enhancing sustainable development in the banking industry through improving governance, risk management, supporting strategic decisions, and enhancing financial and operational performance in a manner that considers environmental, social, and governance dimensions. The results align with the findings of previous studies [9, 11, 13–15, 25, 26].

Based on this finding, Bank boards should enhance the role of the internal auditing department in reviewing sustainable development initiatives, it is also recommended. There is a necessity to heighten the focus on internal audit activities and enhance their effectiveness to ensure independence, objectivity, efficiency, and effectiveness. This is crucial due to the positive impact internal audit has on supporting sustainable development, and it is imperative to persist in improving the expertise and knowledge of internal auditors by expanding and diversifying training programs focused on sustainable development in banks. This will equip them with updated skills in these areas. Finally, the study underscores the importance of supporting the Monetary Authority's efforts to assist internal audit departments in adopting a standardized approach and adhering to relevant standards. This, in turn, elevates the role and contributions of internal auditing within Palestinian banks.

"The study significantly enhances both theoretical and empirical understanding of how internal auditing activities impact the effective management of sustainable development in banks across Palestine and other countries. The study's findings could assist in enhancing the preparedness of bank professionals and auditors to grasp the principles and components of internal auditing activity and its efficacy", and "to implement these principles within their respective banks. Internal auditing activities, structures, and sustainable development should be carefully integrated into the development of strategies for Palestinian banks", recognizing their significance as crucial drivers of bank value. Enhancing the strategy development process can involve fully integrating management practices along with their corresponding indicators.

Palestinian banks can enhance their performance by aligning various perspectives, internal auditing principles, and sustainable development, and by assigning ratings to each of these perspectives. These findings also have significant implications for investors and asset managers.

However, "it's important to acknowledge that this study may have certain limitations, and its results should be interpreted within those limitations. The findings are based on a cross-sectional survey conducted in one country", which means that extending the survey to different time periods and countries might lead to nuanced changes in the results. Additionally, a certain body of literature may have influenced the choice of influencing elements in the model, while other literature may have suggested alternative variables worth looking into. Respondents may have been tempted to downplay or remain neutral on some items they thought sensitive or confidential, even in spite of efforts to increase response rates.

Unveiling the Dynamics of Business Intelligence: Definition, Components, Tools, and Data Mining

Asmaa Jameel AI-Nawaiseh and Mahmoud Barakat Alnawaiseh

Abstract The paper "Unveiling the Dynamics of Business Intelligence: Definition, Components, Tools, and Data Mining" discusses the diverse world of business intelligence (BI) and provides a thorough examination of its essential features. The paper begins by clarifying the definition of BI and providing an expanded understanding of its conceptual foundation. The paper then dissects the components of an effective BI system, highlighting their interdependence and contributions to organizational decision-making processes. A significant portion of this article is dedicated to an in-depth analysis of the tools employed in BI implementation. The authors evaluate various BI tools, ranging from normal reporting and analytics solutions to emerging technologies, highlighting their functionalities and suitability for diverse business needs. The paper explores how business intelligence (BI) dynamics are changing in response to changes in the business landscape and technological advancements. To improve BI capabilities, the authors stress the significance of flexibility and the incorporation of cutting-edge technologies. The information provided in this paper helps researchers, practitioners, and decision-makers understand business intelligence (BI) and offers helpful insights for navigating the ever-evolving and challenging field of BI.

1 Introduction

1.1 Overview of Business Intelligence

Business intelligence systems combine operational data with analytical tools to present complex and competitive information to planners and decision makers. The objective is to improve the timeliness and quality of inputs to the decision process [1].

Business Intelligence is used to understand the capabilities available in the firm; the state of the art, trends, and future directions in the markets, the technologies, and the regulatory environment in which the firm competes; and the actions of competitors and the implications of these actions [2].

The emergence of the data warehouse as a repository, advances in data cleansing, increased capabilities of hardware and software, and the emergence of the web architecture all combine to create a richer business intelligence environment than was available [3]. Although business intelligence systems are widely used in industry, research about them is limited.

This paper, in addition to being a tutorial, proposes a BI framework and potential research topics. The framework highlights the importance of unstructured data and discusses the need to develop BI tools for its acquisition, integration, cleanup, search, analysis, and delivery. In addition, this paper explores a matrix for BI data types (structured vs. unstructured) and data sources (internal and external) to guide research [4].

1.2 Scope and Objectives of the Paper

The scope includes a variety of topics, including the use of business intelligence to understand corporate capabilities, market trends, technical breakthroughs, regulatory settings, and competitor actions. The debate also covers the evolution of the business intelligence environment as a result of data warehousing, data cleansing, technology advancements, and the impact of web architecture.

The objectives of this study are to highlight the purpose of business intelligence. Communicate that the major goal of business intelligence systems is to increase the timeliness and quality of decision-making by combining operational data and analytical tools. Components, Tools, and Data Mining.

1.3 Historical Development of Business Intelligence

The Historical Development of Business Intelligence examines the evolution of a critical field that has revolutionized how firms make informed decisions see Table 1,

From its humble beginnings in simple reporting systems to the complex analytics and data-driven insights of today, this trip through time highlights the important milestones and technological developments that have influenced the landscape of business intelligence [5].

1.3.1 Milestones and Technological Advancements

Technological developments have a significant impact on how businesses use data to make informed decisions in the dynamic field of business intelligence.

Here are some noteworthy developments and trends in business intelligence (BI) that occurred prior to then. Remember that the field is always changing, thus further advancements might have occurred since then [6].

2 Components of Business Intelligence

BI systems typically consist of several key components that work together to collect, process, analyze, and present data [7] and (Lloyd & Corporation, 2011).

These components include:

Data Sources: BI begins with data. Data can be collected from a variety of sources, including databases, spreadsheets, external sources, and web services. These sources might be either structured (relational databases) or unstructured (social media data).

Data Extraction: This component is in charge of extracting data from multiple sources, converting it into a usable format, and loading it into a data warehouse or data mart.

Data Warehouse/Data Mart: Data warehouses or data marts are databases designed to store and manage huge amounts of structured data. They are ideal for querying and reporting, making them an essential component of BI systems.

Data Modeling: Data modeling involves designing the structure and relationships of the data warehouse. Typically, this entails building tables relationships, and metadata to make querying and reporting more efficient.

Data Analytics and Processing: where data is evaluated using a variety of approaches, including statistical analysis, data mining, and machine learning, to identify insights and trends. OLAP (Online Analytical Processing) is commonly used for multidimensional analysis and Advanced BI systems may use predictive analytics and machine learning to determine future patterns and outcomes based on past data [8] (Fig. 1).

Reporting and Dashboards: BI solutions offer a variety of data visualization options, including as reports, charts, graphs, and dashboards. These technologies help users understand and interact with data.

Table 1 Development of business intelligence

Time duration	Evolution	Description
2010–2015	Traditional BI to modern BI transition	Replace static, report-focused business intelligence with more engaging, user-friendly dashboards and self-service analytics The emergence of cloud-based BI tools, which facilitate collaboration, scalability, and simpler access
2015–2017	Rise of data discovery tools	Growing acceptance of data exploration and visualization platforms like Tableau, Power BI, and Qlik, which let users examine and evaluate data in an easy way
2016–2022	Mobile BI adoption	Increasing demand for mobile business intelligence (BI) solutions that enable users to get vital business insights while on the road
2018–2020	Integration of AI and machine learning	BI solutions are being enhanced with AI and machine learning features to enable automated insights, predictive analytics, and more intelligent decision-making
2020–2021	Focus on data governance and compliance	An increasing focus on data governance is necessary to guarantee data security, quality, and compliance with laws like the CCPA and GDPR
2020–2023	Advancements in natural language processing (NLP)	NLP integration with business intelligence (BI) solutions enables users to engage with data using natural language queries and obtain insightful information
2017–2023	Data democratization	Continued efforts to make data accessible to non-technical users, enabling a wider range of employees to make data-driven decisions
2018–2023	Real-time analytics	Growing demand for real-time analytics skills to help companies respond quickly to shifting market dynamics
2021–2023	Focus on augmented analytics	Increased use of augmented analytics, which automates data preparation, insight discovery, and sharing by utilizing AI and machine learning
2022–2023	Enhanced data collaboration	BI solutions include enhanced collaboration tools that make it easier for teams to work together and share information about data findings
2015–2023	Continuous evolution of cloud BI	Cloud-based BI solutions are gaining popularity due to their ease of scaling, affordability, and accessibility. However, the industry is expected to evolve as technology advances and business demands change

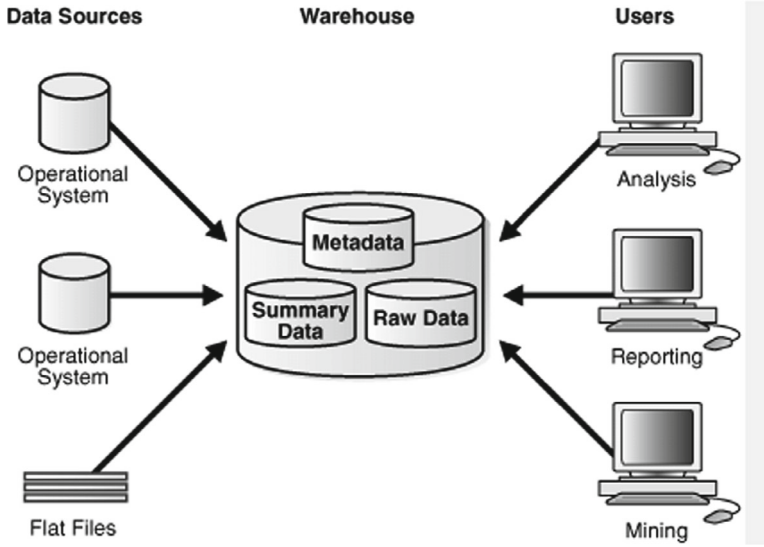

Fig. 1 Components of business intelligence

Business Intelligence Server: The BI server manages user access, security, and dashboard dissemination. It guarantees that authorized users have access to the correct data.

Data Governance and Security: Data governance policies and security procedures are critical for protecting sensitive data, ensuring data quality, and complying with requirements.

Collaboration and Sharing: BI systems frequently contain collaboration tools that allow users to share reports, insights, and notes with colleagues, encouraging collaborative decision-making.

These elements form a comprehensive business intelligence system that helps firms collect, process, and present data in order to support data-driven decision-making. Depending on the needs and technological stack of the company, different parts and tools may be utilized [9].

3 Business Intelligence Tools

3.1 Overview of BI Tools

Business Intelligence (BI) tools are software applications and technologies used by organizations to collect, analyze, and present business data, transforming raw data into valuable insights for decision-making [4, 10].

Reporting Tools: Reporting tools focus on creating and presenting static or interactive reports based on historical data like Crystal Reports, Tableau, Microsoft Power BI, JasperReports.

Dashboards: Dashboards provide a visual overview of key performance indicators (KPIs) and metrics, often in real-time, to facilitate quick decision-making.

Examples: Tableau, Microsoft Power BI, QlikView, Domo.

Data Visualization Tools: tools help in creating visual representations of data, making it easier to understand complex patterns and trends.

Examples: Tableau, Microsoft Power BI, QlikView, D3.js.

OLAP (Online Analytical Processing) Tools: OLAP tools enable users to interactively analyze multidimensional data for better insights and decision-making for example Microsoft SQL Server Analysis Services, IBM Cognos, Palo OLAP.

ETL (Extract, Transform, Load) Tools

ETL tools assist in extracting data from various sources, transforming it into a usable format, and loading it into a data warehouse for analysis for example Informatica PowerCenter, Talend, Microsoft SQL Server Integration Services (SSIS).

Data Warehousing Tools

Data warehousing tools help in the efficient storage and retrieval of large volumes of structured data for analysis for example Amazon Redshift, Snowflake, Google BigQuery.

Data Discovery Tools

Data discovery tools focus on exploring and analyzing data to uncover patterns and insights without predefined queries for example QlikView, Tableau, Spotfire.

Predictive Analytics Tools

Predictive analytics tools use statistical algorithms and machine learning techniques to forecast future trends and outcomes based on historical data for example IBM SPSS, RapidMiner, SAS Predictive Analytics.

Collaborative BI Tools

Collaborative BI tools promote teamwork by facilitating the sharing of insights, reports, and dashboards among team members for example Microsoft Power BI, Tableau, Domo.

Mobile BI Tools: Mobile BI tools enable users to access and interact with business intelligence content on mobile devices for examples MicroStrategy Mobile, Tableau Mobile, Microsoft Power BI Mobile.

BI tools, often overlapping, offer a range of functionalities, with the choice based on business needs, data volume, variety, and desired analytical capabilities.

3.2 Selection Criteria for BI Tools

Factors influencing tool selection Several factors influence the selection of Business Intelligence (BI) tools, as organizations seek solutions that align with their specific needs, infrastructure, and goals. Here are key factors that influence BI tool selection [11].

Business Requirements and Objectives: The tool's ability to address specific business needs and objectives, such as improving sales, enhancing operational efficiency, or optimizing marketing strategies.

Usability and User Adoption

Ease of Use and Availability of training resources and support to facilitate user adoption.

Data Integration and Compatibility: Compatibility with existing data sources and the ability to integrate with various data formats and Capability to handle growing data volumes and adapt to changing business needs.

Functionality and Features: Range of analytical functions such as reporting, dashboards, ad-hoc querying, predictive analytics, and data visualization.

Performance and Speed: Ability to process and retrieve data in real-time or near real-time for timely decision-making.

Security and Compliance: Robust security features to protect sensitive data and comply with industry regulations (e.g., GDPR, HIPAA) and Alignment with industry-specific compliance standards and data governance requirements.

Vendor Reliability and Support: Assessing the vendor's track record, reliability, ongoing support services and Understanding the vendor's future plans for product development and upgrades.

Interoperability and Integration: Compatibility with Existing Systems and Availability of APIs to customize or extend functionality as needed.

User Feedback and Recommendations: User Reviews and Case and organizations can make informed decisions that best suit their BI requirements and contribute to achieving their business objectives.

4 Data Mining in Business Intelligence

Finding patterns, trends, correlations, or important information in huge databases is a technique known as data mining [12]. It entails analyzing and interpreting data using a variety of methods including database administration, machine learning, and statistics. Finding hidden links in the data and extracting insightful knowledge that might help with forecasting, decision-making, and other processes are the main objectives of data mining [13].

4.1 Applications of Data Mining in BI

Data mining plays a crucial role in enhancing Business Intelligence (BI) by extracting valuable patterns, trends, and insights from large datasets. Here are several key applications of data mining in BI: [14].

Predictive Analytics: Predictive analytics determines the probability of future events by Utilizing statistical algorithms and historical data. Data mining can be used to create predictive models that predict customer behavior, trends, and business performance. This supports organizations in developing proactive plans and well-informed judgments [12].

Customer Segmentation: Customers can be divided into groups according to their traits, preferences, and behaviors through data mining. Customer segments can be used by BI systems to optimize product suggestions, enhance customer experiences, and personalize promotions [15].

Anomaly Detection: Detecting anomalies in data, locating odd trends or outliers.

Through the detection of abnormalities in financial transactions, network activity, or business operations, data mining enables firms to recognize and handle possible problems or fraud.

Text Mining and Sentiment Analysis: Extracting information from unstructured text data, such as customer reviews, social media comments, and support tickets. Integrating text mining into BI systems allows businesses to better analyze customer sentiment, identify developing concerns, and improve overall brand reputation [8].

Sales and Revenue Forecasting: Using historical sales data to forecast future sales and revenue. Data mining techniques help firms plan inventories, allocate resources, and budget by generating accurate sales and revenue forecasts [10].

Pattern Recognition: Finding repeating patterns in data. BI systems use pattern recognition to detect trends, anomalies, and hidden connections in datasets, allowing for more informed strategic decisions [14].

Campaign Effectiveness Analysis: Evaluate the impact and success of marketing activities. By evaluating campaign-related data, BI systems may assess the efficiency of marketing initiatives, allowing firms to fine-tune their tactics for future campaigns [16].

5 Case Study and Practical Example in Business Intelligence

Business intelligence (BI) in healthcare involves utilizing data analytics and reporting tools to transform unstructured data into valuable insights for healthcare practitioners. Here, the objectives and aims must be achieved [17].

Patient Care Optimization: BI tools can enhance patient care by analyzing hospital readmission rates, identifying common variables, and implementing initiatives to improve outcomes and reduce costs [18].

Operational Efficiency: BI enhances hospital and clinic efficiency by analyzing patient flow, appointment scheduling, and resource consumption data, thereby reducing wait times and optimizing staffing levels.

Financial Management: Business intelligence (BI) can enhance healthcare firms' financial management by providing insights into revenue cycle management, billing, and claims processing, thereby reducing billing errors and ensuring prompt reimbursements [19].

Clinical Decision Support: By offering data-driven insights that facilitate clinical decision-making, BI systems can help physicians. For instance, BI technologies can assist in predicting patient outcomes, identifying the best treatments for particular illnesses, and customizing patient care plans by analyzing massive datasets from electronic health records (EHRs).

Population Health Management: BI aids in evaluating health data from various sources, improving health outcomes and reducing healthcare inequities, enabling public health officials and healthcare professionals to develop targeted interventions [20].

Predictive Analytics: Healthcare practitioners can utilize predictive analytics and BI technologies to anticipate future trends, preparing hospitals for high demand periods by forecasting patient admission rates and ensuring resource accessibility.

5.1 Case Study: Reducing Hospital Readmissions

A hospital used a business intelligence tool to analyze patient data and identify readmission reasons, revealing that patients often neglected post-discharge instructions, highlighting gaps in patient education.

The hospital implemented specialized teaching programs for high-risk patients, leading to a 15% decrease in readmission rates within six months, improving patient outcomes and reducing costs.

Business intelligence (BI) can significantly enhance patient care, operational efficiency, financial management, compliance, and overall healthcare provision in the healthcare sector [18].

5.2 Practical Example: Reducing Emergency Department (ED) Wait Times

- **Problem**

A large urban hospital faces significant challenges with long wait times in its Emergency Department (ED), leading to patient dissatisfaction and potential negative impacts on patient outcomes. The hospital needs to identify the root causes of these delays and implement strategies to improve the efficiency of ED operations [19].

- **Solution**

Clean, consistent, and up-to-date data is ensured by the BI tool, which unifies data from all sources into a single data warehouse, here are the methods to manipulate data in BI health care system:

1. **Data Collection**

The hospital gathered data from various sources like patient logs, staff schedules, EHRs, and patient surveys to gather data on staff availability, demographics, and time stamps during ED visits.

2. **Data Integration**

The BI tool combines data from various sources into a centralized data warehouse, ensuring its cleanliness, consistency, and up-to-datedness.

3. **Data Analysis**

   - **Descriptive Analytics**: The BI tool generates reports and dashboards outlining key metrics such as average wait times, treatment times, and patient flow patterns [13].
   - **Diagnostic Analytics**: The hospital employs data analysis to identify bottlenecks like delays in triage and treatment initiation, and the correlation between staffing levels and wait times.

- **Predictive Analytics:** The hospital utilizes predictive analytics to anticipate ED demand by analyzing historical data and external factors like seasonal trends and local events.

5.3 Visualization

The BI tool helps identify peak hours, busiest days, and parts of the ED that experience frequent delays by providing visualizations such as heat maps and time-series graphs.

5.4 Decision Support System

BI tools used to leverage a combination of medical knowledge, patient data, and advanced analytical tools to provide recommendations, reminders, and insights that improve patient care and operational efficiency.

The hospital uses BI tool insights to adjust staffing schedules and allocate more resources to the triage area for faster initial assessments during peak times.

The hospital is enhancing its processes by implementing efficient triage protocols and fast-track systems for minor injuries to decrease wait times.

The BI tool continuously monitors ED performance, providing real-time alerts if wait times exceed acceptable thresholds, enabling the hospital to refine strategies and make data-driven adjustments [4].

5.5 Benefits and Outcomes

The hospital utilizes a BI solution to improve patient outcomes and operational efficiency by utilizing data analysis and visualization to generate valuable insights.

- **Reduced Wait Times**: Within six months, the average wait time in the ED is reduced by 30%.
- **Improved Patient Satisfaction**: When wait times are reduced and patients receive care more quickly, patient satisfaction rates rise.
- **Enhanced Operational Efficiency**: The hospital ensures efficient use of resources by improving staff and facilities [17].

6 Future Trends in Business Intelligence

However, based on existing trends and emerging technologies, here are some potential future trends in business intelligence [21] see (Fig. 2).

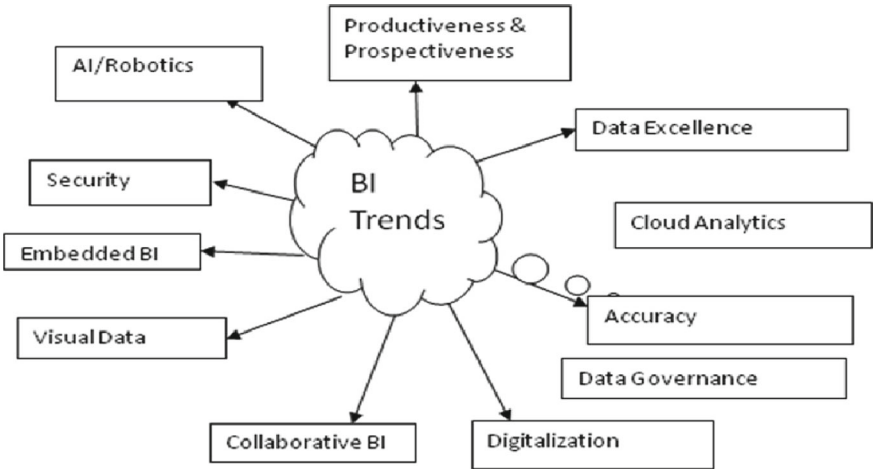

Fig. 2 Business intelligence future trends

Augmented Analytics Artificial intelligence (AI) and machine learning (ML) will be increasingly integrated into business intelligence (BI) systems. Augmented analytics can automate data preparation, insight discovery, and data visualization, allowing non-technical users to gain significant insights [12].

Natural Language Processing (NLP): BI tools are probably going to have more sophisticated natural language processing features. This makes analytics more approachable for a wider range of people by enabling them to engage with data using natural language inquiries [14].

Data Democratization: The trend toward making data accessible to a wider range of users within an organization is expected to continue. Self-service BI tools will empower business users to generate their own reports and insights without heavy reliance on IT departments.

Real-time Analytics: Real-time data analysis and reporting will become more and more in demand. Companies want to base their decisions on the most recent data, so real-time data processing and analytics must be supported by BI technologies.

Cloud-Based BI: Since cloud-based BI solutions are more affordable, flexible, and scalable, they should become increasingly popular. As a result, businesses can simply grow their BI infrastructure to meet their evolving needs.

Mobile BI: Mobile business intelligence will continue to grow in popularity, providing customers with on-the-go access to critical information and insights. Because they are not constantly limited to their workstations, executives and decision-makers will want mobile-friendly BI interfaces and tools.

Integration with Other Business Systems: BI tools will likely become more integrated with other business applications, such as customer relationship management

(CRM) and enterprise resource planning (ERP) systems. This integration can provide a holistic view of business operations [15].

It's essential to stay updated on industry developments to understand how these trends evolve over time.

7 Limitations and Constraints

Business intelligence has several limitations and constraints that organizations should be aware of [22].

Data Quality: BI projects require data quality assurance through data validation, cleansing, and governance procedures to optimize benefits and promote well-informed decision-making. Inconsistent data quality can lead to inconsistencies, wasting time and resources [3].

Integration Issues: Data consistency and reliability problems might arise when combining disparate data sources and systems into a single BI platform.

Cost: Employing and sustaining a BI system can be expensive, especially for small and medium-sized businesses. Costs can include software, hardware, training, and continuing support.

Complexity: BI systems can be complex, needing knowledge to set up, maintain, and analyze data effectively. Users may need training to fully utilize the system [23].

Security Concerns: Storing and analyzing sensitive business data in a BI system can create security risks if not properly protected.

Scalability: As businesses grow and data volumes increase, BI systems need to scale accordingly. Ensuring that the system can handle increasing amounts of data and users is essential for long-term success [24].

Organizational Culture and Change Management

Employees and management may resist adopting new BI systems and processes due to comfort with existing methods or fear of the unknown. Ensuring widespread adoption of BI tools across the organization requires effective change management strategies and demonstrating the value of BI [25].

Keeping Up with Technological Advancements: New tools and technologies are always developing, causing the BI landscape to change quickly. Staying up to date with these changes necessitates ongoing education and adjustment [26].

Integration of Emerging Technologies: While integrating AI, machine learning, and big data analytics into business intelligence (BI) systems can be challenging, doing so is essential to maintaining a competitive edge [3–5].

Understanding these limitations and constraints can help organizations make informed decisions when implementing and using business intelligence solutions [26].

8 Conclusion

This paper's primary objective was to provide a general overview of the field of business intelligence by presenting a range of elements that are used in enterprise theories and practices. Furthermore, we've included sections on various and unique BI applications, BI features, leading technologies used, particular trends, concerns, and challenges that BI will face in the future. Since BI theories, technology, and practices are so vast and complex, we have limited the number of BI components we will discuss in this paper to just a few.

As a last point of conclusion, business intelligence (BI) is becoming more and more common in a variety of areas. Generally speaking, enterprises should take into account a number of important criteria when obtaining and implementing BI, including BI empowerment through organization, flexibility, and integration.

Mobile Payment Adoption: Challenges and Opportunities

Islam Abdeljawad, Muiz Abu Alia, Na'el Musa, Alaa Jarrar, and Lina Yousef Wishahi

Abstract The rapid progression of technology has significantly impacted various aspects of human life, including the financial sector. The objective of this research is to explore the factors that influence the enactment of mobile payment systems, with a particular emphasis on the Palestinian setting. It is crucial to comprehend these factors in order to implement and utilize these technologies effectively. The adoption rates in Palestine, obstacles and challenges, and strategies to promote technology acceptance were all analyzed. Through an analysis of previous scholarly investigations and empirical studies, this article provides substantial insights into the present condition of technology adoption as it pertains to mobile payments in Palestine. According to the conclusion of the report, the adoption of mobile payments is reliant on variables including mitigate security risks, promote standardization, strengthen merchant acceptance, enhance infrastructure, and foster consumer confidence. These conclusions may provide valuable insights for policymakers, financial institutions, and researchers with respect to the formation of future developments.

Keywords Mobile payment · Palestine · Financial inclusion

1 Introduction

Continuous technological advancements in information and communications technology are transforming every aspect of our daily lives. The adoption of electronic methods has emerged as a critical requirement for governmental, educational, and commercial institutions [1, 2]. Particularly in financial operations, this transition provides numerous advantages, including improved service delivery, time savings, and streamlined transactions. Palestine, like numerous other nations, has been profoundly affected by the Internet and its intelligent applications because their widespread adoption [3]. Electronic payments have become an intrinsic component

A. M. A. Musleh Al-Sartawi et al. (eds.), *Business Resilience and Business Innovation for Sustainability*, Studies in Systems, Decision and Control 587,
https://doi.org/10.1007/978-3-031-87584-7_33

of daily existence, materializing in diverse formats including mobile phone-based payment systems, digital cash, digital checks, and digital wallets [4]. Due to the pervasive availability of mobile data and internet services and the exponential growth of mobile network subscribers, mobile payment (MP) systems have attracted significant interest from both industry professionals and academic researchers. This mode of payment is widely praised for its numerous benefits, which include enhanced efficiency, reduced time and costs, improved security and confidentiality, and accelerated transaction processing [5]. Notwithstanding their considerable potential, numerous MP services that have been implemented in Palestine recently, have failed to attain the expected level of widespread adoption [6]. Therefore, it is critical that MP service providers, such as financial institutions and mobile network operators, acquire a thorough comprehension of the determinants that impact consumers' inclination to adopt MP services in order to overcome the obstacles of adoption to this service.

Mobile money has become an accepted and dependable method for facilitating convenient and secure financial transactions worldwide. There is a growing appeal to the idea of replacing conventional paper currency with phone-based transactions that are more streamlined and convenient [7]. Mobile money has revolutionized financial management in numerous ways, including the ability to make online purchases, conduct international transfers, and pay bills with ease [8]. Maintaining this progress requires the integration of motivational elements, including cashback rewards, loyalty points, and discounts, in conjunction with an intuitive and user-centric interface, in order to guarantee that mobile money continues to be the favored option among consumers [8].

The objective of this research is to fill this void through investigating the possible factors that influence consumer behavior regarding the adoption of MP in Palestine. The increasing adoption of MP technology and digital banking signifies a developing pattern in modern society, which is transforming conventional cash-based economies into cashless ones [9]. The proliferation of smartphones and the expanding availability of internet connectivity have contributed significantly to the increased prominence of MPs in recent times. As a result, the primary objective of this study is to investigate a critical question: To what extent are MP technology and digital banking favored in Palestine?

We conducted a review of available data and pertinent literature on MP. We meticulously analyzed and categorized the collected information under relevant thematic headings to facilitate an informed decision-making process. By providing a robust conceptual framework, this study contributes to the existing body of knowledge on this subject, offering insights that are pertinent to both academia and industry stakeholders. Given the novelty of the topic, this study aspires to yield practical and meaningful outcomes and recommendations for MP users. Evidence of this study is of particular importance given the distinct circumstances prevailing in Palestine [10–12]. Palestine is an underdeveloped and politically unstable country [13–16]. However, Palestine has many similarities with many countries, especially in culture [17–19], implying the possibility of benefiting from the results of this study in other countries.

2 What is Mobile Payment?

Mobile payment processes signify a substantial progression in security when contrasted with conventional payment methods. By implementing biometric authentication methods, such as fingerprint or facial recognition, and Near Field Communication (NFC), it is possible to restrict transaction initiation and completion to authorized users only [20]. Moreover, to ensure the security of sensitive data, these applications implement encryption, thereby establishing an extra barrier against potential intruders who may attempt to intercept personal information with malicious intent. Leong [21] asserts that the capability to promptly identify, immobilize, or remotely erase a misplaced or stolen smartphone, in addition to ascertaining its whereabouts, enhances security protocols and effectively mitigates the hazards linked to fraudulent undertakings.

In regions that were previously underserved by conventional banks, MPs have emerged as disruptive forces that have reshaped the financial landscape. These platforms function as digital gateways, allowing users to link their mobile wallets to bank accounts or prepaid cards. This provides access to the digital economy to individuals who do not have traditional bank accounts [6]. This transformation has been exemplified in sub-Saharan Africa, where millions of individuals are now able to send, receive, and save money with the tap of a smartphone. In essence, this has transformed mobile devices into miniature banks and promoted financial empowerment [22].

In addition to facilitating transactions, MP applications have undergone significant development to integrate diverse daily life functions, including ticket reservations and food delivery, into a unified interface. By virtue of this seamless integration, both efficiency and the overall user experience are elevated [23]. It is impossible to ignore the success of MPs when analyzing this phenomenon. Societies have experienced a near-total transition away from cash, with platforms such as Alipay and WeChat Pay influencing all aspects of daily existence, from street vendors to upscale retailers. The extensive implementation of Quick Response (QR) codes has enabled this revolution, permitting even the most modest enterprises to effortlessly process MPs without investing in expensive point-of-sale systems [24].

Financial transactions have been significantly transformed by the advent of MP, which provides unprecedented convenience, enhanced security, and expanded financial inclusion. Ongoing technological progress is expected to facilitate the increased adoption of MP processes, thereby accelerating the progression towards a fully cashless society [25].

3 Mobile Payment in Palestine

These international developments did not result in Palestine's exclusion. Since 2020, MP providers have been operational in Palestine. As shown in Table 1, five companies have introduced MP services. Technological leadership, customers' consideration of online personalization and privacy, customers' inclination towards technology adoption, and e-trust and loyalty all impact the utilization of MP in Palestine [26]. In Palestine, the intention to use electronic wallets was found to be influenced by innovation characteristics, ease of use, and social influence, according to Altarturi [27]. Conversely, Mujahed [28] posits that the business model and enabling environment of Palestinian SMEs are the primary determinants of their adoption of MP. As stated by Ibrahim [29], the significance of MP has grown due to its favorable impacts on businesses and clients, its broad adoption, particularly among younger customers, and its versatility across various domains. The findings of the study shed light on the significance of promoting its usage through cultural shifts and an emphasis on its benefits. One of the advantages of MP adoption in Palestine is the expansion of financial inclusion [8].

In 2021, the number of registered mobile accounts was 227,040, of which only 30,097 are active accounts (Table 2). The number of registered agent outlets was 3419, all of which were active. On the other hand, the number of MP transactions is 699,080, worth 55,305,663 USD. As seen also in Table 2, the outstanding balances of mobile accounts was 1,150,879 USD of which 739,358 USD related to active accounts.

Additionally, Table 3 illustrates the narrow usage of MP within the Palestinian context. Though 84.16 percent of Palestinians own a mobile phone, only 2.33 percent have a mobile money account. The majority of the remaining percentages displayed in the table are a combination of mobile money and mobile banking results; therefore, the comparatively high percentages cannot be attributed to mobile money exclusively. These modest applications of MP underscore the significance of comprehending the obstacles that MP encounters in Palestine and devising strategies to surmount them.

Notwithstanding the manifold benefits of MP, strict adherence to optimal methodologies is critical for guaranteeing secure and efficient transactions. Adopting MP introduces inherent security vulnerabilities, such as the potential for unauthorized access or interception of wirelessly transmitted sensitive financial data. In order to

Table 1 Mobile payment providers in Palestine

Payment Company Name	Commercial Name
Middle East Payment Service	MEPS
The National Electronic Payment Company	JAWWAL PAY
Madfooatcom for Electronic Payment	MADFOOATCOM
Maalchat For Electronic Payment Services Limited liability Co	MAALCHAT
PalPay For Electronic Payment Systems Company	PALPAY

Table 2 Mobile wallets indicators in Palestine

Mobile money (mobile wallets) indicator	Total number/value in USD	
	2020	2021
Number of registered mobile money accounts	75,523	227,040
Number of active mobile money accounts	2219	30,097
Number of registered agents	2508	3419
Number of active agents	2506	3419
Value of mobile transactions	6,866,768	55,305,663
Number of mobile transactions	122,575	699,080
Outstanding balances of active accounts	207,267	739,358
Outstanding balances of all accounts	270,942	1,150,879

Table 3 Usage indicators of mobile money and mobile applications of banks in Palestine

Indicator	2021 (%)
Made a digital in-store merchant payment: using a mobile phone (% age 15+)	3.51
Made a utility payment: using a mobile phone (% age 15+)	0.74
Made a utility payment: using a mobile phone (% who paid utility bills, age 15+)	3.07
Mobile money account (% age 15+)	2.33
Own a mobile phone (% age 15+)	84.16
Received government payments: through a mobile phone (% age 15+)	0.54
Saved money using a mobile money account (% age 15+)	0.55
Store money using a financial institution or a mobile money account (% age 15+)	10.77
Use a mobile phone or the internet to make payments, buy things, or to send or receive money using a financial institution account (% age 15+)	3.24
Use a mobile phone or the internet to make payments, buy things, or to send or receive money using a financial institution account (% with a financial institution account, age 15+)	9.77
Used a mobile phone or the internet to buy something online (% age 15+)	14.93
Used a mobile phone or the internet to pay bills (% age 15+)	2.72
Used a mobile phone or the internet to send money (% age 15+)	2.44

Source World Bank: Global Financial Inclusion (https://databank.worldbank.org/source/global-financial-inclusion)

address these potential hazards, it is advisable for users to select reputable MP service providers that implement strong security protocols, such as multi-factor authentication and regular updates for MP applications [1]. In order to mitigate the risk of malware compromise, it is advisable for users to exclusively obtain MP applications from official app stores. It is imperative to consistently update applications and

smartphone operating systems in order to take advantage of the most recent security patches [30]. It is advisable to augment security measures with two-factor authentication. Additionally, it is advisable for users to exercise prudence when utilizing public Wi-Fi networks and to abstain from inputting sensitive data when connected to unsecured networks [31].

Notwithstanding the growing prevalence of MPs, a subset of merchants has yet to adopt this technology, presenting obstacles for consumers who are highly dependent on MPs. Educating and incentivizing merchants regarding the simplicity and advantages of MPs can potentially stimulate increased rates of acceptance [32]. The lack of uniform procedures among different MP platforms presents difficulties for both vendors and customers. Due to the fact that every platform has unique compatibility concerns and requirements, merchants are compelled to purchase multiple payment terminals or software solutions. A seamless experience for all parties can be facilitated through the establishment of common standards and the promotion of interoperability through collaborative endeavors among industry stakeholders in Palestine [31]. Establishing credibility with Palestinian consumers regarding MPs is vital for broad acceptance. Concerns regarding the privacy and security of financial data are prevalent among those who utilize MP methods. According to Shuhaiber [33], in order to establish confidence in the dependability of MP systems, it is imperative that MP service providers place a high value on transparency, inform users about security protocols, and provide strong customer assistance. Moreover, certain online payment methods are considered less appropriate for consumers due to their higher cost [1]. Hence, it is recommended that MP platforms implement loyalty programs, rewards systems, and discount schemes to encourage users to adopt cashless transactions [8].

Palestine, as stated by Bjørn and Boulus-Rodje [34], is deficient in critical mobility-related infrastructure, legal frameworks, payment gateways, and mobile Internet. MPs are reliant on internet connectivity and a resilient infrastructure, which can pose difficulties in areas where network coverage is insufficient or internet connections are unreliable. Technological advancements, such as the implementation of QR codes and offline payment processing, have the capacity to overcome these obstacles and guarantee MP accessibility in all regions [35].

In summary, the augmentation of the MP in Palestine necessitates the mitigation of security vulnerabilities, promotion of standardization, facilitation of merchant acceptance, infrastructure enhancement, and development of consumer confidence. These measures are crucial in the pursuit of establishing a cashless society and transforming financial transactions through the use of MPs.

4 Mobile Payments Advantages

MPs have revolutionized the transactional landscape by integrating themselves seamlessly into our daily lives. The prevalence of smartphones and mobile banking applications has led to a growing preference among individuals to conduct transactions via their mobile devices rather than carrying physical currency. The transition towards

MPs is not unexpected, considering the numerous benefits they provide in comparison to conventional cash transactions [36]. This segment delves into a selection of these advantages.

Convenience is an exceptional feature of MPs in comparison to conventional cash transactions. This is attributed to the straightforward nature of the payment process, which eliminates the need to transport cumbersome, particularly for larger transactions, physical currency. Additionally, MPs are accessible from any location and at any time via the internet. Business travelers and other individuals with hectic schedules will find this adaptability to be especially beneficial [1, 37].

In terms of security, MPs exceed conventional cash transactions. Although cash inherently carries the risk of theft or loss, MP transactions are safeguarded by encryption, which guarantees the confidential data remains secure. In addition, MP applications integrate strong security protocols, such as two-factor authentication and fingerprint recognition, which significantly bolster their protection in comparison to cash transactions [5].

Particularly for larger payments, the process of counting physical currency can be time-consuming. In contrast, MP transactions are finalized within seconds. The aforementioned swiftness confers notable benefits in situations that require promptness, such as procuring groceries in a crowded supermarket or remitting a taxi fare [38].

The task of overseeing and documenting cash expenditures can prove to be difficult, especially when multiple transactions occur throughout the day. While MPs do offer an exhaustive log of every transaction, they streamline the procedure of monitoring expenditures and efficiently administering finances [39].

Loyalty programs are an advantageous feature of MPs that are not viable in the context of conventional cash transactions. The use of MPs grants access to cashback offers, rewards points accumulation, and discounts, all of which contribute to long-term savings. In addition, specific MP applications provide their users with exclusive discounts and offers, a benefit that is inaccessible to those who pay in cash [40].

While there may be circumstances, such as in regions with limited internet access, where cash transactions are inevitable, the overall trend is clear: MPs signify the forthcoming standard for financial transactions. Consequently, it is essential to adopt this technology and capitalize on its benefits. Certain works is needed by policymakers to adapt the Palestinian environment to comply with this trend.

5 Security Concerns in Mobile Payment Systems

When utilizing MPs, security is paramount. The absence of adequate security measures for MP is generally acknowledged as a significant associated obstacle [1]. As stated by Al-Saedi [41], the safety and integrity of MP systems are contingent upon the implementation of a number of security measures. MP systems commence their security measures with rigorous authentication and authorization procedures. With the increasing adoption of MP systems, security must become a top priority

for both users and service providers in order to protect sensitive financial data [42]. Likewise, two-factor authentication increases the level of security provided by MP systems. By implementing a two-factor authentication system, wherein individuals must supply a one-time verification code via SMS or email in addition to a password or PIN, the likelihood of fraudulent transactions and unauthorized access is substantially diminished [43]. In addition, tokenization is an essential security protocol that substitutes genuine credit card numbers with distinct, arbitrary-generated tokens. Subsequent to a data breach, these tokens remain devoid of significance to potential intruders and thus cannot be employed to execute fraudulent transactions; thus, they safeguard sensitive cardholder information [44]. Encryption is an essential component in safeguarding MP systems as it ensures the privacy of sensitive data throughout its transmission and storage. Strict encryption algorithms guarantee the integrity of user data, encompassing payment card information and personal information, against unauthorized intrusion. In order to safeguard transmitted data during transactions, secure connections are formed utilizing protocols such as SSL or TLS [30]. In conclusion, biometric authentication methods, including facial recognition and fingerprint recognition, add an extra level of security to MP systems. By capitalizing on distinct biological characteristics, these approaches provide a risk-free and practical means of verifying user identities, guaranteeing that solely authorized users are granted access to and can operate MP applications [45].

Security measures within MP systems are vital to safeguard users' financial information and ensure a secure digital economy. Authentication and authorization mechanisms, encryption, tokenization, and biometric authentication provide users with the confidence to engage in electronic transactions securely [5].

6 Mobile Payments and Financial Inclusion

The global trend towards financial inclusion has accelerated by providing access to financial services for both individuals and businesses. By providing individuals who were previously excluded from the formal banking system access to and engagement in the digital economy, MPs have emerged as a powerful instrument for promoting financial inclusion. The advent of mobile phones has enabled individuals to conduct financial transactions in a secure and convenient manner, even in geographically isolated and underserved regions [7].

MPs act as an intermediary between the unbanked and the formal financial system, enabling millions of people around the world to conduct necessities. Through the utilization of mobile phone technology, individuals are able to effortlessly transfer funds, pay bills, and receive wages through their mobile wallets [6].

Additionally, MPs provide unbanked individuals with access to formal financial services that were previously inaccessible to them. Mobile wallets provide users with the ability to access savings accounts, investigate insurance products, and obtain small

loans [6]. Moreover, MPs play a role in mitigating the prevalence of financial exclusion and aid in the resolution of geographical barriers that hinder certain individuals from opening bank accounts [7].

Furthermore, by addressing obstacles to accessing financial services, MPs possess the capacity to empower women and marginalized communities. This would grant them the ability to engage in economic activities, oversee their finances, and develop financial resilience [8]. As an illustration, the partnership between non-governmental organizations and mobile financial service provider bKash in Bangladesh has increased financial inclusion among rural women, thereby bolstering their economic opportunities and empowering them to participate in household decision-making [6]. Additionally, MPs can provide underserved populations with financial education through their platforms. By means of text messages and mobile applications, individuals are able to receive reminders, educational programs, and tips that assist them in making well-informed financial decisions [22]. In fact, they furnish users' mobile phones with educational materials concerning budgeting, saving, and debt management. This empowers individuals with the necessary understanding and abilities to make well-informed decisions regarding their finances [6].

The emergence of MPs has significantly transformed the operational environment for small enterprises, presenting an array of advantages that were hitherto impossible [46]. The adoption of MPs by small businesses facilitates operational streamlining, diminishes dependence on tangible cash transactions, and offers customers a more convenient payment alternative. In addition to conserving time and resources, this increased efficiency improves the customer experience as a whole [47]. In addition, MPs alleviate small businesses' financial burdens by eliminating the requirement for costly card processing equipment and conventional point-of-sale systems [47]. Tablets or smartphones that have been updated with MP applications function as versatile and economical payment terminals. In addition, MPs eliminate the potential for fraud and theft associated with cash transactions, thereby reducing the need for expensive security measures [42]. Conversely, MPs enable small enterprises to expand their customer reach by catering to technologically inclined individuals who favor digital transactions. Businesses have the opportunity to expand their reach to customers from various geographic regions by adopting MPs [48].

MPs have become a catalyst for change in the fight for financial inclusion. Further advancements in mobile phone technology and the growing international recognition of MPs are expected to facilitate additional strides in promoting financial inclusion and empowering individuals to engage actively in the digital economy [1]. Legislators have exerted a substantial influence on small enterprises and the economy at large. In a cashless society, small businesses rely heavily on MPs due to the expansion of their customer base, cost savings, enhanced efficiency, and improved customer experience. Small businesses contribute to the expansion of the digital economy and maintain competitiveness in the face of shifting consumer preferences through the implementation of MP solutions [36].

7 The Future of Mobile Payments

Fundamentally, information technology facets are perpetually evolving and distinguished by consistent innovation. In the context of MP, prospective advancements will augment security measures and provide a cohesive user experience through the incorporation of biometric authentication techniques, such as facial recognition, fingerprints, or iris scans [35]. This technology has been implemented by platforms such as Apple Pay, establishing a model for subsequent MP solutions. Furthermore, advancements in technology such as Near Field Communication (NFC) will further transform in-store transactions by enabling contactless payment methods. This technique provides a streamlined payment experience and mitigates the potential for the transmission of germs by enabling users to scan their cards or mobile devices onto payment terminals [1]. Furthermore, in order to optimize payment processes, mobile wallets will progress by integrating various payment methods—such as loyalty cards, credit cards, and debit cards—onto a solitary, user-friendly platform. In addition to the aforementioned features, these wallets will provide budgeting tools, rewards programs, and personalized offers [49]. In addition, the incorporation of Internet of Things (IoT) devices into MP technology will facilitate smooth transactions that obviate the necessity for a tangible wallet or smartphone. The integration of connected cars and smartwatches into the payment system will streamline the procedure in a variety of situations [50]. Furthermore, the implementation of blockchain technology in MPs has the capacity to augment security, transparency, and efficiency. Blockchain has the potential to enhance security and streamline cross-border transactions by capitalizing on its decentralized and immutable attributes; this can be achieved through cost reduction and the elimination of intermediaries [46].

These upcoming trends and innovations in MP technology are set to redefine how transactions are conducted, offering advancements in convenience, security, and efficiency. From biometric authentication and contactless payments to mobile wallets, IoT integration, and blockchain technology, the future of MPs promises to drive us towards a cashless society fueled by electronic payments.

8 Conclusion

Ultimately, the emergence of MPs has brought about a paradigm shift in financial transactions, providing an unprecedented level of convenience, security, and efficacy in the present-day era. The adoption of MPs as an alternative to conventional cash transactions by both consumers and businesses has contributed to the growth of the digital economy. The ease of use and stress-free experience provided by MPs are clear indications of their convenience; they eliminate the necessity for cumbersome wallets and streamline transactions to a few taps on smartphones. Additionally, stringent security protocols, including authentication techniques and encryption, safeguard

users' financial data to an extent that exceeds that of traditional payment methods such as cash or credit cards.

Promising in efficiency, MPs streamline business operations via process automation and improve the overall customer experience through the execution of transactions in a timely manner. It is of the utmost importance that organizations and individuals prioritize the adoption of trustworthy MP platforms that employ strong security protocols, and that merchants are adequately prepared to accept MPs, as non-cash transactions gain traction. Constant vigilance regarding transactions enables the prompt detection and reporting of any suspicious activities, thereby protecting financial data.

We anticipate that the prevalence of MP operations will increase as technology develops. In order to mitigate the adverse effects of the dearth of education regarding electronic digital interaction, specifically in developing nations, it is possible to cultivate confidence in MP technologies by means of educational endeavors targeting diverse segments of society.

A number of interconnected obstacles exist in Palestine that hinder the progress of MPs. It is crucial, therefore, to implement initiatives to surmount these challenges. In order to bolster the MP in Palestine, it is imperative to undertake the following measures: mitigate security risks, promote standardization, strengthen merchant acceptance, enhance infrastructure, and foster consumer confidence. These measures are crucial in the pursuit of establishing a cashless society and transforming financial transactions through the use of MPs.

The Impact of a Company's Accounting Income and Capital Structure on the Economic and Financial Sustainability—An Empirical Study on Industrial Companies Listed on the Palestine and Amman's Stock Exchange During for the Period 2016–2022

Ghassan Daas and Maram Mashaqi

Abstract The objective of the research was to assess the impact of accounting income and the capital structure on the financial and economic viability (sustainability) of industrial firms listed on the Amman and Palestine Stock Exchanges, determining which of these is most impacted by accounting income and capital structure. on The sustainability measures represented in tax payments to the government, productive diversity, the availability of training courses for employees, the presence of women in the labor market, and return on equity (ROE). The study data was collected for the period 2016–2022 on a sample of 44 firms. The data were analyzed and the hypothesis tested using correlation and regression models. The study discovered that accounting income has a positive significant impact on both the economic and financial sustainability for both Palestinian and Jordanian firms and considered as the main determinant of that. The study suggested that public shareholding companies' management expand employee training opportunities to boost workers' productivity and qualifications, which will enhance their performance and help the company achieve economic sustainability. They should also expand employment opportunities for women and expand the number of production lines to determine the best possible indicators levels to help the company achieve economic sustainability, also to concentrate on the cost.

1 Introduction

The challenges that businesses face in promoting sustainable development have received worldwide attention. In addition to commercial considerations, businesses must also consider sustainability from social and environmental perspectives. This allows them to report on their economic and non-economic performance. From a government point of view, it is also essential to quantify and convey the effects of economic, social, and environmental performance. Moreover, establishing and maintaining the firm's reputation is critical. This trust is based on business decisions and tactics that affect both stakeholders and the organization. Sustainability reporting has the added advantage of making businesses more transparent and taking into account all relevant factors. It does so by exposing the public to the dangers and effects of the issues at hand. Despite the possibility that their activities could harm the environment, businesses often overlook the social and environmental consequences of their economic activity. Stakeholder awareness and media pressure have led companies to include sustainability in their vision, mission, strategy, planning, and decision-making. By reviewing the company's sustainability disclosures, the board of directors, as a member of top management, can ensure that shareholder interests are protected. It is one of the primary means by which managers communicate and distribute information about sustainability initiatives to all stakeholders [1].

A company's capital structure typically emphasizes a combination of debt and equity financing. A company's financial health depends on a variety of financial decisions. Empirical data indicates that a company's decision on which funding sources to use—debt or equity—has a big impact on the company's worth. Making the wrong capital structure decision could cause a business to face financial challenges and, eventually, insolvency. For instance, businesses that have significant amounts of long-term debt that are poorly managed have a higher risk of going bankrupt. Furthermore, maintaining the debt-to-equity ratio is a necessary part of financial planning to maintain public confidence because raising long-term debt shows that management is shifting the company's risk to bondholders or creditors, which raises agency costs and worries shareholders. Ref. countered that firms with lower liquidity and fewer non-debt tax shelters incur higher agency costs and that issuing shares during the debt reduction stage increases the likelihood of a rapid failure. The trade-off theory, which contends that business leverage is established by weighing the benefits of debt tax reduction against the expenses of bankruptcy, provides evidence of this. Thus, managers choose a company's capital structure to maximize its net worth. This demonstrates how a firm's profitability is greatly impacted by its capital structure decision [2].

Because of the unpredictable, uncertain, and unstable nature of the current political and economic climate, as well as the disruptions to customer and supplier interactions, firms must reevaluate their development goals to achieve effective growth. Apart from the primary objectives of the operation, companies are facing challenges in maintaining strong economic indicators, which reduces their activities to a battle for survival. Consequently, the pursuit of sustainable growth and development becomes imperative [3]

2 Problem Statement

Accounting's focus changed from the concept of ownership, which crystallizes in maximizing the self-interest of the owners as it is the primary responsibility of management, to the concept of the accounting unit, which considers the owners as one of the stakeholders in the company [4]. So a company's decision on which funding sources to use—debt or equity—has a big impact on the company's worth. Making the wrong capital structure decision could cause a business to face financial challenges and, eventually, insolvency. For instance, businesses that have significant amounts of long-term debt that are poorly managed have a higher risk of going bankrupt. The evaluation of a firm's financial soundness in the ever-changing world of international commerce goes beyond conventional accounting measures. Scholars, practitioners, and politicians alike are now focusing on accounting income—a measure of a company's underlying activities. According to the hypothesis, a business that only employs equity financing outperforms one that has a large amount of debt on its statement of financial position. The pecking order theory, however, contends that businesses should sequence their funding sources so that equity must be employed as a third source when debt is insufficient and internal financing through net operating income comes in first [2].

Therefore, many businesses started to rely less on maximizing financial gains to establish their reputations and more on disclosing financial and non-financial information to inform their stakeholders about the company's economic performance [5]. Although accounting income is commonly used as a standard measure to evaluate financial performance, it is still unclear how much of an impact it has on sustainability given its correlation with economic revenue [6].

Accounting income, Capital Structure and Economic sustainability are becoming more and more important in the context of corporate responsibility, and it merits scholarly study but there aren't many studies that give a broad picture of the impact of these on Economic sustainability. With human progress and industries expanding, the world has split into two camps: one of them supports the priority of economic growth without regard for the environment [7].

In the context of the financial and economic sustainability, the research problem can be presented as: "What is the impact of a Company's accounting income and Capital Structure on the Economic and Financial sustainability? It is an empirical

study on industrial companies listed on the Palestine and Amman's Stock Exchange during for the period 2016–2022.

Accordingly, the research proposes the following question:

- What is the impact of a Company's accounting income on the economic sustainability of Industrial Companies Listed on Palestine & Amman Stock Exchange?
- What is the impact of a Company's accounting income on financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange?
- What is the impact of a Company's Capital Structure on economic sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange?
- What is the impact of a Company's Capital Structure on financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange?

3 Importance of the Research

The industrial companies [8] use a lot of resources in the course of their daily operations, they are generally characterized by a boring, routine nature that makes the wheel of economic growth slowed because many of those resources are scarce or limited, whether they be natural, economic, or other resources. They are responsible for both the welfare of the present and future generation, making it necessary for those businesses to exercise their economic sustainability, their vision, mission, strategy, planning, and decision-making. According to the information provided, and a review of previous literature regarding sustainability, a research gap was found related to accounting income and Capital Structure impact on Economic sustainability, although there are previous studies conducted to find the effect of accounting income on sustainability performance, so there is lake of studies which examines the relationship between these variables and the Economic and Financial sustainability.

According to [9] the impact of common share capital on financial sustainability has been the subject of conflicting research by different researchers. Some discovered that the impact of common share capital on long-term financial viability was negligible. However, some researchers came to the opposite conclusion that common share capital had a detrimental impact on financial sustainability while others decided that common share capital had a favourable effect. So this study is important because it highlights their impact on economic and financial sustainability, provides a more accurate picture of a company's financial performance, enhances stakeholder communication, guides investor decisions, evaluates performance, allocates capital efficiently, and improves decision-making.

4 Objectives

Since this subject is so important, the study's objectives are as follows:

1. Identify the impact of accounting income on economic sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.
2. Identify the impact of accounting income on financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.
3. Identify the impact of Company's Capital Structure on economic sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.
4. Identify the impact of Company's Capital Structure on financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.

5 Theoretical Framework, Literature Review, and Hypothesis Development

5.1 Theories

According to [10], the best way to achieve growth and capitalist development is to adopt policies that encourage competition and give economic actors more freedom to pursue their interests in line with the widely accepted notions that human nature is characterized by a desire to trade, better oneself materially, and take advantage of advantageous opportunities. In order to stimulate growth [11], the government must increase demand. The shift from goods to services creates forecasts that align with cross-country growth data. These forecasts include an increase in the real investment rate, a decrease in the real interest rate, the marginal product of capital, and an acceleration of technical development particularly in investments as the share of services rises [12].

The main theories Related to the subject:

Stakeholders Theory: [13–15] the voluntary sustainability disclosure of an organization is influenced by a variety of stakeholders, including shareholders, creditors, suppliers, managers, customers, competitors, employees, their families, the media, local communities, charitable organizations, and future generations. Companies will provide more information on sustainable development to minimize the costs associated with inspections and to evade government control and inspection. Managers, on the other hand, anticipate a relaxation of state management regulations when the information is voluntarily shared. The management of a related party's relationship and the company's obligations to them.

Agency Theory: [16] there is a greater likelihood of voluntary sustainability information disclosure from large corporations. The interaction between managers and owners is depicted by agency theory. There is cause for concern that the manager of

the company will not operate in the best interests of the owners, who are the shareholders. If both sides (the owners and the managers) wish to maximize their interests. Agency theory explains why shareholders and creditors get information from annual reports.

Political Economy Theory: [17, 18] managers like the government, labor unions, or community organizations base their choices about matters pertaining to the company's interests (such tax laws, monopoly limits, and competition) on the information that businesses provide.

Signaling Theory: [17, 19] the theory indicated that financial decisions are signals to investors to take feedback into account. The company's financial communication policy is based on this signal. According to signal theory, profitable businesses frequently use financial data as a marketing signal. Greater information transparency will help the business draw investors and facilitate capital raising. As a result, the manager can provide financial statement users with information on corporate sustainability, enabling them to evaluate the company's performance accordingly.

The trade-off theory: this theory [20] introduced that the interest tax shields associated with debt and the costs of financial distress into a state preference model. The trade-off theory of capital structure postulates that managers attempt to balance the benefits of interest tax shields against the present value of the possible costs of financial distress. According to the trade-off hypothesis, there should be an ideal capital structure that strikes a balance between the cost of bankruptcy and the present value of interest tax shielding

5.2 The Conceptual Framework of Economic Sustainability

5.2.1 Sustainability Concept

According to [21] there was a major focus on the idea of sustainability in the early 1970s of the previous Century. Sustainability refers to the coexistence of society within the constraints of available resources in order to achieve social welfare, and it is defined as satisfying the needs of current generations without compromising the capabilities and needs of future generations [5]. Sustainability is the ability of a company to maintain the natural environment and cultural.

5.2.2 Dimensions of Sustainability

There are three sustainability dimensions that are economic, social, and environmental which have come into greater focus in recent years as a result of growing public interest in sustainability [7] and in this research we will focused on the economic

dimension that is relates to economic vitality and diversity within the company. Economic Dimension is required in order to survive in the market by enhancing its financial performance.

5.2.3 Growth in the Economy and Sustainable Development

The interaction of various economic resources is what drives economic activity. The quality and quantity of human and natural resources enable economic growth and comprehensive economic development, which entails significant structural changes in the economy and permits the creation of plans and programs in every area covered by the dimensions of sustainable development. Sustainability accounting standards are essential governance instruments in order to achieve the goals of economic sustainability. It is optional but not required to report on sustainable practices [5].

Through sustainability, a society can develop infinitely, both in terms of its technological aspect and its capacity to ensure rising income levels for future generations. From a strictly classical standpoint, sustainability refers to the maintenance and expansion of economic well-being for the longest amount of time. This well-being is determined by rates of income and consumption, the latter of which includes many necessities for human survival, including clothing, food, housing, transportation, health care, and education, by "discovering and adopting new and better production methods, as well as working to raise production levels by developing human energies and skills. Economic development is defined as "the development of societies" [3]

5.3 The Conceptual Framework of Financial Sustainability

Despite financial sustainability's lack of embeddedness in definitions and measures of economic sustainability, it is possible to explicitly differentiate between various terms [22]. Additionally, accounting theory's "principles of capital maintenance" align with financial sustainability. Many businesses are under pressure to implement sustainable practices because of the many advantages that come with being sustainable. Good capital structure decisions are essential for corporations to become sustainable since they maximize earnings, which in turn makes them sustainable [2].

Microfinance institutions are able to meet all of their operational, financial, and service costs in order to maximize equity market value and accomplish their social objectives. Customers and politicians in developing nations like Pakistan, India, and Bangladesh frequently criticize microfinance institutions (MFIs) for charging exorbitant interest rates in an effort to achieve financial sustainability. All stakeholders have the same primary objective, which is to measure the financial performance of their assets. The majority of earlier research focuses on earnings per share (EPS), return on equity (ROE), return on assets (ROA), and return on sales. Positive correlations between CSR and financial performance are also seen in this research.

Accounting returns and investor returns are the two metrics used to quantify financial sustainability [23].

Accounting practices can enhance financial sustainability when they are used to create value for stakeholders. Because sustainability is so embedded in accounting, the idea of sustainable accounting has grown. Sustainability accounting uses cutting-edge information management and accounting strategies to deliver relevant, high-quality data that supports the long-term, sustainable growth of enterprises. Accounting researchers assert that accounting can be a component of numerous accounting processes, such as accounting techniques for sustainability [24].

5.4 Literature Review and Hypothesis Development

5.4.1 Accounting Income

An entity's net income for any period is the most that can be distributed to its owners during that period while still allowing the entity to have the same net worth at the end of that period as it did at the beginning, after adjusting for the contributions of the owners. In other words, an entity must maintain capital before it can generate income. It should be noted that according to financial accounting theory, capital maintenance refers to financial capital maintenance rather than physical capital maintenance; the distinction between the two is found in how capital is defined. A financial capital method defines capital as the company's net assets, or all assets less all liabilities. A physical capital method measures a firm's productivity, not its financial position. In other words, income only arises from the physical approach if the value of the company's current inventories, along with its property, plant, and equipment, rises throughout the course of the period, after deducting the cost of further purchases made with the help of outside finance [25].

According to the above, we propose the following hypothesis:

H1 There is no impact of accounting income at the level of significance ($a < 0.05$) on economic sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.

H2 There is no impact of accounting income at the level of significance ($a < 0.05$) on financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.

5.4.2 Capital Structure

There are two categories of sources of capital formation: external and domestic sources. For this reason, choosing the best sources of funding is crucial to the health and long-term viability of the business's finances. Selecting a sound and ideal capital structure is crucial since it will influence the expenses that the business will incur.

According to [26] the theories mostly debate the best ways to optimize and balance the capital structure in order to maximize the market value of the company. However, achieving long-term sustainable development is every corporation's primary internal goal. One of the financial elements that affects a company's ability to grow sustainably is its capital structure [27]. Financial sustainability or short-term financial sustainability can indirectly affect long-term financial sustainability.

The capital structure has a big impact on asset returns. The availability and burden of capital are significantly impacted by the capital structure, which in turn impacts the performance of the business [26].

According to the above, we propose the following hypothesis:

H3 *There is no impact of Company's Capital Structure at the level of significance ($a < 0.05$) on economic sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.*

H4 *There is no impact of Company's Capital Structure at the level of significance ($a < 0.05$) on Financial sustainability of Industrial Companies Listed on the Palestine & Amman's Stock Exchange.*

According to [28] inclusion of company's age and size, can impact company's decision in economic sustainability. Research has shown that corporate characteristics affect how sustainability is implemented and disclosed. Considers size to be a risk factor, [29] note that larger companies (in terms of total assets) are more knowledgeable about risk management and are more diversified. Larger businesses typically reveal more information than smaller ones. Big, profitable businesses may afford to pay extra for sustainability reporting or the fullest transparency of financial accounts. The difference in capital structures between industrial companies listed on the ASE and PEX stock markets also should be measured against the impact of the accounting income and the capital structure on both financial and economic sustainability.

6 Methodology and Procedures

The current study aims to determine the impact of accounting income & Capital Structure on the economic and financial sustainability of industrial companies listed on the Palestine & Amman's Stock Exchange.

6.1 Population and Sample

The research population and sample consists of all industrial companies listed on Palestine and.

Amman's Stock Exchange. Data was collected over the period (2017–2022) (Table 1).

Table 1 Study population and sample

Name of the exchange	Companies	Percentage (%)
PEX	11	25
ASE	33	75
Total	44	100

6.2 Data Collection

The data primarily comes from the annual financial reports of industrial companies and from the disclosures issued for the period (2017–2022) and published on the websites. In addition to consulting academic publications on the topic, whether they be from Palestine & Amman (Table 2).

6.3 Variables

6.3.1 Models:

Model 1: Economic sustainability $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

a0: represent Intercept;

β1-6 represents regression coefficient; AI: Accounting Income; CS: Capital Structure; FAGE: Firm Age; FSIZ: Firm Size; ε; error term.

So the multiple regression equation are:

Tax (spending to the government) $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

Line of production $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

Training courses $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

Women's existence $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

Capital structure has a crucial effect on the financial sustainability of companies. To examine the link between capital structure and the financial sustainability of the entities studied more extensively, a model encompassing seven distinct variables was established for estimation. In the model, financial sustainability was the criterion variable represented by return on equity (ROE) [37]. In contrast, the debt ratio (DR) and the debt-to-equity ratio (DE) were the surrogates of capital structure. Because of the consequences of omitted variable bias, the study controlled for firm size (SIZE) firm Age (AGE). The model formulated to study the nexus within the series was specified as follows:

Model 2: ROE $= a0 + 1AI + \beta 2CS + \beta 3FAGE + \beta 4FSIZ + \varepsilon$.

a0: represent Intercept; β1-6 represents regression coefficient; AI: Accounting Income; CS: Capital Structure; FAGE: Firm Age; FSIZ: Firm Size; ε; error term.

Table 2 Variables structure

The variable	Accounting income (AI)	Capital structure (CS)	Economic sustainability	Financial sustainability	Size of the company (FSIZ)	Age of the company (FAGE)
Variable type	Independent	Independent	Dependent	Dependent	Control	Control
Definition	An increase in economic benefits during the accounting cycle in the form of income flows or an increase in assets that results in an increase in property rights other than those associated with the contributions of equity holders [30]	The amount of money, or capital that finances a business's operations, assets, and support. Additionally, it can display capital expenditures and business acquisitions that may have an impact on the company's profitability [31]	Propose an equitable distribution and efficient allocation of resources and the business should be profitable [25]	Is the process by which a business manages its finances to ensure that its present financial success does not jeopardize its prospects for future financial success, including the success of future generations? Since businesses must turn a profit in order to remain in business, the majority of them see the financial pillar as their foundation for success	Natural logarithm of total assets [32]	The variable is usually referred to as a control variable; it is rarely used as an explanatory one [33] the number of years of incorporation of the company [34]

(continued)

Table 2 (continued)

The variable	Accounting income (AI)	Capital structure (CS)	Economic sustainability	Financial sustainability	Size of the company (FSIZ)	Age of the company (FAGE)
Measurement	Reported income in the financial statements	Capital Structure = Cost of debt / cost of equity [24]	Economic indicators: • Government tax: tax and fees payed to the government • Diversification: diversification of production given by the number and relative importance of products and services sold business diversification is measured by [35] the number of production lines • Training courses: the availability of training courses, 1 for the availability, 0 if no training courses introduced • Women Employment existence, existence of employment = 1, unemployment = 0	(Net Income/Average Shareholders' Equity) * 100	Natural Logarithm of total assets [29]	No of years since incorporation [36]

7 Results and Findings

7.1 Correlation and Multicollinearity Analysis, Palestinian Firms

The correlation matrix indicates that any value in the matrix not exceeds 80% between the independent, so there is no probability of multicollinearity effects signs between the independent variables. The values mostly indicate that a positive correlation between the accounting income and annual tax, training course, women's existence, and ROE. Whereas negative correlation with lines of production. The results also indicate that a negative correlation between capital structure and annual tax, training course, women's existence. Whereas positive correlation with lines of production and ROE (Table 3).

7.2 Correlation and Multicollinearity Analysis, Jordanian Firms:

The correlation matrix indicates that any value in the matrix not exceeds 80% between the independent, so there is no probability of multicollinearity effects signs between the independent variables, also the result supports the regression results that all VIF less than 5. The values mostly indicate that a positive correlation between the accounting income and annual tax, women's existence, production lines, and ROE. The results also indicate that a negative correlation between capital structure and annual tax, line of production, and ROE. Whereas positive correlation with women existence. Correlation of training courses was not performed as the variable is constant (Table 4).

7.3 Economic Sustainability

The economic sustainability with its four measured components tested against the impact of the accounting income and the capital structure.

- **Government Spending (Tax and Fees)**: for the Palestinian firm's net income and the capital structure have a significant impact, positive for net income and negative for the capital structure. 0.394 of coefficient of determination which means that 39.4% of the variation of the Government Spending (Tax & Fees) due to the independent and control variables. For the Jordanian firm's net income only with a significant positive impact, positive for net income and negative for the capital structure. 0.868 of coefficient of determination which means that 86.8% of the

**Correlation is significant at the 0.01 level (2-tailed)

*Correlation is significant at the 0.05 level (2-tailed)

[a]Cannot be computed because at least one of the variables is constant

variation of the Government Spending (Tax & Fees) due to the independent and control variables which is higher of the Palestinian firm's model.

- **Line of production**: for the Palestinian the capital structure with negative significant impact. 0.149 of coefficient of determination which means that 14.9% of the variation of the line of production due to the independent and control variables. For the Jordanian firms none of the independent variable have significant positive or negative impact. 0.104 of coefficient of determination which means that 10.4% of the variation of the line of production due to the independent and control variables which is less of the Palestinian firm's model

Training courses: for the Palestinian firms both of the net income and the capital structure have a significant negative impact. 0.677 of coefficient of determination which means that 67.7% of the variation of the training courses due to the independent and control variables. For the Jordanian firms the model will not performed because the variable (Training courses is constant).

Women existence: for the Palestinian firms both of the net income and the capital structure have a significant negative impact. 0.677 of coefficient of determination which means that 67.7% of the variation of the training courses due to the independent and control variables. For the Jordanian both of the net income and the capital structure have no significant impact. 0.218 of coefficient of determination which means that 21.8% of the variation of the training courses due to the independent and control variables which is less the Palestinian firms (Table 5).

7.4 Financial Sustainability

The financial sustainability measured by ROE tested against the impact of the accounting income and the capital structure. For both the Palestinian and the Jordanian firms, the net income has a positive significant impact on the financial sustainability measured by ROE. This because that the net income of one of the determinant of the ROE (Table 6).

8 Conclusions

For the Palestinian firms, the significant impact of the net income on the economic sustainability elements was positive for government spending, and negative for training courses and women existence, the high correlation between net income and the tax amounts is the cause of the positive impact. Whereas the capital structure has a significant negative impact on all the economic sustainability elements which is due to the amount of debts to equity in the capital structure.

For the Jordanian firms, only positive significant impact of the net income on the economic sustainability of the government spending, and negative for training courses and women existence, the high correlation between net income and the tax amounts is the cause of the positive impact. Whereas the capital structure has no significant negative impact on all the economic sustainability elements which is due to the amount of debts to equity in the capital structure.

So, in both cases the net income is the determinant of the economic sustainability of the firms, highly correlated with the governmental tax amounts.

Accordingly, in both of the economic and financial sustainability be determined by the impact of the net income as the profitable firms will pay a lot for tax, internal development for its production lines, and develop its training courses to enhance its employee's skills for both men and women.

9 Recommendations

- Analyzing the relationship between economic expansion and sustainability. Indices of consumption, unemployment, and gross domestic product can be used for future research.
- Assessing the cost of sustainability: The objective of this study may be to ascertain the total cost of implementing sustainable practices in the economy or in specific industries. Examples of the kinds of analyses that could be included in the assessment include a cost analysis of switching to renewable energy sources, a cost analysis of recycling and waste management, and an analysis of the projected financial rewards from long-term sustainability.
- Evaluating the financial returns from sustainable investments: Analyzing the financial returns from sustainable investments in companies and projects. Two instances of analysis include comparing the financial returns of sustainable investments with those of conventional investments and evaluating the performance of sustainable businesses relative to non-sustainable firms.

The Mechanism of Issuing Bonds and Financial Certificates and the Parties Involved in the Process

Ahmad Habes Theyab AL-Mjali

Abstract The primary objective of this study is to examine the concept of bonds or financial certificates, the process of issuing it, and the various entities involved in the securitization process. The findings shed light on the concept itself and underscored the significance of a robust regulatory framework that facilitates bonds or financial certificates issuance. It is crucial to note that legal and regulatory systems play a pivotal role in ensuring transparency and safeguarding the rights of all parties involved. In conclusion, the securitization process encompasses several key participants who assume vital responsibilities in the issuance of bonds or financial certificates. These participants include the organizer or issuer, who determines the terms and initiates the bonds or financial certificates issuance, the investors who acquire these bonds or financial certificates, and the law advisors who ensure compliance with the law concerned. Furthermore, there are additional parties such as agents and fund managers, who oversee bonds or financial certificates investments on behalf of investors, and underwriters, who guarantee subscription coverage in the event of insufficient demand from investors.

Keywords Bonds or financial certificates · Issuance mechanism · Securitization parties · Jordan

1 Introduction

Jordan, classified as a developing nation, faces prevalent economic challenges such as poverty, unemployment, and limited resources. It is widely recognized that the expansion of a country's economy hinges primarily on augmenting production, which

A. M. A. Musleh Al-Sartawi et al. (eds.), *Business Resilience and Business Innovation for Sustainability*, Studies in Systems, Decision and Control 587,
https://doi.org/10.1007/978-3-031-87584-7_35

is contingent upon two key factors: labor and capital. However, the acquisition of capital through the financing process poses a significant impediment to the production process.

The utilization of securitization as a financial tool in conventional economies involved the conversion of loans, which are considered illiquid assets, into bonds that could be subscribed to by a specialized company in order to acquire liquid cash assets. In the realm of Islamic finance, the concept of Sukuk emerged through various studies, notably Hamoud's examination of Muqarada bonds presented to the Islamic Fiqh Academy. Building upon this research, Abbadi and others creatively applied the principles of Muqarada bonds, resulting in the establishment of innovative guidelines based on contemporary jurisprudential efforts. As a result, the Provisional Law on Muqarada Bonds No. 10 of 1981 was issued, signifying the early adoption of this idea in Jordan. The Ministry of Awqaf and Islamic Affairs formed specialized scientific committees to thoroughly study this concept. Additionally, cooperation between the Islamic Research and Training Institute of the Islamic Development Bank and the International Islamic Fiqh Academy led to the issuance of a resolution pertaining to Muqarada and investment bonds (Provisional Law on Muqarada Bonds No. 10, 1981 [13]).

Islamic Sukuk are widely regarded as the most optimal Sharia-compliant method for acquiring financing at minimal expenses, particularly in the context of nations necessitating extensive funding for infrastructure, industrial, and agricultural ventures. Should these nations opt for borrowing, they would bear the additional weight of debt costs. Additionally, lending institutions impose certain conditions that may have political ramifications, potentially encroaching upon a country's sovereignty.

The rapid expansion of Islamic banking instruments has been acknowledged by the International Monetary Fund (IMF), as these products have gained significant traction among a diverse investor base, encompassing both governmental entities and private enterprises. Numerous countries, both in the Arab region and the Western world, are actively pursuing the issuance of Islamic Sukuk as a means to fund crucial developmental and infrastructure initiatives, invigorate financial markets, and address budgetary shortfalls.

1.1 Study Problem

Islamic Sukuk represents a contemporary financial instrument that harmonizes the principles of Islamic Sharia with the demands of modern economics. Given the escalating worldwide interest in Islamic finance, it becomes imperative to delve into the intricate workings of issuing Islamic Sukuk, as well as the obstacles and prospects associated with them. The process of issuing Islamic Sukuk encounters multifaceted hurdles encompassing legal, regulatory, and operational dimensions. Notably, there are challenges in upholding compliance with Islamic Sharia principles,

while simultaneously ensuring transparency and efficacy throughout the issuance procedure.

Considering Jordan's limited exposure to Islamic Sukuk, the present study aims to elucidate the procedure of issuing Islamic Sukuk and the entities engaged in the securitization process. Additionally, it will address the obstacles hindering the expansion of Islamic Sukuk issuance in Jordan, with the ultimate objective of formulating pertinent recommendations grounded in the study's outcomes.

The study aims to answer the following questions:

- What are Islamic Sukuk?
- What is the mechanism for issuing Islamic Sukuk?
- Who are the parties involved in the securitization process?

1.2 Study Significance

The significance of this research resides in its ability to enrich both scholarly and practical comprehension by offering a more profound understanding of Islamic Sukuk instruments and their issuance mechanism. This, in turn, contributes to the advancement of academic and practical approaches within this domain. Furthermore, the study endeavors to make practical contributions that aid in the enhancement of the efficacy of Islamic Sukuk as a financing instrument that conforms to the principles of Islamic Sharia, thereby bolstering and fostering the growth of the Islamic economy.

The objective of this study is to offer feasible resolutions and suggestions to assist relevant stakeholders in surmounting the obstacles encountered in the issuance of Islamic Sukuk. By doing so, it aims to streamline procedures, enhance transparency, and optimize efficiency. The findings of this study have the potential to inform the formulation of policies and regulatory frameworks pertaining to the issuance of Islamic Sukuk, thereby fostering an improved legislative and regulatory landscape within this sector.

1.3 Study Methodology

In order to define the concept of Islamic Sukuk and emphasize their issuance mechanism, the researcher employed the descriptive method, drawing upon previous studies on the subject matter. These studies encompassed research presented at conferences and seminars, as well as theses and dissertations examined within academic institutions.

The research is structured to explore the mechanism of issuing Islamic Sukuk and the parties involved in the securitization process:

- Definition of Islamic Sukuk.
- Mechanism of issuing Islamic Sukuk.
- Parties involved in the securitization process.

2 Definition of Islamic Sukuk

2.1 Linguistic Definition

The Arabic original linguistic meaning of the term "Sukuk" (singular: "sakk") entails a forceful and intense convergence of two entities, with its plural form being "Sukuk." Additionally, the term carries the connotation of "striking," as exemplified in a verse from the Quran which states, "So his wife approached with a cry [and struck her face] and said, '[I am] a barren old woman'" (Quran 51:29). The term "sakk" has been adopted from its Persian origin "chak," where it referred to written provisions and grants known as "chakak," signifying a document that acknowledges monetary transactions or rights of ownership [12].

2.2 Terminological Definition

Imam al-Nawawi provides an explanation of the term "Sukuk," stating that it is derived from the word "sakk" which refers to a written document of debt. Additionally, it can also denote a document issued by a ruler that specifies the quantity of food or provisions that an individual is permitted to sell prior to receiving them [1]. Hamoud [11], on the other hand, defines Sukuk as standardized-value documents that are issued in the names of subscribers who have made payment for their value. These documents are based on the participation in the profits and revenues generated from the invested project, with predetermined ratios. Furthermore, there is a gradual and systematic repayment of the subscribed principal until it is fully repaid.

According to the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI), Sukuk are defined as certificates of equal value that represent undivided shares in the ownership of tangible assets, usufructs, or services. They can also represent ownership in assets of specific projects or investment activities. The AAOIFI further explains that Sukuk are issued after the receipt of funds, the closing of subscriptions, and the commencement of fund utilization for the intended purpose [2].

The International Islamic Fiqh Academy puts forward its own understanding of "Islamic securitization (taskeek)" as the issuance of financial certificates or papers of equal value. Such certificates stand for ordinary shares in ownership of present tangible or usufruct assets or assets to be created from the surpluses of subscription. The Academy emphasizes that these certificates are issued in accordance with Sharia-compliant contracts and adhere to Sharia rules [15].

It is important to note that the Academy distinguishes between traditional securitization and Islamic securitization. The conventional securitization refers to transforming debts into bonds with equal value, which is essentially interest-based debt. This process is deemed as impermissible according to Sharia [9].

The Islamic Finance Sukuk Law in Jordan describes Islamic finance Sukuk as documents of equal value that represent shared ownership in a project. These documents are issued in the names of their owners to provide funds for the realization and exploitation of the project with an aim of achieving returns that comply with Islamic Sharia principles and rules. The Sukuk period is defined in the prospectus document exchange at issuance. This law was enacted in 2012 under No. 30.

The comprehensive and closely aligned definition of Islamic Sukuk provided by the AAOIFI is the foundation upon which this study is based. This definition is particularly valuable due to its alignment with the Jordanian legal definition of Sukuk. According to this definition, Sukuk can be understood as a document that confers upon its holder the right and share in the ownership of a specific project, effectively making the holder a partner in the project with limited profit and loss sharing. It is important to note that Sukuk differ from financial bonds in that they do not represent a debt for the holder.

2.3 Key Points Derived from the Definitions

1. **Equal-Value Documents:** Islamic Sukuk are characterized by their equal-value nature, offering the distinct advantage of facilitating transparency in determining investors' shares and distributing returns.
2. **Common Shares in Ownership:** Sukuk, as financial instruments, embody the collective ownership of either pre-existing or prospective assets, with the subscription proceeds encompassing potential advantages, tangible assets, rights, or a combination thereof.
3. **Participation Basis:** Islamic Sukuk function based on the principle of profit and loss sharing, operating on a participatory basis. These Sukuk are issued in accordance with different Islamic finance contracts, such as Murabaha, Ijara, and Mudaraba, and strictly adhere to Sharia-compliant contracts and their respective regulations.
4. **Registered Ownership:** According to Islamic Sharia principles, the ownership and transferability of Sukuk lie with the subscribers, who are registered as the rightful holders and possess the authority to exercise control over them.
5. **Non-Tradable Types:** Trading of certain types of Sukuk is not permissible under Sharia, thereby limiting their tradability in the market.

3 The Method of Issuing Islamic Sukuk

The process of issuing Islamic Sukuk is of utmost importance and necessitates careful consideration of various factors outlined in the issuance prospectus, encompassing Sharia compliance, the procedural nature of the issuance, and the provision

of comprehensive information and data to prospective subscribers in order to ensure alignment with all investors.

Islamic securitization can be carried out in one of two ways:

3.1 Direct Method or Simple Securitization

The issuance of Sukuk is utilized as a means to generate funds for a particular investment endeavor, such as projects pertaining to public utilities. This process involves the issuance of Sukuk in accordance with diverse Islamic financing structures within the primary market. The cumulative sum obtained from the subscriptions serves as the capital for the designated project.

3.2 Indirect Method or Private/Structured Securitization

The process entails the issuance of Sukuk in order to transform preexisting projects or assets into readily available funds. This conversion necessitates the transformation of income-generating assets into equivalent units, each representing the value of a Sukuk. Subsequently, these units are made available in the financial market with the aim of generating capital [18].

Although there are similarities in the overall structure and issuance procedures of Sukuk, variations exist as a result of the underlying contract upon which the Sukuk are founded. Consequently, this chapter will provide an overview of the general issuance mechanism of Sukuk, followed by comprehensive explanations of the distinct types of Sukuk discussed in subsequent sections.

The steps for issuing Sukuk can be sequentially outlined as follows:

1. **Collection of Assets to be Securitized**: In order to transform leased assets or diverse forms of loans into Sukuk and subsequently offer them to investors, it is necessary to assemble a collection of various asset types within the securitization portfolio [18].
2. **Preparation of the Issuance Prospectus**: In accordance with Sharia-compliant and legal regulatory standards, it is necessary to prepare an issuance prospectus that provides a comprehensive and thorough overview for potential investors seeking to subscribe and invest in Islamic Sukuk. This prospectus should establish a clear administrative and technical framework for the issuance process, outlining the rights and responsibilities of all relevant parties [7]. The Jordanian legislator has made it clear that the prospectus must contain a number of information including that the issue should adhere to the Islamic Sharia principles in the issuance, the amount of money being raised, whether feasibility studies have been conducted (and what they entail), and reasons for initiating or expanding project. It should also set deadlines for completion plus mention

other regulatory matters connected with subscription procedures and mechanism regarding disputes' resolution, not forgetting rights of Sukuk holders. Also, it must elaborate on methods used in Sukuk extinguishment, details relating to all these aspects are presented in the document called "Issuance Prospectus" as defined under Islamic Finance Sukuk Law No. 30 (2012) [16]. The provision defines this document as containing all data related to conditions and terms of Islamic finance Sukuk issuance.

3. **Establishment of a Special-Purpose Vehicle (SPV)**: One of the suggestions in facilitating Sukuk issuance is by creating a Special-Purpose Vehicle (SPV), wherein the capital of a project, existing or planned, is divided into equal Sukuk units and then sold to Sukuk holders. The SPV, which is initiated by the Sukuk issuer, acts as an independent legal body tasked with ownership of the securitized assets. This was stated in Ben Aldaif's work in 2017. By operating independently from the Sukuk issuer, the SPV ensures the safeguarding of assets owned by the Sukuk holders [6]. According to the Islamic Finance Sukuk Law No. 30 of 2012, the SPV is defined as a company specifically established for the purpose of owning the assets and associated benefits that underpin the issuance of Islamic finance Sukuk. During the period when the issuer's assets are no longer recorded on their books and until the issuance of financial documents related to these assets, it is necessary for these assets to be held by an independent legal entity known as the custodian. This entails the establishment of a company without a direct owner, which serves the purpose of owning the assets and issuing financial documents based on them. The duration of this company's existence is directly linked to the maturity of the aforementioned financial documents. The Special-Purpose Vehicle (SPV) assumes responsibility for safeguarding the interests of investors, ensuring satisfactory returns, and facilitating the recovery of their funds upon maturity [8].
4. **Transfer and Sale of Sukuk**: Upon the transfer of assets to the Special-Purpose Vehicle (SPV) and their subsequent conversion into Sukuk of equivalent value, the SPV proceeds to sell these Sukuk through a subscription process. Investors willingly subscribe to these Sukuk and provide the corresponding cash value to the SPV, which functions as the representative for the Sukuk holders. In return for the paid value, the SPV delivers the Sukuk to the holders and remits the Sukuk value to the issuer [10]
5. **Sharia-Compliant Payment**: When remunerating the issuer for the value of the Sukuk, it is imperative to take into account the specific Sharia format under which the Sukuk were established. For instance, in partnership Sukuk, the issuer assumes the role of a partner and contributes either cash or in-kind, with clearly defined shares allocated to both the Sukuk holders and the partner. In Mudaraba Sukuk, the issuer acts as the mudarib (manager), while the Special-Purpose Vehicle (SPV), acting as an agent for the capital owner, disburses the funds to the mudarib subsequent to the establishment of the Mudaraba agreement with the issuer. In the case of Murabaha Sukuk, once the Sukuk value is collected, the SPV promptly procures the commodity from its supplier and immediately settles

the payment, allowing the buyer (issuer) to acquire the commodity at a predetermined profit margin. As for Ijara Sukuk, upon collection of the Sukuk value, the SPV procures and assumes ownership of the leasing assets, subsequently leasing them out for agreed-upon periodic payments [10].

6. **Ownership and Transfer of Sukuk**: Once Sukuk have been acquired by Sukuk holders, they grant complete ownership of a proportionate stake in tangible assets, enabling holders to divest them and transfer them using legally mandated methods such as sale or mortgage [3].
7. **Management of Sukuk Portfolio**: During the duration of the Sukuk issuance, the SPV undertakes the responsibility of overseeing and managing the Sukuk portfolio on behalf of the investors. It assumes the task of collecting regular returns from the underlying assets and subsequently disbursing them to the investors [6]. On the designated dates for periodic distribution, the SPV allocates the profits, if any, to the Sukuk holders based on their respective participation shares in the project [10].
8. **Sukuk Redemption**: Upon the conclusion of the Sukuk tenure, or upon its redemption on the specified date as outlined in the issuance prospectus, the value of the Sukuk is disbursed. This disbursement can occur either through the allocation of the project to the Sukuk holders or through the liquidation of the project by means of sale, with the proceeds being distributed in accordance with the proportionate share of each holder [18].

The nominal value of Sukuk at the time of redemption may fluctuate, either increasing or decreasing, due to its composition of both the principal and potential profits. The principal represents the nominal value and has the potential to generate capital gains if the market value of the Sukuk increases, in addition to the periodic profits distributed during the issuance period. Consequently, the principal can remain unchanged, appreciate in value through capital gains, or depreciate in case of losses at the end of the specified period. The redemption of Sukuk can be executed through various methods, such as liquidating the project, wherein Sukuk holders receive their rightful shares in proportion to their capital contributions. Another approach involves estimating the project's value through expert evaluation and distributing the calculated results to the Sukuk holders. Alternatively, assets may be transferred to holders at a nominal price, as a gift, or at the remaining value, as seen in Ijara Sukuk with ownership transfer [10].

The process of redemption can also take place through liquidation and a single payment to the holder upon reaching maturity, encompassing the repayment of the Sukuk value and profits. Alternatively, periodic redemption can be implemented by disbursing a return to the Sukuk holders, which is divided into two components: the first component represents profits, while the second component serves for the partial redemption of the Sukuk and the recovery of the principal value [4]

4 Parties Involved in the Sukuk Issuance Process

The issuance of Sukuk, a type of financial instrument compliant with Sharia principles, is based on various Sharia-compliant investment contracts such as sale, Ijarah, Mudarabah, and others. The issuance contract involves two main parties: the issuer of the Sukuk and the subscribers. The nature of their relationship is determined by the specific investment contract and its adherence to Sharia principles. As soon as the contract is concluded, the rights and obligations between the parties come into effect. In terms of offer and acceptance, there are three perspectives. The first perspective considers the issuance prospectus as the offer, and the acceptance occurs when subscribers subscribe to the Sukuk and pay its value. The second perspective, supported by the Islamic Fiqh Academy, views the offer as the act of subscribing to the Sukuk, and the acceptance is the approval of the issuing entity to allocate the Sukuk to the subscribers. The issuance prospectus in this perspective serves as an announcement that provides information about the contract terms and conditions. The third perspective, outlined by the Accounting and Auditing Organization for Islamic Financial Institutions (AAOIFI), regards the issuance prospectus as an invitation to subscribers. The offer is represented by the subscription to the Sukuk, and the acceptance occurs when the issuing entity approves the allocation of the Sukuk. (International Islamic Fiqh Academy, Decision 5, Fourth Conference—Jeddah, 1988 [6, 14]).

The main parties involved in the issuance of Islamic Sukuk are:

1. **Sukuk Issuer**: The entity in question is responsible for soliciting funds and allocating the generated revenue towards activities that adhere to Sharia principles. The issuer of these funds can encompass various entities, such as governmental bodies, private corporations, financial institutions, or even individuals [10].
2. **Special-Purpose Vehicle (SPV)**: Typically, the role of this particular entity involves acting as an intermediary for the Sukuk issuer, acquiring the assets that are to be included in the Sukuk issuance through a structured securitization process. Alternatively, it may serve as an agent for the Sukuk issuer in a more straightforward securitization arrangement, governed by an investment agency contract [3].
3. **Sukuk Holders**: The individuals or entities referred to as investors or capital owners are the ones who acquire Sukuk through the process of subscription. By doing so, they obtain financial documents that serve as evidence of their shared ownership in the project, entitling them to a proportionate share of its profits and losses based on their respective ownership stakes. These Sukuk holders can encompass a wide range of entities, including government bodies, banks, individuals, and financially robust institutions seeking to optimize their surplus liquidity and attain comparatively lucrative returns [17].
4. **Sukuk Manager**: The entity responsible for representing the Sukuk holders and overseeing the assets owned by them is commonly referred to as the Sukuk manager. In many cases, a Special-Purpose Vehicle (SPV) is appointed to carry out the securitization procedures on behalf of the Sukuk holders, in exchange

for a predetermined commission or fee as outlined in the issuance prospectus. The relationship between the Sukuk manager and the Sukuk holders is typically governed by an agency contract, wherein the manager acts as an agent for a specified fee [5]. Sukuk can be managed through various structures such as Mudarabah, partnership, or agency, with a designated Mudarib, manager, or agent overseeing the management process [6].

5. **Issuance Agent**: The intermediary institution, acting as a representative for both the issuer and the Sukuk holders, assumes responsibility for carrying out all necessary procedures related to the issuance and management of the Sukuk. These procedures encompass tasks such as organizing the issuance prospectus, registering it, listing it for trading, settling it, and ultimately ensuring its termination at the conclusion of the agreed term, all in exchange for a predetermined fee as stipulated in the issuance prospectus [17].
6. **Issuance Trustee**: The oversight of the issuance manager and the preservation of Sukuk holders' rights are delegated to this middleman entity. Furthermore, it takes charge of safekeeping important documents and assurances with a fee detailed in the issuance prospectus, collected as per an agency agreement [10].
7. **Investment Manager**: The actor who undertakes the investment actions is the one named by the party issuing the Sukuk according to the issuance prospectus [17].
8. **Sharia Supervisory Board**: Their main role is Sharia compliance oversight in Sukuk. It covers looking at the Sukuk's structure, documents and contracts; relationships through Sukuk's trade and termination procedures. All activities and operations related to the project must be presented to the Sharia Supervisory Board for their evaluation and determination of Sharia compliance [10]. Additionally, the board establishes the Sharia standards that govern the securitization process and may require an independent entity to monitor the issuer and investment manager's adherence to these standards [3]. The appeal of Islamic financial transactions lies in the participants' genuine desire to ensure that their financial dealings align with Sharia principles and avoid usurious transactions. Consequently, the presence of a specialized Sharia board becomes imperative to provide authoritative opinions and fatwas on all investment activities, thereby instilling confidence among existing investors and attracting new investments.
9. **Global Rating Agencies**: In the process of securitization, specialized agencies hold the responsibility of evaluating the credit and financial rating of Sukuk. This assessment serves to determine the creditworthiness and financial stability of the Sukuk that will be issued, including any associated guarantees and risks, as well as establishing their fair price. Certain regulations governing securitization mandate the acquisition of a credit rating certificate for the asset being securitized. Notable examples of these agencies include the Islamic International Rating Agency (IIRA) in Bahrain, Standard & Poor's, and the Malaysian Rating Agency (RAM) [17].

The expertise of credit rating agencies is of utmost importance in facilitating the securitization process [8]:

- They verify the credit quality of the securitized asset, which significantly affects the income generated by Sukuk holders.
- They help the issuer sell Sukuk at the right price.
- They clarify the borrower's ability to repay, reducing investment risk.
- Investors trust their assessment of the credit quality of the security because they are completely independent institutions with no direct interest in investing or issuing securities.

5 Study Results

The findings of the study pertaining to the mechanism of issuing Islamic Sukuk and the entities engaged in the securitization process unveil various facets that have a direct influence on the efficacy of these financial instruments. Primarily, it was observed that the formulation of Sukuk is predominantly dependent on Sharia-approved contracts, including Murabaha, Ijarah, and Mudarabah contracts. These contracts guarantee the adherence of Sukuk to the principles of Islamic Sharia, consequently enhancing their attractiveness to investors in search of Sharia-compliant investment opportunities.

Furthermore, it was determined by the research that the process of securitization encompasses various essential stakeholders who perform crucial functions in the issuance of Sukuk. These stakeholders include the regulator or issuing entity responsible for establishing the terms and issuing the Sukuk, the investors who acquire the Sukuk, and the Sharia advisors who ensure the Sukuk's adherence to Sharia principles. Furthermore, there exist other related parties like agents and fund managers, taking care of Sukuk investments' management on behalf of investors, along with underwriters who ensure subscription coverage by pledging a guarantee in situations where demand from investors is insufficient.

The study results pointed out the importance of a strong regulatory environment in Sukuk issuance. Having an operational legal and regulatory system that would ensure transparency, as well as the protection of the interests of all parties involved, is highly necessary. Moreover, a clearly outlined regulatory framework is able to instill confidence among investors (to be noted from their side) and establish trust with issuers on a reciprocal basis, thus acting for long-term sustainability of Islamic Sukuk market through positive business environment. As these intertwined elements play their respective roles, it leads towards building a dynamic marketplace. This is not just for Sukuk but Islamic Finance in totality which can meet varying financial needs from different economies with diverse dimensions effectively.

5.1 Recommendations

Based on the findings, the researcher recommends the following:

- The advice is to start awareness and educational campaigns for the purpose of increasing the level of information available to the Islamic Sukuk investors and financing institutions about the issues, benefits, and procedures related to Islamic Sukuk. The programs might involve workshops or training courses as well as e-learning platforms.
- It is recommended to perform periodic reviews on Jordan's legislative and regulatory framework governing Islamic Sukuk, ensuring that they facilitate clarity of regulations through Sharia compliance. Also, simplifying administrative processes like removing duplications and enhancing coordination among regulators in support of such initiatives is recommended as well.
- Joint committees or regular meetings are suggested to be formed between the parties in the securitization process – government, financial institutions, regulators and Shariah advisors. These committees can help improve coordination, exchange experiences and resolve issues that may arise during the Sukuk issuance process.

The Effect of E-Performance Evaluation on Talent Management: A Conceptual Model

Hanady Al-Zagheer, Qais Kilani, Qais Hammouri, and Ayad Fadhil Altememi

Abstract Electronic management is considered one of the products of the knowledge economy, which came as an inevitable necessity to keep pace with the various types of developments that the institution has known, as its application has a significant impact on the institution's performance. The survival and continuation of the institution in an era of revolution in the world of information and communications technology have become linked to the extent to which the institution applies the elements of electronic management and what Because human resources are considered the basic pillar of an organization, measuring the impact of using electronic human resources management on job performance was the subject of this study. By relying on presenting a proposed model that helps understand the importance of using e-performance evaluation in talent management.

Keywords E-performance · Evaluation · Talent management · Human resource management

1 Introduction

Simply having a Human Resources department does not equate to effective talent management. A tailored talent management strategy that aligns with your company's specific needs is essential to achieve the best outcomes. Talent management's employee-centric approach maximizes the potential value of your workforce. By hiring and nurturing skilled employees, your organization becomes more robust and resilient, better equipped to adapt to changes and navigate potential risks. Additionally, employees with advanced skills are better equipped to leverage new technologies, solve problems creatively, and innovate. This investment in human capital can

thus be a significant driver of your company's success [1]. However, this paper will explore the impact of digital performance appraisals on managing talent. Performance appraisal is the evaluation process that assesses how effectively individuals meet their job roles and contribute to achieving organizational goals. It encompasses a method of measurement, an observation and judgment exercise, and a mechanism for providing feedback. Performance arises from the interplay of an individual's motivation and capabilities, along with contextual elements that can either enhance or hinder employee performance potential [2]. Implementing talent management can present difficulties, such as dealing with supervisors who lack the inclination to support their staff, employees who do not show initiative, and those who are ill-suited for their roles within the company [3, 4].

Attracting and retaining employees is not a task that should fall exclusively on the shoulders of the human resources department; rather, it is a responsibility that should be integrated across all levels of the organization. It is crucial for line managers to take an active role in nurturing the skills of their immediate reports as it aligns with business strategy. To facilitate a comprehensive understanding of the organization's broader objectives, there should be a culture of transparency where different sections within the company freely exchange information among themselves [5]. In understanding organizational performance, professionals are required to establish a well-defined rationale for comprehending the essence of performance and the criteria that will be utilized for its evaluation. When determining the meaning of performance, managers must take into account all stakeholders involved, the level of environmental uncertainty, available resources, strategic choices made by the organization, and temporal factors [6].

While the concept of organizational performance is broad, comprehending its definition through components like financial outcomes, market position, shareholder returns, and sustainability can assist a professional in selecting the appropriate mix of indicators for measurement. Different indicators are employed at multiple levels to gauge the success of an organization [7, 8]. In the ever-evolving business landscape, traditional resources such as fixed assets, land, and capital are no longer the sole factors for creating a long-term competitive advantage and enhancing company performance. Instead, the workforce, or organizational capital, has become the most vital asset. The array of talents and capabilities that employees bring to a company have led them to be regarded as the fundamental resource of production and are often termed as the firm's human resources [9].

Current trends highlight human resources as a company's most critical asset, recognizing employees as the organization's pool of talent and giving rise to the concept of talent management. Talent management is a strategic approach to identifying, acquiring, fostering, retaining, and rewarding capable individuals. This approach can endow organizations with the intelligence, adaptability, and competence required to surpass competitors. By concentrating on attracting, cultivating, and keeping talented staff and channeling their collective efforts, a firm can strengthen its bundle of resources. Furthermore, since exceptional talent constitutes an intangible resource with depth and diversity that cannot be easily copied or replicated by rivals, it solidifies business success and creates a sustainable competitive advantage.

Organizations are thus advised to hire, develop, and maintain remarkable employees who are instrumental in achieving these advantageous outcomes [10]. TM is closely related to performance appraisal as a tool for the development of the organization, as the high levels of employee evaluation are mainly due to the management of special talents in the management of the organization and its methods of investing human capital, which is an internal factor in the organization where it can be controlled in contrast to external factors that prove the extent The presence of TM and the organization's maintenance of high levels of evaluation (distinguished employees).

2 Literature Review

2.1 E-Performance Evaluation

The electronic performance management system is a critical tool utilized by human resources departments across organizational hierarchies—from top-level executives to entry-level employees on production lines. It serves as an efficient mechanism for administrative oversight, allowing for the comparison of employees' actual performance against predefined goals and objectives. This system encourages departments to function with vigor and motivation due to the ongoing assessment of employee performance by their managers. It also drives employees to excel in their roles and be seen as productive by their superiors, as it is often linked to performance-related rewards such as incentives and bonuses. To ensure the effectiveness of this process and achieve its intended outcomes, a methodical and precise approach is necessary, along with the involvement of all stakeholders who stand to benefit from the insights gained through the evaluation process [11].

Electronic performance evaluation is a pivotal process for defining an individual's work proficiency and establishing plans for performance enhancement across various instances. When properly implemented, performance appraisals not only reflect an employee's current performance standards but can also influence their dedication and the trajectory for upcoming tasks. Furthermore, such evaluations play a supportive role in appropriately channeling efforts towards performance improvement, ensuring that employees have a clear understanding of their strengths and areas needing development. E-performance evaluation refers to the digital administrative procedure used to assess the effectiveness of employees and the degree to which they contribute to their assigned tasks. This process involves evaluating worker behaviors and actions during their job duties and measuring the progress they make over time.

There are many best practices in developing and evaluating E-performance, including defining and updating clear, achievable, tangible, and measurable goals. Improving communication and cooperation between management and employees [12]. Evaluate performance regularly and transparently using standard tools and indicators. Providing training and development to employees through workshops and training courses to improve their skills and enhance their performance. Promoting

positive interaction and appreciation of achievements through appreciation and performance evaluation based on employee positivity. Encouraging employees to be creative and finding solutions to improve the production process. Providing a clear path plan for employees and directing appropriate treatment to develop their skills and services. Listen to employee complaints and observations and deal with them professionally and fairly [13].

2.2 Talent Management

In today's business world, firms across all industries rely on various forms of artificial intelligence. AI is widely recognized by both academics and practitioners. Given the rapid technological advancement that has linked the entire planet into a single network, businesses will be guided by the technologies of the future [14]. However, it should be mentioned that gaining a competitive edge is not just about knowing the client and what he wants; it's also about making solutions that meet those wants and needs so that the customer is happy and loyal to the business [12].

Talent management is the competency of an organization to attract, keep, and develop exceptionally skilled workers from the job market. It has been demonstrated that talent has a positive impact on several vital economic indicators, such as revenue, customer contentment, quality, productivity, costs, process duration, and market value. Effective talent management involves leveraging employees' skills, knowledge, cognitive abilities, and potential for high performance. This capability is essential for individuals in the job market to develop.

While it is feasible to identify gifted individuals, the real test lies in ensuring their long-term commitment to the organization. Top talent, due to their high proficiency and performance level, are in demand, and companies aim to retain them for extended periods. Nonetheless, these highly skilled individuals may either be content in their current roles or could be on the lookout for more advantageous opportunities elsewhere [15].

2.3 Talent Management and Competitive Advantage

Human capital is universally recognized as the bedrock of competitive advantage in businesses around the globe. Personnel are invaluable to a company, as they are responsible for conducting research, devising strategies, designing projects, and creating distinctiveness in the market. Indeed, the workforce is the singular authentic asset within any enterprise, driving growth, seizing market opportunities, enhancing organizational capacity to fulfill ambitions, and mitigating prospective challenges in the corporate world. Understanding the role of human resources is pivotal in acknowledging its status as a core element in establishing a competitive edge.

"Competitive" in this scenario pertains to an organization's proficiency in capturing a greater market segment within their respective industry. Achieving such an advantage through human capital is a complex endeavor, necessitating not only the attraction of skilled individuals but also investing in their professional growth and talent development [9].

2.4 Effect Talent Management on Organizational Performance

The impact of Talent Management on organizational performance is often influenced by the level of investment in Human Resource Management. The effectiveness of TM can vary based on factors like the prevailing organizational culture and the HRM strategies in place. For instance, the relationship between TM practices and organizational outcomes might differ significantly in an environment where a select few top talents are prioritized and given exclusive benefits without supportive measures for the broader workforce, compared to a setting where resources and opportunities are more uniformly distributed among employees [16, 17].

A key driver of organizational innovation is the ability to both generate and actualize novel ideas. For this innovation to occur, it's essential to facilitate the transfer of knowledge from individuals to groups, allowing for the creation of new and combinatorial knowledge pools. Human capital elements such as knowledge, expertise, and competencies are extremely valuable assets. Consequently, the generation of fresh knowledge and the fostering of innovation are vital for a company's competitive edge and longevity [14].

3 The Proposed Model Dimensions

3.1 Talent Term

Talents imply people as individual and are today characterized as vital for a company's sustainable competitive advantage and maximizing organizational performance. A talent is typically said to be difficult to copy, imitate and to substitute. In the workplace, the concept of talent generally refers to individuals who possess innate skills that are above average, allowing them to perform at a higher level than their peers. It can also be used to identify a collective of employees and potential hires who demonstrate exceptional performance and high caliber in their roles [18, 19]. Securing talent that consistently exceeds expectations is central to organizational success. Essential traits to identify in potential hires include individual self-motivation manifesting as pride and autonomy in work, the ability to enhance team dynamics with excellent communication skills, a results-driven mindset with

a penchant for achieving goals, innate leadership that garners trust and encourages colleagues, and creative thinking that propels innovative problem-solving and workplace efficiency [20].

3.2 Evaluation

Evaluation is a crucial tool for better management. The efficiency of an organization is measured in terms of its functioning, problems, and successes through organizational assessment, also known as evaluation, from both the behavioral and social system perspectives [21]. "Measurement of factors relevant to patterns of organizational behavior and effectiveness" is what organizational assessment entails. It can help managers enhance their operations' efficiency and effectiveness and build public backing for research programs and outreach activities [22].

3.3 Competencies

The abilities necessary for an organization to thrive and maintain market competitiveness are known as organizational competencies. They consist of expected behaviors, skills, and attitudes that contribute to efficient organizational performance and are heavily dependent on the capabilities of the organization's workforce. Competencies encompass the combination of knowledge, skills, innate abilities, and observable actions that are key to personal and organizational achievement. Knowledge is the understanding acquired through learning, experiences, or research. Skills are developed through consistent application of this knowledge or expertise. Talent refers to the natural aptitude for performing certain mental and physical activities. Behavior is the action an individual displays in response to specific situations. The required proficiency level of each competency differs based on the role of the person and the objectives set forth by the organization [23].

3.4 Talent Marketplace

People are matched to opportunities and potential employment in a talent marketplace based on their talents, interests, and preferences. It can also connect employees with on-the-job learning opportunities that will allow them to gain new skills or practice those they already have. An ideal talent marketplace evaluates the whole person, including their skills and competencies, but also looks at things like interests, work styles, and learning preferences, among other things. The marketplace expands people's knowledge beyond their abilities to what they want to do and how they like to do it. A talent marketplace allows people to grow and thrive while

also providing employers with the information they need to future-proof their staff [24]. Today's Talent Marketplace resembles a "career management" system in that it allows people to promote their skills and aspirations, provides tools for finding mentors and learning, suggests projects and assignments of interest, and manages the search, hiring, onboarding, and movement of people from role to role. As a platform, the talent marketplace is the future of "Talent Management." This system manage absorbs everything we do to manage people.

4 Discussion

Human resources are at the heart of an economic entity's effectiveness and is pivotal for achieving and excelling at organizational goals. It carries significant weight in shaping organizational strategy and endeavors by providing agility, innovative capability, and proactiveness. Consequently, it stands as the dynamo that propels the institution forward. Consequently, human resource management plays a critical role in the synchronization of individual competencies with job requirements, which is vital for overall organizational functioning.

The congruence between employee abilities and their respective roles substantially influences their performance levels, job satisfaction, and related aspects of human resource management. Central to this management domain is the focus on selecting and educating staff, alongside the significant and intricate task of performance appraisal. The performance of team members within an organization is dynamic, necessitating that management constantly monitors, assesses, and refines it. This ensures the enhancement of strengths and the timely rectification of weaknesses.

Therefore, organizations are advised to use electronic evaluation because of its benefits, the most important of which are works to develop administrative procedures and processes in accordance with management objectives. Getting rid of bureaucracy in electronic administrative work and supporting Transitioning to decentralized management by further developing the entity's organizational structure the effectiveness and efficiency of the organization. Involving employees in the decision-making process in their field of work through electronic systems and stimulating the spirit of creativity and self-development among them. Aligning electronic performance systems operations with actual business needs, paying attention to the communication network to ensure that systems respond quickly to commands required, and develop the systems to include all tasks and procedures. Eliminating paper transactions and paying attention to increasing the protection feature and security on systems.

5 Conclusion

Given the complexity of the E-performance appraisal process, errors sometimes occur that make it less efficient. Therefore, we have collected in the following list the most common performance evaluation mistakes for you to avoid halo effect, it is one of the most common mistakes, and it means generalizing one of the employee's characteristics, whether positive or negative, to all other aspects of the evaluation without carefully examining each aspect individually. Personal bias which means lacks objectivity and is based on intuition—whether consciously or unconsciously—rather than on facts or logic. Generalization, that is the use of stereotypical ideas about a group to classify the performance of an employee who belongs to this group, with the automatic assumption that he shares the same characteristics as others in the group. The generalization may be related, for example, to gender, country, religion, etc. Recently of appraisal, this error occurs when a manager bases his appraisal only on the most recent workweek, whether the employee's performance has always been excellent, but he made a mistake just before the appraisal, or vice versa. Diversity of standards, the error of diversity of standards arises when the manager evaluates the performance of employees based on different, subjective criteria between one employee and another who performs the same role, which makes the evaluation lack the simplest principles of fairness. Strictness and softness, this error occurs when the manager is strict or soft by nature. For example, he is strict when most employees rate him below average, or vice versa, he is lenient when most of them rate him above average. Tendency to mediocrity, where some managers tend to evaluate all employees with average ratings overall, so no one has an excellent or poor rating.

Enhancing Financial Integrity: The Role of Accounting Information Systems in Mitigating Creative Accounting Practices Among Industrial Companies Listed on a Stock Exchange

Ziad Abdul Haleem Altheebeh and Braa Adel Alqaise

Abstract The objective of this research is to examine the influence of the accounting information systems (AIS) on the reduction of unethical practices associated with creative accounting in industrial firms that are publicly traded on the Amman Stock Exchange (ASE). The sample for this study comprises a total of 33 industrial companies listed on the ASE. The independent variable is assessed using a specific questionnaire administered to the participants, while the dependent variable is measured using primary sources, namely the annual financial reports of Jordanian industrial companies from the years 2015 to 2021. The findings of this study reveal a statistically significant adverse impact (in terms of both human resources and physical resources) and a statistically significant positive impact (pertaining to laws and regulations) on the mitigation of unethical practices related to creative accounting within industrial companies listed on the ASE. Based on the results obtained, several recommendations have been put forth, such as the need to allocate more resources towards human capital development within companies, as well as the promotion and enforcement of accounting-related laws, regulations, financial reporting, and transparency within these organizations.

1 Introduction

Numerous organizations endeavor to enhance their financial standing, augment profitability, and attain their strategic goals [1, 2]. Nevertheless, in cases where these desired outcomes are not achieved, accountants may resort to the manipulation of financial data and the alteration of figures portrayed in financial statements, thereby presenting an unfair and inaccurate representation [3]. Consequently, this practice, commonly referred to as negative creative accounting, misleads users of financial statements. In recent years, a prevailing trend among companies worldwide has emerged, wherein computerized AIS are widely employed and further developed [4]. This is attributed to their effectiveness in providing financial data and statements, streamlining processes, and facilitating access to financial information through various accounting software programs [5, 6].

The utilization of AIS is essential in preventing the occurrence of negative creative accounting practices [7–9]. These systems consist of various components, including human resources at different levels of administration and technical expertise, such as accountants, auditors, decision-makers, programmers, and system designers [10, 11]. Additionally, physical resources and IT infrastructure, encompassing communication means, devices, equipment, and buildings, are integral to these systems [12, 13]. Moreover, legislation, instructions, and laws, such as accounting principles, financial reporting standards, state tax regulations, and directives from regulatory bodies like corporate watchdogs, central banks, and board directives, contribute to the functioning of these systems [14, 15].

The rise in negative creative accounting practices has resulted in the downfall of numerous companies, exerting a detrimental impact on the economy and raising concerns regarding the objectivity and trustworthiness of financial data provided to users [13, 16, 17]. Consequently, AIS play a significant role, whether actively or passively, in both implementing creative accounting practices and safeguarding the economy. Furthermore, these systems ensure the objectivity and credibility of financial data [14, 15, 18–21].

1.1 Study Variables

See Fig. 1.

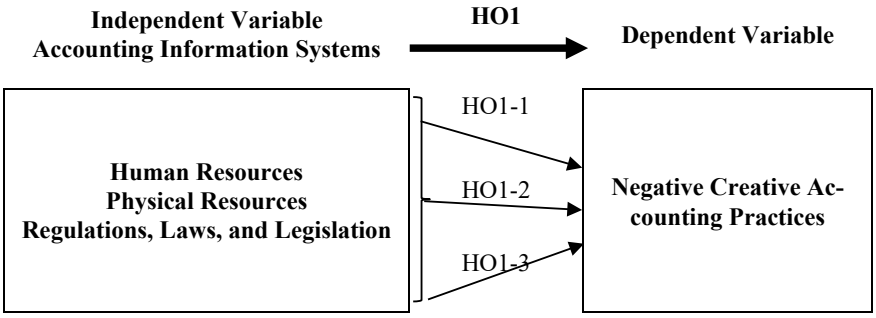

Fig. 1 Study variables

2 Theoretical Framework

2.1 Accounting Information Systems (AIS)

In recent times, there has been a rapid advancement in the field of information systems, which heavily relies on technology [22, 23]. The integration of modern systems in the preparation of AIS has become necessary, considering its significance in economic entities. This shift is indispensable [24]. It keeps pace with innovations, ensuring the provision of correct information. This information, in turn, eases appropriate decision-making as well as its timeliness [1].

Alicia [2] brought out the importance of an AIS in collecting, storing and processing financial and accounting data. The use of this data by internal users ensures that information is relayed to investors, creditors and government authorities. AIS is a computer-based system widely recognized among accounting circles for marrying age-old accounting practices (such as compliance with GAAP) to modern technology [3]. Aoun Allah and Blaik [4] offered their definition as well, depicting AIS as a subsystem stemming from enterprise information systems. They specialize in accounting operations by providing financial reports: these reports are instrumental in facilitating timely decision-making for both internal and external stakeholders. Moreover, Al-Ramahi [5] highlights that AIS does have another critical function aside from just providing those important reports: it plays a significant role towards activating and sustaining any organization's good control environment measures.

2.2 Creative Accounting

The term "creative accounting" has gained significant traction in the realm of accounting and auditing especially post the Enron scandal era. The collapse of Enron shed light on Arthur Andersen, the auditing firm that was supposed to be keeping a check on Enron's financial statements. However, it was found wanting in its duties

and partly blamed for the downfall of the company. Arthur Andersen was accused of resorting to manipulative accounting practices whereby they used certain treatment and policies under accounting that would distort Enron's financial data, consequently, misrepresenting their actual financial standing [6, 16, 17].

Scholars like [7] or [8] point out that creative accounting entails using various techniques intended to mislead users about a company's true financial picture as these methods aim at camouflaging actual details concerning an organization's financial health by taking advantage of flexibility plus changes surrounding standards and systems within accounting. Moreover, creative accounting involves accountants using their cognitive capabilities to tweak numbers with a purpose [9, 10]. Typically, these actions run counter to the laws, principles, or standards of an organization's accounting arm. Keep in mind that such acts fly in the face of professional ethics; though creative accounting practices might seem within the bounds of legality, they are fundamentally unethical.

3 Study Methodology

In order to assess the effectiveness of the AIS in reducing instances of creative accounting within industrial companies listed on the ASE, this study employed a descriptive-analytical methodology.

3.1 Study Population and Sample

The sample for this study consisted of a total of 33 industrial companies that are publicly listed on the ASE. In order to assess the independent variable, a specifically designed questionnaire was created and administered to individuals within the research participants who represented the study population. These individuals included financial managers, heads of accounting departments, accountants, auditors, and employees in the IT department. A total of 300 questionnaires were distributed, resulting in the retrieval of 231 electronic questionnaires, indicating a response rate of 77%. Alongside the questionnaire, the dependent variable was measured using primary sources, specifically the annual financial reports of Jordanian industrial companies from the years 2015 to 2021.

3.2 Study Variables

The variables associated with the influence of the AIS, namely human resources, physical resources, laws, and legislation, were identified in the study. To measure the independent variable, a questionnaire consisting of 35 statements was utilized,

distributed across three dimensions. Furthermore, the dependent variable focused on the reduction of unethical practices related to creative accounting in industrial companies listed on the ASE. This was assessed using the earnings management model proposed by Dechow et al. [11], which can be represented by the following formula:

Firstly: Determining the total receivables value

"Tait = Net Income it − OCF it (Operating Cash Flow)"

Secondly: Estimating the slope (a0 + a1 + a2 + a3) to calculate non-discretionary accruals, by building the regression model as follows:

$$\text{“}\frac{TA_t}{A_{t-1}} = a_0 + a_1\left(\frac{1}{A_{t-1}}\right) + a_2\left(\frac{\Delta Rve_t - \Delta Rect_t}{A_{t-1}}\right) + a_3\left(\frac{PPE_t}{A_{t-1}}\right) + £_t''$$

TA_t: Total receivables of company (i) in year t

A_{t-1}: Total assets at the end of the previous year

ΔRve: Change in company (i)'s revenues between years (t) and (t − 1)

ΔRect: Change in company (i)'s accounts receivable between years (t) and (t − 1)

PPE_t Size of company (i)'s property, plant, and equipment in year (t)

£: Error term in the regression equation.

Thirdly: Estimating non-discretionary accruals by compensating for expected values, which were extracted from the previous regression equation for each company individually and during each study year, as follows:

$$\text{“}NDA_t = a_0 + a_1\left(\frac{1}{A_{t-1}}\right) + a_2\left(\frac{\Delta \text{ Rve }_t - \Delta \text{ Rect }_t}{A_{t-1}}\right) + a_3\left(\frac{PPE_t}{A_{t-1}}\right) + £_t''$$

$NDA_{i,t}$ Non-discretionary accruals of company (i) in year (t).

Fourthly: After estimating total accruals and non-discretionary accruals, discretionary accruals are calculated by:

$$\text{DA i, t} = \text{TA i, t} - \text{NDA i, t}$$

DA i, t: discretionary accruals for company i, in year t.

NDA i, t: Non-discretionary accruals of company (i), in year (t).

TA i, t: Total receivables of company (i), in year (t).

The assessment of creative accounting practices in industrial companies is conducted by calculating the absolute value of the average discretionary accruals over the study period for all companies and contrasting it with the absolute value of the arithmetic mean of discretionary accruals for each company during the study years. If the arithmetic mean of discretionary accruals for a specific company (i) exceeds the overall arithmetic mean of discretionary accruals for all companies in the study sample, it signifies the presence of creative accounting practices. Conversely, if the arithmetic mean of discretionary accruals for a specific company (i) is lower than

Table 1 Multiple regression results for hypothesis testing

Dependent variable: reducing negative creative accounting practices in industrial companies listed on the ASE			
Independent variable	B	T	Sig.
Constant	0.958	1.819	0.07
HR	− 0.355	− 2.19	0.03**
Physical resources	− 0.361	− 2.506	0.013**
Rules and regulations	0.272	2.14	0.033**
R^2	50.70%		
F	7.565		
Sig	0.000***		

the overall arithmetic mean of discretionary accruals for all companies, it indicates the absence of creative accounting practices.

Based on the data presented in Table 1, it becomes apparent that the dimensions of the AIS have a significant impact on reducing the occurrence of creative accounting practices in industrial companies listed on the ASE. This impact was measured using the earnings management model. Furthermore, the coefficient of determination (R^2) was calculated to be 50.7%, indicating that the variables of human resources, physical resources, and laws and legislation collectively account for 50.7% of the variability observed in the occurrence of negative practices of creative accounting in Jordanian industrial companies.

The regression model was statistically significant, with a significance value for the F-statistic ($F = 0.000$) less than 5%, indicating the statistical acceptance of the model.

The table further indicates the following:

- The statistical analysis reveals that the coefficient ($T = -2.19$) and the significance value ($Sig = 0.03$) indicate a significant negative relationship between human resources and the mitigation of negative practices of creative accounting in industrial companies listed on the ASE. Consequently, the alternative hypothesis, which states that there is a statistically significant effect at the significance level ($a < 0.05$) of the AIS (human resources) on mitigating negative practices of creative accounting in industrial companies listed on the ASE, is accepted, thereby rejecting the null hypothesis.
- The statistical analysis reveals that the coefficient ($T = -2.506$) and its corresponding significance value ($Sig = 0.013$) provide evidence of a significant negative relationship between physical resources and the mitigation of negative practices of creative accounting in industrial companies listed on the ASE. Consequently, the null hypothesis is rejected in favor of the alternative hypothesis, which asserts that there is a statistically significant effect, at a significance level of ($a < 0.05$), of the AIS (physical resources) on the mitigation of negative practices of creative accounting in industrial companies listed on the ASE.

- The statistical analysis reveals that the coefficient (T = 2.14) and the significance value (Sig = 0.033) indicate a significant positive impact of laws and legislation on reducing unfavorable practices of creative accounting in industrial companies listed on the ASE. Consequently, the null hypothesis is rejected in favor of the alternative hypothesis, which asserts that there is a statistically significant effect, at a significance level (a < 0.05), of the AIS (laws and legislation) in mitigating negative practices of creative accounting in industrial companies listed on the ASE.

4 Results

- The presence of a statistically significant association between human resources and physical resources and the reduction of negative practices of creative accounting in industrial companies listed on the ASE has been observed. This implies that an increased emphasis on the AIS, specifically through the allocation of human resources, leads to a decrease in the utilization of creative accounting techniques, such as earnings management.
- The impact of laws and legislation on curbing detrimental practices of creative accounting in industrial companies listed on the ASE is statistically significant. This finding suggests that when industrial companies prioritize their AIS by adhering to laws and legislation, the occurrence of creative accounting, specifically earnings management, diminishes.

4.1 Discussion of Results

There is now evidence that AIS introduction has proven effective in reducing unethical practice (creative accounting, which was rampant in ASE industrial firms). The discovery of benefits from AIS is now driving the trend of improving ethical accounting practices, preventing cases where unethical practices erode the credibility of data and having negative impacts on the reputation of the companies. Reliable support can be obtained: the system is amenable to auditors and reviewers who can perform scrutiny easily, as the rules are well defined for strict compliance with standards. The system preempts fraudulent practices through stiffer procedures while generating the information. In fact, compliance should be with guidelines, not knowing ways to adopt bending rules. It should not only be documented but published for all the stakeholders taking part in that process. AIS is shows its position in good management practices of industrial firms, which also serve indicative role for the level of investors' confidence (or negative, which the research in 2019 of Althebeh actually showed) in the financials of entity, which could be used as a signal to mitigate risk.

The findings from this study on research indicate how some of these human interactions within the AIS are a hindrance to creativity at the firm level-particularly to those firms within the ASE index. The likely cause for this negative impact could be a lack of skilled personnel in either the accounting or IT department, which limits their ability to adopt modern practices or innovation in accounting: thus if there is any deficiency of skillful manpower it would mean delays related to processing and analysis of accounting information—which would strangle any creative ideas within these organizations …from flowing easily towards challenges faced by their accounting systems. This finding is consistent with [16–18, 23] indicating that failure to comply with international accounting standards leads institutions into various frameworks on financial operations—thereby drowning fraud opportunities. Another finding from Zein and Hajazi's study in 2020 is that they identified creative accounting as a subset of manipulation and fraud. They underscored the value of external auditors' experience: it plays a key role in eliminating creative accounting practices. On a different note, pointed out that combating creative accounting is highly complex and challenging work [10, 14, 19, 20, 22]. This should serve as an impetus to stakeholders involved in this field to consistently work towards detecting and reducing these fraudulent practices [3, 21].

In the ASE, creative accounting practices are negatively affected by the presence of physical resources within AIS. This is due to large physical resources that need to be allocated for such systems—which in turn hampers companies' abilities to think innovatively because establishing and running those systems already takes a lot of effort. Instead of coming up with creative solutions that enhance performance or streamline processes, accountants find themselves stuck in mundane tasks like data entry or generating reports. Allocation of physical resources might draw attention away from any technological innovation at company level thereby acting as an impediment towards investment on new systems or technologies. Moreover, stifling creative accounting practices with potential new systems and technologies aid could be offered. This result agrees with a research undertaken by [12] showing that the use of creative accounting significantly affects the fairness and truthfulness of financial statements. In turn, it leads to more cases of fraud. One must use AIS prudently if they hope for attaining desired qualities of accounting information, among them include accuracy and clarity, as well as suitability and reliability along with timeliness [14, 19, 23].

4.2 Recommendations

The main outcomes of this research can provide a number of recommendations that could enhance the behavioral practices for industrial firms in the ASE, including:

- The research suggests that the development of investment in companies' human resources should be based on continuous training, ongoing development of personnel, and enhancement of approaches to selection and retention

of outstanding staff members. This will lessen the adverse effect from human resources on negative creative accounting.

- The research also suggests enhancing adherence to laws and regulations related to accounting, financial reporting and transparency within firms. It can result in enhanced behavioral practices. Such practices include curtailing negative creative accounting malpractices.
- It suggests bettering company's organizational culture by fostering transparency, accountability, and open communication among employees and management. Such a thing in turn could counteract negative creative accounting practices; leading improvement on behavioral practices.
- The study recommends improving reporting of violations and misconduct in companies, including improving reporting policies and whistleblower protection. This can lead to improved behavioral practices and a reduction in negative creative accounting practices.

Attracting Consumer Attention by Exploring the Effects of Sales Promotion Tools: A Case Study on Carrefour Customers

Mustafa S. Al-Shaikh and Hadeel Mohammad Ahmad Shaza

Abstract The objective of this study is to investigate the influence of sales promotion tools, including free samples, coupons, discounts, and promotional competitions, on consumer attention. To accomplish this, a sample of 550 consumers from Carrefour (Amman) is randomly selected. A questionnaire is administered to the participants, and 490 completed questionnaires are included in the analysis. The descriptive analytical method is employed as it is deemed appropriate for the nature of the study, and statistical analyses are conducted using the SPSS program. The findings reveal a significant statistical impact of sales promotion tools in attracting consumer attention. Specifically, discounts are found to have the greatest effect, while coupons had the least effect. Based on the results, it is recommended that commercial centers, such as Carrefour, prioritize the use of sales promotion tools, particularly discounts, as they have a positive impact on attracting consumer attention and subsequently increasing sales.

Keywords Sales promotion tools · Attracting consumer attention · Jordan

1 Introduction

The current era of technological advancement, economic prosperity, and cultural growth has brought about a more complex market environment. In this context, commercial establishments like Carrefour are facing challenges in order to survive

and thrive amidst fierce competition. As individuals' needs and desires become more diverse and their behavioral patterns undergo changes, production and market centers are compelled to adapt and promote their goods and services in order to attract customers, ensure satisfaction, and foster loyalty. As a result, more and more such centers are emerging, more and more products are being produced to provide customers with more options, greater efforts are being made to meet their needs, and greater accessibility is being made for cultural and economic consumers to compare. This has led to more competition between businesses to provide customers with more opportunities to compare stores. Moreover, consumer cultural and economic awareness has also led to the creation of more conscious and difficult to please customers. Conventional consumer behavior has lost its meaning, and people want multiple options so that their needs can be met at the best possible quality and/or price.

The sales promotion strategy has gained popularity as the preferred approach in many retail outlets. The strategy is aimed at persuading the customer to make a purchase immediately and attracting their attention after entering the premises. Fortunately, these stores have seen an increase in sales volume and expanded their market penetration. However, this change in corporate behavior, with the widespread use of sales promotion tools by marketers, has had an impact on consumers. This has now created price sensitivity and made consumers more willing to take advantage of good deals. Marketers have used more tools to deal with new consumer behaviors to retain existing customers and prevent the risk of losing customers to other competitors [1].

1.1 Research Problem and Questions

Currently, both shopping malls and commercial stores are struggling to attract the same customers, increase their market share, maintain a competitive advantage and bring benefits to their business. Moreover, the vast purchasing power of customers made it difficult to choose the heads and get a positive reaction from them. To address this issue, retail centers and stores have turned to the utilization of sales promotion tools as a means to attract consumer attention. However, determining the effectiveness of these sales promotion tools in capturing customers' attention poses a significant challenge for retail stores. Therefore, the main focus of this study is to investigate the impact of using sales promotion tools on attracting consumer attention. This main research question can be further broken down into the following sub-questions:

- What is the extent of the impact of free samples on attracting consumer attention?
- What is the extent of the impact of coupons on attracting consumer attention?
- What is the extent of the impact of discounts on attracting consumer attention?
- What is the extent of the impact of promotional competitions on attracting consumer attention?

1.2 Importance of the Study

The examination of sales promotion, one of the elements of the promotional mix, underscores the significance of this scientific study. It aims to elucidate the role of these tools in effectively capturing consumer attention and attracting customers, considering the intensified competition among commercial companies to garner a larger customer base. Furthermore, this study seeks to shed light on the concept of sales promotion. The practical value of this research lies in providing Carrefour and other commercial centers with valuable insights into the significance of employing sales promotion tools. Additionally, it contributes to the understanding of strategies for attracting customer attention and boosting sales.

1.3 Objectives of the Study

- To understand the impact of using sales promotion tools on attracting consumer attention.
- To identify the impact of using free samples on attracting consumer attention.
- To uncover the role of coupons in attracting consumer attention.
- To determine the extent of the impact of discounts on attracting consumer attention.
- To assess the impact of promotional competitions on attracting consumer attention at Carrefour (Amman).

1.4 Study Hypotheses

Main Hypothesis (H01): "There is no statistically significant impact of sales promotion tools on attracting consumer attention at the significance level ($\alpha \geq 0.05$)." From this hypothesis, the following sub-hypotheses are formulated:

- H01-1: "There is no statistically significant impact of free samples on attracting consumer attention at the significance level ($\alpha \geq 0.05$)."
- H01-2: "There is no statistically significant impact of coupons on attracting consumer attention at the significance level ($\alpha \geq 0.05$)."
- H01-3: "There is no statistically significant impact of discounts on attracting consumer attention at the significance level ($\alpha \geq 0.05$)."
- H01-4: "There is no statistically significant impact of promotional competitions on attracting consumer attention at the significance level ($\alpha \geq 0.05$)."

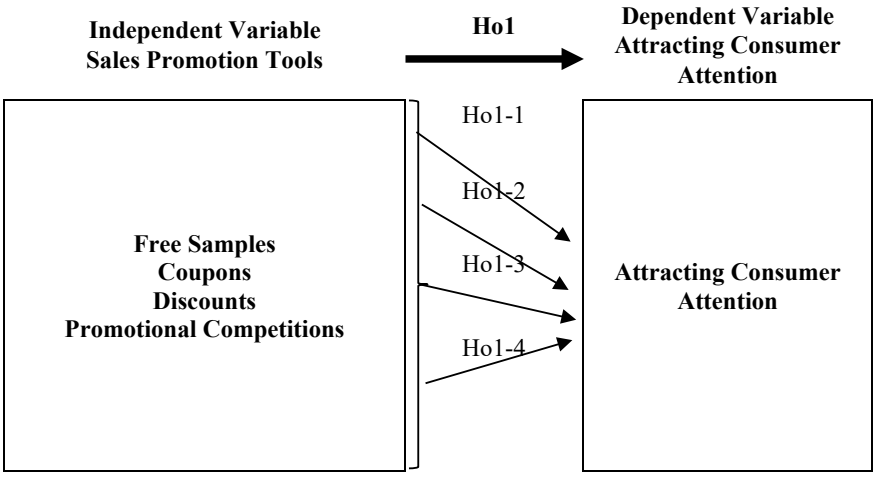

Fig. 1 Study model

1.5 Study Model

The study model was built based on [2–6] (Fig. 1).

1.6 Terminological Definitions

- **Consumer**: Individuals, whether they be natural or legal persons, engage in the act of purchasing goods and services from the market for personal use or on behalf of others. The purpose of these purchases is to fulfill their needs and desires, which are fulfilled through a variety of processes involving the acquisition of goods and services [7].
- **Sales Promotion**: Sales promotion refers to non-traditional approaches employed in the promotional process that are distinct from advertising, personal selling, and public relations. This category encompasses various incentive-based strategies that are specifically designed to yield immediate and short-term effects, with the goal of expediting the purchase of goods and services. Notable examples of sales promotion techniques include the provision of offers, free samples, coupons, and gifts, among others [8].
- **Attracting Attention**: The initial phase that guides consumers towards the process of making a purchase is known as attention. Attention refers to the mental state of concentrating and directing one's focus towards a particular subject, resulting in heightened awareness while disregarding other influences and stimuli that fail to reach conscious perception during this period of intense concentration and focus [9].

- **Free Samples**: Offering complimentary product samples to consumers is the most efficient method of introducing new products, despite the higher associated costs [10].
- **Coupons**: Vouchers that afford consumers discounted prices for a designated item are commonly referred to as certificates. These coupons can be delivered via mail, disseminated within the confines of a retail establishment, or featured in print advertisements found within newspapers or magazines [11].
- **Promotional competitions**: Contests that necessitate the sagacity and ingenuity of the contenders, with outcomes unaffected by chance, in order to acquire monetary rewards or tangible incentives through the acquisition of specific merchandise or active engagement in contest-related endeavors [12].
- **Discounts**: The packaging of the product may display a discounted price, which is a reduction from the original base price. This discount could be implemented by offering a single unit of the product at a lower price or by providing two units of different products at a price that is lower than their respective base prices [13].

2 Theoretical Framework

Promotional activity holds the distinction of being the most direct form of marketing that involves interaction with customers. It is through promotion that customers become aware of the existence of a product. The term "promotion" encompasses the process of popularizing a product, which necessitates effective communication and dissemination of information regarding the goods and services offered by the seller [14].

The primary objective of promotion is to capture the customer's attention, cultivate their interest, and facilitate their purchasing behavior by delivering relevant information. This promotional approach involves acquainting customers with new products and services, highlighting their distinctive features, and motivating them to make a purchase while also ensuring that the product remains top-of-mind through periodic reminders. Furthermore, promotion serves to shift the demand curve from one position to another [15]. Scholars have defined promotion as a collection of strategies employed to stimulate desire and interest, ultimately fostering customer engagement and facilitating the purchasing process through effective communication between the seller and the customer [13].

2.1 Previous Studies

According to a study [1], various sales promotion tools have been identified as effective in influencing consumer behavior. These tools include samples, discounts, buy one get one free offers, and in-store promotions. On the other hand, additional quantity and free gifts were found to have a moderate level of effectiveness. Coupons

and scratch and win promotions were identified as the least effective tools. Another study [4] conducted in Jordan found that sales promotion activities have a negative impact on consumer behavior, except for competition programs. This suggests that these activities may not be well-received by Jordanian consumers.

Furthermore, a study [16] confirmed the positive utilitarian effect of sales promotion programs on consumer behavior. These programs were found to play a significant role in influencing consumers' purchase decisions and contributing to increased sales for the institution. The study revealed that sales promotion activities have a strong influence of 93.8% on consumers' purchase decisions, with offers being the most responsive promotional tool. Moreover, one study [17] found that sales promotion techniques such as trade shows, promotional competitions, cost reduction and coupons strongly influence consumers' purchasing process, for example their initial thought about the product/service, subsequent thoughts, their opinion about product/service, their intention and likelihood to purchase. Finally, another study [18] shows that the key issue in relation to the consumer purchasing process is price reduction, which further emphasizes the importance of pricing policy in promotional and sales activities.

A study [19] shows that price cuts often affect Internet users. Similarly, another study [3] found that discounts are a tool that has a huge impact on improving consumer purchasing behavior and sales promotion is of great importance for retailers when creating their marketing plans. Sales promotions serve the excellent purpose of attracting a large number of customers to stores with the intention of making exceptional sales by offering incentives to encourage customers to purchase their products, which proves the enormous impact of sales promotion tools on repeat consumer behavior. Additionally, another study [2] found that discounts, samples, and free gifts are the most effective methods for generating a consumer response, while lotteries and games are less effective in eliciting purchasing behaviors. Furthermore, a study [20] revealed that promotions, instalment plans, and promotional competitions have the greatest influence on consumers' purchase decisions, highlighting the important role of sales promotions in shaping consumer behavior.

3 Methodology

3.1 Study Population and Sample

The target demographic for this study comprises individuals who are customers of the Carrefour retail chain located in Amman. Within the Kingdom, there are a total of 18 Carrefour stores, with 14 of them situated in Amman (as stated on the Carrefour website). These establishments attract a substantial number of consumers on a daily basis. The decision to focus on Carrefour customers in Amman as the study population was primarily driven by the fact that the majority of Carrefour branches are concentrated in this city. In order to ensure a scientifically sound representation of

the population, the researchers determined a minimum sample size of 384 customers, which was deemed sufficient to accurately reflect the study population [21].

4 Hypothesis Testing

- **Main Hypothesis (HO1)**: "There is no statistically significant impact of sales promotion tools on attracting consumer attention at the significance level ($\alpha \geq 0.05$)." Multiple linear regression tests were used to test the hypothesis, and Table 1 shows the results.

Based on the information provided in the table, it can be observed that the calculated value of F, which is (61.699), exceeds the critical value (2.42), indicating a statistically significant relationship between the independent and dependent variables. The significance level associated with F is (0.00), which is lower than the predetermined significance level of (0.05) for this study. Therefore, we can conclude that the null hypothesis is rejected, and the alternative hypothesis is accepted. This implies that there is indeed a statistically significant impact of sales promotion tools on attracting consumer attention, with a significance level of ($0.05 \geq \alpha$).

The value of R, which stands for the correlation coefficient, is 0.581, indicating a strong positive relationship between the dependent variable (consumer attention) and the combined independent variables (free samples, coupons, discounts, promotional competitions). This value exceeds the threshold of 0.5, further supporting the strength of the relationship. Additionally, the value of R2, which represents the coefficient of determination, is 0.337. This signifies that the combined independent variables account for approximately 33.7% of the variability observed in the dependent variable.

Therefore, the primary inquiry regarding the influence of employing sales promotion techniques in capturing consumer attention has been addressed. The provided table further indicates that the computed T value for coupons does not exhibit statistical significance at the designated significance level of 0.05, as evidenced by a value of 0.120. Conversely, the T values for the variables of free samples, discounts, and promotional competitions demonstrate statistical significance at the significance level of 0.05, with respective values of 0.00, 0.00, and 0.00, all of which are lower than 0.05.

4.1 Sub-Hypothesis 1

- H01-1: "There is no statistically significant effect of free samples on attracting consumer attention at the significance level ($0.05 \geq \alpha$)." To test Sub-Hypothesis 1, simple linear regression was used, and Table 2 illustrates the results of the simple linear regression for Sub-Hypothesis 1.

Table 1 Results of multiple linear regression test

Dependent variable	Correlation coefficient R	Determination coefficient R^2	Calculated F	Degrees of freedom	Significance level Sig	Independent variable	B Value	t Value	Significance level Sig
Attracting consumer attention				4		Free samples	0.213	4.260	0.000
	0.581	0.337	61.699	485	0.000	Coupons	0.061	1.556	0.120
				489		Discounts	0.215	4.623	0.000
						Promotional competitions	0.213	4.848	0.000

Table 2 Results of simple linear regression for sub-hypothesis 1

Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Independent variable	B value	Tabulated T value	Calculated T value	Significance level (Sig)
Attracting consumer attention	0.475	0.225	Free samples	0.485	1.96	11.917	0.000

The analysis of the data presented in the table reveals that the calculated T value (11.917) surpasses the tabular T value (1.96), thereby establishing a statistically significant relationship between the variables "attracting consumer attention" and "free samples". The significance level for the T value is recorded as 0.00, which is lower than the predetermined significance level of 0.05. Consequently, we reject the null hypothesis of the first sub-hypothesis and accept the alternative hypothesis, affirming that there is indeed a statistically significant effect of free samples on attracting consumer attention at a significance level of 0.05 or less. Moreover, a positive correlation is observed between attracting consumer attention and the variable "free samples", with a correlation coefficient of $R = 0.475$. The variable "free samples" accounts for 22.5% of the variation in the dependent variable, as indicated by the determination coefficient $R^2 = 0.225$ for both variables. Additionally, the value of $B = 0.485$ signifies the anticipated change in the dependent variable when the independent variable increases by one unit. Based on this value, it can be concluded that a one-unit increase in the variable "free samples" corresponds to a 0.485 increase in the dependent variable "attracting consumer attention".

4.2 Sub-Hypothesis 2

H01-2: "There is no statistically significant effect of coupons on attracting consumer attention at the significance level ($0.05 \geq \alpha$)." To prove the second sub-hypothesis, a simple linear regression test was used, and Table 3 illustrates the results of the simple linear regression for the second sub-hypothesis.

The results presented in the table demonstrate that the calculated T value (9.164) exceeds the tabulated T value (1.96), indicating a significant effect between the variables "attracting consumer attention" and "coupons". The T value has a significance

Table 3 Results of simple linear regression for sub-hypothesis 2

Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Independent variable	B value	Tabulated T value	Calculated T value	Significance level (Sig)
Attracting consumer attention	0.383	0.147	Coupons	0.323	1.96	9.164	0.000

level of (0.000), which is lower than the predetermined significance level of the study (0.05). Consequently, we reject the null hypothesis for the second sub-hypothesis and accept the alternative hypothesis: "There is a statistically significant effect of coupons on attracting consumer attention at the significance level ($0.05 \geq \alpha$)". A positive relationship exists between attracting consumer attention and the variable "coupons", as evidenced by a correlation coefficient of $R = 0.383$. The variable "coupons" accounts for 14.7% of the variability in the dependent variable, indicated by the determination coefficient $R^2 = 0.147$ for both variables. Moreover, the value of $B = 0.323$ signifies the anticipated change in the dependent variable when the independent variable experiences a one-unit change. In other words, a one-unit increase in the variable "coupons" corresponds to a 0.323 increase in the dependent variable "attracting consumer attention."

4.3 Sub-Hypothesis 3

H01-3: "There is no statistically significant effect of discounts on attracting consumer attention at the significance level ($0.05 \geq \alpha$)." To prove sub-hypothesis 3, simple linear regression was used, and Table 4 shows the results of the simple linear regression for sub-hypothesis 3.

The data presented in the table above demonstrates a statistically significant relationship between the variables "attracting consumer attention" and "discounts". This is evident from the calculated T value (12.099), which is greater than the tabulated T value (1.96). The significance level for the T value is (0.000), which is lower than the chosen significance level of the study (0.05). As a result, the null hypothesis for the third sub-hypothesis is rejected, and the alternative hypothesis is accepted: "There is a statistically significant effect of discounts on attracting consumer attention at the significance level ($0.05 \geq \alpha$)". Furthermore, there is a positive correlation between attracting consumer attention and the variable "discounts", as indicated by a correlation coefficient of $R = 0.480$. The variable "discounts" accounts for 23.1% of the variability in the dependent variable, represented by the determination coefficient $R^2 = 0.231$ for both variables. The value of $B = 0.470$ suggests that the dependent variable "attracting consumer attention" is expected to change by 0.470 units when the independent variable "discounts" changes by one unit. In other words, a one-unit

Table 4 Results of simple linear regression for sub-hypothesis 3

Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Independent variable	B value	Tabulated T value	Calculated T value	Significance level (Sig)
Attracting consumer attention	0.480	0.231	Discounts	0.470	1.96	12.099	0.000

increase in the variable "discounts" corresponds to a 0.470 increase in the dependent variable "attracting consumer attention."

4.4 Sub-Hypothesis 4

H01-4: "There is no statistically significant effect of promotional competitions on attracting consumer attention among Jordanian consumers at the significance level ($0.05 \geq \alpha$)." To prove sub-hypothesis 4, simple linear regression was used, and Table 5 shows the results of the simple linear regression for sub-hypothesis 4.

Based on the data presented in the table, it can be observed that the calculated T value (11.816) exceeds the tabulated T value (1.96), indicating a statistically significant relationship between the variables "attracting consumer attention" and "promotional competitions". The significance level for the T value is (0.000), which is lower than the predetermined significance level of the study (0.05). As a result, we can reject the null hypothesis for the fourth sub-hypothesis and accept the alternative hypothesis: "There is a statistically significant effect of promotional competitions on attracting consumer attention at a significance level of ($0.05 \geq \alpha$)".

A significant correlation exists between the variable "promotional competitions" and the ability to attract consumer attention, as evidenced by a correlation coefficient of $R = 0.472$. The variable "promotional competitions" accounts for 22.2% of the variability in the dependent variable, as indicated by the determination coefficient $R^2 = 0.222$ for both variables. Moreover, the coefficient value of $B = 0.450$ signifies the anticipated change in the dependent variable when the independent variable increases by one unit. Consequently, a one-unit increase in the variable "promotional competitions" corresponds to a 0.450 increase in the dependent variable "attracting consumer attention".

5 Discussion of Results

The most important findings of the study can be summarized as follows:

Table 5 Results of simple linear regression for sub-hypothesis 4

Dependent variable	Correlation coefficient (R)	Coefficient of determination (R^2)	Independent variable	B value	Tabulated T value	Calculated T value	Significance level (Sig)
Attracting consumer attention	0.472	0.222	Promotional competitions	0.450	1.96	11.816	0.000

- The influence of sales promotion tools in capturing consumer attention has been observed. The findings of the study indicate that a majority of the participants acknowledged the effectiveness of free samples, coupons, discounts, and contests in attracting consumer attention. It was determined that sales promotion tools accounted for 33.7% of the factors contributing to consumer attention.
- Discounts have been identified as the most captivating sales promotion tool, as indicated by both the sample and the researcher. This is due to the considerable significance consumers place on price, leading them to be more drawn to activities that offer cost savings on products. The variable of discounts exhibited a substantial arithmetic mean of 4.16, signifying a statistically significant impact of discounts as a sales promotion tool in attracting consumer attention. Furthermore, discounts demonstrated the highest degree of explanatory power among the variables examined in the study, accounting for 23.1% of the observed effects.
- The research findings demonstrated that both the distribution of free samples and the organization of contests play a significant role in capturing the attention of consumers, as evidenced by an average score of 4.15 for each variable. This indicates the substantial influence that both tactics have on attracting consumer attention. It is common for consumers to actively seek out opportunities that offer added value or advantages to their purchases, which explains why sales promotion tools are frequently appealing to them.
- As a sales promotion strategy, coupons possess the capacity to captivate consumer interest towards products. The conducted study revealed that coupons indeed have an impact on attracting consumer attention, accounting for approximately 14.7% of the overall attention garnered. Nevertheless, it is worth noting that coupons exhibited the lowest explanatory capability among the variables examined in the study. From the standpoint of consumers, coupons are perceived as comparatively less effective than alternative sales promotion tools, suggesting that consumers place less emphasis on the specific type of coupon and instead prioritize its value.
- The findings of the study revealed that the provision of complimentary samples has a statistically significant effect on capturing the attention of consumers, accounting for 22.5% of the variance in consumer attention.
- Promotional competitions have been found exerting a statistically significant influence on the attraction of consumer attention, accounting for 22.2% of the variance in consumer attention towards products.

5.1 Recommendations

1. Exercising more fpcus on sales promotion tools in shopping centers of Carrefour due to their impact on attracting consumers' attention to products, which positively translates into sales growth.
2. It is imperative not to rely solely on the sales promotion tools mentioned in the study; rather, research and adopt other tools and methods that work to attract attention, such as additional quantities or installment options.

3. Increase the use of discounts, promotional competitions and free samples in shopping malls to attract consumers' attention.
4. Develop sales promotion tools, in particular coupons, to make them a stronger element of attracting consumers' attention and providing tangible benefits to consumers, as consumer interest is focused on savings.

The Impact of Digital Marketing Techniques on Purchasing Decisions of Services: Telecommunications Customers as a Case Study

Iyad A. A. Khanfar and Rawaah Bassem Ahmed Al-Qaisi

Abstract The objective of this study is to examine how digital marketing techniques influence the purchasing decisions of services in Amman, Jordan. In order to achieve this objective, an inductive approach is utilized, combining descriptive and analytical methods. A questionnaire is developed based on relevant theoretical literature and previous studies pertaining to the topic of this study. The questionnaire is distributed electronically, resulting in a total of 409 responses. After excluding 17 responses from individuals who are not customers of Orange Telecom, 392 valid responses remained for analysis. The study population consists of all customers of Orange Telecom in Amman. The findings of the study indicate that digital marketing techniques, such as social media, email, text messages, and websites, have a statistically significant impact ($\alpha \leq 0.05$) on service purchasing decisions in Amman. Therefore, it is recommended that the company prioritize and allocate resources accordingly to each technique, focusing on utilizing the most effective ones. For instance, by emphasizing the company's website, service purchasing decisions can increase by 38%, followed by text messages, social media, and email.

Keywords Digital marketing · Social media · Email · Text messages · Website · Purchasing decision

1 Introduction

The advent of technology and progress in our contemporary society has led to the extensive utilization of the internet and its various modern instruments, such as mobile devices, social media platforms, websites, and digital screens. Consequently, this has resulted in substantial transformations in the practices and conduct of both businesses and individuals. Furthermore, these advancements have exerted a significant influence on the modification of consumer buying habits. This has given rise to a virtual realm that offers novel opportunities for unorthodox marketing strategies for both sellers and buyers within the realm of the digital sphere [9].

The adoption of digital marketing strategies by organizations has been greatly influenced by the growing prevalence of the internet. This shift is primarily motivated by the fact that a significant portion of consumers now dedicate a substantial amount of time to online activities and heavily depend on the internet for product and service research and purchases [12]. As a result, incorporating digital techniques into marketing operations has become imperative.

The progressions in technology have given rise to contemporary and sophisticated domains of marketing, notably digital marketing. In the present era, digital marketing is widely regarded as the most crucial marketing tool owing to its expeditiousness, precision, rapid information retrieval, and direct interaction with customers. It assumes a pivotal role in executing marketing initiatives for organizations and enterprises at large, with a particular emphasis on telecommunication companies, as digital platforms have come to dominate the majority of services offered to their clientele [5].

When it comes to purchasing decisions, which serve as the crucial factor determining the success or failure of any organization, irrespective of its field of operation, it is imperative to acknowledge the growing range of services provided by organizations and the heightened consumer awareness regarding their wants and needs. However, it is equally important to recognize the challenges in comprehending consumers' purchasing decisions and their subsequent impact on future behavior.

1.1 Problem Statement and Research Questions

One of the key advantages offered by digital marketing methods is the convenience of reaching a vast consumer base at any time and from any location, with minimal exertion. Additionally, it grants consumers the ability to explore numerous online purchasing options and select the most suitable product from a wide array of choices, thereby prompting telecommunications companies to enhance their marketing approaches.

Although digital marketing techniques have been widely adopted by telecommunication companies in Jordan, there are still some companies that do not actively promote their services through these technologies. Moreover, some companies seem

to use such techniques only occasionally, without necessarily realizing that greater importance should be attached to their consequences. They do not provide adequate budgets or efforts for their promotional goals and may not have a holistic view of the most commonly used techniques. Our observation is that business owners may not be aware of the full potential of these technologies and all the benefits, returns and impact they can have in promoting their services and reaching potential consumers.

The advent of digital technologies and their integration with the internet has revolutionized the field of marketing, prompting an important inquiry: How do digital marketing techniques affect the decision-making process when it comes to purchasing services from Orange, a telecommunications company based in Amman, Jordan?

1.2 Study Objectives

The purpose of this research is to reveal the impact of implementing digital marketing strategies on potential behavior of Orange's, a telecommunication company, customers in Jordan. In pursuit of this main objective, a comprehensive set of sub-objectives has been formulated.

1.3 Study Hypotheses

The study hypotheses can be formulated as follows:

- **Main Hypothesis (HO)**: "There is no statistically significant impact ($\alpha \leq 0.05$) of digital marketing techniques, including social media, email, text messages, and website, on the purchasing decisions of services in Amman city."

This main hypothesis leads to the following sub-hypotheses:

- **Sub-Hypothesis 1 (HO1)**: "There is no statistically significant impact ($\alpha \leq 0.05$) of social media as one of the digital marketing techniques on the purchasing decisions of services in Amman city."
- **Sub-Hypothesis 2 (HO2)**: "There is no statistically significant impact ($\alpha \leq 0.05$) of email as one of the digital marketing techniques on the purchasing decisions of services in Amman city."
- **Sub-Hypothesis 3 (HO3)**: "There is no statistically significant impact ($\alpha \leq 0.05$) of text messages as one of the digital marketing techniques on the purchasing decisions of services in Amman city."
- **Sub-Hypothesis 4 (HO4)**: "There is no statistically significant impact ($\alpha \leq 0.05$) of the website as one of the digital marketing techniques on the purchasing decisions of services in Amman city."

These hypotheses will guide the study in exploring the relationship between digital marketing techniques and purchasing decisions in the context of Orange Telecom in Amman city.

2 Previous Studies

In a study conducted by Beshlawi et al. [5], significant findings were obtained. The research demonstrated that digital marketing, which includes various aspects such as website, social media, phone marketing, and email, exerts a favorable influence on consumers' purchasing decisions. However, the study also revealed that certain individual dimensions of digital marketing do not independently affect specific dimensions of the dependent variable, namely the purchasing decision.

In a similar vein, Batal's [4] research uncovered a cause-and-effect connection between online sales promotion strategies and consumers' purchasing choices. Likewise, identified a statistically significant influence of digital marketing and its various dimensions on the efficacy of customer communication. The study is concluded by recommending a comprehensive understanding of digital marketing requirements, as well as a focus on fostering innovation and creativity in marketing endeavors.

In a recent study conducted by, it was discovered that mobile phone advertisements garnered widespread acceptance and exerted a significant influence (with a level of significance set at 0.05) on the purchasing choices made by customers who engage with Mobilis. Similarly, Mouwaj [11] demonstrated a positive impact of social media platforms on the purchasing decisions of mobile phone users residing in the state of Jijel. The study further advised emphasizing the visual and auditory appeal of advertisements, as well as prioritizing the organization of information in a list format and establishing connections between their pages on various social media platforms.

3 Methodology and Procedures

3.1 Study Design

In this study, a descriptive methodology was employed, along with an inductive analytical approach. The descriptive method utilizes a range of statistical techniques associated with this approach, particularly measures of central tendency. The primary objective of the descriptive method is to provide clarity and description of data or phenomena by organizing, restricting, and presenting them in a clear manner through the use of tables and graphical representations ([2], p. 22). On the other hand, the inductive approach aims to analyze data in order to make reasonable predictions or inferences, understand the statistical significance, and provide a more comprehensive interpretation and description compared to the descriptive method. This approach

Table 1 Criteria for corresponding arithmetic mean levels

Arithmetic mean	(1–2.33)	(2.34–3.66)	(3.67–5.00)
Level	Low	Medium	High

strives to generate results that can be generalized to the entire statistical population based on the selected sample ([1], p. 20).

3.2 Study Population and Sample

The research encompassed the entire customer base of Orange Telecommunications Company located in Amman, Jordan. As stated in the company's 2023 report, the subscriber count reached an estimated 4.1 million by the conclusion of 2022. Additionally, the company had a presence in 61 different geographical locations within Amman, apart from their main headquarters. To obtain the study sample, an online questionnaire was created and distributed using the snowball sampling technique. This method involves selecting certain individuals to participate in the study and then requesting them to identify other interested individuals who can also contribute by completing the survey. Snowball sampling is employed when it is challenging to directly access individuals from the target population ([13], p. 351).

Following a waiting period of four weeks, a total of 409 questionnaires were received electronically. Subsequent screening resulted in the exclusion of 17 questionnaires, as the respondents did not meet the criteria of being subscribers or customers of Orange. As a result, the final number of questionnaires included in the analysis amounted to 392. This sample size surpasses the minimum requirement for a statistically representative population, as indicated by the sampling table developed by Sekaran and Bougie ([15], p. 375), ensuring coverage of any indeterminate population.

From Table 1, it is evident that if the mean falls below (2.33), the level can be judged as low. If the mean ranges between (2.34–3.66), it is within the moderate level. If the mean exceeds (3.67), it is considered of high importance.

3.3 Validity and Reliability of the Study Tool

- **Face Validity**

To ensure content validity, the questionnaire was initially presented to a panel of 8 experts, consisting of academics and other knowledgeable individuals, who were tasked with reading, evaluating, and reviewing the questionnaire. Following their thorough review of the questionnaire's items and phrases, several suggestions were

offered, and necessary adjustments were made to enhance the readiness of the final version.

- **Construct Validity**

To assess the validity of the study instrument and effectively accomplish its desired goals, the relationship between the phrase and its corresponding domain, which represents the dimension being measured, will be determined and quantified using Pearson's coefficient. As explained by Patten and Newhart ([14], p.126), when calculating the correlation between the phrase and its domain, it is important to note that the phrase should not exhibit a negative sign (−), and the correlation coefficient should exceed 0.25. If these conditions are not met, it is advisable to exclude the phrase from further analysis. The outcomes of the construct validity assessment of the scale items are presented in Table 2.

According to the scale items in Table 2, it can be clearly seen that the correlation coefficient of the scale was greater than the cut-off point of 25%, that is, it had a significant positive relationship. The scale items that are related to each other have a value between 0.600 and 0.827.

3.4 Reliability of the Study Tool

Reliability measurement is an important assessment used in determining the reliability of a scale or tool used in a research study. By using reliability, it ensures that the results obtained from administering the scale to the same participants on different occasions are consistent. Additionally, the alpha coefficient of the Cronbach scale was used to assess the reliability of the research tool, where a value greater than 70% indicates the reliability of the research tool, and the closer the value is to 100%, the higher the degree of reliability ([15], p. 322).

Table 3 shows that the reliability and stability of the scale are reflected in the data, as the overall Cronbach's Alpha coefficient reached an acceptable value of 0.929 and its dimensions (0.782–0.892) reached acceptable values. These findings confirm the reliability and stability of the scale, as coefficients exceeding 70% were obtained.

3.5 Normal Distribution Test

In order to determine whether the data collected from customers of Orange Jordan Telecommunications Company adheres to a normal distribution, the researchers conducted Kurtosis and Skewness tests. It is important to note that a Skewness value below ± 1 indicates that the data is normally distributed. Similarly, a Kurtosis value below ± 1.96 is considered indicative of a normal distribution ([8], p. 70). The findings of the normal distribution test for the variables and dimensions of the study's respondents can be found in Table 4.

Table 2 Mean correlation of scale items with their domain

Technique	Phrase	Correlation
Digital marketing techniques		
Social media marketing	1	0.653
	2	0.689
	3	0.686
	4	0.683
	5	0.760
	6	0.685

	26	0.739
	27	0.738
Service purchase decision		
Service purchase decision	28	0.601
	29	0.647
	30	0.735
	31	0.724
	32	0.695
	33	0.659

(continued)

Table 2 (continued)

Technique	Phrase	Correlation
	34	0.671
	35	0.685

Table 3 Cronbach's Alpha results

Statement	Social media technology	Email technology	SMS technology	Website technology	Digital marketing technologies
Number of items	6	9	5	7	27
Cronbach's Alpha	0.782	0.838	0.822	0.854	0.892

Statement	Service purchase decision
Number of items	8
Cronbach's Alpha	0.830
Overall indicator for all items	0.929

Table 4 The results of the normal distribution test

Variable/Dimension	Test	Independent
Social media technique	Skewness	0.692
	Kurtosis	1.689
Email technique	Skewness	0.607
	Kurtosis	0.925
Text messaging technique	Skewness	0.666
	Kurtosis	1.239
Website technique	Skewness	0.512
	Kurtosis	1.270
Digital marketing techniques	Skewness	0.612
	Kurtosis	1.650
Service purchase decision	Skewness	0.463
	Kurtosis	0.792

The data that has been gathered exhibits a normal distribution, as can be observed from the findings presented in Table 4, wherein the skewness and kurtosis values lie within the range of $\pm$ 1 and $\pm$ 1.96, correspondingly.

The suitability of the study model for the statistical methods employed must be considered when investigating the impact of multiple independent variables on a dependent variable. It is imperative to avoid significant correlations between these variables, as such correlations can undermine the predictive power of the study model and obscure the true contribution of each independent variable in explaining

the dependent variable. Consequently, the regression coefficients lose their independence and become unreliable. Ideally, in multiple regression analysis, the correlations between independent and dependent variables should be strong, while the correlations among independent variables should be weak ([3], p. 17). In our study, we have identified four independent variables: Social Media Technique, Email Technique, Text Messaging Technique, and Website Technique. It is crucial to examine these variables and ensure that there are no substantial correlations among them. This can be accomplished by analyzing the Pearson correlation matrix, whereby a correlation coefficient below 0.80 indicates the absence of multicollinearity ([7], p. 365).

Upon conducting calculations to determine the correlation coefficient between various digital marketing techniques, as presented in Table 5, it becomes apparent that the highest value of the correlation coefficient obtained is 0.576. This correlation is also seen between text messaging technique and web development technique which is below 0.80. From this finding, we can conclude that there is no significant correlation between the three different types of digital marketing techniques analyzed because there is no type of linear duplication between them.

The VIF test is a good measure to detect whether there is multicollinearity between the digital marketing techniques we used in the study: social media technique, email technique, text messaging technique, and website technique. If the inflation factor is less than five, it means that there is no significant consistency or linear repetition of digital techniques. Tolerance can be a good indicator and can be obtained by dividing it by the inflation factor. For this reason, if the tolerance of digital marketing techniques is greater than 0.2 and less than one, then we find out that digital marketing techniques do not repeat linearly ([8], p. 201).

Looking at Table 6, we can conclude that there is nothing to worry about, that is, multicollinearity, which is confirmed by the VIF value being lower than (5), and also because the tolerance values are higher than the threshold values—(0.2) and not exceeding (1).

Table 5 Pearson correlation matrix between digital marketing techniques

Digital marketing techniques	Social media technique	Email technique	Text messaging technique	Website technique
Social media technique	1			
Email technique	0.456	1		
Text messaging technique	0.466	0.502	1	
Website technique	0.478	0.449	0.576	1

Table 6 Results of variance inflation factor and tolerance test

Digital marketing techniques	Social media technique	Email technique	Text messaging technique	Website technique
Variance inflation factor (VIF)	1.480	1.496	1.742	1.675
Allowed variance (1/VIF)	0.676	0.669	0.574	0.597

3.6 The Statistical Methods Used in the Study

The research questions and objectives were analyzed and implemented to achieve the purpose of the study and evaluate its model. For this purpose, the SPSS "Statistical Package for the Social Sciences" was used, which helped in conducting several descriptive inferential tests related to the study.

3.7 Testing the Study Hypotheses

Following a thorough assessment of the appropriateness of the statistical techniques employed, this section presents the outcomes of the statistical analysis conducted to test the study hypotheses. Subsequent to the analysis, the null hypothesis (HO) is either accepted or rejected.

3.8 Results of the Main Hypothesis Test

- HO: "There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) for digital marketing techniques, represented by (social media, email, text messaging, website), on the purchasing decision of services in Amman city."

This hypothesis was tested using multiple linear regression, and the results are as shown in Table 7.

The findings of the multiple regression analysis, as presented in Table 7, demonstrate a robust association between digital marketing strategies and the decision to purchase services, as manifested by the correlation coefficient value (R = 68.3%). It can be observed that digital marketing techniques explain 46.6% of the variability in the decision to purchase services, as indicated by the coefficient of determination (R2).

The findings derived from Tables 4, 5, 6, and 7 indicate a substantial influence of digital marketing strategies on the decision-making process for service purchases, as per the decision rules. This conclusion is further supported by the probability value

Table 7 Results of testing the impact of digital marketing techniques on the purchasing decision of services

Dependent variable	Digital marketing techniques	Standard deviation coefficients		Standard coefficients	(T) calculated	T.Sig.
		Standardized	Standard error	Beta coefficient β		
Purchasing decision for services	Constant	1.021	0.171		5.986	0.00
	Social media	0.136	0.044	0.139	3.067	0.002*
	Email	0.115	0.041	0.128	2.808	0.005*
	Text messaging	0.169	0.042	0.197	4.016	0.00*
	Website	0.352	0.045	0.380	7.908	0.00*
R	R^2	Adj R^2		F calculated		F.Sig.
0.683	0.466	0.460		84.403		0.00*
Significant at ($0.05 \geq \alpha$) level						
Tabulated F value = 2.21			DF = 4/38		Tabulated T value = (1.960)	

(F.Sig = 0.00), which is lower than the predetermined significance level (0.05). Moreover, the computed F value (F = 84.403) surpasses the critical F value corresponding to 4/387 degrees of freedom.

Upon examination of the standardized coefficients in the primary hypothesis table, it is evident that social media marketing yielded a positive impact (β = 0.139) on the dependent variable, namely the purchasing decision for services, with a t-value of 3.067, surpassing the critical threshold at a significance level of 0.05. Likewise, email marketing (β = 0.128), text messaging (β = 0.197), and website marketing (β = 0.380) also exhibited favorable effects on the purchasing decision, as indicated by their respective t-values surpassing the critical threshold at a significance level of 0.05.

Consistent with the prescribed decision rules, we proceed to reject the null hypothesis (HO) and embrace the alternative hypothesis (Ha), which posits that digital marketing techniques, encompassing social media, email, text messaging, and website marketing, have a statistically significant impact, at a significance level of ($\alpha \leq 0.05$), on the consumer's decision to purchase services within the confines of Amman city.

4 Discussion of Results and Recommendations

4.1 Discussion of Results

The study yielded the following results:

- Discussion of the results related to the main question (H0): What is the influence of digital marketing techniques on the decision to purchase Internet services at Orange Jordan Telecommunications Company in Amman?

The findings of this study demonstrate a statistically significant impact, with a significance level of ($\alpha \leq 0.05$), of digital marketing strategies, encompassing social media, email, text messaging, and website marketing, on the decision-making process for service purchases in the city of Amman. These results align with prior research conducted by, which also established the influence of different facets of digital marketing tool utilization on the purchasing behavior of students attending private universities in Amman.

- The discussion of the results concerned the first sub-question: What influence do social media have on the decision to purchase Internet services at Orange Jordan Telecommunications Company in Amman?

The findings of this study indicate a statistically significant impact of social media marketing on the purchasing decision for services in Amman, with a significance level of ($\alpha \leq 0.05$). These results align with prior research conducted by Mouwaj [11], which also demonstrated a significant positive association between positive advertising on social networks and the perception of service value.

- The discussion of the results concerned the second sub-question: What impact does e-mail marketing have on the decision to purchase Internet services at Orange Jordan Telecommunications Company in Amman?

The research results show that e-mail marketing has a significant impact on the decision to purchase a service in Amman with a significant level less than or equal to 0.05.

This is consistent with the results of a study conducted by Lajdell and Ben Jameel [10], which showed a significant impact of email marketing on the purchase decision.

- Results of the third sub-question: What is the impact of SMS on the purchase of Internet services at Orange Jordan Telecommunications Company in Amman?

The study results indicate a significant statistical impact on customers' decision-making process regarding the use of digital marketing via text messaging to purchase services in Amman city with a significance level of ($\alpha \leq 0.05$). These results align with the research conducted by Eishawi [6], which also identified a statistically significant influence of mobile marketing on consumer purchasing decisions.

- Discussion of the results related to the fourth sub-question: What influence does the website have on the decision to purchase Internet services at Orange Jordan Telecommunications Company in Amman?

The findings of this study indicate a statistically significant impact of the website as a digital marketing strategy on the decision-making process for services in Amman, with a significance level of ($\alpha \leq 0.05$). These results align with previous research conducted by, who emphasized the efficacy of websites in achieving diverse aspects of digital marketing for organizations in Egypt.

4.2 Recommendations

In light of the study results, the researchers recommend the following:

1. Marketers should focus on leveraging digital marketing techniques due to their significant impact on purchasing decisions in Amman. This can be achieved by examining the impact of each technique mentioned (social media, email, text messaging, internet marketing) on purchasing decisions.
2. For Orange Jordan Telecommunications Company, it is important to improve the quality of interactions via social media platforms. Given their strong influence on purchasing decisions, the company can offer new and innovative services through these platforms.
3. Offering limited free trials of Internet services provided by Orange Jordan Telecommunications Company via email may increase demand. This strategy allows potential customers to experience services firsthand, leading to potential conversions.
4. There should be awareness campaigns highlighting the benefits of SMS messaging offered by Orange Jordan Telecommunications Company. Thanks to the ease and speed of delivery, SMS messages can effectively communicate a company's services to customers.

The Determinants of Banks' Efficiency: A Comparative Study of Islamic and Conventional Banks Using Data Envelopment Analysis

Islam Abdeljawad, Shatha Qamhieh Hashem, and Muna Ghaleb Mahmoud Nairat

Abstract Efficiency stands as a cornerstone for banks to foster economic growth and ensure financial stability within a nation. This study delves into the evaluation and comparison of technical efficiency between Islamic and conventional banks across Iran, Jordan, Palestine, Lebanon, and Syria. Employing the Data Envelopment Analysis (DEA) model, we assess the performance of eighty-three banks, considering inputs such as assets, capital, and deposits, alongside outputs including income, investment, and advances. Additionally, regression analysis is utilized to identify key factors influencing bank efficiency, encompassing bank size, liquidity, profitability, capital ratio, non-performing loans, gross domestic products (GDP), rule of law, and the bank's Islamic or conventional nature. Our findings unveil that Islamic banks, on the whole, surpass their conventional counterparts. Particularly, Islamic banks in Iran, Jordan, and Palestine exhibit superior efficiency, while conventional banks in Syria and Lebanon demonstrate greater efficacy. Regression analysis underscores the positive impact of return on assets, non-performing loans, capital adequacy, liquidity, and GDP on bank efficiency, whereas the rule of law exerts a negative influence. To bolster efficiency, regulatory bodies should contemplate establishing efficiency benchmarks for banks. Moreover, future research avenues should explore alternative efficiency measurement methodologies to deepen our understanding and enhance banking efficiency. This study contributes to the existing literature by furnishing empirical evidence on the determinants of bank efficiency in the Middle East region.

Keywords Data envelopment analysis · Technical efficiency · Constant return to scale · Variable return to scale · Islamic banks

1 Introduction

The banking industry's rapid expansion has drawn increased attention from stakeholders, who seek to evaluate banks' performance through key financial metrics such as productivity and efficiency [1, 2]. Efficiency plays a pivotal role in both Islamic and conventional banks, influencing their overall success and financial stability. Efficient banks possess the ability to generate profits, maintain a robust capital base, and navigate through market risks, financial challenges, and economic uncertainties [3, 4]. Efficiency is fundamental benchmark for assessing bank performance, representing the ratio of outputs to inputs. The goal is to maximize output relative to inputs or to minimize inputs relative to outputs, with highly efficient banks demonstrating superior productivity, thus enhancing their financial performance and competitive edge [5–7].

The Middle East, strategically positioned between Europe and Asia and endowed with vast oil reserves, has witnessed rapid growth in its banking systems. However, the presence of political instability and weak institutional foundations have limited their potential, necessitating proactive economic and institutional policies, especially in the realm of Islamic finance, to fully harness the region's banking capabilities. Middle Eastern banks confront systemic risks [8] such as price shocks and inflation, since they are operating within challenging economic and political landscapes [7, 9, 10], demanding vigilant credit management strategies. Additionally, the proliferation of domestic and international commercial banks intensifies competition for Islamic banks [2], prompting them to adopt internal revenue generation strategies to ensure sustainability.

Against this backdrop, studying the efficiency of conventional and Islamic banks in Middle Eastern countries becomes imperative, guiding these institutions towards corrective measures and underscoring the importance of banking efficiency. This study aims to address two key questions:

1. How are the efficiency levels of Islamic banks compared to conventional banks in the selected countries, as evaluated by the DEA?
2. What are the determinants of bank efficiency in these countries?

Efficiency in banking is crucial for cost reduction, leading to improved profitability and competitiveness. Given the lack of prior research evaluating bank efficiency in these specific countries, this study employs DEA and regression analysis to assess technical efficiency. Notably, previous studies suggest that Islamic banks in the Middle East may be more vulnerable to competition-induced fragility compared to their conventional counterparts, highlighting the policy implications for bank stability [1, 3, 5, 11].

This study holds significance for various stakeholders, including investors, customers, regulators, and central banks, by providing insights to enhance decision-making and monitoring in the banking sector. By enhancing performance, fostering competition, and understanding performance variations across different conditions, this research contributes to a comprehensive understanding of bank efficiency in the Middle East.

2 Bank Efficiency Using DEA

DEA serves as a powerful tool for evaluating bank efficiency, allowing for comparisons between a bank's technical efficiency and that of others operating under similar conditions. It operates as a non-parametric method grounded in linear programming theory, enabling the assessment of relative efficiency among decision-making units (DMUs) [1, 11]. These DMUs utilize inputs to generate outputs, and their efficiency is measured relative to other units within the sample [12]. DEA aids in identifying best practices by benchmarking unit performances against each other.

DEA encompasses several models, with the Constant Returns to Scale (CRS) and Variable Returns to Scale (VRS) models being the most notable. The CRS model assumes that inputs lead to constant returns, indicating that banks produce consistent outputs using the same inputs [13]. Conversely, the VRS model recognizes heterogeneous changes in both inputs and outputs among banks, offering a more flexible assessment of efficiency [14]. While VRS is considered more realistic, it requires more detailed data processing.

DEA employs two primary efficiency measurement models: input-oriented and output-oriented. The input-oriented model aims to minimize inputs, assuming that the most efficient bank utilizes the fewest resources to produce the same outputs [15]. Conversely, the output-oriented model seeks to maximize output with the same level of resources, considering the most efficient bank achieves the highest output with the same input level [15, 16].

3 Hypotheses Development About the Determinants of Bank Efficiency

Banks exhibit varying characteristics that distinguish their internal environments and performance within the sector. Key factors such as capital ratio, size, liquidity, GDP, profitability, non-performing loans (NPL), rule of law, and bank type are pivotal in defining a bank's efficiency.

1. Non-Performing Loans (NPL)

Non-performing loans, relative to total loans and advances, indicate loans at risk or in default, necessitating significant capital allocation for risk management. Elevated levels of non-performing loans diminish bank efficiency, escalating credit risk and operating expenses. Banks typically mitigate this risk through asset restructuring and distressed asset sales [17].

H1: There exists a negative correlation between non-performing loans and technical efficiency.

2. Bank Size

Bank size, often quantified by total assets, profoundly impacts bank efficiency. Larger banks often benefit from economies of scale, resulting in cost efficiencies and

improved service provision. Conversely, smaller banks may display enhanced flexibility in adapting services, rendering them more resilient during economic downturns [17, 18].

H2: A positive relationship is observed between bank size and technical efficiency.

3. Profitability

Profitability, gauged by return on assets (ROA), serves as a fundamental indicator of a bank's efficiency. The bank's capability to generate profits and uphold profit margins underscores effective expense management, risk distribution, and investment competence. However, an excessive focus on profitability may elevate risks and administrative costs, thereby dampening bank efficiency [17].

H3: A positive correlation exists between profitability and bank efficiency.

4. Liquidity

Liquidity, assessed via the ratio of total equity to total assets, signifies a bank's capacity to meet short-term obligations without incurring substantial losses. Banks boasting high liquidity are perceived as more stable and appealing to clients, while low liquidity amplifies operational inefficiencies and risk exposure [19].

H4: A positive association is evident between liquidity and technical efficiency.

5. Capital Adequacy

The capital ratio, ascertained by total equity to total assets, plays a pivotal role in bolstering financial stability and efficiency. Adequate capital empowers banks to withstand losses effectively and allure customers seeking secure banking options. Nevertheless, an excess of capital may inflate administrative costs and risks [17, 19].

H5: A positive correlation is observed between bank capital and technical efficiency.

6. GDP Growth

GDP growth exerts influence on bank efficiency by stimulating consumer demand for financial services. A stable economy fosters profitability and competition among banks, thereby enhancing efficiency. However, economic expansion may precipitate inflation and financial instability, potentially undermining bank efficiency [17, 19].

H6: A positive relationship is anticipated between GDP growth and technical efficiency.

7. Rule of Law

The rule of law, safeguarding banking system integrity and stakeholder interests, positively impacts bank efficiency by fostering competition and transparency. Nonetheless, robust legal frameworks may escalate administrative costs, thereby affecting bank profitability and efficiency [17].

H7: A positive correlation is expected between the rule of law and technical efficiency.

8. Bank Type

Both Islamic and conventional banks prioritize efficiency to ensure stability, confront risks, and attract clientele. Enhanced bank efficiency bolsters stability and profitability, rendering banks more resilient to economic and political fluctuations [1, 3, 15, 16].

H8: A positive relationship is predicted between Islamic bank status and technical efficiency.

4 Research Methodology

4.1 Data

This study compares the efficiency of Islamic banks with traditional banks across the aforementioned countries. The sample comprises 83 banks, including 27 Islamic banks and 56 traditional banks. Some banks were excluded due to insufficient data covering the entire study period. The research adopts a quantitative study design utilizing secondary data extracted from annual financial reports. To mitigate the impact of the global financial crisis of 2008 and the COVID-19 pandemic of 2019, we have chosen the period between 2013 and 2017.

4.2 Data Analysis Approach

First stage: Data Envelopment Analysis (DEA). The DEA technique is vital for evaluating banks' efficiency by comparing inputs and outputs. It helps identify best practices and areas for improvement. In this study DEA has assessed both Islamic and traditional banks' efficiency using input-oriented approach. Inputs in this study include assets, deposits, and capital, while outputs consist of advances, investments, and income as presented in Table 1.

Mathematical explanation. The CRS model can be represented mathematically using an efficiency estimation equation using data envelopment analysis as in Model 1 below:

$$Minimize\ \emptyset_k \tag{1}$$

Subject to

$$y_{rk} - \sum_{j=1}^{n} \lambda_j y_{rj} \leq 0 \quad r = 1, \ldots, s$$

Table 1 Measurements of inputs and outputs for DEA analysis

Variables	Description	Reference
Inputs		
Deposits	Total deposits of client	Abdeljawad et al. [20], Kerimov et al. [21], Hassan and Aliyu [22], Sillah and Harrathi [23]
Assets	Total assets of the bank	Kerimov et al. [21], Hassan and Aliyu [22], Sillah and Harrathi [23]
Capital	Total equity capital	Hassan and Aliyu [22], Abdeljawad et al. [20]
Output		
Investment	Total investments granted	Hassan and Aliyu [22], Sillah and Harrathi [23], Hassan et al. [24]
Advances	Financing and other related assets	Hassan et al. [24]
Income	Total bank revenues after subtracting the costs of doing business such as depreciation, interest, taxes and other expenses	Hassan and Aliyu [22], Abdeljawad et al. [20]

$$\emptyset_k x_{ik} - \sum_{j=1}^{n} \lambda_j x_{ij} \geq 0 \quad i = 1, \ldots, m$$

$$\lambda_j \geq 0 \quad \forall j = 1, \ldots, n$$

Minimize $\emptyset_k$: The minimum degree of efficiency of the DMU and k is the total number of units to be measured.

x_{ik}: The number of inputs to the DMUs to be measured
y_{rk}: The number of outputs of the DMUs to be measured
M: is the total number of input variables (in this study, 3 inputs)
S: is the total number of output variables (in this study, 3 outputs)
N: The number of units to be measured (in this study, 83 banks)
λ_j: The inputs and outputs to be measured must be positive.

Second stage: **Regression analysis**. The second objective of this study involves employing regression analysis to address the primary factors influencing bank efficiency. The dependent variable in this analysis represents bank efficiency, measured through various indicators utilized to capture different dimensions of bank efficiency. Table 2 presents the measurement of dependent variables and independent variables in this study. Model 2 next was estimated using pooled panel data with robust standard errors to account for heteroscedasticity and autocorrelation.

$$\begin{aligned} Y_{it} = {} & B0 + B1 * SIZE_{itm} + B2 * PROF_{itm} + B3 * LIQ_{itm} \\ & + B4 * CAR_{itm} + B5 * NPL_{itm} + B6 * Islamic_{itm} \end{aligned}$$

Table 2 Dependent and independent variables measurement

Variable	Definition	References
Dependent variables		
IO CRS	Input oriented technical efficiency with constant return to scale. Calculated from the first stage	Kamarudin et al. [19]
IO VRS	Input oriented technical efficiency with variable return to scale. Calculated from the first stage	Kamarudin et al. [19]
Independent variables		
NPL	Non-performing loans to gross loans and advances granted to customers	Al-Sharkas and Al-Sharkas [25]
SIZE	Natural logarithm of total asset	Al-Sharkas and Al-Sharkas [25]
PROF	Return on assets is the net profit after tax to total assets	Abdeljawadet al. [17]
LIQ	Total loans divided by total deposits	Saleem et al. [26]
CAR	A ratio of the total equity to total asset	Abdeljawadet al. [17]
GDP growth	Measured as the percentage change in real gross domestic products obtained from world bank national accounts data	Antunes et al. [27]
Rule of law	The "Rule of law" concept reflects society's confidence in and adherence to rules, encompassing aspects like contract enforcement, property rights, law enforcement, judiciary quality, and crime likelihood. Obtained from worldwide governance indicator of world bank	Kamarudin et al. [19]
Islamic	Measured as dummy variable, where '1' is used for Islamic, while '0' is used for conventional	Abdeljawadet al. [17]

$$+ \mathrm{B7} * \mathrm{GDP}_{\mathrm{tm}} + \mathrm{B8} * \text{Rule of Law}_{\mathrm{tm}} + \mathrm{e} \tag{2}$$

Y is the technical efficiency,
B0-B8 are the regression coefficients, and
e is the error term. i subscript is used for bank, t for year, and m for country.

5 Results and Discussions

5.1 Results for the First Stage: Efficiency Estimation Using DEA

DEA results with input orientation focus on minimizing inputs. The closer the score is to 1, the more efficient the DMU is. CRS assume proportional scaling of inputs and outputs, while VRS allow for deviations from this proportionality. Efficiency

Table 3 Summary for results of average technical efficiency score

Type	Country	Input-CRS	Input-VRS
Conventional banks	Iran	0.430	0.477
	Jordan	0.597	0.663
	Lebanon	0.466	0.534
	Palestine	0.593	0.631
	Syria	0.602	0.732
Average		0.537	0.613
Islamic banks	Iran	0.740	0.832
	Jordan	0.874	0.926
	Lebanon	0.256	0.761
	Palestine	0.612	0.655
	Syria	0.577	0.666
Average		0.591	0.802

scores in DEA indicate how effectively a DMU is utilizing its resources to achieve its objectives relative to other units being evaluated. Table 3 presents the results of country average DEA for both conventional banks and Islamic banks.

In Iran, Jordan, and Palestine Islamic banks showed superior average technical efficiency. However, in Lebanon and Syria conventional banks displayed better average technical efficiency. Overall, Islamic banks are, on average, more efficient.

5.2 Results for the Second Stage: Regression Analysis

Descriptive statistics. Descriptive statistics were computed for a sample consisting of 415 observations spanning the period from 2013 to 2017 across 83 banks. However, the number of observations for some variables was 323 due to missing data for certain variables in certain years. These descriptive statistics provide insights into the central tendency, variability, and range of the data, helping to identify any outliers or trends within the dataset.

Table 4 presents descriptive statistics for the dependent variables representing the efficiency of all banks across the selected regions. These variables include the input-oriented technical efficiency models with both CRS and VRS. The table indicates that the average efficiency ratios for the banks within the sample are 0.591 for CRS and 0.675 for VRS. This suggests that banks are generally able to utilize their inputs to produce outputs efficiently, but there is room for enhancement. However, there is considerable variation within the sample, with some banks exhibiting low technical efficiency and others demonstrating high technical efficiency, as indicated by the standard deviations of 0.203 for CRS and 0.212 for VRS.

Table 4 Descriptive statistics

Variable	Obs.	Mean	Std. Dev.	Min	Max
CRS	415	0.591	0.203	0.002	1
VRS	415	0.675	0.212	0.005	1
Bank size	415	21.581	1.656	17.672	24.804
ROA	415	0.013	0.041	− 0.325	0.287
Capital ratio	415	0.127	0.118	− 0.633	0.792
Liquidity	323	0.235	0.106	0.011	0.499
GDP growth	323	− 0.004	0.069	− 0.263	0.089
Rule of low	323	− 0.676	0.722	− 2.096	0.467
NPL	323	0.151	0.199	0	1.296
Islamic	415	0.325	–	0	1

Furthermore, the table includes descriptive statistics for factors influencing bank efficiency, such as bank size, return on assets, capital ratio, liquidity, GDP growth, rule of law, and non-performing loans. These statistics reveal averages, minimums, and maximums for each factor, highlighting the range of values observed within the sample. Negative values for GDP growth and the rule of law indicate instances of economic recession and weak legal frameworks, respectively. Additionally, the table presents statistics for the dummy variable indicating Islamic banks, with an average of 32.5 percent of the sample consisting of Islamic banks.

Pairwise correlations. Table 5 displays the pairwise correlation between variables. It reveals a strong correlation of 0.881 between VRS and CRS, adding to the validity of the dependent variable's measurement. To address the multicollinearity issue, we need to examine the correlation between the independent variables (size, profitability, capital, liquidity, GDP, rule of law, and non-performing loans), which is less than 0.80 in absolute value [28]. Therefore, we can conclude that there is no multicollinearity problem among the independent variables.

Estimation Results. The estimation yielded R-squared values of 0.644 and 0.474, indicating the extent to which the independent variables can explain the dependent variable. The model is estimated using pooled panel data, and all standard errors are robust. The relationship between the size of the bank and efficiency is not significant. This implies that larger banks do not exhibit different efficiency than smaller ones. As for profitability, the analysis revealed a positive, statistically significant relationship with both models. This suggests that banks with higher profitability tend to utilize inputs more efficiently to generate outputs. Essentially, more profitable banks are generally more efficient, as they have greater resources to invest and manage risks effectively [3, 27]. Regarding the capital adequacy variable, there was a positive relationship between capital adequacy and VRS. This implies that banks with strong capital bases tend to be more efficient than those with weaker capital, as they have greater resilience to absorb losses without facing bankruptcy [1, 29]. For the liquidity

Table 5 Correlation coefficient

Variables	1	2	3	4	5	6	7	8	9
(1) CRS	1.000								
(2) VRS	0.881	1.000							
(3) Size	0.000	− 0.012	1.000						
(4) ROA	0.260	0.195	− 0.198	1.000					
(5) capital ratio	0.210	0.232	− 0.524	0.655	1.000				
(6) Liquidity	0.512	0.356	0.222	− 0.149	− 0.124	1.000			
(7) GDP growth	0.007	− 0.020	0.346	− 0.278	− 0.199	0.375	1.000		
(8) Rule of low	0.155	0.036	0.375	− 0.192	− 0.184	0.660	0.506	1.000	
(9) NPL	0.046	0.162	− 0.439	0.275	0.307	− 0.475	− 0.560	− 0.590	1.000

variable, the analysis revealed a positive, statistically significant relationship between liquidity and both CRS and VRS models [30]. This indicates that banks with higher liquidity levels tend to exhibit greater technical efficiency, as they are more adept at using inputs to produce outputs. Essentially, more liquid banks are generally more efficient, as they possess sufficient funds to meet their obligations efficiently [1, 11]. For the non-performing loans variable, the analysis revealed a positive significant relationship between non-performing loans and technical efficiency models—both CRS and VRS [31]. This suggests that banks with higher levels of non-performing loans tend to exhibit greater efficiency compared to those with fewer non-performing loans. Such banks typically focus on improving their operations by implementing strategies like restructuring, rescheduling, or selling loans at higher prices, which enables them to recover a significant portion of these loans and thereby enhance their efficiency [31].

The results also demonstrated a positive and significant relationship between the Islamic banks variable and technical efficiency. This indicates that Islamic banks tend to be more efficient than conventional banks, likely due to their adherence to Islamic Sharia principles [31–33]. These principles often provide advantages that enhance banks' efficiency, such as a business strategy that shields them from sudden political and economic volatility commonly experienced in the regions studied, including Iran, Jordan, Lebanon, Palestine, and Syria. Table 6

As for the GDP variable, a positive relationship with statistical significance was observed between GDP and VRS efficiency [31]. This suggests that higher GDP leads to increased efficiency in banks' utilization of inputs to produce outputs. Essentially, banks tend to be more efficient in a growing and stable economy compared to a deteriorating one, as economic growth provides opportunities for expansion and growth.

Finally, the rule of law variable exhibits a negative, significant relationship in both CRS and VRS models. This indicates that a strong rule of law adversely affects

Table 6 Pooled results with robust standard errors

Independent variables	Dependent variable	
	CRS	VRS
Bank size	0.00320	0.0129

banks, as they incur increased administrative costs to comply with legal requirements, leading to a decline in efficiency [17].

6 Conclusion

This research compared the efficiency level of Islamic versus conventional banks and investigated the determinants of banks' efficiency in selected Middle Eastern countries. Efficient resource management is essential for banks to minimize costs, maximize profits, improve competitiveness, and foster customer trust. Effectively managing capital, deposits, and assets enables banks to achieve their objectives with minimal resources, thereby enhancing profitability and customer satisfaction. Across the studied countries—Iran, Jordan, Palestine, Lebanon, and Syria—similar political and economic conditions significantly influence their banking sectors, including

regional instability, inflation, political turmoil, economic challenges, and security risks.

The research findings suggest that Islamic banks tend to exhibit higher efficiency compared to conventional banks. We attribute this trend to their adherence to Sharia principles, which prioritize risk-sharing and discourage usury. Islamic banks prioritize diversification of investments and the provision of specialized financing services, effectively managing inputs and outputs while mitigating risks. Conversely, conventional banks prioritize profit maximization, often engaging in high-risk ventures and offering high-interest loans, thereby increasing their vulnerability to default risks during crises. However, conventional banks outperform Islamic banks in Lebanon and Syria due to regulatory constraints and political pressures, limiting the growth and operations of Islamic banks.

To address these findings, policymakers in Lebanon and Syria are encouraged to consider relaxing restrictions on Islamic banking to promote competition and enhance overall sector efficiency.

The selected Middle Eastern countries need to introduce legislation to promote efficiency and incentivize innovation. Governments can establish efficiency benchmarks and tie bank incentives to performance, encouraging banks to streamline operations and improve performance. Additionally, supporting fintech development will foster innovation and efficiency within the sector.

Transparency measures, such as mandatory financial disclosures and performance reports, are essential for stakeholders to assess banks' efficiency and hold them accountable. Governments should also enact laws to protect clients' rights and establish effective grievance mechanisms to address consumer concerns.

While this study offers valuable insights, it is not without limitations. Firstly, the focus on specific Middle Eastern countries, namely Iran, Jordan, Palestine, Lebanon, and Syria, may restrict the generalizability of the findings to other regions. Additionally, the reliance on secondary data sources, while necessary for comprehensive analysis, may introduce biases or limitations in data quality and completeness. Moreover, the quantitative methods employed in this study may not capture all factors influencing bank efficiency, overlooking qualitative aspects that could provide deeper insights. Furthermore, the exclusive emphasis on efficiency as the sole performance metric may neglect other important dimensions of bank performance, such as stability or customer satisfaction.

Looking forward, future research could address these limitations and expand the scope of inquiry. Comparative studies across diverse regions could help validate the findings and provide a broader understanding of banking efficiency dynamics. Additionally, there is a need to delve deeper into the impact of Sharia-compliant financial products on bank efficiency, as these products play a significant role in Islamic banking systems. Furthermore, exploring the adoption of financial technology (fintech) and its influence on banking efficiency could uncover new

avenues for enhancing performance. Lastly, qualitative studies focusing on organizational and institutional factors affecting bank performance could provide valuable insights complementary to quantitative analyses. By addressing these limitations and exploring new research avenues, future studies can contribute to a more comprehensive understanding of banking efficiency in the Middle East and beyond.

Marketing Factors Influencing Customers' Purchasing Decisions: Pharmaceutical Products as a Case Study

Zakaria Azzam and Dana Ali Joodeh

Abstract The objective of this research is to investigate the influence of marketing factors on customers' purchasing decisions for pharmaceutical products. These factors include pharmacy location, country of origin of the drug, service provided at pharmacies, pharmacy brand name, and availability of alternatives in the pharmacy. In order to achieve the research objectives and test the hypotheses, a total of 450 questionnaires were distributed to customers from different pharmacies in Jordan. The sample was selected using a simple random sampling method to ensure homogeneity. Out of the distributed questionnaires, 422 were retrieved, resulting in a response rate of 94%. After reviewing the retrieved questionnaires for validity, it was found that 29 questionnaires were not suitable for analysis due to incomplete responses and lack of seriousness from the participants. Therefore, the final number of analyzable questionnaires was 393, accounting for 88% of the total. The findings of the study indicate a significant combined effect of the marketing variables on customers' purchasing decisions for pharmaceutical products. Furthermore, the study reveals that these variables have separate effects with varying degrees of impact, all of which are statistically significant. Among the various marketing factors examined in the study, the availability of alternative drugs in pharmacies was found to have the most significant influence. This was closely followed by the country of origin of the drug, the service provided at the pharmacy, and the brand name of the pharmacy. Interestingly, the location of the pharmacy was found to have the least impact among these factors. The study findings led to a number of recommendations. Firstly, the advice was given that the location selection process be very delicate. The

second recommendation is to include a wide range of health care services at the pharmacy's disposal, in support of selling drugs as a process. It was also mentioned that diversifying drug options would play a significant role for customers. This is not only by providing different options other than one, but giving customers freedom to select drugs based on their preferences and capabilities. Finally, brand names must match well with the mission statement assigned to the pharmacy.

Keywords Marketing factors · Pharmaceutical products · Purchasing decision · Pharmacies · Jordan

1 Introduction

The pharmaceutical industry has become an integral component of modern national economies, owing to the notable expansion of pharmaceutical factories and the presence of numerous pharmaceutical companies catering to the Jordanian market. These companies consistently strive to develop effective marketing strategies in order to sustain their presence, thrive, and secure a substantial market share. Pharmaceutical marketing plays a vital role in establishing a strong relationship between national pharmaceutical industries and the marketing sector. By effectively distributing pharmaceutical products and enhancing their profitability, marketing contributes significantly to the overall success of the industry. Notably, the pharmaceutical sector in Jordan ranks second in terms of total exports, thereby playing a crucial role in reducing the budget deficit. Jordan's pharmaceutical exports surpass its imports by threefold, underscoring the local pharmaceutical industry's pivotal role in bolstering the national economy. Since the inception of the first pharmaceutical factory in Al-Salt, the number of pharmaceutical factories has proliferated, reaching a total of 20 factories with a registered capital of approximately 250 million Jordanian dinars. The market value of these factories exceeds one billion Jordanian dinars. Moreover, these factories provide direct employment to over 5000 workers and indirectly support an additional 3000 individuals through various industrial services, supply chains, research, packaging, design, advertising, promotion, and other marketing activities. The operational industrial sector of pharmaceutical industries holds significant importance, primarily due to the presence of skilled and experienced local workers. This workforce contributes to the sector's efficiency and effectiveness, making it a crucial component of the overall industrial landscape (Al-Rai Newspaper).

In the present era, there are notable global advancements taking place such as globalization, market economy orientation, trade liberalization, and openness to the external world. These developments have a profound impact on pharmaceutical marketing as a whole, including the marketing of pharmaceutical products. The pharmaceutical industry and pharmacy practice serve as a hub of business and a market characterized by fierce competition, whether operating as an independent business, healthcare institution, or private pharmacy. In order to thrive and maintain their presence in the market, pharmacies that cater to customers (patients) must exert significant

efforts to achieve their desired objectives. It is imperative for them to thoroughly study and comprehend the needs and desires of pharmaceutical customers. Pharmacy management should establish a well-organized relationship with the market and customers, focusing on providing a range of healthcare services that effectively address customers' needs and desires. This approach emphasizes the importance of viewing pharmacy activities as a form of marketing rather than solely a sales-oriented endeavor. Key factors that contribute to the pharmacy's effectiveness in the market include selecting an appropriate location and ensuring the availability of necessary medications, among other considerations [3].

Examining the pharmaceutical industry in the Jordanian market reveals a multitude of pharmaceutical products and alternatives, as well as a significant number of pharmacies, both independent and chain establishments. These factors contribute to a highly competitive environment, with pharmacies striving to offer exceptional services in order to attract and retain customers. The presence of these characteristics poses challenges for companies and pharmacies operating in this sector, necessitating the development of effective marketing methods and strategies to effectively distribute products, engage with customers, and meet their specific needs and preferences. Consequently, marketing decisions play a crucial role in influencing customers' purchasing choices when selecting a pharmacy, particularly in the city of Zarqa, where the study area comprises over 360 pharmacies.

The examination of marketing factors plays a crucial role in understanding the purchasing behavior of customers, particularly when it comes to pharmaceutical products. The objective is to identify the underlying reasons for variations in customers' purchasing behavior and the factors that influence their decision-making process. Therefore, it is imperative for marketers and pharmacy management to thoroughly investigate and comprehend these factors in order to gauge their impact on customer behavior and their decision-making process when it comes to specific pharmaceutical products. Contemporary marketing literature emphasizes the significance of placing the customer at the center of the marketing process. Analyzing the factors that guide customers' purchasing behavior and decision-making aims to determine the extent to which it is possible to influence their choices and align marketing strategies accordingly, with the ultimate goal of attracting and retaining customers.

1.1 Problem Statement

The issue at hand pertains to the capacity of pharmacies and industry professionals to comprehend the needs and preferences of customers, as well as to devise a marketing strategy that aligns with prevailing market conditions. Despite the growing significance of pharmaceutical marketing in contemporary times, numerous pharmaceutical companies and pharmacies encounter challenges in identifying the marketing factors that influence customers' choices when purchasing drugs and medical products. Consequently, their ability to effectively promote their pharmaceutical offerings is hindered. The pharmaceutical industry in Jordan, including establishments in

Zarqa, confronts a multitude of difficulties. These include fierce competition within the market, the impact of rapid external environmental changes, and the unyielding demand for pharmaceutical products. These factors have made it arduous for many companies to attract and retain customers. Moreover, companies and pharmacies operating in the Jordanian pharmaceutical sector face additional obstacles, such as the proliferation of pharmacies and their close proximity to one another, the limited availability of alternative options in pharmacies, the Ministry of Health's enforcement of price uniformity, and the purchasing privileges extended to all pharmacies by drug warehouses. These factors have intensified competition among industry players. Consequently, there has been a growing focus among companies and pharmacies on identifying and analyzing the various marketing factors that influence customers' buying choices. This heightened interest stems from the need to devise innovative marketing strategies that can effectively target a wide range of customers, especially in the midst of intense market competition. Thus, the primary objective of this study is to address a series of research questions that encapsulate the core problem under investigation.

In this study, the primary focus revolves around addressing the fundamental inquiry: To what extent do marketing factors influence the purchasing decisions of customers when it comes to pharmaceutical products obtained from pharmacies operating within the context of Jordan?

2 Hypotheses of the Study

Based on the problem of the study and its objectives, the researchers assumed the following hypotheses:

- **Primary Hypothesis (H0)**: "There is no statistically significant effect at the significance level ($\alpha \leq 0.05$) of marketing factors on customers' purchasing decisions for pharmaceutical products from pharmacies operating in Jordan."

2.1 Study Model

The study model was developed by synthesizing existing literature and incorporating relevant variables identified through a comprehensive review. Figure 1 illustrates the sources that informed the design of the model, including studies by [1, 2, 4, 6, 9, 11].

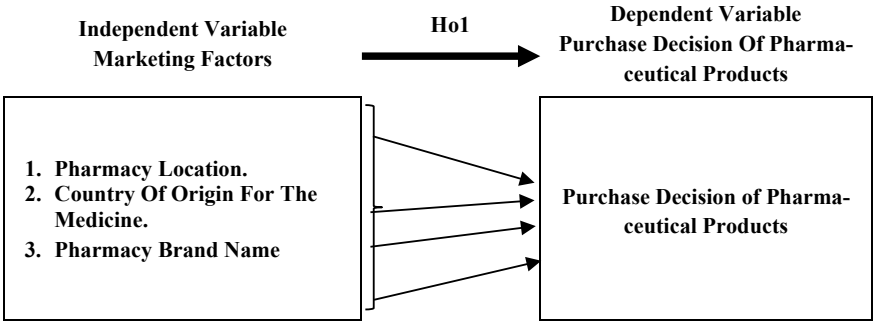

Fig. 1 Study model

3 Theoretical Framework

Marketing factors encompass both internal and external elements and forces that play a crucial role in enhancing an organization's competitiveness, while also influencing the development and execution of its marketing policies and strategies [6].

- **Location**: The establishment in question is meticulously crafted to cater to the requirements, fulfill the aspirations, and embody the attributes that align with the expectations of both clientele and stakeholders. This is the space where individuals associated with the organization are present to facilitate the transfer of advantages from the product to the customers. Furthermore, the physical setting is symbolized by the pharmacy, where patients engage with the pharmacy personnel to acquire appropriate medications that aid in their recuperation from illness or affliction [6].
- **Country of Origin**: The country of origin is a multifaceted concept that can be defined in two dimensions. Some define it as the country where the product is manufactured, while others consider it to be the country where the product is designed.
- **Brand Name**: According to Kotler, the concept of a brand name encompasses a unique and recognizable name or symbol that serves the purpose of identifying and differentiating the goods and services provided by a specific producer or group of sellers. It plays a crucial role in indicating the origin of the product to the customer, while simultaneously safeguarding both the customer and the product from potential competitors who may attempt to offer similar products [10].
- **Service**: According to the scholarly work by Azzam et al. [6], the concept of service can be defined as an intangible activity or benefit provided by one party to another, which does not involve ownership and may be associated with either tangible or intangible products.
- **Alternatives**: Pharmacy personnel engage in a variety of activities that aim to provide significant benefits to customers. These products share common attributes and fulfill identical requirements, allowing for the interchangeability of one alternative with another to yield equivalent advantages [6].

- **Purchase Decision**: According [6], the customer engages in a multifaceted cognitive process with the objective of selecting the optimal options for goods, services, and organizations. This process requires the collection and study of data plus finding appropriate options customized to one's unique situation. The act of purchase decision denotes the selection among various choices available and seeing it as better than others [5, 7, 8].

4 Study Methodology

The researchers used a Sekaran table as a resource for sample selection, aiming to overcome the difficulty of determining the exact number of pharmacy customers without insurance affiliations. In this table provided estimates for both the size of the study population and the appropriate sample size that should be taken into consideration to represent the population accurately. A mathematical approach was then adopted by the researchers in order to come up with another table that clearly illustrated who to be represented as the study population and what would constitute an ideal representative sample.

The researchers chose the maximum value from the table, which pointed out that there should be 384 people in the sample. This number was considered to be the smallest limit that is possible to reach in order for a sample to represent a population. In an attempt to ensure the sample size was appropriate and avoid questionnaires that might not be returned or were unusable for analysis, 450 questionnaires were given to customers from various pharmacies in Zarqa Governorate. The selection of participants was done using simple purposive sampling, which aimed to ensure the similarity of characteristics within the sample.

Upon the completion of the distribution process, the researchers successfully obtained a substantial number of (422) questionnaires, signifying a retrieval rate of approximately (94%). Regrettably, (29) questionnaires were unable to be retrieved, resulting in a minor loss. To ensure the accuracy and reliability of the data, a thorough review of the retrieved questionnaires was conducted. It was discovered that (29) questionnaires were deemed unanalyzable due to incomplete responses and the lack of seriousness exhibited by some participants. Consequently, the final number of analyzable questionnaires amounted to (393), accounting for approximately (88%) of the total questionnaires.

4.1 Study Instrument

A comprehensive questionnaire was carefully devised in order to evaluate the study variables. It was not just any questionnaire; it was made up of a sequence of items, each tailor-made to capture a unique aspect of the variables being probed. These items did not come into existence haphazardly; they were meticulously formulated after

Table 1 The items in the questionnaire

Axis	Number of items
First Part	
Gender	2
Age	4
Marital status	4
Educational level	4
Income	4
Second Part	
Pharmacy location	6
Country of origin	6
Pharmacy brand name	6
Service provided	6
Alternatives available	6
Drug purchase decision	8

Table 2 Likert five-point scale

Response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
Code	5	4	3	2	1

delving deep into the annals of existing literature. The aim was simple yet profound: ensure that they were not only valid but also relevant. But the quest for quality did not stop there. The researchers, in their pursuit of excellence, decided to knock on the ivory towers where distinguished academicians from the realm of marketing resided. Their mission? Seek feedback that would help enrich the questionnaire further: in terms of both comprehensiveness and accuracy. The birth of a questionnaire thus turned into an epic saga where every character (or insight) played a crucial role in shaping its destiny—towards becoming an invaluable tool for this research study.

The questionnaire was bifurcated into two parts: the primary part covered basic details, and the secondary part delved into variables along with their corresponding items. An overview of the count of items in each section is detailed in Table 1.

In the study, a five-point Likert scale was adopted to encode the sample responses to the questionnaire items, as shown in Table 2.

4.2 Reliability

The concept of reliability pertains to the degree of consistency exhibited by questionnaire items, encompassing both the coherence of an individual's responses and the consistency of their rankings in the event of test repetition. Reliability serves as

Table 3 Cronbach's alpha coefficients

Variables	Items	Cronbach's Alpha
Pharmacy Location	Q1–Q6	0.745
Drug Country of Origin	Q7–Q12	0.787
Pharmacy Name	Q13–Q18	0.780
Services Provided	Q19–Q25	0.804
Alternatives Available	Q26–Q31	0.794
Purchase Decision	Q32–Q39	0.846
Overall Performance	–	0.901

an indicator of the anticipated stability in questionnaire responses when the measurement process is replicated for the same individual under comparable circumstances, thus implying a sense of steadfastness.

The questionnaire's reliability was assessed using Cronbach's alpha coefficient (α), which measures the correlation between individuals' responses on different occasions. Cronbach's alpha ranges from (1) to (0). Reliability is considered low if alpha is below (0.4), moderate if it falls between (0.4–0.7), and high if it exceeds (0.7). Table 3 presents the alpha coefficients for the study variables.

The findings from the Cronbach's alpha test indicate that the variables' items exhibit a high level of reliability, surpassing the minimum threshold of 0.7. Among the variables, the items of the Pharmacy Location variable were found to have the lowest reliability coefficient of 0.754, whereas the Purchase Decision variable demonstrated the highest reliability with a coefficient of 0.846. Overall, the items displayed a commendable level of reliability, with a coefficient of 0.901.

4.3 General Information About the Study Sample

The participants in this study exhibit a range of characteristics, which were assessed through a series of questions incorporated into the questionnaire. These characteristics encompass gender, age, marital status, educational attainment, and income. The frequency and corresponding percentages of these characteristics are presented in Table 4.

The analysis of the personal information data from the study sample revealed a notable gender disparity, with males comprising a majority at approximately 62%, while females accounted for approximately 38%. Age information was categorized into four groups, with the age range of 29–38 years being the most prevalent among the participants, representing approximately 37% of the sample. Conversely, the age range of 18–28 years had the lowest representation, constituting only 15.5% of the total sample.

In terms of educational attainment, the study sample individuals were categorized into four distinct levels. Notably, those with a Bachelor's degree accounted for the

Table 4 Description of study sample data

Variable	Personal information	Frequency	Percentage (%)
Gender	Male	243	61.8
	Female	150	38.2
Age	18–28 years	61	15.5
	29–38 years	146	37.2
	39–48 years	89	22.6
	49 years and above	97	24.7
Educational Level	General Secondary or below	66	16.8
	Intermediate Diploma	88	22.4
	Bachelor's Degree	214	54.5
	Postgraduate Studies	25	6.4
Income	$\leq$ 300 JD	93	23.7
	301–500 JD	132	33.6
	501–1000 JD	111	28.2
	> 1000 JD	57	14.5
Marital Status	Single	155	39.4
	Divorced	64	16.3
	Married	155	39.4
	Widowed	23	5.9
Total		393	100

largest proportion, comprising approximately 54.5% of the participants. Conversely, individuals with postgraduate degrees were the least represented, constituting only 6.4% of the sample.

The study focused on analyzing the income levels of individuals, which were classified into four distinct categories. Among the sampled individuals, those falling within the income range of 301–500 dinars constituted the largest proportion, comprising approximately 33.6% of the sample. Conversely, the category with the least representation was individuals earning more than 1000 dinars, accounting for approximately 14.5% of the sample. The researcher postulates that this disparity may be attributed to their affiliation with insurance networks that have contractual agreements with their respective companies.

In terms of marital status, the highest proportion of individuals in the sample were found to be married, accounting for approximately 39.4%, while the lowest representation was observed among widowed individuals, constituting approximately 6% of the sample.

4.4 Description of Study Variables

The study covered a wide range of 6 factors, including the dependent variable, to look at how pharmacy customers liked medication purchasing decisions. We used statistical measures like the mean and standard deviation to figure out where most of the data points lie and how scattered they are around that value. Moreover, we also looked into how important each item was so we could get an idea about what customers typically prefer. The analysis that follows will give you numbers on central tendency, dispersion, and importance for each variable considered in this study.

Pharmacy Location

A total of six items were used to measure pharmacy location as a variable. The results are detailed in Table 5, offering a complete summary of the arithmetic means, standard deviations and relative significance for each item.

The findings presented in Tables 5 indicate that the majority of participants assigned a high level of importance to all aspects of the pharmacy location variable, with the exception of the fourth item. Notably, the first item received the highest

Table 5 The arithmetic means and standard deviations for the items of the pharmacy location variable

Item	Rank	Mean	Standard deviation	Relative importance
1. Preferring dealing with pharmacies near my residence	1	4.61	0.781	High
2. Repeating the purchasing process from pharmacies located on main roads	4	3.94	0.91	High
3. Preferring to buy from pharmacies with multiple locations (pharmacy chain)	5	3.88	1.169	High
4. The presence of the pharmacy within a shopping complex encourages me to deal with it	6	3.62	1.157	Medium
5. The availability of parking space in front of the pharmacy is important for me to deal with it	2	4.04	1.1	High
6. Preferring pharmacies located away from congestion and traffic signals	3	3.98	1.098	High
General Scale	–	4.01	1.035	High

Table 6 Arithmetic means and standard deviations of items of the country of origin variable for pharmaceutical products

Item	Rank	Mean	Standard deviation	Relative importance
7. I am curious to know the country of origin of the medicine I buy from the pharmacy	1	4.01	1.139	High
8. Knowing the country of origin of the medicine gives me a good idea about the medicine	6	3.68	1.139	High
9. I believe that knowing the country of origin gives an idea about the effectiveness of the provided medicine	2	3.81	1.177	High
10. I prefer locally manufactured pharmaceutical products more than foreign ones	3	3.73	1.181	High
11. I prefer locally manufactured pharmaceutical products because of their easy availability	4	3.72	1.27	High
12. I prefer local medicines for their affordable prices	5	3.69	1.21	High
General Scale	–	3.77	1.186	High

average score of 4.61 among all items within the variable. This suggests a unanimous preference among the respondents for pharmacies that are conveniently located near their places of residence.

Among the items analyzed in the study, the fourth item received the lowest average score of 3.62. This score indicates a medium level of importance. Consequently, it can be inferred that the participants in the study do not exhibit a strong inclination towards choosing pharmacies located in shopping complexes.

The findings of the study revealed that the variable of pharmacy location demonstrates a significantly high arithmetic mean of 4.01, indicative of a favorable inclination towards selecting pharmacies based on their geographical proximity.

Country of Origin of the Pharmaceutical Product

The country of origin variable was measured through a detailed compilation of six items, tabulated in Tables 3, 4 for an explicit graphical depiction detailing the means, standard deviations, and relative significance of the components (Table 6).

The average values of all variables related to the country of origin were found to be highly significant in terms of importance. The seventh item stood out with an arithmetic mean of 4.01 (the highest among all items). This underscores participants'

keen interest in knowing and caring about the country of origin prior to any purchase decision.

The eighth item has the lowest arithmetic mean of (3.68) among all the items. Despite this, it still holds significant importance as it highlights the strong association customers make between the country of origin and the perceived quality of the medicine. Customers consider the country of origin as an indicator of quality when making their purchasing decisions.

In terms of the average value for the variable representing the country of origin, it was found to be (3.77), indicating a significant level of importance. The individuals in the sample exhibit a strong preference and keen interest in the country from which the medicine originates.

Pharmacy Name

The measurement of the variable "Pharmacy Name" was conducted through the utilization of a comprehensive set of 6 items. The means, standard deviations, and relative importance of these items are effectively presented in Table 7, providing a valuable illustration of the variable's characteristics.

Among all the items evaluated, the eighteenth item received the highest average score of (3.98), indicating its significant importance. This suggests that the name of the pharmacy plays a crucial role in attracting customers and motivating them to engage with the pharmacy, ultimately leading to increased purchases.

In contrast, item 14 ranked the lowest in terms of arithmetic mean, with a moderate relative importance score of (3.6). This indicates that the connection between a pharmacy's name and medicine does not serve as a significant motivating factor for customers to choose that particular pharmacy.

In general, the variable representing the name of the pharmacy exhibited a considerable level of importance, as evidenced by its high relative importance score of (3.8). This underscores the significant role that the pharmacy's name plays in the attraction of customers to the establishment.

Pharmacy Service

The measurement of the pharmacy service variable consisted of 7 items, which are presented in Table 8. This table provides the arithmetic means, standard deviations, and relative importance values for each item.

The variable pertaining to the pharmacy service displayed significant relative importance across all items. Among these, the nineteenth item emerged as the most relatively important. This is evident from its high arithmetic mean of 4.31, highlighting the crucial role of the service in attaining a competitive edge and influencing customers' choice of pharmacy.

In contrast, item 24 received the lowest average score of (3.9) among all the items, indicating its high significance. This finding implies that a considerable number of pharmacies prioritize post-purchase health check-ups, fostering ongoing communication with their customers.

In general, the variable pertaining to pharmacy services demonstrated a significant level of importance, as evidenced by a relatively high arithmetic mean of (4.08). This

Table 7 Arithmetic means and standard deviations of items of the pharmacy name variable

Item	Rank	Mean	Standard Deviation	Relative Importance
13. The pharmacy's name in Arabic strengthens the relationship between the customer and the pharmacy	2	3.97	1.161	High
14. I believe that a pharmacy's name related to medicine encourages me to deal with it	6	3.6	1.043	Moderate
15. The pharmacy's name on social media platforms continuously enhances customers' trust in the pharmacy	5	3.65	1.205	Moderate
16. The pharmacy's name gives an idea about the type of healthcare service provided in the pharmacy	4	3.76	1.046	High
17. The compatibility of the pharmacy's name with its nature attracts me to deal with it	3	3.87	1.139	High
18. The clarity of the pharmacy's name motivates me to deal with it	1	3.98	1.095	High
General Scale	–	3.8	1.114	High

suggests a prevailing inclination among the individuals surveyed to select pharmacies that provide a comprehensive array of services.

Alternatives Available in the Pharmacy

In relation to the final independent variable, the measurement of the available alternatives within the pharmacy was conducted through the utilization of six distinct items. The means, standard deviations, and the relative importance of these variable items are presented in Table 9.

Among the survey items, Item 26 received the highest mean score of 4.04, indicating that the availability of lower-priced alternatives in the pharmacy has a positive impact on customers' interactions with the pharmacy. The respondents emphasized the significant role of alternative pharmaceutical products in their choice of pharmacy, particularly when considering lower-priced options.

In reference to Item 27, which pertains to the abundance of alternatives available at the pharmacy and its impact on customers, it was rated as relatively less important with a mean score of 3.81. However, it still falls within the category of high relative

Table 8 Arithmetic means and standard deviations of items of the pharmacy service quality variable

Item	Rank	Mean	Standard deviation	Relative importance
19. I believe that the service provided at the pharmacy is a competitive factor that influences its selection	1	4.31	0.989	High
20. Pharmacy staff have sufficient knowledge about the medicines they deal with	3	4.09	0.96	High
21. Pharmacy staff provide sufficient time for medical advice	2	4.18	0.959	High
22. The presence of auxiliary health services in the pharmacy attracts me to it (blood pressure, sugar, weight measurement)	4	4.08	0.975	High
23. The pharmacy providing fast services motivates me to deal with it	5	4.03	1.065	High
24. Pharmacy staff follow up on the customer's health status after purchasing the medicine	7	3.9	1.161	High
25. Pharmacy staff have politeness in dealing with the patient	6	3.97	1.069	High
General Scale	–	4.08	1.025	High

Table 9 Mean and standard deviation of items for the alternatives available in the pharmacy variable

Item	Rank	Mean	Standard deviation	Relative importance
26	1	4.04	1.109	High
27	6	3.81	1.137	High
28	3	3.98	1.052	High
29	5	3.86	1.031	High
30	4	3.91	1.03	High
31	2	4.01	1.09	High
Scale		3.93	1.075	High

importance. Respondents unanimously agree that the availability of alternatives in the pharmacy plays a crucial role in enhancing its reputation among customers. The variable representing the availability of alternatives at the pharmacy obtained a mean

Table 10 Mean and standard deviation of items for the decision to purchase medicines variable

Item	Rank	Mean	Standard deviation	Relative importance
32	3	4.02	1.09	High
33	8	3.85	1.031	High
34	5	3.92	1.035	High
35	2	4.03	1.047	High
36	1	4.04	1.079	High
37	4	4.01	1.01	High
38	6	3.91	1.09	High
39	7	3.92	1.053	High
Scale		3.96	1.054	High

score of 3.93, indicating its significant influence on customers' decision-making process when choosing a pharmacy and making medication-related choices.

Decision to Purchase Medicines Variable

The measurement of the dependent variable, which pertains to the decision-making process surrounding the purchase of medicines, was conducted through the utilization of eight distinct items. The corresponding means, standard deviations, and relative significance of these variable items are presented in Table 10.

The mean values obtained from the analysis reveal that every item pertaining to the decision to purchase medicines carries substantial importance. Particularly, item 36 stands out with the highest relative importance, measuring at 4.04. This finding strongly suggests that the quality of service plays a significant role in influencing the decision to purchase medicines.

Among the items surveyed, Item 33 received a relatively lower mean score of 3.85. However, it is important to note that this item still falls within the category of high relative importance. This finding underscores the significance of the country of origin in influencing customers' decisions when it comes to purchasing medication.

In general, the choice to procure pharmaceuticals exhibited a noteworthy mean value with a substantial relative importance (3.96), indicating the influential role of multiple factors in customers' decision-making process when it comes to purchasing medications.

4.5 Comparison with the Relative Importance of Independent Variables

Table 11 provides a comparison of the means and standard deviations for the independent variables.

Table 11 Mean and standard deviation for items of the decision to purchase medicines variable

Item	Rank	Mean	Standard deviation	Relative importance
Pharmacy location	2	4.01	1.035	High
Country of origin for the pharmaceutical product	5	3.77	1.186	High
Pharmacy trade name	4	3.8	1.114	High
Service provided in the pharmacy	1	4.08	1.025	High
Alternatives available in the pharmacy	3	3.93	1.075	High
Overall scale		3.92	1.087	High

Upon examining the mean values of the independent variables, it is evident that all variables exhibit a considerable level of importance. Notably, the variable pertaining to the quality of service rendered by the pharmacy displayed the highest relative importance, boasting an impressive mean of 4.08. Conversely, the variable associated with the country of origin of the pharmaceutical product showcased the lowest relative importance, with a mean value of 3.77.

The substantial mean of 3.92 for the independent variables signifies the crucial influence of marketing factors in the decision-making process when it comes to purchasing pharmaceutical products.

4.6 The Main Hypothesis

In order to test the main hypothesis, the researchers employed multiple linear regression analysis as a statistical tool. This analysis allowed them to investigate the following research question in a comprehensive manner: To what extent do various marketing factors, such as pharmacy location, drug country of origin, pharmacy name, pharmacy services, and available alternatives in pharmacies, influence customers' decision-making process when purchasing pharmaceutical products from pharmacies in Jordan?

The main hypothesis was tested at a significance level ($\alpha \leq 0.05$), and the results were as follows (Table 12):

- The calculated F value (65.355) was found to be greater than the tabulated value, which indicates a statistically significant effect between the variables.
- To demonstrate statistical significance, the significance level of the test was compared to the significance level adopted in the study. The significance level for F was (0.000), which is lower than the significance level adopted in the study (0.05). Thus, the null hypothesis was rejected and the alternative hypothesis was accepted, indicating a statistically significant impact of marketing factors (pharmacy location, country of origin of the drug, pharmacy brand, services provided

Table 12 Shows the results of the multiple linear regression analysis

Dependent variable	Correlation coefficient (R)	Determination coefficient (R^2)	Calculated F	DF	Significance level (Sig)	Independent variable	B value	t value	Significance level (Sig)
Purchase decision	0.677	0.458	65.355	–	0.000	Pharmacy Location	0.002	0.048	0.961
				5		Drug Country of Origin	0.159	3.829	0.000
				387		Pharmacy Name	0.108	2.67	0.008
						Pharmacy Services	0.165	3.575	0.000
				392		Available Alternatives in Pharmacies	0.433	9.599	0.000

and available alternatives) on customer satisfaction with the decision to purchase pharmaceutical products from pharmacies operating in Jordan.

- The correlation between the independent variables and the dependent variable was inferred using the correlation coefficient (R). The correlation coefficient was found to be 0.677, indicating a strong positive relationship between the combined independent variables (pharmacy location, country of drug origin, pharmacy brand, services provided and available alternatives) and the dependent variable (drug purchase decision). This correlation was found to be significant.
- The results also show an explanatory power of 45.8% for the combined independent variables (pharmacy location, country of drug origin, pharmacy brand, services provided and available alternatives) of the dependent variable (drug purchase decision), as indicated by the coefficient of determination ($R^2 = 0.458$).
- The table shows that the calculated t-values for the independent variables (country of origin of the drug, pharmacy brand, services provided and available substitutes) were statistically significant at the 0.05 level of significance, while the variable (pharmacy location) was not statistically significant. At a significance level of 0.05, with a significance level of (0.961).

4.7 Recommendations

- Pharmacies should choose appropriate locations when establishing pharmacies, taking into account factors such as avoiding traffic congestion and choosing locations near apartment complexes.
- Providing a range of health services in pharmacies, including the sale of medicines, within the capabilities of existing staff. If possible, there should be a pharmacist on duty in the pharmacy who will provide patients with medical advice and guidance and handle electronic payments by cards.
- Constantly provide a variety of drug alternatives and avoid limiting customers to one option by giving them the freedom to choose drugs according to their capabilities.
- Choose the right pharmacy brands that reflect your pharmacy's core mission. Promote your pharmacy brand and available services via social media platforms to attract customers.
- Pharmacists should disclose the country of origin of medicines as it plays a significant role in helping customers make purchasing decisions, reflecting the quality of the pharmaceutical product.

The Impact of Accounting Conservatism on the Profits of Insurance Companies Listed on a Stock Exchange During the COVID-19 Pandemic

Ola Khresat and Khaldoun Omar Ali Al Khalayla

Abstract The aim of this research is to assess how accounting conservatism impacts the profitability of insurance firms listed on the ASE for a period between 2018 and 2022, taking into account the effects related to COVID-19. The assessment of the level of accounting conservatism was conducted using the Basu model (J Account Econ 24(1), 3–37, 1997 [1]), and other statistical tests were performed to validate the results utilizing the EViews 13 software. The sample for this study consisted of 19 insurance companies that are listed on the ASE. The study findings indicate the presence of accounting conservatism in the financial reports of these companies, as losses were recognized more promptly compared to profits. The results demonstrated a positive and statistically significant influence of accounting conservatism on both Return on Equity (ROE) and Return on Assets (ROA). However, no significant impact of accounting conservatism on Return on Invested Capital (ROIC) was observed. Furthermore, the outcomes did not reveal any significant effect of the pandemic of COVID-19 on the Jordanian insurance companies' profitability. Building on these results, the study proposes several recommendations, including the enhancement of accounting conservatism practices by insurance companies to enhance the quality of their financial reports and bolster investor confidence. It is imperative for regulatory authorities to enforce strict adherence to accounting conservatism standards by insurance companies. Additionally, investors and financial analysts should duly consider the influence of accounting conservatism when assessing the financial performance of insurance firms.

1 Introduction

The accounting system heavily relies on the principles of accounting conservatism, which serve as a vital framework for the presentation and preparation of financial statements [2, 3]. Over time, these principles have experienced significant development within accounting practices, assuming a substantial role in the assessment of corporate profits and facilitating sound decision-making. The utilization of accounting conservatism has expanded to encompass a wide range of economic sectors, including the insurance industry [4].

The attainment of profitability serves as a fundamental objective for corporations, serving as a crucial metric for assessing their performance and capacity to endure and expand amidst a dynamic business landscape [5–7]. The advent of the pandemic of COVID-19 introduced novel obstacles for insurance companies listed on the ASE, exerting a direct impact on their financial performance and their capacity to realize desired levels of profitability [8–11].

The global proliferation of the pandemic of COVID-19 has had a great impact on the insurance industry as well as financial services [1, 12–14]. Because cases and deaths are still rising, leading to considerable increases in demand for health and life insurance by people and companies alike. This is likely, in turn, to affect significantly the markets for insurance products and investment portfolio strategies. These changes are foreseen to have a big influence on the financial results and accounting forecasts, say, of such insurance firms [15].

Furthermore, due to the pandemic of COVID-19, a considerable instability has been generated in financial markets that have led to significant fluctuations [16–18]. Market volatility has a cascading impact and it can directly affect the investment portfolios of insurance firms which then contributes towards determining the total value of their assets. As a result, these companies are under pressure to generate reliable accounting estimates so as to ascertain the actual effect on their profit-making level.

An analysis into the impact of accounting conservatism among insurance companies on their earnings through the ASE during COVID-19 can be helpful in understanding how to mitigate risks and, consequently, improve financial gains of such firms later. The findings of this chapter are expected to elucidate new insights into understanding the effects of major economic downturns on the insurance industry as well as other financial markets which might broaden our scope in this area.

The need for a study in accounting conservatism in its effect towards public insurance companies listed on ASE under COVID-19 using the Basu model [1]. This is important because we must not lose sight of what these unforeseen events mean for the performance of this key sector. Thereupon, the study will inspect the different models of accounting conservatism; one being Basu [1], which will help us to establish whether they indeed have an impact on insurance companies' net profit from 2018 through 2022.

1.1 The Problem Statement

Jordan's insurance sector faces many obstacles, notably due to the economic recession which has affected the world market and exacerbated by the pandemic of COVID-19. These challenges emanate from the fierce rivalry among local insurance companies, as well as their competition with regional and international counterparts. Consequently, it is imperative for these companies to adopt a prudent and risk-averse strategy in their operational and investment practices, as this will inevitably impact their financial performance and ultimately their profitability.

By conducting a comprehensive review of various prior studies, such as those conducted by [10], and [8, 13, 19–23], the researchers successfully identified the problem statement pertaining to the examination of the correlation between accounting conservatism.

1.2 Study Model

The design of the study model was formulated by conducting a comprehensive examination of the existing literature pertaining to the subject matter, as well as utilizing the problem statement, hypotheses, and variables outlined in the study. The model encompasses the incorporation of the independent variable of accounting conservatism, which is measured using the Basu model [1]. Additionally, the dependent variables encompass the assessment of insurance companies' profitability, as measured by ROA, ROE, and ROIC.

Based on [1–14, 16–27, the model was conducted by the researchers (Fig. 1).

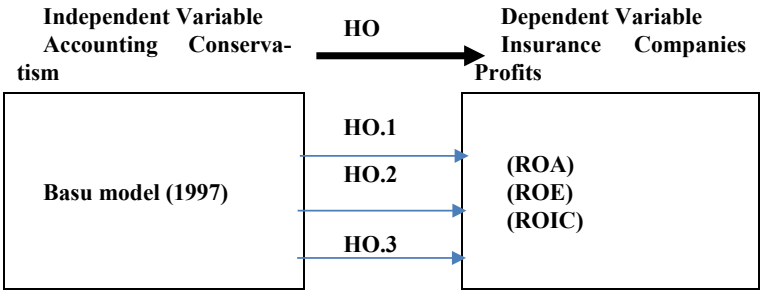

Fig. 1 Study model

2 Hypotheses of the Study

Building on the study problem and the questions thereof, the following were formulated:

Main Hypothesis

- H0: "There is no statistically significant effect at a significance level of ($0.05 \geq \alpha$) of accounting conservatism using the Basu [1] model on the profits of insurance companies listed on the ASE."

Subsidiary Hypotheses

- H0.1: "There is no statistically significant effect at a significance level of ($0.05 \geq \alpha$) of accounting conservatism using the Basu [1] model on the profits of insurance companies listed on the ASE measured by ROA."
- H0.2: "There is no statistically significant effect at a significance level of ($0.05 \geq \alpha$) of accounting conservatism using the Basu [1] model on the profits of insurance companies listed on the ASE measured by ROE."
- H0.3: "There is no statistically significant effect at a significance level of ($0.05 \geq \alpha$) of accounting conservatism using the Basu [1] model on the profits of insurance companies listed on the ASE measured by ROIC."

3 Previous Studies

There exists a lot of literature that explores the link between accounting conservatism and investment. Take for example the work done by [7] who found that there is no positive correlation between accounting conservatism and the effectiveness of investments using market-to-return model, indicating negative association with investment efficiency in public shareholding companies. On the other hand, it reported a situation where accounting conservatism was positively associated with investment efficiency as measured by deviation from expected investment model. Similarly, Yasa et al. [27] found through their study that profit quality receives positive impact from accounting conservatism, therefore an important factor to consider in managerial decisions which affect profit quality.

Al-Khaldi and Abu Al Jaleel [3] found a similarity in the level of accounting conservatism among firms that are listed on Palestine Stock Exchange. However, their investigation could not find any statistically significant impact of the degree of accounting conservatism on profits. On the contrary [2] showed a negative correlation between accounting conservatism and profit management as two variables among the companies traded publicly in Palestine Stock Exchange.

The article of [5] reported a study that looked into how accounting conservatism affects profit quality indicators and the debt level. The findings indicated a notable positive relationship between the level of accounting conservatism and profits sustainability. Although no substantial impact was found regarding the level

of accounting conservatism on profit predictability, it was revealed that there is an adverse effect within firms listed in Saudi Stock Market on their debt levels due to this conservatism practice.

Likewise, investigation delved into the correlation between accounting conservatism and financial performance in commercial banks. The study found a positive connection of conservatism with ROE and return on assets.

Many studies have delved into the effect of accounting standards on accounting conservatism. A case in point is the research by Khreisat et al. where they looked at how Financial Reporting Standard 15 impacts accounting conservatism which was an analysis that used the Basu model as a yardstick. Curiously, these investigations failed to unearth any substantial impact of net assets acting as a mediating variable on accounting conservatism.

Additionally, the research carried out by [9] was aimed at exploring the composition of accounting information systems and their impact on implementing conservatism in accounting. The findings of the chapter showed a positive correlation between how accounting information systems are structured and how much conservatism is applied.

4 Study Methodology

This paper applied the Basu model [1] to assess the impact of accounting conservatism on the earnings of insurance firms in ASE amid COVID-19, based on data collected from their financial reports.

4.1 Study Sample and Population

The research sample encompassed all insurance firms that were publicly traded on the ASE. The study employed financial information extracted from the annual financial reports of these listed firms from 2018 to 2022, resulting in a total of 20 companies. The study sample selection criteria were as follows.

- Exclusion of companies involved in mergers or acquisitions during the study period.
- Exclusion of companies with insufficient data.
- Exclusion of companies subjected to liquidation or trading suspension.

Upon the application of the aforementioned criteria, the study sample was constrained to encompass a total of 19 Jordanian insurance companies that are publicly traded on the ASE. The data available for analysis spanned the duration from 2018 to 2022. It is noteworthy that this selected sample constitutes 95% of the entire population of Jordanian insurance enterprises listed on the ASE.

4.2 Measurement of Variables

The goal of the chapter is to evaluate the influence of accounting conservatism, as measured by the Basu model [1], on the financial performance of insurance firms listed on the ASE during the COVID-19 crisis. To accomplish this, the study compared the degree of conservatism, as indicated by the Basu measure, between the pre-COVID-19 periods (2018–2019) denoted by the dummy variable (0), and the COVID-19 period (2020–2022) denoted by the dummy variable (1).

The Independent Variable: Accounting Conservatism

Accounting conservatism serves as the independent variable in this study. Various models are available to gauge the extent of accounting conservatism, and the researcher opted to utilize the Basu model [1] to examine the study hypotheses.

The Basu Model, proposed in 1997, operates under the assumption that accountants have a tendency to acknowledge unrealized losses prior to unrealized gains. In accordance with the Basu model, negative information is promptly incorporated into earnings, while positive information is comparatively slower to be reflected.

Hence, the metric for conservatism entails assessing the disparity in earnings fluctuations between unfavorable news periods and favorable news periods. The Basu model [1] employs a reverse regression analysis, wherein the decrease in earnings (X) is regressed against returns (Ric), as represented by the following regression model:

$$\boldsymbol{X_{i,t}/P_{i,t-1} = \alpha 0 + \alpha 1 DR_{i,t} + \beta 0 R_{i,t} + \beta 1 \left(R_{i,t} \times DR_{i,t}\right)}$$

where:

Xi, t Ordinary earnings per share for company iii in period ttt, equals net income before extraordinary items divided by the number of ordinary shares.
Pi, t Share price at the beginning of period t for company iii.
Ri, t Return on shares, measured by the difference between the market price of shares at the end and beginning of the period, plus dividends.
DRi, t Dummy variable, equals 1 if Ri, t is less than zero, and 0 if Ri, t is greater than zero."

The Dependent Variable: Insurance Companies' Profits

The study used the following indicators to measure insurance companies' profits:

- ROA: The company's capacity to generate profits from its investments, as a reflection of its managerial competence, can be assessed through a calculation that involves dividing the net income (profit after taxes) by the total assets [20] $\textbf{ROA} = \frac{profits\ after\ taxes}{total\ assets}$.
- ROE: The calculation of this metric involves dividing the net income by comprehensive equity. Its purpose is to provide insight into the effectiveness of capital

management and the utilization of financial resources in order to generate a return on investment $\mathbf{ROE} = \frac{net\ income}{total\ assets}$.

- ROIC: The calculation involves the division of net income by invested capital, allowing for the expression of the actual return that the company attains from the capital allocated to different assets [16] $\mathbf{ROE} = \frac{net\ income}{invested\ capital}$.

5 Data Analysis and Hypothesis Testing

To analyze and evaluate the hypotheses, the E-views software was employed. The random effects model was utilized to estimate the Basu model. Three distinct models, namely the ROA model, the ROE model, and the ROIC model, will be employed to assess the hypotheses.

5.1 Estimation of the Basu Model

In the light of Hausman test results, we decided to use the random effects model to quantify Basu [1] model. This model is widely acknowledged for its ability to capture accounting conservatism. It hinges on an interesting behavioral assumption where accountants are said to exhibit greater promptness in acknowledging unrealized losses as opposed to gains. This has been made possible through employment of a new approach; the reverse regression model unveiled by Basu [1] that essentially correlates declining earnings with returns and thus allows us estimate coefficients for this particular model (Table 1).

The analysis findings reveal a positive statistical correlation (which is also significant) between the Return on Stock (RIT) and falling Earnings Per Share (X/P). This can be seen through the value of the regression coefficient, which is 0.2012, and the fact that the *p*-value is less than 5%. On another note, there seems to be a negative relationship that is statistically significant between DR*RIT and X/P with a regression coefficient of − 0.1512 and also a *p*-value below 5%. These results seem to point towards an interesting observation in the accounting practices of Jordanian insurance firms. Indeed, they seem to follow more of an accounting conservatism principle where losses are recognized more promptly than gains which is reflective via financial statements.

The residuals were acquired after estimating the Basu model, representing the portion of unexplained declining Earnings Per Share. These residuals will be used as a check on conservatism in accounting and also applied to test the various hypotheses following the study's evaluation.

Table 1 Estimation of the Basu model

Independent variable: insurance companies' profitability				
Panel least squares				
Sample: 2018–2022				
Periods included: 5 periods				
Cross-sections included: 19 companies				
Total observations: 95 observations				
Variable	Coefficient	Std. error	t-Statistic	Prob
C	0.0061	0.0072	0.8434	0.4017
DR	0.0108	0.0086	1.2493	0.2155
RIT	0.2012	0.0618	3.2550	0.0017
DR*RIT	− 0.1512	0.0713	− 2.1207	0.0373
R	0.8509			
R^2	0.7240			
Adjusted R-squared	0.6446			
F-statistic	9.1197			
Prob (F-statistic)	0.0000			
Durbin-Watson stat	2.0657			

5.2 Hypothesis Testing (ROA Model)

To examine the influence exercised by accounting conservatism on the ROA in insurance companies listed on the ASE, a multiple linear regression model was employed. Additionally, a dummy variable was included to account for the pandemic of COVID-19 period. The presence of autocorrelation was addressed through the utilization of the GLS-PCSE method. The outcomes of the initial hypothesis test are presented in Table 2.

The results reveal a statistically significant positive correlation between ROA and accounting conservatism. This is reflected in the regression coefficient of 30.71 with a *p*-value less than 1%, suggesting that with every uptick in conservatism levels, ROA is expected to surge by 30.71 units—all other factors held constant. Additionally, findings point towards insignificance of COVID-19 era on ROA; the *p*-value surpassing 5%. Ergo, it can be deduced that profitability among Jordanian insurers remains unperturbed by the pandemic period—an indirect implication from this analysis.

The results lead us to reject the primary null hypothesis (H0.1) and support the alternative hypothesis, implying that there is indeed a considerable and statistically meaningful effect of accounting conservatism on ROA in Jordan's insurance industry during the study period.

Table 2 Results of the first hypothesis test

Dependent variable: ROA				
Method: generalized least squares (GLS) panel estimation (cross-section weights)				
Sample: 2018–2022				
Periods included: 5 periods				
Cross-sections included: 19 companies				
Total observations: 95				
One-step weighting matrix linear estimation				
Dependent variable: ROA				
Variable	Coefficient	Std. error	t-Statistic	Prob
BASU	30.7100	4.8252	6.3646	0.0000
COVID	− 0.4960	0.2930	− 1.6930	0.0938
C	2.1796	0.2133	10.2202	0.0000
R	0.4905			
R^2	0.2405			
Adjusted R-squared	0.2240			
F-statistic	14.5700			
Prob (F-statistic)	0.0000			

5.3 Hypothesis Testing (ROE Model)

To study the effect of accounting conservatism on ROE for insurance firms in ASE, the multiple linear regression model was used, which controlled for the impact of COVID-19 by using a dummy variable. To address the issue of autocorrelation, the GLS-PCSE method was utilized. The results concerning the second hypothesis test are outlined in Table 3.

The findings demonstrate a notable and statistically significant impact of accounting conservatism on the ROE, as evidenced by a regression coefficient of 68.78 and a *p*-value below 1%. This implies that for every unit increase in the level of accounting conservatism, there is an associated increase of 68.78 units in the ROE, while controlling for other variables. Furthermore, the results indicate that the pandemic of COVID-19 period (COVID) does not have a significant effect on the ROE, given that the *p*-value exceeds 5%. This outcome aligns with the earlier findings regarding the impact on the ROA.

Upon analyzing the findings, it is evident that the second null hypothesis (H0.2) can be refuted, thereby accepting the alternative hypothesis. This signifies that there exists a substantial and positive impact of accounting conservatism on the ROE within Jordanian insurance firms throughout the duration of the study.

Table 3 Results of the second hypothesis test

Dependent variable: ROE				
Method: generalized least squares (GLS) panel estimation (cross-section weights)				
Sample: 2018–2022				
Periods included: 5 periods				
Cross-sections included: 19 companies				
Total observations: 95				
One-step weighting matrix linear estimation				
Cross-section weights (PCSE) standard errors and covariance (corrected for degrees of freedom)				
Variable	Coefficient	Std. error	t-Statistic	Prob
BASU	68.7804	17.2725	3.9821	0.0001
COVID	− 1.3726	1.1588	− 1.1846	0.2392
C	4.2274	0.8580	4.9273	0.0000
R	0.2993

Adjusted R-squared	0.0698			
F-statistic	4.5259			
Prob (F-statistic)	0.0133			

5.4 Hypothesis Testing (ROIC Model)

To examine the impact of accounting conservatism on the ROIC in insurance companies listed on the ASE, a multiple linear regression model was employed. Additionally, a dummy variable was included to account for the period of the pandemic of COVID-19. The issue of autocorrelation was addressed using the GLS-PCSE method. The findings of the third hypothesis test are presented in Table 4.

Based on the findings, it can be concluded that there is no statistically significant impact of accounting conservatism on the ROIC, as evidenced by a *p*-value exceeding 5%. Furthermore, the results indicate that the pandemic of COVID-19 period does not have a significant effect on the ROIC, as the *p*-value also exceeds 5%.

After analyzing the obtained findings, it can be concluded that the third null hypothesis (H0.3) is upheld, thus suggesting that there is an absence of a substantial impact of accounting conservatism on the ROIC within Jordanian insurance companies throughout the duration of the study.

Table 4 Results of the third hypothesis test

Dependent variable: ROIC				
Method: generalized least squares (GLS) panel estimation (cross-section weights)				
Sample: 2018–2022				
Periods included: 5 periods				
Cross-sections included: 19 companies				
Total observations: 95				
One-step weighting matrix linear estimation				
Cross-section weights (PCSE) standard errors and covariance (corrected for degrees of freedom)				
Variable	Coefficient	Std. error	t-Statistic	Prob
BASU	0.1985	0.1181	1.6808	0.0962
COVID	− 0.0113	0.0078	− 1.4408	0.1530
C	0.0709	0.0062	11.3562	0.0000
R	0.2169			
R^2	0.0470			
Adjusted R-squared	0.0263			
F-statistic	2.2703			
Prob (F-statistic)	0.1090			

6 Results

The impact of accounting conservatism on ROA in insurance companies listed on the ASE during the pandemic of COVID-19 period was examined using the multiple linear regression model. The findings revealed a significant and positive correlation between ROA and accounting conservatism, as indicated by a regression coefficient of 30.71 and a *p*-value of less than 1%. This implies that for every one unit increase in accounting conservatism, there is a corresponding increase of 30.71 units in ROA, while holding other variables constant. However, it was observed that the COVID-19 period did not have a significant effect on ROA.

In terms of ROE, the findings demonstrated a statistically significant positive impact of accounting conservatism, as evidenced by a regression coefficient of 68.78 and a *p*-value of less than 1%. This implies that a one-unit increase in the level of accounting conservatism results in a corresponding increase of 68.78 units in ROE, while controlling for other variables. Similar to the effect observed on ROA, the pandemic did not exhibit a significant influence on ROE.

In terms of the ROIC, the findings did not indicate any substantial impact of accounting conservatism or the COVID-19 period. Consequently, the null hypothesis, which posits that there is no notable influence of accounting conservatism on ROIC in Jordanian insurance firms throughout the duration of the study, was upheld.

7 Recommendations

- Compliance with international accounting standards has to be enhanced.
- Accurate transaction documentation and clear and transparent financial reporting ensure the quality of financial data and increase investor confidence.
- Insurance companies should direct their investments towards high-return areas, which can benefit shareholders and increase their ROA and equity.
- Strengthen the financial and investment management strategies to achieve maximum return on appropriate risk, thereby achieving your long-term financial goals.
- Continuously monitor the impact of economic and environmental conditions, including pandemics such as COVID-19, and take necessary actions to mitigate negative impacts and capitalize on any positive opportunities that may arise.
- Conduct more research to examine the impact of firm characteristics such as size, leverage, and ownership structure on the relationship between accounting conservatism and profitability.
- Investigate the impact of accounting conservatism on other aspects of financial performance, such as market value and cost of capital.
- Conduct comparative research between different countries aimed at understanding the impact of institutional and cultural factors on accounting conservatism practices and their impact on financial performance.

The Impact of Green Accounting Disclosure on the Financial Performance of European Industrial Companies During the Period 2010–2022

Ghassan Daas and Nour Abu Ridi

Abstract This study examines the impact of green accounting disclosure on financial performance indicators of European industrial companies during the period 2010–2022, as eight indicators of green accounting disclosure were used as independent variables, and these indicators were considered dummy variables with an amount of **(0**, **1)**, and the ROA**, ROE and EPS** dependent variables, and the data were extracted from the DataStream database for 1050 firms. Using multiple regression analysis, the results of the study showed a variation in the effect of green accounting disclosure indicators on the financial performance indicators of industrial companies. Environmental Expenditures Investments, Environmental Expenditures, Environment Management Team, Policy Energy Efficiency, Renewable Energy Use, Policy Emissions, and Environmental Supply Chain Management have a positive effect on the ROA, ROE, and EPS with different level. The firm size as control variable affects the impact of the green accounting disclosure on the financial performance. Finally, the study recommended a set of recommendations, including that regulations and instructions related to green disclosures and sustainability disclosures be taken into account within the company's internal strategies, and disclosures should be provided periodically to stakeholders to preserve the company's funding sources, which fundamentally affect the companies' financial performance indicators.

Keywords Green accounting · Financial performance indicators · ROA · ROE · Green accounting disclosure indicators

1 Introduction

The environmental disturbance is increasing significantly day after day, and what helped intensify this is the industrial revolution that occurred in the late eighteenth century, when the most difficult technological or mechanical system was authorized to carry out traditional work instead of human hands [1]. We do not deny that companies provide financial reports, but at the time they failed to recognize the extent of the impact of their economic activities on the surrounding environment [2]. The concept of green accounting emerged, which calls for the process of integrating environmental costs and financial operations in a way that serves the interest of the institution and the surrounding environment, which reflects the possibility of achieving a balance between making money, people's lives, and the health of the planet [3].

Disclosure is one of the basic and necessary methods that help decision-makers make the correct decisions and thus follow green accounting standards disclosing them in the company's financial reports is one of the most important ways to know the extent of the company's responsibility toward the environment [4]. As a result of the increasing environmental risk, it has become one of the most important ways to know the extent of the company's responsibility towards the environment. It is necessary to implement environmentally friendly measures by institutions and disclose them [5].

The goal of green accounting, known as environmental accounting, is to take into account the environment and its sustainability by including environmental impacts in financial reports, and the fact that the industrial sector is one of the most important economic sectors that has the greatest impact on the environment, as it includes the manufacture of many products, some of which have environmental emissions and environmental damage. It has become a must to find out whether there is a relationship between green accounting disclosure and the financial performance of industrial companies [5].

The financial performance indicators only provided insight into an organization's financial well-being through measures such as liquidity and profitability. However, the concept of financial health has evolved and is now evaluated by considering the effective allocation of resources that incorporates both environmental costs and profitability. This approach supports sustainable growth. According to [2] highlights the importance of evaluating financial and environmental performance to achieve profitability. However, the disclosure of green accounting is still voluntary as there are no specific accounting standards regulated for this purpose. Nevertheless, SFAS No. 1 of 2009 allows companies to provide additional services in financial reports related to the environment and value-added services, especially in specific industries [6].

The unique role of social responsibility allows companies to acquire strategic resources for development, which in turn helps them earn the trust of consumers. By assessing their environmental costs and estimating their resource losses within the country, companies can demonstrate their commitment to social responsibility. It is important to note that disclosing social responsibility, whether through financial

reports or company websites, can significantly increase transparency and positively impact the long-term sustainability of the company [7].

Water and air pollution are major environmental disasters that need to be addressed. Striking a balance between environmental development and the economy is important, and this can be achieved through the use of green accounting strategies. Recently, it has been recommended that the environmental and economic accounting systems be linked by connecting natural assets accounts to income and production accounts. This follows the basic principle of national accounts and allows for the evaluation of natural resources and productive capital at any given time [4].

Green accounting, and according to previous studies [1] the concentration were on the disclosure of Environmental Expenditures Investments, Environmental Expenditures, Environment Management Team, Policy Energy Efficiency, Renewable Energy Use, Policy Emissions, Environmental Supply Chain Management and Environmental R&D Expenditures. Which is the main components collected in a formal procedure from the European firms and accordingly disclosed in the published database (**DataStream** data).

2 Problem Statement

According to [8] the industrial revolution that took place in the late eighteenth century has caused significant environmental damage worldwide. Due to the conflicting interests of institutions and the local communities in which they operate, it has become essential to strike a balance between economic and environmental interests. This is why accounting contribute for, specifically green accounting, which is crucial in reducing the ecological footprint of companies and demonstrating their environmental responsibility. By disclosing their green activities in their financial reports, companies can show their commitment to the environment.

Green accounting is a type of accounting that attempts to factor environmental costs into the financial results of operations, and companies that disclose environmental information are, on average, larger in terms of total assets and income, owe more and provide a higher return on investment. So, environmental disclosure is a determinant of the company's profitability or value [9]. Accordingly, this study try to examine the green accounting disclosure and the firm's performance, and the study problem aimed to answer research question of "What is the impact of green accounting disclosure on the financial performance of European industrial companies listed on the European Stock Exchange for the period 2010–2022?"

3 Objectives of the Study

This study aims to investigate the effects of green accounting disclosure on the financial performance of European industrial companies listed on the European Stock Exchange for the period 2010 to 2022. The study aims to achieve the following objectives:

- Determine whether companies are capable of making green accounting disclosures either within their financial reports or in a separate report.
- Analyze the impact of green accounting disclosure on the return on assets, return on equity, and earnings per share.
- Identify the impact of green accounting disclosure on the financial indicators, considering company size and quality management as control variables.

4 Research Importance

Green accounting is a comprehensive field that is utilized at all levels of accounting. Its primary goal is to provide accounting information to the makers and users of internal and external financial reports. This type of accounting is also utilized to identify different environmental investments to gain profits and avoid environmental accountability [10]. Many countries are still struggling to balance environmental preservation with economic development. To achieve this balance, it would be beneficial for them to adopt accounting practices related to green accounting and incorporate disclosures related to environmental impact in their financial reports [3].

All business looks for sustainability, to survive and to be going concern. So, it is important to investigate whether there is a correlation between green accounting disclosure and a company's performance. Recently, financial accounting has been a major topic of research due to its role in sustaining the environment by striking a balance between development and environmental protection while also achieving societal returns [11].

5 The Theoretical Framework and Hypotheses Development

Financial indicators play a crucial role in providing information about a company's financial performance and its ability to meet its obligations. They also help evaluate the company's work, determine the level of its administrative success, and ensure legal compliance.

Legitimacy theory: according to [12] "Legitimacy theory is crucial in explaining the organization's behavior in implementing and developing social responsibility

policies, and then communicating its results. It treats corporate social and environmental performance and disclosure of this information as a way to fulfill the organization's social contract that enables the recognition of its objectives." Also, "Theory of legitimacy asserts that the organization seeks to ensure that they are perceived as operating within the bounds and norms of their respective societies, that is they attempt to ensure, that their activities are perceived by outside parties as being "legitimate" [13]

Green accounting: according to [14] companies need to understand environmental reports to increase their knowledge and awareness of their responsibilities towards the environment. The local government can also use these reports to understand an organization's environmental practices. Green accounting is viewed as an accurate source of information on an organization's impact on the environment. It is often disclosed in the company's environmental report or through collective disclosure [1]**.**

Return on assets: The rate of return on assets is one of the most important traditional financial indicators that are used to measure a company's performance and indicate the extent of its ability to achieve an appropriate return on assets [1, 15]. It was found that there is a close and positive relationship between environmental disclosure and the rate of return on assets [16, 17]**.** So, the first hypothesis can be set as:

H01: *There is positive impact of disclosing green accounting on the return on assets of European industrial companies listed on the European Stock Exchange for the period 2010–2022.*

Return on equity: according to [18] this indicator has great importance in attracting investors and plays a vital role in comparing institutions, especially in the industrial sector. Green accounting and practices lead to an increase in company profits, making this indicator one of the most crucial financial indicators. Social spending can also lead to an improved return on equity. Therefore, the disclosure of green social practices has a positive relationship with the return on equity [15–17]. So, the second hypothesis can be set as:

H02: *There is positive impact of disclosing green accounting on the return on equity of European industrial companies listed on the European Stock Exchange for the period 2010–2022.*

Earnings per share: Earnings per share is a crucial financial indicator that investors use to calculate expected profits and revenues from investing in a company's ordinary shares. The disclosure of green accounting significantly impacts the EPS. A positive disclosure of green accounting can boost demand for the company's shares and increasing its trading value. Therefore, companies should prioritize disclosing their green accounting practices to attract more investors and improve their financial performance [17]**.** So, the third hypothesis can be set as:

H03: *There is positive impact of disclosing green accounting on the earnings per share of European industrial companies listed on the European stock exchange for the period 2010–2022.*

Company size: Large companies have access to multiple financing sources, which gives them the ability to perform better and have stronger support. This strength can be reflected in the level of disclosure they provide. For instance, industrial companies, being large in size, have higher disclosures and more accurate information compared to smaller companies. This positive relationship between company size and disclosure can be useful for companies that are committed to green environmental practices [19]. So, the fourth hypothesis can be set as:

H04: *There is positive impact of green accounting disclosure on the financial performance of European industrial companies listed on the European Stock Exchange for the period 2010-2022in light of the presence of company size as a control variable.*

Quality Management: according to [11]**,** it is crucial to prioritize quality management within an organization. This administrative task is aimed at upholding a high level of product quality, which in turn plays a positive role in preserving the environment. Quality management is not limited to the product itself but also extends to the workers who are trained to produce high-quality products. The quality of these products is measured by the amount of expenses incurred, both on the product and on the workers. So, the fifth hypothesis can be set as:

H05: *There is positive impact of green accounting disclosure on the financial performance of European industrial companies listed on the European Stock Exchange for the period 2010-2022in light of the presence of quality management as a control variable.*

6 Methods and Procedures

6.1 Data collection methods

The study collected data from the DataStream database (DataStream is a global financial and macroeconomic time-series database, providing data on equities, stock market indices, currencies, company fundamentals, fixed income securities and key economic indicators for 175 countries and 60 markets) [20], which covered the period (2010 to 2022). The companies had to be listed on European stock exchanges for the period 2010 to 2022. Data for 1050 firms were collected. Moreover, all information and disclosures related to green accounting indicators and financial indicators had to be available. For each of the green accounting disclosure the sample was selected on the data availability by each green accounting disclosure variable. Table 1 illustrates the number of observation through the study period (2010–2022) for each

Table 1 Study sample

Variable	Observations	Variable	Observations
1.EEI = Environmental expenditures investments	5192	2-EE = Environmental expenditures	1109
3-EMT = Environment management team	5642	4-PEE = Policy energy efficiency	5648
5-REU = Renewable energy use	5640	6-PE = Policy emissions	5948
7-ESCM = Environmental supply chain management	5640	8-ERD = Environmental R&D expenditures	277

variable. No consistent disclosure for all variables. So, each variable was analyzed independently for its impact of the financial performance indicators

6.2 Variables

Table 2 Presents the Study Variables, Their Types, Scientific Terms, Measurement Mechanisms, and Sources of Information.

A regression model was developed to determine the effect of green accounting disclosure on the financial performance of European industrial companies listed on the European Stock Exchange.

Regression model —— $FP = \alpha 0 + \beta 1GACC + \beta 2FSIZ + \beta 3QMAN_{+} \varepsilon$.

Where: FP: Financial performance indicator, GACC: Green accounting disclosure variable, FSIZ: Firm size, QMAN: Quality Management.

7 Results

The total number of 1050 European industrial companies for the period (2010 to 2022) were surveyed. The study examined a set of green accounting disclosure indicators and financial performance indicators. The selected period was based on the availability of data related to green accounting disclosure indicators, which was only available from the year 2010.

To ensure that the data used for the statistical analysis was complete and error-free, any missing data was excluded from the sample. The green accounting disclosure

Table 2 variables definition and measurement

Variable	Variable type	Definition of variable	Measurement mechanism	Source of information
Green Accounting disclosure 1- EEI = Environmental Expenditures Investments 2-EE = Environmental Expenditures 3-EMT = Environment Management Team 4-PEE = Policy Energy Efficiency 5-REU = Renewable Energy Use 6-PE = Policy Emissions 7-ESCM = Environmental Supply Chain Management 8-ERD = Environmental R&D Expenditures	Independent	It is the impact of human activity on the Earth's environmental systems and resources, and it is an accounting that calls for a balance between the organization's interest and the environmental interest [1]	The impact of green accounting disclosure is measured by examining a group of environmental indicators within companies' reports and giving the code (1) to companies that disclose these indicators and the code (0) to companies that do not disclose these indicators	Data published in)DataStream)
Return on assets	Dependent	It is an indicator used as a measure to determine the amount of profits generated on average per unit of assets	Calculated through the following equation: net profit after tax/ total assets [21]	Data published in (DataStream)
Return on equity	Dependent	It is an indicator used as a measure to determine the returns of shareholders and the potential growth of their investments	Net profit after tax / Equity [21]	Data published in (DataStream)

(continued)

Table 2 (continued)

Variable	Variable type	Definition of variable	Measurement mechanism	Source of information
Earnings per share	Dependent	It is the ratio that indicates shareholders' profits	(Net profits after tax - dividends on preferred shares)/number of common shares [22]	Data published in (DataStream)
Quality Management	Control	It is a measure used to express the extent of the company's interest in the degree of efficiency of its products and their distinction from other products	It is measured by all expenses spent on the product and also by workers to produce the best they can [11]	Data published in (DataStream)
Company size	Control	Large companies enjoy a high volume of financing sources, and therefore they have great strength in support and great strength	Natural logarithm of total assets, [19]	Data published in (DataStream)

indicators were then organized to measure their impact on the financial performance indicators. And, additionally, the study examined the impact of company size and quality management as control variables. All the regression models for the eight independent variable indicates VIF less than 5, which indicates no multicollinearity problems.

8 The Impact of Disclosing Environmental Expenditure Investments (EEI) on Financial Performance (ROA, ROE, EPS)

Firms through its social and environmental responsibility have to invest in environmental protection, such investment will gain the reputation of the firm's equity. Results in Table 3 indicates that there is a significant positive impact of the of the environmental expenditure investment on the financial performance indictors (0.88, 9.975, and 0.117) for ROA, ROE, and EPS respectively. The most positive impact was for the ROE. The values of R square before and after the inclusion of the control variables are significant, then the model is fit.

By adding the control variables (Firm size) and (Quality management), the results were show significant impact of on ROA and ROE belongs to the firm size, and the

Table 3 The Regression analysis on the impact of disclosing environmental expenditures Investments (EEI) on financial performance) ROA, ROE, EPS)

Dependent variable		Coefficient	R square/Sig	Sig coefficient	Result					
ROA		0.880	0.002/0.001	0.001 < 0.05	Significant impact					
ROE		9.975	0.001/0.026	0.026 < 0.05	Significant impact					
EPS		0.117	0.002/0.001	0.001 < 0.05	Significant impact					
In the presence of QM and company size as control variables								**Independent**		
Dependent variable	R square/Sig	**With size**			**Quality management**			**EEI**		
		Coefficient	Sig	VIF	Coefficient	Sig	VIF	Coefficient	Sig	VIF
ROA	0.014/0.00	1.407	0.00	1.664	− 3.818E−12	0.396	1.487	0.043	0.884	1.155
ROE	0.005/0.00	12.928	0.000	1.664	1.282E−11	0.862	1.487	1.686	0.725	1.155
EPS	0.004/0.00	0.045	0.090	1.664	5.479E−13	0.351	1.487	0.082	0.032	1.155

quality management insignificant for all dependents. The overall impact of the control variable on EEI, only significant for EPS. The results indicate the control variables affect the results of ROA, and ROE.

8.1 The Impact of Disclosing Environmental Expenditure (EE) on Financial Performance (ROA, ROE, EPS)

Firms through its social and environmental responsibility have to pay expenses for environmental protection, such expenses if disclosed will gain the reputation of the firm's equity. Results in Table 4 indicates that there is light significant positive impact of the environmental expenditure on the financial performance indictors (very low impact) for ROA, ROE. Compared to the environmental expenditures investment, the investment is more impact and seen on the ground. The values of R square are insignificant for all models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for ROA and EPS, then the model is fit when it is significant by adding the control variables. The results also show significant impact of on ROA belongs to the firm size, and the quality management significant for ROA and EPS. The overall impact of the control variable on EE, only significant for EPS. The results indicate the control variables affect the results of ROA, and EPS.

9 The Impact of Disclosing Environment Management Team on Financial Performance ROA, ROE, and EPS

Managing the environmental impact with its policies, investment, and procedures needs to be driven by highly qualified team. Results in Table 5 indicates that there is a significant positive impact of the of the environmental management team on the financial performance indicators of ROA and EPS (1.013, and 0.89) for ROA, and EPS respectively, but with no significant impact for ROE.. The most positive impact was for the ROE even it insignificant. The values of R square are significant for ROA and EPS models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for all dependents. The results also show significant impact of on ROA and ROE belongs to the firm size, and the quality management insignificant for all models. The overall impact of the control variable on EMT, insignificant all dependents. The results indicate the control variables affect the results of ROA, and EPS. Table 5

Table 4 The Regression results on the impact of disclosing environmental expenditures (EE) on financial performance) ROA, ROE, EPS)

Dependent variable		Coefficient		R square/Sig	Sig coefficient	Results				
ROA		7.212E−13		0.001/0.384	0.384	No significant impact				
ROE		2.371E−13		0.000/0.994	0.994	No significant impact

ROE	0.005/0.00	12.889	0.000	1.655	6.14E-12	0.927	1.482	-1.348	0.747	1.143
EPS	0.003 /0.001	0.04	0.102	1.655	6.38E-13	0.231	1.482	0.062	0.062	1.143

10 The Impact of Policy Energy Efficiency on Financial Performance (ROA, ROE, and EPS)

Managing the environmental impact with its policies, investment, and procedures that driven by highly qualified team is one side, but the impact of the pollution resulted from energy providers also highly considered. The implementation of policies in efficient manner shall be examined Results in Table 6 indicates that there is a significant positive impact of the of the Policy Energy on the financial performance indicators of ROA and EPS (4.420, and 0.224) for ROA, and EPS respectively, but with negative significant impact was for the ROE. The values of R square are significant for ROA and EPS models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for all dependents. The results also show significant impact of on ROA and ROE belongs to the firm size, and the quality management insignificant for all models. The overall impact of the control variable on PEE, significant ROA and EPS. The results indicate the control variables have no affect the results of ROA, and EPS. Table 6

11 The Impact of Renewable Energy Use on Financial Performance (ROA, ROE, and EPS)

To protect the environment from the pollution impact, the clean sources of energy will decline the pollution percentage, so, the use of renewable energy will affect the protection. Results in Table 7 indicates that there is a significant positive impact of the of the renewable energy use on the financial performance indictors (2.336, 0.109) for ROA, and EPS respectively. The most positive impact was for the ROA resulted from cost reduction on the use of energy sources. The values of R square are significant for ROA and EPS models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for all dependents. The results also show significant impact of on ROA and ROE belongs to the firm size, and the quality management insignificant for all models. The overall impact of the control variable on REU, significant ROA and EPS. The results indicate the control variables have no affect the results of ROA, and EPS.

Table 6 The Regression results on the impact of **disclosing Policy Energy Efficiency** (PEE) on financial performance) ROA, ROE, EPS)

Dependent variable		coefficient		R Square/ Sig	Sig coefficient	Result				
ROA		4.420		0.027/0.00	0.000	Significant impact				
ROE		1.992-		0.000 / 0.724	0.724	No significant impact

Table 7 The Regression results on the impact of Renewable Energy Use (REU) on financial performance) ROA, ROE, EPS)

Dependent variable		coefficient		R Square/ Sig	Sig coefficient	Results				
ROA		2.336		0.014/0.00	0.000	Significant impact				
ROE		0.012		0.000/0.998	0.998	No significant impact				
EPS		0.109		0.002/0.001	0.001	Significant impact				
In the presence of QM and company size as control variables								**Independent**		
Dependent variable	R Square/ Sig	**With Size**			**Quality Management**			**REU**		
		coefficient	Sig	VIF	Coefficient	Sig	VIF	coefficient	Sig	VIF
ROA	0.022/0.00	1.156	0.000	1.471	-3.146E-12	0.453	1.601	1.750	0.000	1.111
ROE	0.005/0.00	14.086	0.000	1.471	1.524E-12	0.982	1.601	-7.520	0.084	1.111
EPS	0.003/0.00	0.039	0.108	1.471	6.008E-13	0.251	1.601	0.082	0.018	1.111

12 The Impact of Policy Emissions on Financial Performance

To protect the environment from the pollution impact, a policy's effectiveness depends on its ability to exploit possibilities for reducing (energy-related) CO2 emissions across the economy which will decline the pollution percentage, so, the use of a policy's effectiveness of emissions will affect the protection. Results in Table 8 indicates that there is a significant positive impact of the Policy Emissions on the financial performance indictors (2.725, 0.111) for ROA, and EPS respectively. The most positive impact was for the ROE (6.527) even if it is insignificant. The values of R square are significant for ROA and EPS models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for all dependents. The results also show significant impact of on ROA and ROE belongs to the firm size, and the quality management insignificant for all models. The overall impact of the control variable on PE, significant ROA. The results indicate the control variables have an effect on the results of EPS.

13 The Impact of Environmental Supply Chain Management on Financial Performance (ROA, ROE, and EPS)

Environmental supply chain management recognizes the crucial role to be played by the purchasing and the function's involvement in activities that include reduction, recycling, reuse and the substitution of materials. Results in Table 9 indicates that there is a significant positive impact of the Environmental supply chain management on the financial performance indictors (1.466, 8.750) for ROA, and ROE respectively. The most positive impact was for the ROE (8.750). The values of R square are significant for ROA and ROE models before the inclusion of the control variables.

By adding the control variables (Firm size) and (Quality management), the results show that the values of R square are significant for all dependents. The results also show significant impact of on all dependents belongs to the firm size, and the quality management insignificant for all models. The overall impact of the control variable on ESCM, significant ROA. The results indicate the control variables have an effect on the results of ROE. Table 9

Table 8 The Regression results on the impact of Policy Emissions (PE) on financial performance) ROA, ROE, EPS)

Dependent variable	coefficient	R Square/ Sig	Sig coefficient	Results
ROA	2.725	0.011/0.00	0.000	Significant impact
ROE	6.527	0.000/0.224	0.224	No Significant impact

EPS	0.002/0.003	0.059	0.019	1.710	5.122E-13	0.339	1.500	-0.010	0.783	1.175

14 The Impact of Environmental R&D Expenditures on Financial Performance (ROA, ROE, and EPS)

Previous research found a positive association of environmental performance with financial performance [23]. Results in Table 10 indicates that there is insignificant impact of the Environmental R&D Expenditures on the financial performance indicators. Also the results still insignificant through adding the control variables. This result due to the role and responsibilities of the firms to pay not to be part of R&D activities. The values of R square are insignificant for all models before and after the inclusion of the control variables.Table 10

15 Conclusions and Recommendations

15.1 Conclusions

The results of the current study showed that environmental expenditure investments and expenditure have a positive impact on the financial performance indicators. The results of the study was in agreement with the study of [22] proving the existence of an impact of green accounting disclosure on both assets and equity the study also showed the positive impact of the index on earnings per share, and therefore the results of the current study agreed with the results of the study of both [17, 2, 24], Which all found a positive impact of green accounting disclosure on financial performance indicators.

The current study also found that there was an impact of the Environment Management Team, which is one of the indicators of green accounting disclosure consistent with. [6],which found an impact of green accounting disclosure on financial performance indicators.The current study concluded that Policy Energy Efficiency affects the return on assets and EPS. The result agreed with a study of [8] that found an effect of green accounting disclosure on the return on assets. Also, the result of the current study differed with the [5], which found an impact of green accounting disclosure on both return on equity and return per share.

The current study found an impact of Renewable Energy Use on financial performance indicators, this agreed with [19], the results. The study also concluded that there is an impact of Policy Emissions on the return on assets, and this study agreed with [18], in that it reached the same result. For the effect of both Environmental Supply Chain Management has an impact on financial indicators, whereas Environmental R&D Expenditures indicates no effect on the financial performance indicators, Therefore, the results of this study [1] agreed with the study that concluded the same result.

The overall conclusion of the results that firms intersted with the envirnmental disclousure that be sensitive and attrachtive to the readers of the reports which mailly consentated on the investment, expenditures, renewble energy, redusing the pollution

Table 10 The Regression results on the impact of Environmental R&D Expenditures (ERD) on financial performance) ROA, ROE, EPS)

Dependent variable		Coefficient	R square/Sig	Sig coefficient	Results					
ROA		1.227E-10-	0.002/0.557	0.557	No significant impact					
ROE		7.598E-10	0.003/0.421	0.421	No significant impact					
EPS		-1.244E-11	0.000/00.793	0.793	No significant impact					
In the presence of QM and company size as control variables								**Independent**		
Dependent variable	R square/Sig	**With Size**			**Quality Management**			**ERD**		
		coefficient	Sig	VIF	Coefficient	Sig	VIF	coefficient	Sig	VIF
ROA	0.007/0.664	-0.940	0.258	2.523	1.337E-11	0.539	6.214	-1.9E-10	0.628	3.722
ROE	0.010/0.545	-2.189	0.559	2.523	1.163E-10	0.237	6.214	-1.12E-9	0.538	3.722
EPS	0.010/0.530	-0.264	0.162	2.523	3.118E-12	0.528	6.214	-2.01E-11	0.826	3.722

and manageing the envirnmental activities. The overall effect of the control variables indicates that the firm size has an impact on the results due to the capacity of the researched firms, whereas the quality management as control vriable have no effect.

16 Recommendations

It is clear that most of the green accounting disclosure components have an impact on the financial performance indicators, so, the research recommend that firms shall enhance expenditures to protect environment as social responsibility for both operating expenses and investments. It is recommended to get more emphases on the reporting issues that disclose the environmental impact as green accounting practices.

Issuing legislations through which bodies can force companies to integrate environmental costs into the companies' strategic and operational plan, in addition to publishing accounting standards and guidelines issued by standard-setting accounting bodies, whether local or international, in order to be held legally accountable for them.

Disclosing costs and matters related to the environment and making stakeholders constantly aware of them that will increase the confidence of investors, whether current or potential, and thus leads to an increase in the company's investments to achieve significant returns.

Does Board Diversity Matter on Financial Performance?

Abdulnaser I. Nour, Mohammad Talalweh, and Abdul-Hakeem Obeid

Abstract The aim of this study is to examine how the characteristics of boards affect the financial performance of banks that are listed on the Palatine Exchanges. The study uses a quantitative approach to test hypotheses, gathering data on various variables from secondary sources, primarily the annual reports of banks over a ten-year period from 2010 to 2019. Both descriptive and inferential statistical analysis methods are applied to analyze the secondary data. Additionally, panel data regression is utilized to explore how board diversity factors such as gender, age, nationality, education, and experience affect the financial performance of banks, as measured by ROE and ROA. The results indicate that board age diversity has a positive impact on the ROE of banks in Palestine.

Keywords Board diversity · Palestinian banks · Performance

1 Introduction

Modern companies typically focus on improving their financial performance by assessing how efficiently they utilize their skills and resources to generate revenue and achieve desired profits [1, 2]. This measurement provides insights into a company's overall financial well-being during a particular period, facilitating comparisons with similar firms in the same industry or across industries [3]. It is a valuable tool for evaluating a company's financial status over a specified timeframe [4].

Although financial performance is vital for businesses, it can be affected by the composition of the board. Board characteristics encompass all the qualities and aspects of a company's board that facilitate the effective and efficient pursuit or full achievement of the interests of different stakeholders [5].

Despite its modest economy, Palestine is increasingly adopting effective corporate governance principles. The increasing focus on advancing corporate governance standards by government entities, civil society groups, and the business community demonstrates a heightened acknowledgment of governance's crucial role in creating an attractive investment environment. Consequently, this facilitates the attraction of both local and foreign investments, contributing to enhanced economic growth, lower unemployment rates, reduced poverty levels, and decreased reliance on external assistance [6, 7].

Although the importance of corporate governance is increasingly acknowledged, there is a lack of empirical research investigating how board characteristics relate to the corporate performance of Palestinian companies. Only a handful of studies have delved into this connection within the Palestinian context [6–8]. Examining the link between boards and performance in Palestine is essential for deepening our comprehension of this relationship within the distinct parameters of a small and somewhat isolated economy. This study seeks to fill this gap by exploring how gender, age, nationality, education, and experience diversities impact banks' financial performance using metrics such as ROE and ROA.

Our paper contributes significantly to corporate governance research in the banking sector, echoing the Basel Committee on Banking Supervision's call for more international studies. The banking industry provides a unique setting to explore how board diversity impacts performance, particularly given the global financial crisis aftermath and potential legal liabilities for bank directors. This study is the first known to highlight the importance of bank board diversity in relation to performance within the bank's institutional context.

The rest of the Paper is structured as subsequent sections. Section 2 Literature review and developing hypotheses: Sect. 3 discusses the sample, data, and methodology used for empirical analysis. Section 4 presents the results, while Sect. 5 presents our concluding.

2 Literature Review and Developing Hypotheses

Board characteristics encompass the distinct blend of attributes, traits, and expertise contributed by each member to the decision-making process [9]. In the fields of psychology and organizational management, positive perceptions regarding demographic diversity within workgroups arise from its potential to enhance cognitive task performance, including activities such as planning, idea generation, problem-solving, and decision-making [10]. Research indicates that workgroups with higher diversity levels may operate at a slower pace compared to less diverse ones, as noted by Zwelef and Nour [11] in homogeneous top management teams. However, despite

the potential for conflicts, highly diverse workgroups consistently demonstrate superior performance, as evidenced by Momani et al. [12] in mixed groups. The literature on board diversity highlights a positive correlation with enhanced company performance [13–17]. This impact is attributed to diverse boards facilitating extensive information exchange, fostering effective decision-making processes, and promoting independence while considering the interests of minority shareholders [18–21].

There exist at least five theories supporting a positive correlation between board characteristics and company performance. One of these is the widely recognized agency theory, often discussed in literature on demographic diversity [22–24]. This theory emphasizes the diversity of independent supervisory boards, particularly focusing on their independence, as a means to mitigate agency conflicts. The resource dependency theory, on the other hand, views board diversity as a valuable asset for companies, explaining its benefits across executive and non-executive boards. Diversity within the executive board enhances decision-making, while diversity within non-executive boards improves oversight and advisory functions, thereby impacting decision quality. Researchers frequently utilize this theory to examine the relationship between board diversity and bank performance [22–24].

The stakeholder theory posits a mutually beneficial relationship between companies and stakeholders, necessitating diverse corporate boards to meet their needs. Many studies on board diversity draw upon this theory to explain the inherent connection [25, 26]. The critical mass theory suggests that a minority of board members with specific characteristics, such as age, gender, education, and tenure, make significant contributions to the board's duties and functions once they reach a certain threshold [27]. In the financial sector, this theory has been employed in various studies to explore the relationship between diversity and bank performance [28]. Notably, [28] discovered that having women on boards notably improves bank performance. The positive relationship between gender diversity and performance is evident when boards have at least three female members; however, when the number falls below that threshold, the relationship turns negative.

Lastly, the human capital theory argues that differences in perspectives and roles due to demographic variances constitute a form of human capital. Several studies, including those by Farag et al. [23], Talavera et al. [24], use this theory to explain the associated relationship. Despite the endorsement of a positive correlation between board diversity and firm performance by these five theories, empirical evidence remains inconclusive.

Gender Diversity

Historically, boards were predominantly male-dominated. Introducing women to boards increases gender diversity, which is anticipated to enhance organizational value and performance through fresh perspectives [29]. The impact of board characteristics, particularly in terms of gender, on company performance has been extensively researched. As per [30, 31], some studies have observed a positive influence, while others have reported a negative or insignificant effect. Consequently, building on the aforementioned argument, the first hypothesis can be formulated as follows:

H1: Gender diversity significantly increases on the financial performance of the banks listed on Palestine Exchanges.

Age Diversity

Age diversity in a firm can impact performance positively by enhancing skills, resources, knowledge, and relationships. However, it may also lead to cognitive conflicts and weaker team cohesion, negatively affecting firm performance.

Studies have shown that boards with diverse age groups are associated with enhanced financial performance for companies [32–34]. However, contrasting research suggests a potential adverse effect of age diversity on the social performance of firms [24, 35]. On the other hand, certain studies have found no significant correlation between age diversity and firm performance [36].

H2: age diversity significantly increases on the financial performance of the banks listed on Palestine Exchanges.

Nationality Diversity

While nationality fosters national loyalty, diverse board members bring both potential benefits and communication challenges [37]. Studies in developed economies link nationality of board members to positive financial performance [38, 39]. Similar findings in developing economies exist [40], but consistent evidence is lacking [41].

H3: Nationality diversity significantly increases on the financial performance of the banks listed on Palestine Exchanges.

Experience

Board directors need decision-making experience to qualify. Older boards are thought to bring valuable corporate governance experience. This accumulated experience positively impacts overall efficiency and company performance. The connection between board members' educational background and firm performance may vary, but the theory of constrained resources suggests that higher board experience benefits effective management, especially in group settings, enhancing firm performance [42–44] highlighted the importance of corporate management experience for Public Listed Company (PLC) boards. Additionally, there is a clear correlation between firm performance and directors' seniority.

H4: experience diversity significantly increases on the financial performance of the banks listed on Palestine Exchanges.

Education Diversity

Diverse educational backgrounds, functional experiences, and upper management roles are positively linked to financial performance [45, 46]. This diversity in knowledge fosters varied perspectives in top management discussions, aiding strategic decision-making. While some studies show no correlation between educational heterogeneity in upper management and innovation or decision-making, [47] suggest highly educated members may lack practical knowledge, leading to ineffective decisions. Lower-educated board members may gain valuable practical experience. Anticipated benefits of educational diversity among directors include enhanced analytical thinking from those with higher education and practical expertise from those with lower education, ultimately contributing to optimal strategies and improved financial performance.

H5: education diversity significantly increases on the financial performance of the banks listed on Palestine Exchanges.

3 Methodology

3.1 Population and Sample

The study's target population consists of all banks that were listed on the PEX from 2010 to 2019. The sample is composed of banks that meet two specific requirements: they must have been listed on the PEX during the mentioned timeframe, and comprehensive data on these banks for that period must be accessible. Consequently, the sample includes 7 banks, totalling 70 observations. The study collects the necessary data from the annual reports of these sampled banks, which are publicly available on the PEX website.

3.2 Measurement of Variables

3.2.1 Variables and Their Measurement

This study utilizes three categories of variables. Firstly, the dependent variable focuses on the financial performance of banks listed on the Palestinian exchange, measured through return on assets (ROA) and return on equity (ROE).

Secondly, the independent variables pertain to board diversity, encompassing gender, age, nationality, education, and experience.

Lastly, considering that the unique characteristics of each bank can influence corporate governance practices and potentially impact financial performance, the study includes several control variables in the regression model to address this. These control variables consist of board size, bank age, bank size, bank type, and financial leverage Table 1.

3.3 The Regression Model

In order to examine the impact of board characteristics on the banks performance of Palestinian-listed banks between 2010 and 2019, the following multiple regression model was developed:

$$Y_{it} = B_{0i} + \sum_{j=1}^{k} B_j X_{jit} + \varepsilon_{it} (i = 1, 2, \ldots, N; t = 1, 2, \ldots, T; j = 1, 2, \ldots K)$$

Table 1 Variables and their measurement

Variable	Measurement	Reference
Dependent variable (Financial performance)		
ROA	% of net income to total assets	[48]
ROE	% of net income to total equity	[48]
Independent variables (Board characteristics)		
Gender diversity	% of female members to total members	[49]
Age diversity	Standard deviation of ages of board members	[50]
Nationality diversity	% of foreign members to total members	[50]
Education diversity	% of high education members to total members	[50]
Experience diversity	Std. dev. of board members' years of experience	[50]
Control variables (Bank-specific characteristics)		
Board size	Total number of board members	[49]
Bank age	Total number of years since incorporation	[49]
Bank size	Natural log of total assets	[49]
Bank type	0 if commercial bank, 1 if Islamic bank	[49]
Bank leverage	% of total liabilities to total assets	[49]

4 Result and Discussion

4.1 Descriptive Statistics

In Table 2 The study finds that return on assets (ROA) has a mean value of 0.010, indicating a $0.010 profit on average for every dollar invested in assets, ranging from − 0.060 to 0.052. Gender diversity shows a mean of 5.3% females on boards, varying from 0 to 33%. The age dispersion of board member's averages 10 years (7.4–13.7), while foreign board members average 20% (0–62%).Board experience has a mean dispersion of 3.5 years (0–7.2), and 57% of board members hold high education degrees (23–100%). Palestinian banks have an average of 10 board members (6–13), an average age of 27 years (14–59), and an average asset size of $952 million ($11.3 million to $5,260 million). The average financial leverage is approximately 76% (8–92%).

Table 2 Descriptive statistics of variables for Palestinian banks

Variable	Minimum	Maximum	Mean	Std. Dev
Dependent variable (Financial performance)				
ROE	− 0.069	0.183	0.071	0.052
ROA	− 0.060	0.052	0.010	0.015
Independent variables (Board diversity)				
Gender diversity	0.000	0.330	0.053	0.078
Age diversity	7.350	13.740	10.073	1.425
Nationality diversity	0.000	0.620	0.199	0.191
Experience diversity	0.000	7.150	3.532	2.097
Education diversity	0.230	1.000	0.569	0.183
Control variables (Bank-specific variables)				
Board size	6.000	13.000	9.714	1.787
Bank age	14.000	59.000	27.714	13.348
Bank size ($million)	11.366	5,260.000	952.00	1,1140.000
Bank type	NA	NA	NA	NA
Bank leverage	0.075	0.920	0.758	0.274

5 The Matching Function Approach

5.1 Statistical Analysis

Both descriptive and inferential statistics are employed in the data analysis process. Descriptive statistics, such as minimums, maximums, standard deviations, and means, are utilized to provide a descriptive overview of the dependent, independent, and control variables in the study.

Conversely, inferential statistics are used to explore the influence of board characteristics on the financial performance of banks. Specifically, panel data regression is utilized to investigate this impact on the financial performance of banks listed on selected Middle Eastern Exchanges. This technique is chosen due to the panel nature of the data, which includes both time series and cross-sectional elements.

Finally, it is worth saying that the descriptive and inferential data analysis is carried out using the SPSS software.

5.2 Panel Regression Model Analysis

Table 3 presents the panel regression results for Palestinian banks with return on equity (ROE) as the dependent variable. The model, comprising five diversities and

Table 3 Regression results for Palestinian banks using ROE

Constant and variables	Coefficient	Std. error	t-statics	Sig.
Constant	− 0.190667	0.073677	− 2.58788	0.0121
Gender diversity	− 0.038449	0.128364	− 0.299531	0.7656
Age diversity	0.008661	0.00342	2.532326	0.0140*
Nationality diversity	− 0.039207	0.036304	− 1.079957	0.2846
Education diversity	0.019268	0.043121	0.446827	0.6566
Experience diversity	0.004321	0.003265	1.323518	0.1908
Board size	0.007456	0.00465	1.603673	0.1141

Bank size	2.57E−12	1.23E−11	0.208402	0.8356
Bank type	0.004863	0.014201	0.342464	0.7332
Bank leverage	0.056965	0.045778	1.244358	0.2183
R^2	0.610875			
F-Statistic	0.000000			

* Significant at the 0.05 level

five bank-specific variables, explains about 61% of ROE variation ($R^2 = 0.610$). The F-statistic (< 0.05) confirms the overall significance of the regression model.

Table 4 displays the panel regression findings for Palestinian banks with return on assets (ROA) as the dependent variable. The model, featuring five diversities and five bank-specific variables, accounts for around 27% of ROA variation ($R^2 = 0.2669$). The F-statistic (< 0.05) affirms the overall significance of the regression model.

6 Testing Hypothesis and Results

6.1 Hypotheses Testing

H1: Gender diversity has a significant positive impact on the financial performance of the banks listed on Palestinian exchange.

The study reveals that Palestinian banks with more gender-diverse boards do not show higher return on equity (ROE) and return on assets (ROA) when compared to banks with less diverse boards. It is evident that banks with more gender diversity on their boards do not achieve superior ROE and ROA compared to those with less diversity. The researcher attributes this finding to the low percentage of female representation on bank boards. This outcome aligns with the findings of [51] who similarly concluded that gender diversity does not have a significant impact on financial performance.

Table 4 Regression results for Palestinian banks using ROA

Constant and variables	Coefficient	Std. error	t-statistic	Sig.
Constant	0.064388	0.027994	2.300076	0.0250

Bank leverage	− 0.051432	0.017394	− 2.95691	0.0045*
R^2	0.266900			
F-Statistic	0.034231			

* Significant at the 0.05 level

H_2: Age diversity has a significant positive impact on the financial performance of the banks listed on Palestinian exchange.

Palestinian banks exhibit greater age diversity on their boards, resulting in higher return on equity (ROE) compared to banks with less diverse boards. However, despite having more age-diverse boards, they do not achieve higher return on assets (ROA) compared to less diverse banks. The researcher attributes the positive impact of age diversity on ROE in Palestinian banks to the effective collaboration and brainstorming among older and younger board members. This observation is consistent with the findings of [32].

H_3: Nationality diversity has a significant positive impact on the financial performance of banks listed on Palestinian exchange.

Initially, Palestinian banks demonstrate greater diversity in terms of nationality on their boards, yet they do not achieve higher return on equity (ROE) when compared to banks with less diverse boards. Conversely, although they have more diverse boards in terms of nationality, they achieve lower return on assets (ROA) compared to less diverse banks. The researcher attributes this negative impact of nationality diversity on ROA in Palestinian banks to the inadequate communication and discussion among board members from different nationalities. This finding is supported by the results of [1, 52, 53].

H_4: Education diversity has a significant positive impact on the financial performance of banks listed on Palestinian exchange.

Palestinian banks that feature diverse educational backgrounds among their board members achieve a higher return on assets (ROA), although they do not exhibit a similar increase in return on equity (ROE) compared to banks with less diverse boards, aligning with the findings of [46]. However, studies conducted by Fares and

Nour [51], Abdelhaq et al. [52] did not identify a significant impact on financial performance from board education diversity.

H_5: Experience diversity has a significant positive impact on the financial performance of banks listed on Palestinian exchange.

Palestinian banks demonstrate increased diversity in board experience without experiencing a higher return on equity (ROE) when compared to less diverse boards. Nevertheless, they do achieve a higher return on assets (ROA) with more diverse boards in terms of experience compared to less diverse ones. The researcher credits the positive influence of experience diversity on banks' ROA in Palestine to the improved capacity of board members with diverse experiences to generate innovative ideas and solutions, in accordance with [54].

7 Conclusion

The preceding findings suggest certain commonalities regarding board characteristics and firm performance. Consistent with prior literature, these results support the idea that the makeup of board characteristics positively influences firm performance. The primary aim of this study is to examine the impact of board characteristics on the financial performance of banks listed on the PEX.

To achieve this objective, we utilized data from banks listed on the Palestinian exchange, specifically focusing on seven banks over the period from 2010 to 2019, with a total of 70 observations. The sample is restricted to banks only, and financial performance is measured solely using ROA and ROE.

Our findings reveal that the financial performance of Palestinian listed banks is not associated with gender diversity. However, this indicates that the presence of women on boards is not widespread in the country, despite robust initiatives under the Code of Corporate Governance in Palestine aimed at promoting gender equality in various sectors.

We observed a positive relationship between age, education, and experience characteristics with ROA, while their impact on ROE was not significant. Additionally, age diversity showed a positive impact on ROE but not on ROA.

Future studies could explore the influence of board characteristics, encompassing both executive and non-executive directors, on bank performance. This would contribute to enhancing the existing corporate governance literature. Furthermore, the study suggests investigating other non-financial sectors to gain a comprehensive understanding of board characteristics' impact on performance.

Utilizing Artificial Intelligence Techniques to Strengthen Marketing Campaign Resilience: A Proposed Model

Hanady Al-Zagheer, Qais Hammouri, Hamza Ali ALShawabkeh, and Ibrhim Abu Nahleh

Abstract We now live in the age of technology, where companies thrive to revolutionize their strategies and stay ahead of the competition. In the search for powerful data and insights, artificial intelligence (AI) marketing tools have emerged as a game-changing force in the world of market research. Using these tools, companies can now easily collect, analyse, and interpret data, providing them with competitive advantages. In this paper, we will present a proposed model in the world of artificial intelligence marketing tools that help us enhance marketing campaigns, explore its potential to transform market research, the benefits and challenges of its use, and its impact on the future of business, as artificial intelligence marketing tools can be considered advanced software applications that change the game. For businesses, when it comes to market research, these elements use machine learning algorithms to simplify and automate marketing tasks, such as examining customer data from various sources like social media, email, and customer interactions. The valuable insights generated by AI marketing tools can provide important information about customer behaviour, preferences, and trends and enable companies to make informed decisions and create personalized marketing strategies that connect with their audiences. By integrating AI tools into their operations, businesses can enhance their marketing efforts and stay ahead of the competition in today's fast-paced digital landscape.

1 Introduction

Digital marketing campaigns are the ideal tool for firms to gain clients and establish leadership in this era of fast digital transformation and information technology [1]. Within this framework, AI is quickly becoming a game-changer in terms of technology, significantly enhancing the efficacy of digital marketing initiatives [2]. Understanding data intelligently and using sophisticated insights to extract meaningful insights is the power of artificial intelligence [3]. In this light, the paper delves into some novel uses of AI that might boost the efficiency of digital marketing initiatives.

Artificial intelligence (AI) marketing is quickly becoming a game-changer in the realm of cutting-edge advertising, completely altering the way we engage with consumers [4]. Digital marketing strategies can be made more effective with the help of artificial intelligence by utilizing machine learning techniques and big data analysis [5]. Companies may improve the personalization of marketing messages and the accuracy of audience identification with the help of AI because it precisely understands consumer behavior and preferences [6]. With this fresh strategy, we can enhance the customer experience and give ourselves a better shot at succeeding in this cutthroat industry [7].

Businesses are transforming their communication with target audiences and achieving results using AI-powered marketing [8]. The fast development of AI technology has provided marketers with effective methods and tools to improve their marketing efforts and provide large-scale tailored experiences to consumers [9]. Digital marketing is going through a revolution due to AI-powered chatbots that engage with consumers in real-time and predictive analytics that enhance advertising efforts [10].

2 Methods Involving Artificial Intelligence

Machines and programs that demonstrate intelligence in ways that resemble human mental capacities and ways of working are referred to as artificial intelligence (AI) [11]. AI can learn, infer, and respond to programmed situations in the same way that humans can. Additionally, it is the name of a subfield of computer science that focuses on developing AI-like computer systems and software. “The science and engineering of making intelligent machines. “ John McCarthy, who first used the term in 1955, and leading researchers agree that AI is “the study and design of intelligent systems that understand their environment and take actions that increase their chances of success. “ Recent years have seen tremendous progress in artificial intelligence research and development, with “deep learning” technology serving as its most visible expression [12]. The foundation of this field is the creation of artificial neural networks that can learn and grow autonomously, just like the human brain. These networks are designed to function similarly to how the human brain does its

job. However, there are several AI methods that can be utilized to support marketing activities like chatbot, predictive analysis, machine learning and others.

2.1 Chatbots

Across all digital platforms, chatbots are a great way to communicate with consumers, answer their questions, and help them with purchases and customer service [13]. In order to comprehend consumer questions and give helpful responses, chatbots use AI methods like machine learning and natural language processing. In a natural way, chatbots may converse with consumers, answer their questions, point them in the direction of relevant information, and even handle some basic issues [14]. The usage of chatbots in e-marketing has the potential to enhance both the user experience and the conversion rate [15]. Chatbots allow clients to self-serve by answering their queries and addressing their requirements without interacting with a human support representative. To further boost sales and consumer engagement, chatbots can use data analytics and previous purchases to suggest items and services [16]. In electronic marketing, chatbots often help with user experience, involvement, and engagement, which in turn lead to better results in recruiting and retaining clients [17].

One goal of using chatbots in e-marketing is to achieve highly targeted marketing is data analysis, where e-marketing makes use of AI to sift through mountains of information on prospective buyers, such as their tastes, buying habits, and online habits. In order to better target consumers with marketing campaigns, this data is analyzed to spot trends and patterns and to foresee what customers might require [18]. E-marketing AI sifts through consumer data, interests, and actions to come up with suggestions for goods and services that could pique their interest. When it comes to improving the personalized shopping experience and increasing the conversion rate, artificial intelligence (AI) can rely on machine learning techniques to identify and provide the most likely offers to clients [19]. Also, AI give quick response E-marketing chatbots and self-support systems powered by artificial intelligence allow for real-time handling of client inquiries and complaints. By analyzing past encounters and learning from them, AI can deliver accurate and individualized responses. This helps with meeting consumer needs and creating a happy experience [20].

Moreover, AI in e-marketing may scour existing data for ad-targetable trends and models. AI can optimize advertising tactics by predicting the possibility that customers would connect with specific ads [6]. Using the data and context provided by the target client, smart advertising enables the automatic generation of targeted ads. Ads can be more effective and reach their intended audiences with the help of AI, which can analyze data, generate personalized ads according to consumer interests and preferences, and assess the success of ads by tracking how customers engage with them. With the use of historical data, AI can figure out what people like and don't like and then suggest ways to make ads better in the future [21]. In addition, AI examines information about consumers, rivals, and the market. Using factors like

supply and demand as well as competitive pricing dynamics, AI can spot patterns and trends in the market and determine how to best price products and services [22].

Finally, AI can be utilized to predict prices and customer behavior. Prices can be adjusted in real time to reflect market fluctuations and new information. Production costs, supply and demand, and projections for the market all play a role in the ongoing process of price adjustments. Businesses can adjust prices based on market conditions in this way [23]. Moreover, AI can help with pricing testing to see how different amounts affect response and sales. Artificial intelligence can sift through trial data and offer advice on the optimum costs to get the best results. In the term of customer behavior, (AI) can look at past data and forecast how supply and demand will vary based on a number of factors; this helps with pricing in the future [24, 25].

2.2 Marketing Campaigns with AI

AI can analyze large amounts of data quickly, which helps firms save both time and money. In addition, AI systems are able to draw trustworthy conclusions about consumer habits, tastes, and tendencies by sifting through mountains of data. Moreover, it can enhance the client experience by creating personalized marketing strategies that are based on individual preferences [26].

The use of artificial intelligence (AI) in marketing is becoming increasingly common. It is rare to find companies, whether large or small, that do not use marketing tools based on artificial intelligence. Big companies like Google, IBM, and Airbnb are using AI marketing tools to gain a competitive advantage.

A large number of global companies have begun to rely on artificial intelligence technologies, despite warnings issued by a number of experts. For example, Mattel turned to the DALL-E image generator powered by artificial intelligence to come up with ideas for toy cars. CarMax, a used car company, also uses artificial intelligence techniques to survey customers. Moreover, Grocery delivery company Instacart has also turned to GPT chat technology to answer customer questions about food. In addition, Coca-Cola also plans to use generative AI to help create new marketing content. Although the company did not detail exactly how it plans to deploy the technology, the move reflects increasing pressure on companies to use tools that many of their employees and consumers are trying out for themselves.

2.3 Automated Systems Methods and Advertising Initiatives

The potential for AI-driven advertising campaigns is limitless, given the rapid advancements in AI technology. Marketers should take advantage of these new trends to boost marketing, customer experiences, and company growth. To keep up with the dynamic digital world, firms are embracing AI-powered marketing methods [27]. Nowadays, companies can't do without social media marketing to reach their

customers and sell their wares. The integration of AI into social media marketing has unleashed limitless potential, thanks to the lightning-fast development of AI technology. This paper will examine- by proposed model—the ways in which artificial intelligence is changing the face of social media marketing and will provide a few instances of its use based on several algorithms. Content suggestions algorithms powered by artificial intelligence may sift through user data including interests, preferences, and past web searches to deliver tailored content suggestions. Instagram and Facebook employ AI to personalize users' news feeds with material they are more likely to find interesting and relevant. For instance, the AI algorithm will give more weight to health and fitness-related material if the user regularly engages with postings about fitness [28, 29]. In addition, analysing sentiment algorithms powered by artificial intelligence can sift through the sentiments shared by social media users. By doing so, businesses can learn how the public perceives their name, goods, and services. A company's reputation, customer service, and ability to respond to bad evaluations can all be enhanced by keeping an eye on sentiment analysis. To better understand customer sentiment and act accordingly, AI may, for instance, analyse the language used to determine if a brand-related tweet is favourable or negative [30]. Moreover, marketing using influencers: by finding the most relevant influencers for brands and establishing connections with them, AI has greatly improved influencer marketing. Machine learning algorithms can sift through mountains of social media data in search of niche-specific influencers with substantial followings, active interaction, and solid credibility. In this way, companies may team up with influential people who already have a large following and can spread the word about their products and services to that demographic [31].

Personalizing and optimizing ads utilized algorithms comes to social media and targeting. A company's target audience's demographics, interests, and habits can be uncovered by analyzing user data using AI. Businesses can use this data to make advertisements that are more relevant to their customers' interests [32]. Such data can be analyzed to create appealing and effective marketing messages, AI programs can sift through mountains of consumer data. Systematically examining market movements and forecasting trends are two examples of how artificial intelligence (AI) can outperform humans in data analysis [33, 34].

3 Proposed Business Intelligence Model

Given previous literature, and launching from main aim of this paper, it was meant to examine how to utilize artificial intelligence Techniques to strengthen marketing campaign resilience; the following Fig. 1 showed the proposed model.

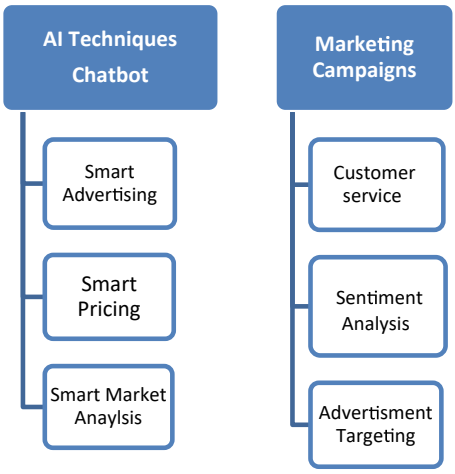

Fig. 1 The proposed model

4 Discussion

Marketing that relies on artificial intelligence is the one that uses artificial intelligence tools to automate management and operating processes and make decisions based on collecting information, analyzing data, in addition to continuous observation of common economic topics that can affect the results and effects of marketing. It also relies on user data to learn more about the best ways to communicate with them and provide them with personalized messages at the right time. Here we must ask: How has the emergence and advancement of artificial intelligence contributed to the development of digital marketing?

This requires creating a plan to apply the full benefit of AI technologies to advertising campaigns and marketing activities. The plan includes minimizing risks and challenges and achieving maximum return on investment.

Before using any AI tool, you should consider the following:

1. Setting goals: Is the goal to achieve speed in productivity, improve customer satisfaction, or automate tasks? So, determine your purpose of use.
2. What are your data standards: What limits will you set when collecting data, and how they might impact security, privacy, and data ownership, which are customers' biggest concerns?
3. The amount of data, its sources, and will it be done legally?

As a logical consequence of the above, it will become possible:

Providing high-quality customer experiences, by providing personalized recommendations for services and purchases based on their previous purchases and interests.

Generate artificial intelligence content and content titles, including all types of written, audio and visual content that do not have copyrights.

Create highly customized marketing campaigns to meet specific needs that differentiate repeat customers.

Using predictive analytics to determine customer behaviors based on purchase history, purchasing preferences, etc.

Optimize advertising campaigns and determine the most effective channels.

On the other side there are many risks resulting from using artificial intelligence tools to enhance marketing campaigns are:

1. Data accuracy

Data accuracy is a challenge for artificial intelligence (AI) in advertising. The data collected for modelling must represent all aspects of customers in order to create effective models for them. The data must be accurate and then there must be a way to verify its accuracy. However, incorrect data entry leads to wrong output by AI, which ultimately affects the advertising campaign and its success.

2. Data privacy

There is an AI threat to marketing fields and a growing concern about data privacy as artificial intelligence (AI) becomes more common in advertising, with the potential to create more personalized ads and can inadvertently collect sensitive information about consumers. This makes protecting consumer data difficult while allowing AI technology to perform better. There are different ways to mitigate these risks, but in the end, it depends on which companies can protect privacy while using AI.

3. Changes in customer behaviour

Customer behaviour is a challenge for AI in advertising. For example, customers today interact with ads more than ever before. They are also more dependent on their phones and computers and can access more information at any time. As brands try to target them with new and tempting offers, their loyalty is likely to falter. This means that AI must be able to understand and respond to customer behaviour to create successful ads.

4. Weak IT infrastructure

The use of artificial intelligence in advertising is increasing, and companies are looking to automate tasks and produce more engaging ads. However, poor IT infrastructure may make it difficult to use, as it can slow down data processing or lead to errors. This means that companies need to invest in good IT infrastructure if they want to use it in their marketing campaigns.

5. Lack of trust of (AI)

For artificial intelligence (AI) to be widely used in advertising, there must be a greater level of trust between AI systems and humans. Currently, the risk of AI to marketing areas in this lack of trust is a challenge that companies face when it comes to using it in advertising. There are several reasons for the lack of trust, including the fact that AI systems are not always accurate and can be biased.

In addition, well-known companies such as Google have been criticized for misusing user data, and Facebook has been accused of spreading false information. Now, with all this talk, it begs the question, how reliable is AI in advertising?

6. The danger of artificial intelligence on marketing areas: low investment

One of the main challenges of AI in advertising is the lack of investment in its software and services. Even if the AI market is thriving and very popular, continuous AI modelling and hiring skilled human resources or using AI consulting services can be expensive. This has led to a low rate of adoption by businesses, meaning some agencies and brands are still hesitant to use it for advertising.

However, companies like Albert, Google, Invoca, Amplify. AI, and Amplero are a few that are using AI to create powerful, engaging and relevant ad copy for their clients.

5 Conclusion

Insights generated by AI marketing tools provide valuable information about customer behavior, preferences, and trends, enabling businesses to make informed decisions and create targeted marketing strategies that resonate with their audiences. By harnessing the power of AI tools, companies can improve their marketing efforts, stay ahead of the competition, and build long-term customer relationships. As we know, artificial intelligence tools have pros and cons, and the benefits far outweigh the potential disadvantages. With their ability to analyze massive amounts of data quickly and accurately, businesses can save time and resources while gaining valuable insights into their target audience. All companies understand the importance of using the latest technologies to stay ahead in today's competitive market. That's why we offer a suggested model of artificial intelligence tools to help companies of all sizes improve their market research and enhance their marketing campaigns.

An example of the benefits of AI experience is that AI Customer Experience, which is the practice of using AI technology to provide an enhanced and intelligently considered user experience at every customer touchpoint. Some reports state that 80% of customers indicate that they are more likely to buy from brands that provide a personalized experience.

Artificial intelligence is an important factor in changing the rules of the customer experience game, and leading brands are adopting artificial intelligence technology as a seamless way to provide their users with a personalized experience.

In fact, one previous study showed that 63% of people who used artificial intelligence-based services or products, such as chatbots, did not realize that they were using artificial intelligence, and this number is likely to be higher nowadays with the development of artificial intelligence technology.

Artificial intelligence helps predict customer behaviors and needs, as predictive personalization is an artificial intelligence technology that can make customer experiences feel as if it was made just for them. Not long ago, companies relied on manual

data collection combined with forecasting to make important business decisions, and AI-powered insights improve the decision-making process, Therefore, the company's vision can become more data-driven now through artificial intelligence.

Successful companies have several channels of communication and enhance engagement with customers, such as the company's website, applications, social media channels, and the customer service platform, and artificial intelligence can work to seamlessly connect all of these channels to provide a multi-channel customer experience.

As for the marketing sector, it has become more targeted and effective, because artificial intelligence has become useful for understanding customer behavior, Artificial intelligence can easily perform the task of customer engagement, because it will help connect the customer to every touchpoint and inspire him to belong to the brand.

AI can also reduce the need for human intervention to solve customer service issues, streamlining positive customer experience processes.

Artificial intelligence greatly serves each component, as it helps with its ability to collect and analyse customer data in real time and obtain a better understanding of customer behavior and needs, in order to create a customized customer experience strategy.

Artificial intelligence also seeks to satisfy customers by analysing customer data and main criteria and recommending products or services to them, based on their browsing and purchasing preferences, in addition to the ability of artificial intelligence to analyse large data sets and then draw information such as weather and location and suggest relevant content to customers.

The Impact of Savings on Economic Growth: A Case Study

Nidal Ali Abbas

Abstract From 1991 to 2021, a detailed investigation was undertaken to evaluate the factors underlying savings trends in Jordan. Utilizing a carefully developed standard model founded on time series methodology, the researcher sought to establish the intricate association between savings and its primary determinants. The choice of this analytical framework was deliberate, aimed at unraveling the link between savings patterns and the broader economic growth context. The main aim of this research initiative was to conduct a comprehensive analysis of savings patterns in Jordan, the researcher employed a meticulous standard model rooted in time series methodology to elucidate correlations between savings and key determinants. By utilizing a clever combination of unit root tests and the Johansen co-integration test, alongside the use of the Fully Modified Ordinary Least Squares (FMOLS) methodology, we can obtain a thorough comprehension of the contributing factors behind the decrease in living standards of Jordanian inhabitants. This research is primarily focused on understanding this decline within the framework of the economic downturn that was triggered by a significant decrease in the ability to save. Our end goal is to achieve a profound insight into this issue. The robustness of the relationship between savings and economic growth was investigated through a rigorous analytical analysis that aimed to examine the existence of co-integration among study variables. The multi-faceted analysis produced critical insights into the complicated dynamics governing the interplay between savings patterns and economic growth within the context of Jordan. The knowledge offered from these findings adds value to the discussion on economic fluctuations and living standards in the region.

Keywords Savings · Economic growth · Jordan · Co-integration

1 Introduction

Amidst today's experts, there is a strong agreement that savings is a key factor driving economic growth in various nations. Though a collection of funds, savings represents the possibility of future spending, especially in times of financial hardship. This function extends beyond buffering financial instability, as savings can become a foundation for investments that support economic development and boost productivity in various important industries. The connection between savings and investments creates a holistic approach to development by transcending various economic aspects. For individual finances, investing savings triggers a ripple effect, increasing incomes and ultimately leading to national economic growth and improved well-being. At a macro level, this intricate interplay resonates in numerous ways [1]. Inflation poses a complex challenge to the economy, impacting employment rates and necessitating prolonged efforts for correction. However, investigating the diverse effects of savings reveals that it can act as a powerful remedy against economic disruptions caused by inflation. This highlights the vital role of savings in promoting amplified job opportunities and reducing unemployment rates. It is important to note that the repercussions of inflation are not fleeting, but can extend into prolonged periods, requiring prolonged corrective measures. Internal financing is crucially enhanced by an indispensable reservoir of savings that wields transformative influence in bolstering investment activity [2]. The crucial role of savings as a linchpin in steering the trajectory of economic development and vitality is underscored by the profound implications of this intricate interplay between savings and economic indicators that permeate through the economic fabric.

In this thorough study, we focus on the striking decrease in savings rates that have been observed across the world in connection with the intricate fabric of global economic and political factors. This notable dip, which has been aggravated by a palpable slump in economic development rates, has forced developing countries to depend on outside financial support, leading to an unstable economic situation [3]. It is important to note that Jordan has also experienced the same trend, despite intense government efforts to encourage savings and growth. This underscores the seriousness of the issue at hand, and the government's recognition of the key role of savings in economic activity [4].

Identifying the most important variables that influence savings rates is crucial for this study. The fluctuations of these variables are key to understanding economic growth rates and the acquisition of necessary funds. Internal sources of financing play a vital role in achieving this pivotal outcome. Therefore, pinpointing these variables is of heightened significance to the study. Dipping into a variety of vital economic factors such as inflation, labor, exports, and fixed capital, the examination strives to reveal the elaborate consequences of savings. As such, the study's scope expands well beyond the mechanics of savings alone, going so far as to fully explore the intricate connection between savings and a breadth of economic variables. In order to shed light on the complex interplay between economic factors and savings, a carefully-crafted model is employed on this exploratory journey. The ultimate goal

is to furnish experts with unique insights that can be used to provide wise counsel to decision-makers who seek to foster economic prosperity. The pressing need behind this mission stems from the crucial role that enhanced economic growth plays in navigating unpredictable economic terrain. Not limited to the context of this study, there is a significant emphasis on defining the concept of savings at a pivotal point in this journey. Given the diversity of perspectives within different economic schools of thought, it is crucial to take a foundational step by dissection of the definition of savings. This meticulous approach serves as a preamble to the all-encompassing exploration that will follow, highlighting the multifaceted nature of savings and its critical role in economic development. This step is absolutely essential due to the varying conceptual nuances related to savings which emanate from different sources [5].

A. **Classical School:**

At the crux of the approach advocated by Adam Smith and John Say lies an intriguing argument: savings serve as a key vehicle for future consumption, forsaking fleeting indulgences in immediate gratification. This perspective boasts a widened scope, taking into account diverse factors like inheritance, the gradual build-up of money and assets, and real-world possessions in the careful crafting and molding of savings. This nuanced paradigm moves beyond the mundane understanding of savings as a mere act of restraint from spotty spending, delving into a more encompassing perspective that acknowledges the multifaceted nature of savings.

B. **Neoclassical School:**

Intriguingly, the conceptualization at hand has its roots in the musings of Fisher [6], whose insightful analysis posited that the act of consumers refraining from purchasing a specific product does not merely result in a decrease in their capacity, rather it leads to an increase in their savings. According to Fisher, any given interest rate is acceptable to individuals, as it fosters savings intended for investment in fresh assets. The cornerstone of this economic equation is the interest rate, serving as the dynamic variable that manages a fragile balance between the total amount of savings and the overall expanse of total investment.

Alfred Marshall delves into the neoclassical perspective and adds an intricate dimension to the debate by identifying two significant factors that determine the amount of reserves wanted: the inherent importance of savings and wealth. Marshall's principles stipulate that the interest rate materializes as the natural expense linked with deploying capital in markets. An equilibrium comes about when the overall demand for capital is in sync with the complete supply of capital at a standard price [7]. To attain complete employment and fortify growth, neoclassical theory postulates that the crucial factor is savings. The intricate task of achieving these objectives requires careful consideration of saving formation and expansion. Neoclassical underpinnings assert that this vital element is the keystone in funding the lofty goals of full employment and sustained economic growth [7].

C. **Keynesian School:**

In the world of economics, the famed economist Keynes has an interesting view on savings. According to him, savings are what is left of income after all the expenses are covered. But this view is not just about income and expenses—there are two crucial factors that play a role in determining savings: personal income and the marginal propensity to consume. Essentially, the income we receive includes both consumption and savings. And since savings are just deferred consumption, the factors that impact consumption also impact savings, creating an unbreakable bond between the two economic concepts. Scrutinizing household savings and their determinants is of great importance in developing countries where access to local funds is crucial for necessary capital accumulation—thereby becoming a critical driver for economic growth and development. In Jordan's socio-economic context, savings are notably restricted, largely due to the relatively modest per capita income. According to statistical records, savings on average, as a percentage of Gross Domestic Product (GDP), remained at 12.38% within the timespan from 1980 to 2014. A survey recently conducted by the Central Bank of Jordan has revealed that savings levels have experienced a discernible decline, dwindling down to approximately 4.35% of GDP in 2022. This downward trajectory can be attributed to both the adverse impact of COVID-19 and a reduction in the financial capacities available for savings within households throughout Jordan [8]. On a related note, a World Bank report from 2017 made an interesting observation—that 45.2% of Jordanians possessed the ability to save money through various means. Jordan reveals a fascinating trend of domestic savings, comprising 10.6% of all savers in 2022, as the primary mode of financial preservation. This mosaic of data uncovers the multifaceted factors that shape Jordan's savings behavior and offers insight into the nuanced landscape of savings in the region.

2 Economic Literature and Previous Studies

It is crucial to recognize the essential role of savings in economic growth and development as it serves as a vital source of financing for numerous sectors. This, in turn, reflects the national economic activity and has a diverse impact on the employment rates which ultimately affects the Gross National Product (GNP). To gain insight into the influence of savings on economic growth, it is pertinent to examine key studies in this line of inquiry. One such study [8] scrutinized the determinants of household savings in Jordan over the span of 1980–2014. Significant effects on household savings were revealed by the study upon investigating variables with a long-term co-integrating relationship, with a correction rate of 65% for short-term deviations. Direct taxes and inflation had a negative impact on savings, while private consumption and deposits were positively and significantly affected by interest rates. The study also noted how cash holdings and worker remittances had no significant impact.

Egypt's economic growth is the subject of a study [5] on the effects of local savings. Conducted over the period of 1990–2017, the study shows that local savings have a

highly beneficial impact on both long-term and short-term economic growth. Meanwhile, Algeria is the focus of another study [9] examining the period from 1970–2016 and the economic factors at play when it comes to household savings. Identifying the determinants of household savings in Algeria, the study found that narrow money supply, direct taxes, private consumption, Gross Domestic Product (GDP), and inflation rate were all contributing factors. Narrow money supply was found to be the primary determinant of household savings, with a flexibility coefficient of 2.27. Direct taxes followed at a flexibility coefficient of 1.68. Private consumption had a flexibility coefficient of 0.88, GDP a coefficient of 0.73, and inflation rate had a coefficient of 0.45, making it the last determinant named.

Using Ordinary Least Squares (OLS) analysis on the economy of Palestine from 1995 to 2013 [10], researchers examined the savings situation and found that political instability led to changes in savings. Final consumption, international aid, and individual disposable income had a notable positive correlation with savings, whereas savings and investment, public debt, and unemployment rate had an inverse relationship.

During the timeframe of 1980 to 2018, a study [11] was undertaken in order to determine the elements which impacted the saving conduct of households in Saudi Arabia. The outcomes revealed that numerous variables had an effect on household savings, such as financial system development, interest rate on the real, real gross domestic income and wealth. Conversely, savings had an inverse correlation with inflation.

Using the life cycle hypothesis, a study [12] delved into the factors that influence private savings in India from 1954 to 1998. Curiously, the results divulged that disposable income and deposit interest rates have a positive correlation with savings. Conversely, exchange rates demonstrated an inverse relationship with private savings.

The study [13] analyzing savings and investing habits of households in Thailand revealed that the average savings rate equaled 29.17% of income. Most individuals saved with the intention of using their funds after retirement. Traditional saving methods such as real estate, bank deposits, and gold remained the most preferred options over financial asset investment.

Using data from the World Bank's World Savings Database spanning between 1961 and 1994, a study [14] examined the correlation between economic growth, investment rate, and savings rate. As per the findings, government savings were shown to negatively impact the overall savings rate in most of the regression models. On the other hand, the study found that labor quantity had a considerable positive effect.

For the years spanning between 1970 and 2007, a study [15] formulated a model representing the economy of Cameroon's savings function through utilization of the Johansen co-integration method. After analysis, it was discovered that stable political conditions and the availability of financial institutions and branches had a positive correlation with savings, as did the level of income. However, the real interest rate was found to hold little significance in regards to savings.

Using unit root tests and the Engle-Granger co-integration method, a study in Egypt [16] examined the influence of certain variables on overall savings during the

time frame (1975–2006). The results revealed that income growth rate contributed positively and significantly to both short-term and long-term savings, while interest rate effects were found to be positive and significant in the short term and not significant in the long term. Inflation rate effects also had a positive impact on savings in both short and long term. Both short and long-term savings were significantly positively affected by the ratio of money supply to GDP as a financial development measure, albeit insignificant in the former. Conversely, there were significant negative impacts on both timeframes due to the budget and current account deficits.

The Johansen co-integration method and error correction model were used in a study [17] to investigate the association between national savings and a variety of economic factors in Malaysia. The study found that the inflation rate, elderly dependency ratio and average individual income were the most significant variables affecting national savings. Interestingly, it revealed a significant negative correlation between income and national savings, and a positive relationship with interest rates. However, a negative relationship was observed between error correction rate, elderly dependency and national savings. Moreover, there was a significant and positive association between inflation and national savings.

3 Study Methodology

The years encompassed in this extensive study range from 1991 to 2021, with the investigator using a time series data analysis approach, and employing a set of standard tests to uncover the complexities that define the connection between economic growth and savings. Data integral to the empirical foundation of this research was sourced from reliable repositories, specifically the Central Bank of Jordan and the World Bank, and it was conscientiously attained. All of this establishes a strong groundwork for the ensuing analytical exploration. Within the scope of this study, an extensive range of variables were covered with meticulous attention to detail. These variables comprise of the Gross Domestic Product (GDP), inflation rate, exports, total capital formation, and a dynamic workforce. Collectively, they shape a comprehensive framework essential for exploring the intricate correlation between economic growth and savings in Jordan. An E-Views data package was employed to carry out a thorough analysis of the collected data, which provides a crucial compilation of economic indicators. The application of the Harrod-Domar model provided additional analytical depth in assessing the impact of savings on economic growth within Jordan's intricate economic landscape. Through scrutinizing this nuanced relationship, a theoretical lens was provided for interpreting the empirical findings derived from the comprehensive dataset under consideration. Thus, this multifaceted methodological approach allowed for a holistic understanding of the interplay between savings and economic growth in Jordan. The Harrod-Domar model illustrated this relationship as follows:

$$G = (\Delta Y/y) = (s/k)$$

This model serves as the basis for assessing the impact of savings on economic growth in Jordan during the specified time period.

$$\text{LGDP} = \Delta Y/y = f\ (\text{Lns},\ \text{LK},\ \text{Lx},\ \text{Linf},\ \text{Ll})$$

where:

GDP = Economic Growth, Lns = Gross Domestic Savings, Lk = Gross Capital savings, Lx = Export, Linf = Inflation Rate, Ll = Labor Force.

Based on the information provided, the researcher will conduct a series of standard tests to determine the nature of the relationship between savings and economic growth in Jordan, as follows:

1. Unit Root Test

It is crucial to ensure the stability and stationarity of time series data, whether at the level or in differences. This is particularly important when applying the Fully Modified Ordinary Least Squares (FMOLS) method, as it depends on this condition. By analyzing the variables in the study model, we can determine the degree of stationarity for the time series. Rejecting the null hypothesis of non-stationarity (Ho: $\delta = 0$) indicates that the time series has a unit root and is therefore considered stationary. Table 1 displays the unit root test outcomes. Unlike the null hypothesis [which affirms the existence of a unit root in the time series (H0: $\delta \geq 0$)], the alternative viewpoint proposes that the time sequence lacks a unit root (H1: $\delta < 0$).

Table 1 indicates that five variables out of six were stationary after the first difference with a constant intercept, while only one variable was stationary about the trend.

2. Johansen Co-integration Test

Using the Johansen methodology, the researcher conducted a co-integration test and discovered that the study variables are co-integrated. With this information, the researcher has decided to utilize the Fully Modified Ordinary Least Squares (FMOLS) approach.

The results of the co-integration analysis using the Johansen methodology can be displayed in Table 2.

Table 1 Unit root test

Variables	Levels	1st diff.
Variables	−0.5878	−1.8177*
Variables	−2.0636	−5.4285*
Variables	−1.5999	−4.0422*
Variables	−1.0966	−6.3748*
Variables	−1.1895	−5.0452*
Variables	−5.1543*	−6.9213*

* Differs from zero

Table 2 Johansen Co-integration test

Hypothesized		Trace	0.05	
No. of CE(s)	Eigenvalue	Statistic	Critical Value	Prob.**
None *	0.967307	192.7096	95.75366	0.0000

Trace test indicates 3 co-integrating eqn(s) at the 0.05 level
* denotes rejection of the hypothesis at the 0.05 level
** MacKinnon-Haug-Michelis (1999) p-values

3. Modified Least Squares (FMOLS) estimation

Using the method of Fully Modified Ordinary Least Squares (FMOLS), the researcher assessed the effect of savings on economic growth. The study demonstrated that economic growth is influenced by savings at a rate of roughly (0.817056%). Therefore, a heightened savings rate of 1% equates to an augmented economic growth of around (0.817056%). During the study period, variables such as savings explained (0.463036%) of the fluctuations in Gross Domestic Product (GDP), as shown by the R-squared coefficient. The adjusted R-squared (0.346308) indicates that roughly (0.346308) of the GDP changes can be traced back to these factors. However, the remaining (65.5%) of GDP variance stands unaccounted for and warrants further research into external factors. This outcome aligns with the research conducted by Almutaim and Almokhzengi [5] on Egypt's case from 1990–2017, as well as Dhanya Jagadeesh's examination of Botswana. The test results are presented in Table 3.

Table 3 Fully modified ordinary least squares (FMOLS)

Variable	Coefficient	Std. error	t-Statistic	Prob
LOG(K)	0.106968	0.042384	2.523770	0.0190

Long-run variance	0.000577			

4 Results and Recommendations

The researcher, with meticulous precision and over a temporal span ranging from 1991 to 2021, endeavored to unearth the tangled web that connects savings and economic growth in Jordan. The researcher set out to investigate the notable decrease in savings rate within a particular socio-economic environment due to the observable downward trend in living standards, reduced spending power, and declining economic growth. To decipher the complex dynamics of this relationship, the investigator used a three-step methodology involving unit root tests, Johansen co-integration tests, and the advanced Fully Modified Ordinary Least Squares (FMOLS) technique. This research aims to unravel the underlying factors responsible for the decline in savings in this specific social context. Amidst a strategic deployment of a comprehensive analytical arsenal, the empirical foundations of the savings rate's decline were probed alongside the inherent relationships between savings patterns and prevailing economic growth trends in the considered temporal scope. Through methodical exploration, nuanced findings uncovered a compelling facet of the research that highlights the presence of co-integration among study variables. This revelation serves as a noteworthy testament to the entrenched and robust relationship between savings and economic growth, shedding light on the intricate interplay between these critical economic indicators in Jordan's specific socio-economic context.

The researcher advocates for a multifaceted approach to fortify and optimize the symbiotic relationship between savings and economic growth by strategically recommending the following:

1. Cultivate Savings Awareness:

Incentivize financial savings by establishing multiple campaigns targeting individuals from different income brackets, all while emphasizing higher income groups. Therefore, enable channels that effectively inform and encourage the practice of savings. These initiatives should raise awareness of the vital role savings play in personal finance.

2. Enhance Savings Efficiency:

Augmenting the efficiency of savings channels is a vital mission that can be accomplished through robust mechanisms. Providing facilitation is requisite by streamlining processes and implementing innovative approaches. The main aim is to ensure that saved funds are directed strategically towards avenues that bolster economic growth. A mechanism with such potential can propel savings into impactful ventures that contribute significantly to overall economic development.

3. Optimize Fiscal and Monetary Policies:

By pushing for the implementation of fiscal and monetary policies that specifically enhance savings returns, a strategic alignment can be achieved. This alignment can be achieved by carefully calibrating policies that not only promote saving but also foster an environment for maximizing returns on saved funds. Establishing a virtuous

cycle of sustained economic growth can be achieved by aligning economic policies with the ultimate goal of enhancing savings.

4. Diminish Reliance on External Financing:

Bolstering Jordan's economic self-sufficiency is the key to mitigating dependency on grants and loans for development financing. Jordan must proactively enhance its capability to generate internal funds through savings. If the economy can fund its own savings more efficiently, Jordan can lessen its external dependencies and maintain greater control over its economic destiny.

Envisioned to create a holistic framework, these recommendations advocate a synergistic approach to encourage savings at the individual level and strategically channel them towards initiatives that drive economic growth. The alignment of fiscal and monetary policies, optimized for savings returns, aims to establish an economic environment that empowers Jordan's economy to depend less on external financial sources. This promotes resilience and sustainability in the face of global economic dynamics. The ultimate objective is to establish a self-sufficient economy that can tap into internal financial reservoirs.

The Impact of Digital Marketing on Customer Satisfaction in Tourism Companies: The Mediating Role of Perceived Value

Iyad A. A. Khanfar and Qusay Khalaf Muhammad Al-Khawaldeh

Abstract The objective of this study is to assess the influence of digital marketing tools on the satisfaction of customers in Jordanian tourism companies, while also considering the mediating role of perceived value from the customers' perspective. A descriptive analytical approach is employed, utilizing a questionnaire as the primary data collection instrument. The questionnaire is distributed to a sample of 500 customers, resulting in the retrieval of 408 valid questionnaires. This represents a response rate of 82%, which exceeds the minimum acceptable rate of 384. The questionnaire consists of 40 items designed to measure the variables and their respective dimensions. Statistical analysis is conducted using AMOS software version 22. The findings reveal a statistically significant positive impact of various digital marketing dimensions (including email marketing, influencer marketing, commercial advertising, and video marketing via YouTube) on the enhancement of customer satisfaction levels within Jordanian tourism companies. Collectively, these digital marketing dimensions account for 35.7% of the variance in customer satisfaction, with each dimension making distinct contributions: Email marketing explained 2.4%, influencer marketing 3.9%, commercial advertising 4.4%, and video marketing via YouTube 2.9%. Notably, video marketing via YouTube exhibits the highest explanatory power in relation to perceived value, contributing 34.2% towards the achievement of customer satisfaction. Based on the findings, it is recommended that tourism companies allocate more resources towards the creation of high-quality and captivating content, particularly in the realm of video marketing through platforms like YouTube. Emphasis should be placed on providing informative and engaging information that showcases the unique tourism experiences offered by Jordan. Additionally, it is advised to collaborate with influencers who possess a strong connection to Jordanian tourism and culture. Furthermore, email marketing strategies should

be enhanced by improving the content of emails to make them more personalized. Customized deals that cater to the specific needs and preferences of customers should also be offered.

Keywords Digital marketing · Perceived value · Customer satisfaction · Tourism companies

1 Introduction

The examination of digital marketing tools enables an exploration of the benefits that can be derived from enhancing customer satisfaction. Numerous companies globally have dedicated teams to oversee their online operations, with some even establishing customer satisfaction departments that synergistically collaborate with other departments. The interdependence between customer satisfaction and digital marketing is evident, as the attainment of primary organizational objectives relies on the effective integration of both elements. Presently, companies are prioritizing customer-centric approaches by cultivating robust and authentic relationships.

The primary objective of companies is to ensure the satisfaction of both their customers and employees. In order to achieve this, astute companies prioritize the establishment of a heightened level of employee contentment. This, in turn, results in enhanced productivity, improved service and product quality, heightened customer satisfaction, increased customer retention, and ultimately, amplified business expansion and profitability. It has been observed that the quality of service and customer satisfaction exert a positive and substantial influence on customer loyalty, while the perceived price does not exhibit a positive and significant impact on customer loyalty [1].

The pursuit of stability, security, livelihood, and the acquisition of knowledge and cultural experiences has driven human beings to engage in tourism since ancient times. This multifaceted activity encompasses various aspects of life and serves as a crucial contributor to national income and the overall economic well-being of a country.

1.1 Problem Statement

The objective of this research is to examine the influence of digital marketing tools on customer satisfaction in the context of tourism companies. While digital marketing is recognized as a crucial factor in achieving customer satisfaction, its impact is often overlooked, resulting in a lack of clarity regarding customer needs and expectations. The complexity of digital marketing allows for multiple perspectives to be explored independently by marketers. However, there is a limited amount of literature that investigates the relationship between the five components of digital marketing (online

communities, interaction, content sharing, accessibility, and credibility) and their collective influence on user opinions, feedback, information, and ultimately customer satisfaction. Notably, no previous study has specifically examined this relationship within the tourism industry while considering the mediating role of perceived value. Therefore, this research aims to fill this gap in the literature [1–3].

From this, we can summarize the research problem that will be addressed in the main question as follows:

- What is the extent of the impact of digital marketing tools on customer satisfaction in tourism companies, which is measured in two dimensions: digital marketing and customer satisfaction?

1.2 Study Objectives

The primary objective of this study is to identify the impact of digital marketing on customer satisfaction and perceived value, while a set of sub-objectives are pursued in order to achieve this overarching goal.

1.3 Study Hypotheses

Based on the research problem and objectives, and drawing on relevant literature, the researchers propose the following hypotheses:

Main Hypotheses

- **HO1**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of digital marketing tools (email marketing, influencer marketing, commercial advertising, video marketing) on customer satisfaction in tourism companies."
- **HO2**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of digital marketing tools (email marketing, influencer marketing, commercial advertising, video marketing) on perceived value in Jordanian tourism companies."
- **HO3**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) on perceived value."
- **HO4**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of digital marketing tools in their combined dimensions (email marketing, influencer marketing, commercial advertising, video marketing) on customer satisfaction with perceived value as a mediating variable in Jordanian tourism companies."

The study attempts to verify the following sub-hypotheses:

- **HO1.1**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of email marketing on customer satisfaction in Jordanian tourism companies."
- **HO1.2**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of influencer marketing on customer satisfaction in Jordanian tourism companies."
- **HO1.3**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of commercial advertising on customer satisfaction in Jordanian tourism companies."
- **HO1.4**: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of video marketing via YouTube on customer satisfaction in Jordanian tourism companies."

2 Previous Studies

The research conducted by [4] revealed that social media influencers possess certain attributes, such as fame, content quality, expertise, and credibility, that significantly impact the positioning of local tourism products in the minds of consumers. The result is a positive perception that allows products to speak for themselves—effectively fueling tourists' appetite for what these places have to offer. Ali [5] echo similar sentiments toward electronic advertising within the fast food industry. Indeed, it does not just influence consumer behavior positively but also steers it towards wiser purchasing choices, all while playing a pivotal part in unraveling the enigma that is consumerism. The impact of social media on consumer decision-making processes was unraveled by Belaichi [6], whereas Belaichi [6] brought into focus Facebook's role in putting tourism on the map. And as Al-Shammari [2] succinctly puts it, social media networks act as time-efficient information highways regarding customer tourism needs, slashing down time required for customer enlightenment.

3 Methods and Procedures

The aim of this section is to provide a complete description of the methodology used in the study, paying close attention to how the process was implemented. It details an elaborate explanation on how the population and sample were chosen including why specific criteria were used for data collection. Moreover, it paints a picture of what research instruments went into play, and what steps were taken to ensure they were reliable and valid through some serious test procedures. Such ones led us eventually towards certain objectives using various statistical tests. This chapter also took into consideration whether or not we had quality data that met assumptions required for hypothesis testing; if so, then we delved deep into unveiling our analytical toolkit along with strategies deployed during hypothesis testing.

3.1 Study Methodology

The present research takes a descriptive and analytical view of phenomena in their current state, particularly the factors surrounding them. The descriptive analytical approach is opted for to pave the way for an in-depth scrutiny and understanding of data. This serves as a boost to the credibility of our research as it helps us stay on course with our set objectives. The primary objective of this study is to investigate the impact of various digital marketing tools on customer satisfaction within Jordanian tourism companies. The study encompasses three independent variables, namely digital marketing (including email marketing, influencer marketing, commercial advertising, and video marketing via YouTube), a dependent variable (customer satisfaction), and a mediating variable (perceived value). To test the research hypotheses and analyze the collected data, the researcher employed appropriate statistical analysis methods.

3.2 Study Population and Sample

The study sample comprises individuals who are customers of tourism companies, encompassing a range of demographic attributes. Owing to the limited availability and confidential nature of data within the tourism industry, the researchers encountered difficulties in ascertaining the precise magnitude of the study population.

3.3 Study Sample

In accordance with Sekaran's [7] recommended guidelines for sample size, the study employed the largest representative sample size, which should not fall below 384 clients in order to ensure the representativeness of the sample. A total of 500 questionnaires were disseminated to clients of the company, yielding a response rate of 82% and resulting in 408 participants, surpassing the minimum requirement. To expedite the process and reach a greater number of targeted individuals with minimal time and effort, Google Forms was utilized to create and administer the questionnaires electronically (Table 1).

Table 1 The statistical standard for interpreting the arithmetic averages of study variables and determining their relative importance

Level	Range
Low	1–2.33
Medium	2.33–3.66
High	3.67–5

3.4 Reliability of the Study Tool

The consistency of performance or results obtained from the questionnaire when it is administered repeatedly to the same sample or variables pertains to its reliability. The purpose of assessing reliability is to ascertain the stability of measurement tools or questionnaires over time. Various statistical tools are employed to measure the reliability of a questionnaire, and this study utilized the internal consistency method.

3.5 Internal Consistency Reliability

Internal consistency pertains to the degree to which the individuals within the sample exhibit coherence and concurrence in their responses to the items presented in the questionnaire. The reliability of the questionnaire was assessed utilizing Cronbach's Alpha coefficient, which can assume values between 0 and 1. A Cronbach's Alpha coefficient of 0.7 or higher is indicative of satisfactory reliability [8]. The Cronbach's Alpha coefficients for the study variables and their respective items are displayed in Table 2.

Based on the data presented in Table 2, it is apparent that the Cronbach's alpha coefficients displayed a range of values between 0.729 and 0.863. Notably, all of these coefficients surpassed the minimum acceptable threshold for reliability, which is set at 0.7. Consequently, it can be inferred that the variables and their respective dimensions in the study demonstrate a strong internal consistency. This finding suggests that the questionnaire used in the study exhibits a high level of stability, thus providing assurance that the scale can be effectively employed and replicated to yield consistent results. It is noteworthy to mention that the overall reliability of the questionnaire was calculated to be 0.925.

Table 2 Cronbach's alpha coefficients for study dimensions

Dimension	Number of items	Cronbach's alpha
Email marketing	5	0.729
Influencer marketing	6	0.773
Electronic commercial advertising	6	0.805
Video marketing via YouTube	6	0.758
Perceived value	6	0.863
Customer satisfaction	11	0.828
Overall performance	40	0.925

3.6 Analysis of Data Suitability for Testing Study Hypotheses

The verification of data quality is of utmost importance in order to establish its appropriateness for hypothesis testing, a prerequisite for ensuring accurate outcomes when employing linear regression analysis. The evaluation of data suitability and quality involves the utilization of various statistical tests, such as assessments for normal distribution and multicollinearity.

4 Presentation of Results

4.1 Means and Standard Deviations of Study Variables

In order to evaluate the efficacy of digital marketing in Jordanian tourism companies and gain insights into the perceived value of their services and customer satisfaction, the researchers employed measures of central tendency and dispersion. The utilization of standard deviation as a measure of dispersion enabled the assessment of the level of consensus or divergence among the individuals sampled with regard to the various dimensions of the variables. Conversely, the arithmetic mean provided an indication of the magnitude of the variable dimensions and their practical implementation.

- **Email Marketing**

The dimension of email marketing was measured using five items. Table 3 displays the arithmetic means, standard deviations, and the relative importance of the items.

The range of these means varied from 3.35 to 4.10, indicating a combination of relatively high and medium importance. Among the items, the fifth one, which received the highest mean score of 4.10. This item also had a standard deviation of 0.914, suggesting its relatively high importance. On the other hand, the first item, which had the lowest mean score of 3.35 and a standard deviation of 1.213, indicating its relatively medium importance. Overall, the email marketing dimension demonstrated a relatively high level of importance, as evidenced by an overall mean score of 3.80. This suggests that email marketing is highly effective among Jordanian tourism companies.

- **Influential Marketing**

The influential marketing dimension was measured through six items, and Table 4 shows the arithmetic means, standard deviations, and the relative importance of the items.

Based on the data presented in Table 4, it is clear that the influencer marketing dimension has an average score of 3.66, indicating a medium level of relative importance. The items within this dimension are categorized as having medium to high

Table 3 Arithmetic means and standard deviations for email marketing dimension

Item	Ranking	Mean	Standard deviation	Relative importance
1. Email marketing stands out in presenting information about tourist attractions	5	3.35	1.213	Medium
2. Email marketing provides me with useful information about tourist attractions	3	3.96	0.989	High
3. Advertisements about tourist attractions in the Kingdom via email marketing are efficient	4	3.59	1.229	Medium
4. Email marketing provides me with information about tourist attractions in an easy language	2	4.02	1.006	High
5. Email marketing saves me time, effort, and money to access tourism information	1	4.10	0.914	High
Overall mean (email marketing)	–	3.80	–	High

Table 4 Means and standard deviations for influencer marketing dimension

Item	Order	Mean	Standard deviation	Relative importance
6. Provides useful information about tourist attractions	6	3.14	1.158	Medium
7. Provides me with visual experience about the nature of tourist attractions	2	4.00	0.991	High
8. Influencer marketing about tourist attractions on social media is efficient	3	3.64	0.848	Medium
9. Provides me with information about tourist attractions in an easy language	1	4.19	0.755	High
10. Saves me time, effort, and money to access tourism information	4	3.55	0.915	Medium
11. Provides me with exclusive news about domestic tourism	5	3.46	0.999	Medium
General average (influencer marketing)	–	3.66	–	Medium

relative importance. Among these items, Item 9 received the highest mean score of 4.19, with a standard deviation of 0.755, suggesting a high level of relative importance. On the other hand, Item 6 received the lowest mean score of 3.14, falling within the medium level of relative importance, along with a standard deviation of 0.858.

- **Electronic Commercial Advertisements**

Electronic commercial advertisements are one of the dimensions of the independent variable, which was also measured through six items. Table 5 shows the arithmetic means, standard deviations, and the relative importance of the items.

The findings presented in Table 5 reveal that the items pertaining to the electronic advertising dimension possess a significant level of importance. Among these items, Item 16 garnered the highest mean score of (4.02), accompanied by a standard deviation of (0.948). Conversely, Item 17 obtained the lowest mean score of (3.45), with a standard deviation of (1.182). On the whole, the electronic advertising dimension attained an impressive average score of (3.77), indicating a high level of effectiveness for Jordanian tourism companies.

- **Video Marketing through YouTube**

Table 5 Means and standard deviations for electronic advertising dimension

Item	Order	Mean	Standard deviation	Relative importance
12. Electronic ads stand out with an attractive style in presenting information about tourist attractions	3	3.99	0.964	High
13. Electronic ads provide me with useful information about tourist attractions	4	3.59	0.968	Medium
14. Electronic ads about tourist attractions are efficient	5	3.57	1.147	Medium
15. Electronic ads provide me with information about tourist attractions in an easy language	2	4.00	0.983	High
16. Electronic ads save me time, effort, and money to access tourism information	1	4.02	0.948	High
17. Electronic ads provide exclusive news about domestic tourism	6	3.45	1.182	Medium
General average (electronic advertising)	–	3.77	–	High

The dimension of video marketing through YouTube was measured through six items, and Table 6 shows the arithmetic means, standard deviations, and the relative importance of the items.

The data presented in Table 6 demonstrates that Jordanian tourism companies highly value the effectiveness of video marketing on YouTube. The mean scores for the sample ranged from 4.31 to 3.96, indicating a significant level of importance. Item 18 received the highest mean score of 4.31, while Item 23 had the lowest mean score of 3.96, both indicating a high level of importance. In general, the average mean score for the dimension of video marketing on YouTube was 4.12, suggesting a high level of effectiveness for this aspect among the companies surveyed.

The data presented in Table 7 clearly indicates that the dimensions of the digital marketing variable are predominantly of significant importance, with the exception of YouTube video marketing, which is classified as having a moderate level of importance based on its relatively lower mean score of 3.66. This implies that among the various digital marketing methods employed by Jordanian tourism companies, YouTube video marketing demonstrates the least effectiveness. Conversely, it is worth noting that YouTube video marketing obtains the highest mean score of 4.12, signifying the highest level of effectiveness among the digital marketing methods

Table 6 Means and standard deviations for video marketing through YouTube dimension

Item	Order	Mean	Standard deviation	Relative importance
18. Video marketing stands out with an attractive style in presenting information about tourist attractions	1	4.31	0.750	High
19. Video marketing provides me with useful information about tourist attractions	2	4.24	0.747	High
20. Video marketing about tourist attractions on social media sites is efficient	4	4.06	0.929	High
21. Video marketing provides me with information about tourist attractions in an easy language	3	4.07	0.973	High
22. Video marketing saves me time, effort, and money to access tourism information	5	4.00	0.971	High
23. Video marketing offers exclusive news about domestic tourism	6	3.96	0.933	High
General average (video marketing through YouTube)	–	4.12	–	High

Table 7 Mean scores for digital marketing variables

Dimension	Order	Mean score	Relative importance
Email marketing	2	3.80	High
Influencer marketing	4	3.66	Medium
Electronic advertising	3	3.77	High
YouTube video marketing	1	4.12	High
Digital marketing overall	–	3.84	High

utilized by these companies. In general, the efficacy of digital marketing tools for tourism companies in Jordan is considerably high, as evidenced by the mean score of the independent variable (3.84), which falls within the category of high relative significance.

4.2 Mediating Variable: Level of Perceived Value

The perceived value variable was measured through six items, and Table 8 shows the arithmetic means, standard deviations, and the relative importance of the items.

The perceived value variable displayed a range of mean scores between 3.30 and 3.99, indicating high and medium levels of importance. Among the items, item 24, which achieved the highest mean score of 3.99, accompanied by a standard deviation of 0.975. Conversely, item 27 obtained the lowest mean score of 3.30, placing it within the medium level, with a standard deviation of 1.285. Overall, the perceived value variable demonstrated a high level of significance, as evidenced by its mean score of 3.67, indicating a high perception of value among customers of tourism companies.

4.3 Dependent Variable: Customer Satisfaction Level

The customer satisfaction variable was measured through eleven items, and Table 9 shows the arithmetic means, standard deviations, and the relative importance of the items.

The level of importance attributed to customer satisfaction within tourist companies appears to vary between high and medium. This is evident from the arithmetic means calculated for different paragraphs, which range from 3.47 to 3.71. Notably, item 40 achieved the highest mean score of 3.71. Conversely, paragraph 36 obtained the lowest mean score of 3.47. On the whole, the variable of customer satisfaction attains a medium level of significance, as indicated by an overall arithmetic mean of 3.58. This implies that the level of customer satisfaction at tourist companies can be characterized as average.

Table 8 Mean scores for perceived value variable

Item	Order	Mean score	Standard deviation	Importance level
24. Jordanian tourism company provides added value through apartment offers	1	3.99	0.975	High
25. Quality of services offered by Jordanian tourism companies on digital marketing platforms is satisfactory	2	3.93	1.006	High
26. Cost of services provided by Jordanian tourism companies is satisfactory	3	3.86	1.109	High
27. Service prices in Jordanian tourism companies are commensurate with low-cost market value	6	3.30	1.285	Medium
28. Intend to recommend friends or family to services provided by Jordanian tourism companies	5	3.44	1.264	Medium
29. Jordanian tourism company offers diversity in various tourism programs	4	3.52	1.317	Medium
Perceived value overall	–	3.67	–	High

5 Testing the Study Hypotheses

The study was built on a set of hypotheses, and the researcher relied on testing Structural Equation Modeling, which was tested at a significance level ($\alpha \leq 0.05$). The following is an explanation of the results of hypothesis testing.

5.1 Testing the Main Hypothesis

HO1: There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of digital marketing channels (email marketing, influencer marketing, display advertising, video marketing) on customer satisfaction in tourism companies. Table 10 illustrates the results.

Based on the data presented in Table 10, it is evident that there exists a robust inverse correlation between the various dimensions of the independent variable

Table 9 Arithmetic means, standard deviations, and relative importance levels of customer satisfaction variable

Paragraph	Rank	Arithmetic mean	Standard deviation	Importance level
30. Digital marketing methods attract me towards dealing with tourism companies	6	3.57	1.254	Medium
31. I am attracted by the responsiveness and cooperation of the employees in tourism companies	5	3.59	1.193	Medium
32. The staff of tourism companies deal with me in solving the problems I encounter in tourism	10	3.50	1.254	Medium
33. The staff of tourism companies treat me kindly	4	3.61	1.231	Medium
34. You feel satisfied after using the services of Jordanian tourism companies	8	3.52	1.183	Medium
35. The staff of tourism companies listen to me and speak in an understandable manner	3	3.69	1.194	High
36. The information published through digital marketing drives me to repeatedly deal with tourism companies	11	3.47	1.214	Medium
37. The employees in tourism companies provide service with high efficiency	2	3.70	1.194	High
38. I recommend my friends to deal with tourism companies through digital marketing channels	7	3.53	1.175	Medium
39. Tourism companies have the ability to solve problems through digital marketing channels	9	3.51	1.264	Medium

(continued)

Table 9 (continued)

Paragraph	Rank	Arithmetic mean	Standard deviation	Importance level
40. The response from tourism companies through digital marketing channels is considered satisfactory	1	3.71	1.203	High
Customer satisfaction		3.58		Medium

(namely, email marketing, influencer marketing, electronic display advertising, and video marketing) and the dependent variable, customer satisfaction. This correlation is quantified by a correlation coefficient of $R = 0.598$. Consequently, it can be inferred that there is a positive association between the dimensions of digital marketing and customer satisfaction. Furthermore, this association is characterized by its strength and inverse nature, implying that an augmentation in these dimensions corresponds to an increase in customer satisfaction.

The value of the coefficient of determination (R^2) was found to be 0.357, indicating that the dimensions of the independent variable account for 35.7% of the variability in customer satisfaction. The remaining percentage of variance is attributed to factors that were not examined in this study. Furthermore, when comparing the tabulated F value (2.61) with the calculated analysis of variance for the F-test (56.290), it is evident that the calculated value significantly exceeds the tabulated value. This confirms the statistical significance of the regression model. As a result, the null hypothesis can be rejected, and the alternative hypothesis, which states that there is no statistically significant impact of digital marketing channels on customer satisfaction in tourism companies, can be accepted.

First Subsidiary Hypothesis Test

- HO1.1: There is no statistically significant effect of email marketing on customer satisfaction in Jordanian tourism companies.

Based on the findings presented in Table 10, there exists an inverse correlation between email marketing and customer satisfaction, as evidenced by a Beta value of 0.156. It is worth noting that this Beta value is the lowest among all the dimensions of digital marketing. The coefficient of determination (R^2) value, which measures the proportion of variance in customer satisfaction explained by email marketing, was calculated to be 0.024. This indicates that email marketing accounts for only 2.4% of the variation in customer satisfaction, while the majority of the variation can be attributed to other factors that were not examined in this study. The computed critical ratio (C.R.) value was determined to be 3.131, surpassing the tabulated value of 1.96. This suggests the statistical significance of the regression model used. Furthermore, the significance level for the test was found to be 0.002, which is lower than the predetermined threshold of 0.05. This confirms that the observed relationship between email marketing and customer satisfaction is not due to random chance.

Table 10 Results of testing the main hypothesis

Model summary		ANOVA			Dimensions of the independent variable	Unstandardized coefficients	Standardized coefficients	Regression weight	
Correlation coefficient R	The coefficient of determination R^2	F value	Degree of freedom	*P* value		B value	Beta value	C.R. value	*P* Value
0.598	0.357	56.290	4	0.000	Email marketing	0.154	0.156	3.131	0.002
					Influencer marketing	0.237	0.198	3.309	0.000
			403		Electronic Display advertising	0.208	0.209	3.865	0.000
			407		YouTube video marketing	0.196	0.159	2.805	0.005

The findings derived from the analysis of data lead us to reject the null hypothesis and accept the alternative hypothesis, thereby indicating a statistically significant impact of email marketing on customer satisfaction within Jordanian tourism companies. Moreover, the results demonstrate that a marginal increase in email marketing corresponds to 0.154 increase in customer satisfaction.

Second Subsidiary Hypothesis Test

- HO1.2: There is no statistically significant effect of influencer marketing on customer satisfaction in Jordanian tourism companies.

According to the data presented in Table 10, the correlation coefficient (Beta) between the independent variable, influencer marketing, and the dependent variable, customer satisfaction, was calculated to be 0.198. This positive value suggests an inverse relationship between the two variables, indicating that an increase in influencer marketing is associated with an increase in customer satisfaction. Additionally, the coefficient of determination (R2) was found to be 0.039, indicating that influencer marketing accounts for approximately 3.9% of the variability in customer satisfaction, while the remaining variance is attributed to other factors that were not examined in this study. Furthermore, the computed critical ratio (C.R.) value was determined to be 3.309, which exceeds the tabulated value of 1.96, thus confirming the statistical significance of the regression model.

Consequently, the null hypothesis is negated and the alternative hypothesis is embraced, signifying a statistically meaningful impact of influencer marketing on customer satisfaction. Furthermore, the findings illustrate that for every unit escalation in influencer marketing, there is a corresponding 0.237 elevation in customer satisfaction.

Third Subsidiary Hypothesis Test

- HO1.3: There is no statistically significant effect of electronic display advertising on customer satisfaction in Jordanian tourism companies.

The findings presented in Table 10 reveal a Beta coefficient of 0.209, indicating a positive inverse association between electronic display advertising and customer satisfaction. The coefficient of determination (R^2) was calculated as 0.044, suggesting that electronic display advertising accounts for 4.4% of the variability in customer satisfaction, while the remaining variance is attributable to unexplored factors. The computed critical ratio (C.R.) was determined to be 3.865, surpassing the tabulated value of 1.96, thus confirming the statistical significance of the regression model.

Drawing upon the findings, we refute the null hypothesis and embrace the alternative hypothesis, thereby implying a statistically substantial impact of electronic display advertising on customer satisfaction. Additionally, the outcomes reveal that a mere increment of one unit in electronic display advertising results in a corresponding augmentation of 0.208 in customer satisfaction.

Forth Subsidiary Hypothesis Test

- HO1.4: There is no statistically significant effect of video marketing through YouTube on customer satisfaction in Jordanian tourism companies.

The findings presented in Table 10 reveal a Beta coefficient of 0.159, indicating a positive inverse association between video marketing on YouTube and customer satisfaction. Furthermore, the coefficient of determination (R^2) value of 0.029 signifies that video marketing on YouTube accounts for 2.9% of the variability in customer satisfaction, while the remaining variance is ascribed to unexplored factors. Additionally, the computed critical ratio (C.R.) value of 2.805 surpasses the tabulated value of 1.96, providing confirmation of the regression model's statistical significance.

Consequently, the null hypothesis is discarded in favor of the alternative, signifying a statistically substantial impact of YouTube video marketing on customer satisfaction. Furthermore, the findings reveal that a rise of one unit in YouTube video marketing corresponds to a 0.196 augmentation in customer satisfaction.

5.2 Testing the Second Main Hypothesis

HO2: There is no statistically significant effect (at the 0.05 level) of digital marketing channels (email marketing, influencer marketing, electronic display advertising, video marketing) on perceived value in Jordanian tourism companies. Table 11 illustrates the results.

The correlation coefficient, denoted by R, demonstrates a robust negative correlation between the various dimensions of the independent variable, namely email marketing, influencer marketing, electronic display advertising, and video marketing, and the mediating variable of perceived value. Additionally, the Beta coefficient substantiates that these dimensions possess the ability to account for a substantial proportion of the variability observed in perceived value.

The proportion of variance in perceived value accounted for by the dimensions of the independent variable, as indicated by the coefficient of determination (R^2), is approximately 33.8%. This suggests that these dimensions have the ability to explain a significant portion of the perceived value. The comparison between the computed value of F and the tabulated value confirms the statistical significance of the regression model, with the computed value being significantly higher. As a result, the alternative hypothesis was accepted and the second main hypothesis was rejected.

The statistical analysis revealed that the dimensions of digital marketing, specifically electronic display advertising and video marketing via YouTube, exhibited a noteworthy level of statistical significance in relation to perceived value. Conversely, the other dimensions of digital marketing, namely email marketing and influencer marketing, did not demonstrate a statistically significant impact. These findings suggest that the utilization of multiple digital marketing channels can have a considerable influence on the perceived value of customers patronizing Jordanian tourism companies, particularly through the implementation of video marketing via YouTube and electronic display advertising.

Table 11 Results of testing the second main hypothesis

Model summary		ANOVA			Dimensions of the independent variable	Unstandardized coefficients	Standardized coefficients	Regression weight	
Correlation coefficient R	The coefficient of determination R^2	F value	Degree of freedom	*P* value		B value	Beta value	C.R. value	*P* value
0.581	0.338	51.395	4	0.000	Email marketing	0.057	0.059	1.174	0.240
					Influencer marketing	0.103	0.089	1.470	0.142
			403		Electronic display advertising	0.208	0.215	3.929	0.000
			407		YouTube video marketing	0.377	0.317	5.494	0.000

Table 12 Results of testing the third main hypothesis

Mediating variable	Model summary		Unstandardized coefficients	Standardized coefficients	Regression weight	
	Correlation coefficient R	The coefficient of determination R^2	B value	Beta value	C.R. value	*P* value
Perceived value	0.585	0.342	0.605	0.585	14.538	0.000

5.3 Testing the Third Main Hypothesis

HO3: There is no statistically significant effect at the ($0.05 \geq \alpha$) level of the perceived value on customer satisfaction in Jordanian tourism companies. Table 12 illustrates the results.

The findings presented in Table 12 demonstrate a robust and positive association between perceived value and customer satisfaction, as indicated by a correlation coefficient of $R = 0.585$. This further supports the statistically significant impact of digital marketing on enhancing customer satisfaction. Moreover, the determination coefficient (R2) of 0.342 reveals that perceived value accounts for 34.2% of the variability in customer satisfaction, while the remaining portion can be attributed to unexplored factors.

The critical ratio (C.R.) has been computed to be 14.538, which is considerably greater than the tabulated value of 1.96. This stark difference unequivocally confirms the statistical significance of the regression model. Furthermore, the test's significance level is calculated to be 0.000, which is lower than the standard threshold of 0.05. As a result, we reject the null hypothesis and accept the alternative hypothesis, indicating a statistically significant impact of perceived value on customer satisfaction.

The findings additionally demonstrate that the B value, with a magnitude of 0.605, signifies that a marginal augmentation in perceived value corresponds to a 0.605 increment in customer satisfaction within the context of Jordanian tourism enterprises.

5.4 Testing the Fourth Main Hypothesis

H04: There is no statistically significant effect at a significance level ($\alpha \leq 0.05$) of digital marketing channels in their entirety (email marketing, influencer marketing, display advertising, video marketing through YouTube) on customer satisfaction with perceived value being a mediating variable in Jordanian tourism companies.

Table 13 illustrates the coefficients of each path in the model, the standard error, critical ratio, and the statistical significance values.

Table 13 Coefficients in the path model, standard error, critical ratio, and statistical significance values

Path	Coefficient	Standard error	Critical ratio	Statistical significance
Digital marketing → perceived Value	0.970	0.095	10.160	0.000
Digital marketing → customer satisfaction	0.776	0.132	5.871	0.000
Perceived value → customer satisfaction	0.230	0.084	2.546	0.002

The findings presented in Table 13 demonstrate a statistically significant impact of digital marketing on perceived value and customer satisfaction. The coefficients for perceived value and customer satisfaction are (0.970) and (0.776) respectively, both of which are highly significant at a level of (0.000), indicating a strong relationship. Furthermore, the critical ratio values for perceived value and customer satisfaction are (10.160) and (5.871) respectively, surpassing the critical values.

In addition, the presented table provides evidence of a notable and statistically significant impact of perceived value on customer satisfaction, as indicated by a coefficient of (0.230), a significance level of (0.002), and a critical ratio of (2.546), surpassing the critical thresholds. To further investigate the role of perceived value as a mediator between digital marketing and customer satisfaction, the model was analyzed to assess both the direct and indirect effects. Specific details regarding these effects can be found in Table 13.

The coefficients of the direct and indirect path model, mediated by perceived value, are presented in Table 14.

The statistical analysis conducted in Table 14 reveals that both the direct and indirect paths of influence demonstrate significant results at a significance level of (0.05). The obtained findings are as follows:

The impact of digital marketing on perceived value is evident, as indicated by a coefficient of (0.725). Similarly, digital marketing has a direct influence on customer satisfaction, with a coefficient of (0.604). Furthermore, the findings reveal that perceived value has a direct effect on customer satisfaction, with a coefficient of (0.136).

Table 14 The coefficients of the direct and indirect path model through the mediation of perceived value

Variables	Nature of effect	Perceived value	Customer satisfaction
Digital marketing	Direct	0.725	0.604
	Indirect	0.000	0.662
Perceived value	Direct	0.000	0.136
	Indirect	0.000	0.000
Total effect		0.725	1.262

In terms of the indirect impact, the only route identified is the influence of digital marketing on customer satisfaction through perceived value. The coefficient for this path is 0.662, which is higher than the direct effect of digital marketing on customer satisfaction (0.604). The results of the path analysis lead to the rejection of the null hypothesis (Ho4) and the acceptance of the alternative hypothesis, which suggests a statistically significant effect of digital marketing channels (email, influencer, display, and video marketing) on customer satisfaction in Jordanian tourism companies, with perceived value serving as a mediating variable. This effect is significant at a significance level of $\alpha \leq 0.05$.

5.5 Recommendations

- Invest in engaging content, especially YouTube videos, focusing on useful and interactive information that reflects unique tourism experiences in Jordan.
- Collaborate with influencers in Jordanian tourism and culture to increase credibility and appeal, carefully selecting influencers to cater to an audience interested in Jordan's travel and heritage.
- Improve your email content by making it more personalized and delivering offers tailored to your customers' needs and preferences.
- Implement digital advertising strategies to reach a wider audience, promote travel offers and increase customer satisfaction.
- Use data analytics to understand customer behavior and preferences, helping you tailor your marketing campaigns and improve the customer experience to increase satisfaction and perceived value.
- Create interactive content such as contests, games and surveys to increase interaction and engagement with your brand, increasing customer satisfaction and encouraging them to share their experiences.
- It is important to regularly measure and analyze the effectiveness of your digital marketing campaigns to understand what worked and what needs improvement.

The Relationship Between Internal Marketing Elements and Customer Satisfaction in Islamic Banks: The International Arab Islamic Bank as a Case Study

Zakaria Azzam and Sameer Alissa

Abstract This research sought to illustrate the link between the internal marketing aspects of the service provider and customer contentment in Islamic banking institutions. The variables involved in this study encompassed selection, training and development, motivation, delegation of authority, internal communication, and customer satisfaction. The choice to employ a descriptive-analytical method was based on its appropriateness for the study's nature. Two questionnaires were crafted as data collection instruments; one for employees and another for customers. The sample population was drawn from five branches of the International Arab Islamic Bank located in Zarqa city, (44) employee questionnaires were distributed with (33) deemed valid for analysis, while (450) customer questionnaires were sent out with (391) considered valid for analysis. The researchers applied suitable statistical techniques using the SPSS software to draw meaningful insights from the collected data. The findings point to a statistically significant correlation between all internal marketing components and customer satisfaction at the International Arab Islamic Bank in Zarqa. Among the variables, it was interesting to note that training and development garnered the highest importance from the employees' viewpoint, whereas delegation of authority was ranked fifth and least important according to them. On a positive note, customers showed satisfaction towards the services offered by the bank's branches. The study put forth several recommendations based on these findings:

enhancing employee authority within the bank, removing unnecessary task performance restrictions for employees, urging management to revamp the incentive system with a more equitable distribution of financial rewards. Additionally, it stressed upon developing strategies aimed at bolstering marketing dimensions of the bank; this includes allocating a substantial budget as well.

Keywords Internal marketing · Customer satisfaction · Islamic Banks · Jordan

1 Introduction

Marketing of banking services is one of the hottest issues for researchers and professionals who are interested in the field of banking service marketing. This is largely due to the challenges hampering this area. These include, among others, information revolution and technological advancements in communication, competition, and evolving customer needs and wants. In order to address these challenges effectively, banks should begin their strategies from an internal standpoint. This involves creating a conducive environment within the organization, focusing on elevating the standards and quality of services provided by the bank (which falls under the responsibility of the service provider). The ultimate aim would be to attain customer satisfaction as well as a competitive edge in the market: two significant outcomes determined by actions taken within this external environment.

The practice of internal marketing stands as one of the foremost practices used by banks to better the quality of their services. This also satisfies the customers and comes highly recommended. The practice is that by satisfying service providers, it would lead to customer satisfaction [30]. This includes various elements such as ensuring selection of competent qualified service providers capable of delivering excellent service to customers, training and development, and retaining outstanding personnel with effective motivation techniques. Information for marketing banking services is included and so are interactive communication skills among employees. Suitable work environment at all levels within the bank's administration should be ensured too since it can play a significant role in achieving job satisfaction internally as well as satisfying external customers [8–11, 19, 20, 23, 27,].

The primary objective of this research is to delve into the connection that exists between the notion of internal marketing and customer contentment within Islamic banking establishments by means of the elements of internal marketing tailored for the service provider. These elements include selection, training and development, motivation, delegation of authority, and internal communications for the service provider. We seek to grasp how these individual components relate to customer satisfaction in the realm of Islamic banks.

1.1 Research Problem and Questions

The growth of the banking sector has reached an unprecedented level, making competition very tough between Islamic banks and then with traditional banks on the other hand. Both are striving to attain customer satisfaction through the delivery of quality banking services at par. As noted by [19, 20], this pressure has led banks to adopt marketing policies that will ensure excellence in service provision. One area that banks focus on as part of their marketing strategies is the internal marketing components. These components address the needs of service providers within the bank. They aim at achieving a high level of service quality that will lead to customer satisfaction. Unfortunately, there are times when these banks do not have sufficient awareness on how important internal marketing is towards customer satisfaction. This lack of understanding poses a real problem for them. Such a thing constitutes an inability to deliver effective services despite efforts made by staff members who are not properly motivated due to this reason. Internal marketing elements are said to have a major role in customer satisfaction according to [11, 29], and the failure of satisfying bank employees will result into negative impact on their performance plus quality of banking service, which then leads to customer dissatisfaction.

Based on the above, the research problem can be formulated with the following questions:

- Do Islamic banks in Jordan adhere to the application of the internal marketing concept?

1.2 Research Hypotheses

Based on the research problem and objectives, the following hypotheses are formulated:

- H01: "There is no statistically significant relationship at a significance level of $\alpha \leq 0.05$ between the selection of the service provider and customer satisfaction in Islamic banks in Jordan."
- H02: "There is no statistically significant relationship at a significance level of $\alpha \leq 0.05$ between the training and development of the service provider and customer satisfaction in Islamic banks in Jordan."
- H03: "There is no statistically significant relationship at a significance level of $\alpha \leq 0.05$ between the motivation of the service provider and customer satisfaction in Islamic banks in Jordan."
- H04: "There is no statistically significant relationship at a significance level of $\alpha \leq 0.05$ between the delegation of authority of the service provider and customer satisfaction in Islamic banks in Jordan."
- H05: "There is no statistically significant relationship at a significance level of $\alpha \leq 0.05$ between the internal communications of the service provider and customer satisfaction in Islamic banks in Jordan."

1.3 Study Model

The development of the study model was influenced by the study variables and related works. These include: [1– 3, 5–7, 9, 12–18, 21, 22, 24, 26, 27, 29].

The study model can be illustrated in the following Fig. 1 [8].

2 Theatrical Framework

- **Internal Marketing**: It involves an array of functions carried out by the organization. This is to meet the needs and wants of the workforce, that is seen as internal customers, while also catering to the demands of external customers. The tasks that fall under this include selection, training and development, motivation as well as delegation of authority and internal communications, among others.
- **Banking Service**: It is a collection of actions and procedures, consisting of utilitarian value, that are embedded in both tangible and intangible aspects offered by the bank. These are perceived by the recipients based on the features and practical worth, which later act as a source to fulfill their present and future financial prerequisites while also serving as a credit requirement [30, 10]. At the same time, it acts as a profit generation for the bank due to this symbiotic relationship between both ends.
- **Banking Service Provider**: People in the bank who deal with customers directly and indirectly and are accountable for providing top-notch service quality as well as ensuring that customer transactions are done without delay [11].
- **Selection of Service Provider**: The procedure of choosing individuals with the appropriate skills to carry out specific job responsibilities efficiently [16].
- **Training and Development of Service Provider**: Strategies employed to polish, uplift, and take the current capacities and talents of the chosen person to a whole new level according to what is needed [25].

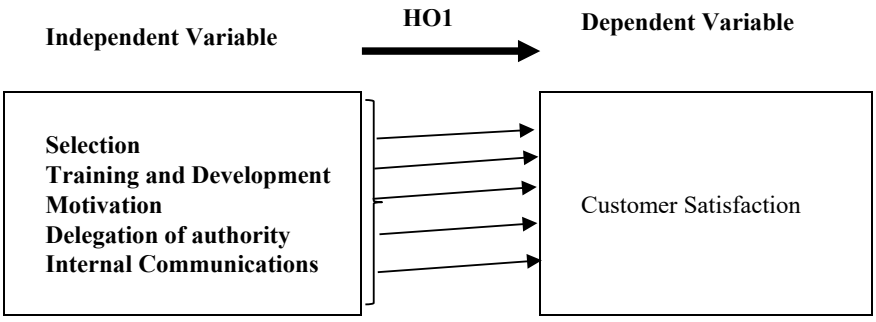

Fig. 1 Study model

- **Motivation of Service Provider**: Motivating people and firing up their drive to be productive in their tasks so as to achieve the goals of the institution. It starts with an external trigger like more pay for more effort but its triumph is hinged on intrinsic determinants associated with an individual's mental disposition [12].
- **Delegation of authority of Service Provider**: Transferring the official authority to another person or the distribution of the right to act and make decisions within a specified scope is referred to as delegation [12].
- **Internal Communications of Service Provider**: The transfer system: it is how information is collected and passed that underpins any decision-making effectiveness but also directly contributes towards high customer quality service by ensuring that all employees get what they need about it and are able to pass it along smoothly.
- **Customer Satisfaction**: Consumption satisfaction is defined by Azzam et al. [16] as the feeling of pleasure or displeasure that results from comparing how well a product or service performs with what was expected by the consumer or customer after consuming or benefiting from it.

3 Study Methodology

A study was conducted that emphasized a set of goals with the main focus being on establishing the connection between service provider's internal marketing elements and customer satisfaction in Islamic banks. This major goal leads to different subgoals which are associated with diverse inquiries, thus shaping the structure of the study. In order to attain these goals, the researchers applied the descriptive-analytical method where qualitative expression delineates the phenomenon and its features as alluded in the theoretical framework, while quantitative expression provides an exact depiction of the phenomenon's extent and volume.

The study was divided into two parts. The first section is the theoretical framework which describes all aspects of the phenomenon and topic in detail, along with a review of previous studies related directly and indirectly to the study topic, internal marketing in banks. The second part presents the quantitative and analytical aspect. This includes a detailed analysis of study data which derives its basis from demographic factors—hypothesis testing and arithmetic means of sample responses.

Two questionnaires were created to collect data from the study samples. One targeted the staff members of International Arab Islamic Bank while the other was meant for the bank's customers. Data from both samples were obtained and subsequently analyzed.

Table 1 Number of clients of the Islamic International Arab Bank

Branch	Number of customers
Zarqa	11,509
Russeifa	4332
North Hill	4506
New Zarqa	7471
Zarqa University	3552
Total	31,370

3.1 Study Population

The sample population was split into two parts: One consisting of the staff members of the International Arab Islamic Bank at all Zarqa city branches, and the other comprising the bank's customers within the same locality. This bifurcation was done in order to align the study's scope with its pertinent factors. Indeed, it would be impractical to gauge the interplay of internal marketing and customer satisfaction using a single homogeneous study group.

- **Bank Employees Population**: The population size was 44 employees distributed across five branches in the city of Zarqa.
- **Bank Customers Population**: The population size was 31,370 customers distributed across five branches. The table below shows the distribution of customers across the five branches (Table 1).

3.2 Study Sample

The researchers used [28] sample size table to choose an optimal sample that represents each study population.

- **Employees Sample**: The study considered all 44 employees due to the low population size. From the questionnaires distributed, 39 were returned which accounted for a non-return rate of five questionnaires, an approximate 87% return rate. Upon data entry, it was noted that six questionnaires were incomplete and not analyzable; this left us with 33 usable questionnaires, amounting to 85% of those returned and representing part of the sample.
- **Customers Sample**: A sample size of 382 customers would be the minimum acceptable representation of the customer population, which consists of 31,370 customers. The researchers distributed 450 questionnaires through simple random sampling.

Fair distribution among branches was determined by calculating the percentage of customers in each branch relative to the total number of customers in Zarqa, and

Table 2 Number of questionnaires distributed in each branch

Branch	Number of customers	Representation percentage (%)	Number of questionnaires distributed
Zarqa	11,509	36.7	165
Russeifa	4332	13.8	62
North Hill	4506	14.4	65
New Zarqa	7471	24	107
Zarqa University	3552	11.3	51
Total	31,370	100	450

consequently establishing the number of questionnaires to be distributed in each branch. The results are illustrated in Table 2.

A sum of 433 questionnaires were returned from the 450 handed out to Zarqa bank clientele, an astonishing 96% retrieval rate. Upon completion of data entry, it was discovered that 42 surveys were unsuitable; nevertheless, there remained 391 serviceable questionnaires which accounted for an impressive 87% of those initially returned.

3.3 Study Tool

In order to gather data from the specified populations, two distinct questionnaires were formulated, as previously indicated. The construction of each questionnaire was customized to suit the specific data requirements of the study sample, incorporating a range of items and variables that were pertinent to the targeted population.

Employee Questionnaire

The initial survey administered to bank employees encompassed a total of 31 items, which aimed to assess five distinct independent variables. Additionally, the questionnaire included a series of inquiries pertaining to the demographic characteristics of the participants. The following table provides a concise overview of the items included in the employee questionnaire (Table 3).

Customer Questionnaire

The customer questionnaire, which aimed to assess customer satisfaction as the dependent variable, consisted of 23 items. Additionally, the questionnaire included a set of items to gather demographic information from the customers. The items of the customer questionnaire are summarized in (Table 4).

The study employed a five-point Likert scale to encode the sample's responses to the items in both questionnaires. Table 5 illustrates this scale.

Table 3 Employee questionnaire items

Axis	Number of items
Part one	
Gender	2
Age	4
Educational level	4
Job Level	3
Number of years working in the bank	4
Part two	
Service provider	5
Training and development of service provider	8
Service provider motivation	7
Delegation of authority of service providers	6
Internal communication of service providers	5

Table 4 Customer questionnaire items

Axis	Number of Items
Part one	
Gender	2
Age	3
Monthly income	3
Educational level	4
Employment sector	3
Number of years dealing with the bank	3
Account type	3
Part two	
Customer satisfaction	23

Table 5 Five-point Likert scale

Response	Strongly agree	Agree	Neutral	Disagree	Strongly disagree
Code	5	4	3	2	1

3.4 Internal Consistency Reliability

The degree of consistency in the results of the questionnaire when administered to the study sample is indicated by the reliability coefficient. If the tool produces inconsistent results upon repeated administration, concerns arise regarding the reliability of its findings [4]. The Cronbach Alpha coefficient, which ranges from 0 to 1, was employed to assess the internal consistency of the questionnaire. Reliability

Table 6 Internal consistency reliability (Cronbach alpha) for employee and customer questionnaires

Item	Question items	Cronbach alpha
Selection of service provider	Q1–Q5	0.762
Training and development	Q6–Q13	0.877
Motivation	Q14–Q20	0.976
Delegation of authority	Q21–Q26	0.895
Internal communication	Q27–Q31	0.914
Overall performance (Employees)	Q1–Q31	0.945
Overall performance (Customers)	Q1–Q23	0.875

is considered low if Alpha is below 0.4, moderate if it falls between 0.4 and 0.7, and high if it surpasses 0.7 [4]. Table 6 presents the Cronbach Alpha coefficients for the employee and customer questionnaires, reflecting their internal consistency reliability.

The reliability of all items included in the employee questionnaire was found to be high, as indicated by Alpha values exceeding 0.7. Specifically, the "Motivation of Service Provider" section exhibited the highest reliability, with an Alpha value of 0.976, while the "Selection of Service Provider" section displayed the lowest reliability, with an Alpha value of 0.762. Overall, the items demonstrated a strong internal consistency, with an Alpha value of 0.945. Similarly, the customer questionnaire items exhibited a high level of reliability, with an Alpha value of 0.875.

3.5 Data on Study Sample

Employees

Table 7 displays the demographic characteristics and representation percentages of employees from the Arab International Islamic Bank branches in Zarqa city.

The findings derived from the demographic examination of bank personnel in the city of Zarqa revealed a predominant male presence, constituting approximately 76% of the workforce, while females accounted for approximately 24%. In terms of age distribution, individuals falling within the 25–35 year range constituted the largest proportion, comprising approximately 33% of the total. Equally represented were the age cohorts of 36–46 and 47–57 years, each encompassing approximately 21% of the overall population.

The majority of the participants in the study were individuals employed within the organization, accounting for approximately 70% of the sample. The remaining 30% was divided equally between managers and assistants, each comprising around 15% of the sample. In terms of tenure, the largest proportion of employees, approximately 30%, had been working at the bank for a period of 6–10 years.

Table 7 Demographic data for study sample (Employees)

Item	Demographic information	Frequency	Percentage (%)
Gender	Male	25	75.8

Customers

Regarding the demographic characteristics of the customers, Table 8 illustrates the results of the analysis.

In Zarqa City, the customer base of Arab Islamic International Bank is predominantly male, accounting for approximately 62% of the total sample, while females constitute the remaining 38%. The customer demographic exhibits a range of age groups, with the 22–30 age bracket comprising the largest proportion at approximately 37%, while individuals over the age of 46 are the least represented, making up only about 3% of the customer base.

In regards to the various types of accounts, it is notable that a significant portion of customers possess current accounts, encompassing approximately 59% of the total, whereas the percentage of individuals holding investment accounts is comparatively lower, standing at approximately 8%.

3.6 Description of Study Variables

The purpose of the study was to assess six variables, with five independent variables being assessed through a questionnaire administered to employees. Customer satisfaction, the dependent variable, was also measured using a questionnaire specifically designed for this purpose. Each variable consisted of a series of items from which inferences could be made. To describe the study variables, measures of central tendency, specifically the mean, were used, along with measures of dispersion, such

as the standard deviation, to determine how responses from the sample varied around the mean. By calculating the arithmetic means of the responses from both samples, the relative importance of each item can be determined, allowing for inferences to be made about the opinions of the participants in the sample.

Service Provider Selection

The first independent variable was measured through 5 items, and Table 9 illustrates the arithmetic means and standard deviations for the variable's items.

Based on the arithmetic means of the items pertaining to the service provider selection variable, it is evident that each of them falls under the category of high relative importance. In summary, the service provider selection variable holds a significant level of relative importance, as indicated by an arithmetic mean of 4.12.

Training and Development Variable for Service Provider

The measurement of the training and development variable was conducted using a total of 8 items. In order to provide a comprehensive overview of this variable, Table 10 has been included, which showcases the arithmetic means and standard deviations.

Based on the arithmetic means, it can be concluded that all items pertaining to the training and development variable hold significant relative importance. The training and development variable itself is deemed highly important, as evidenced by an arithmetic mean of 4.27. This result highlights the bank's strong dedication to consistently offering a diverse range of training programs for its employees.

Table 9 Arithmetic means and standard deviations for service provider selection variable items

Item	Ranking	Mean	Standard deviation	Relative importance
1. The bank prioritizes hiring individuals with high skills that match their job nature	1	4.26	0.663	High
2. The bank selects employees based on a set of criteria and principles	3	4.13	0.331	High
3. The bank ensures that the number of employees matches the number of bank customers	5	3.88	0.781	High
4. The bank's hiring decisions are linked to available vacancies	4	4.12	0.600	High
5. The bank conducts necessary tests and interviews for recruitment	2	4.24	0.830	High
General scale		4.12	0.641	High

Table 10 Arithmetic means and standard deviations for training and development variable items

Item	Ranking	Mean	Standard deviation	Relative importance
6. The bank is keen on developing the skills and competencies of its employees	3	4.38	0.489	High
7. The bank holds training courses for employees regularly	1	4.45	0.754	High
8. The topics and nature of training courses align with employees' job needs	8	4.05	0.631	High
9. The training courses conducted by the bank contribute to my development	4	4.36	0.706	High
10. I participate in future training course topics	2	4.37	0.699	High
11. The bank ensures the selection of highly skilled individuals to deliver training courses	7	4.09	0.601	High
12. The bank adequately invests in training courses	5	4.33	0.736	High
13. There is fairness and equal opportunities among employees to attend training courses	6	4.13	0.636	High
General scale		4.27	0.656	High

Service Provider Motivation Variable

The motivation variable for service providers was measured through 7 items, and Table 10 illustrates the arithmetic means and standard deviations for the variable (Table 11).

The relative importance of the motivation variable items exhibited variation. The arithmetic mean of the motivation variable is 3.79, indicating a high level of significance. This suggests that the bank employs diverse strategies to stimulate and motivate its employees.

Delegation of Authority Variable for Service Provider

The measurement of the delegation of authority variable for service providers was conducted using a set of six items. The corresponding arithmetic means and standard deviations for this variable are presented in Table 12.

Table 11 Arithmetic means and standard deviations for service provider motivation variable items

Item	Ranking	Mean	Standard deviation	Relative importance
14. The bank offers a variety of material incentives to encourage employees to improve their performance	2	3.97	1.015	High
15. The material incentives provided by the bank are fair and commensurate with employees' performance	7	3.61	1.223	Average
16. I receive praise and commendation from my immediate supervisor when I perform well	1	4.12	0.927	High
17. Management makes me feel that I am one of the most important success criteria in the bank	3	3.85	1.278	High
18. There is interest from the bank's management in employees' demands	6	3.63	1.023	Average
19. The bank endeavors to motivate employees in various ways	5	3.65	1.002	Average
20. The bank seeks to consider employees' suggestions for performance improvement	4	3.76	0.830	High
General scale		3.79	1.042	High

The items within the delegation of authority variable exhibited varying levels of relative importance, with the majority falling within the category of average relative importance. From this, it can be deduced that employees possess complete autonomy and decision-making power within the parameters of their delegated authorities and assigned responsibilities.

Internal Communication Variable for Service Providers

The measurement of the internal communication variable for service providers involved the utilization of five items, and Table 13 provides a comprehensive depiction of the arithmetic means and standard deviations associated with said variable.

In relation to the final independent variable, namely internal communication, it is noteworthy that all items are categorized as possessing a significant level of importance. This is demonstrated by the clear assignment of tasks to employees,

Table 12 Arithmetic means and standard deviations for delegation of authority variable items

Item	Ranking	Mean	Standard deviation	Relative importance
21. I can modify the service to meet the customer's needs without resorting to my immediate supervisor	6	2.97	1.237	Average
22. I perform my tasks without continuous supervision from my immediate supervisor	4	3.27	1.398	Average
23. I have the freedom to act in my work according to the delegated authority	1	4.09	0.631	High
24. The bank's management receives my suggestions and encourages them	5	3.12	1.053	Average
25. Management supports employees to perform their tasks to the best of their ability	3	3.39	0.998	Average
26. There is trust from management in employees to provide the best services to customers	2	3.76	0.969	High
General scale		3.43	1.047	High

ensuring that each individual is aware of their expected responsibilities. The variable of internal communication has garnered considerable relative importance, as indicated by an arithmetic mean of 4.12.

In order to ascertain the independent variable with the utmost relative significance, a comparison of arithmetic means and standard deviations is conducted for the variables (Table 14).

Based on the findings, it is evident that the training and development of service providers hold the greatest significance among the variables examined, as indicated by the highest arithmetic mean of 4.27. Conversely, the delegation of authority is deemed to have the lowest relative importance, with an average relative importance of 3.43. Moreover, the dimensions of internal marketing exhibit a considerable level of importance, with an arithmetic mean of 3.94, thereby suggesting that the Arab Islamic International Bank diligently embraces the principles of internal marketing within its branches located in the city of Zarqa.

Customer Satisfaction

Customer satisfaction, the dependent variable, was evaluated using a tailored questionnaire administered to the bank's customers in Zarqa. This questionnaire consisted

Table 13 Arithmetic means and standard deviations for internal communication variable items

Item	Ranking	Mean	Standard deviation	Relative importance
27. Tasks for employees are clear to everyone, facilitating the service delivery process	5	3.88	0.781	High
28. Positive cooperation among employees prevails in the work environment	2	4.24	0.663	High
29. The bank's internal environment is characterized by friendliness and respect among employees, contributing to better work performance	1	4.36	0.699	High
30. Management informs employees about changes in bank policies and goals	3	4.12	0.600	High
31. Information can be easily obtained from colleagues	4	4.00	0.500	High
General scale		4.12	0.649	High

Table 14 Arithmetic means and standard deviations for independent study variables

Variable	Ranking	Mean	Standard deviation	Relative importance
1. Selection of service provider	2	4.12	0.641	High
2. Training and development of service provider	1	4.27	0.656	High
3. Motivation of service provider	4	3.79	1.042	High
4. Delegation of authority to service providers	5	3.43	1.047	Average
5. Internal communication for service providers	3	4.12	0.649	High
General scale		3.94	0.807	High

of (23) items aimed at assessing their level of satisfaction. The corresponding arithmetic means, standard deviations, and relative importance of the dependent variable are presented in Table 14.

The classification of all customer satisfaction items revealed a high level of relative importance. In terms of overall customer satisfaction, it was found that the variable held significant weight, as indicated by an arithmetic mean of 3.97. This suggests that the majority of customers express satisfaction with the performance of employees at Arab Islamic International Bank (Table 15).

4 Testing Study Hypotheses

In order to examine the study hypotheses and address its inquiries, the utilization of the Pearson correlation test was implemented to ascertain the association between the independent and dependent variables.

Hypothesis 1

- H01: There is no statistically significant relationship (at a significance level of $\alpha \leq 0.05$) between service provider selection and customer satisfaction in Islamic banks in Jordan.
- Study Question 2: Is there a relationship between service provider selection and customer satisfaction in Islamic banks in the city of Zarqa?

For testing Hypothesis 1 and answering Study Question 2, the Pearson correlation test was used, and Table 15 illustrates the results (Table 16).

Based on the findings, it is evident that the level of significance in the association between the selection of service providers and customer satisfaction is below the predetermined significance level of 0.05. The computed t-value of 9.725 exceeds the critical t-value of 1.96. As a result, we can reject the null hypothesis and accept the alternative hypothesis, which states that there is a statistically significant relationship (with a significance level of $\alpha \leq 0.05$) between the selection of service providers and customer satisfaction in Islamic banks in Jordan.

The correlation between the variables is moderately positive, with an R value of 0.451, which falls within the moderate strength range according to Cohen's (1988) classification. The service provider variable accounts for 20.3% of the variance in customer satisfaction, as indicated by the value of R^2. Consequently, Study Question 2 has been successfully addressed.

The examination outcomes additionally demonstrate that a modification of one unit in the independent variable (selection of service provider) leads to a corresponding alteration of 0.428 units in the dependent variable (satisfaction of the customers), as deduced from the obtained value of B obtained through the process of simple linear regression analysis.

Table 15 Arithmetic means and standard deviations for customer satisfaction variable items

Item	Ranking	Mean	Standard deviation	Relative importance
1. The number of bank employees is proportional to the number of customers, facilitating quick transaction processing	2	4.31	0.797	High
2. Bank employees possess high efficiency and skill in providing excellent service	1	4.37	0.712	High
3. Service providers are characterized by high accuracy and speed in execution	3	4.25	0.814	High
4. Service providers have the ability to solve problems even if they are beyond their authority	23	3.12	1.121	Average
5. I am satisfied with the level of cooperation among bank employees when providing service to customers	6	4.08	0.869	High
6. The bank continuously seeks to improve services provided to customers by increasing the efficiency of workers	8	4.05	0.820	High
7. I do not have to wait long to get the desired service	17	3.90	0.923	High
8. Bank employees deal fairly and transparently with all customers	14	3.94	1.080	High
9. The relationship between bank employees and customers is characterized by respect and appreciation	22	3.81	1.085	High
10. The bank continuously informs me about new services it offers	20	3.83	1.114	High
11. Bank employees have sufficient information about the services provided by the bank	4	4.22	0.802	High

(continued)

Table 15 (continued)

Item	Ranking	Mean	Standard deviation	Relative importance
12. Service delivery procedures to customers are comfortable and free of complications	5	4.15	0.861	High
13. The bank always meets my needs and desires	9	4.04	0.977	High
14. The bank consistently seeks my opinion on the quality of service provided	16	3.93	1.022	High
15. The bank provides sufficient information about its activities to customers	10	3.99	0.979	High
16. Bank employees provide sufficient and clear details about the costs of the service provided to customers	11	3.98	0.874	High
17. Services provided by the bank exceed my expectations	21	3.82	0.980	High
18. The bank ensures to select employees who have sufficient experience to provide excellent services	18	3.83	0.997	High
19. The training courses held by the bank contribute to providing excellent services to customers	15	3.94	0.888	High
20. I feel that bank employees are motivated to perform their tasks excellently	13	3.95	0.808	High
21. Bank employees have the authority to deal directly with emergency cases	19	3.83	1.086	High
22. Service delivery procedures are easy, convenient, and fast	12	3.96	0.867	High

4.1 Recommendations

1. Empower Arab Islamic International Bank employees, reduce restrictions on their tasks and make it easier to solve some problems without having to refer to their direct superiors.
2. Identify employee training needs by relevant department and stay updated with developments and innovations in the world of Islamic banking.
3. Continue to offer training programs systematically and periodically.
4. The management of Arab Islamic International Bank should diversify the incentive system and create a fair mechanism adapted to the nature of achievements, offering material incentives based on results.
5. Updating and strengthening the selection criteria for service providers, focusing primarily on competencies rather than skills.
6. Build an atmosphere of kindness and love among bank employees, making it one of the bank's values that should be disseminated among employees.
7. Continuously strive to achieve employee professional satisfaction and motivate them to achieve customer satisfaction.
8. Develop strategies to strengthen the marketing dimensions of Arab Islamic International Bank, allocate sufficient budget for this purpose and incorporate it into the bank's policies.

The Role of Administrative Communication in Achieving the Effectiveness of Administrative Decisions in Private Sector Institutions

Jiries Abu Ghannam, Rawan Wael Siaj, and Khaled Alzeaideen

Abstract This study aimed to identify the role of administrative communication in achieving the effectiveness of administrative decisions. The study was conducted on private sector institutions in the Bethlehem Governorate. To achieve the objectives of the study, the research team prepared a questionnaire to collect the necessary data from its various sources to achieve those goals. Analytical study and questionnaire as a main tool for collecting information. The study was conducted on a random sample of (58) questionnaires. The sample items were distributed to the study population of employees of private sector institutions in the Bethlehem Governorate. The study reached several results, the most important of which are: The results showed that the degree of employees' evaluation of the patterns of administrative communication was large, as the most common manifestations were the communications issued by managers to employees facilitate obtaining the information necessary for decision-making, followed by facilitate communication between employees at the same administrative level to obtain information before making decisions. The results showed that the degree of the means of administrative communication was great, as the most common manifestations were the social media contribute among the workers by providing the information required to make the decisions, then the means of oral communication among the workers contribute to the provision of the necessary information to make the decisions. The results showed that the degree of workers' evaluation of administrative communication skills was large, as the most common manifestations were that workers considered written communications more accurate and safer, followed by workers characterized by written skills that express what they want clearly.

1 Introduction

Administrative communication represents a fundamental means for making sound managerial decisions and is essential for fostering unity and collaboration among departments within an organization. Continuous interaction with the environment, characterized by recurring challenges such as competition, changes in customer lifestyles and preferences, and technological advancements, necessitates successful organizations to adapt their administrative processes. As change and development occur continuously, there is a need for the emergence of new communication and development methods to increase efficiency, effectiveness, and achieve organizational success and development. Administrative communications constitute one of the necessary administrative elements for making managerial decisions, as the communication process is closely linked to human interaction within the organization to facilitate communication, information transfer, and exchange of experiences [1–11].

Communication is one of the most essential executive tools without which any management cannot perform its duties effectively, as it constitutes the common element in all administrative operations. The more efficient and effective the communication process is, the easier it is to pass information to the parties responsible for decision-making within the organization flexibly and in a timely manner. The inability of communication to convey and deliver this information at the required speed and accuracy constitutes a barrier to this process [12–18].

Therefore, communication today has become a matter of great interest in the fields of management and organization, whether by researchers or practitioners, as communications are the nerve center of the organization, its beating heart. They propel activity and vitality throughout its parts, and without them, decisions and information remain stagnant, and the administrative process comes to a complete halt. The entire management activity leads to communications [19–31].

1.1 Problem Statement

Administrative communications within public institutions are considered a fundamental and necessary process and a significant criterion for measuring the development and success or failure of these institutions in achieving their goals. However, this does not mean that attention to the subject of communication is limited only to its technical aspects, equipment, and technological means. It is a human and social process that connects individuals within the institution and coordinates between the

units of the same institution and its interests. Based on this, the problem of the study can be formulated in the main question:

What is the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate?

Significance of the Study: The importance of this study lies in:

1. Monitoring and analyzing the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate and highlighting the role and importance of these activities in providing effective information contributing to making effective managerial decisions.
2. Revealing the most important administrative communication technologies used by private sector institutions in Bethlehem Governorate to obtain necessary and essential information.
3. The recommendations resulting from this study will help in the development and enhancement of the efficiency of managers in the process of effective communication.

1.2 Study Objectives

The study aimed to achieve the following objectives:

1. The role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate.
2. Identifying the nature of administrative communications used in private sector institutions in Bethlehem Governorate by understanding (patterns, means, and skills of administrative communications).
3. Identifying the characteristics of information available and resulting from administrative communications in private sector institutions in Bethlehem Governorate in terms of timing, accuracy, comprehensiveness, clarity, flexibility, and ease of access.

1.3 Study Questions

1. What are the patterns of administrative communications in private sector institutions in Bethlehem Governorate?
2. What are the means of administrative communications in private sector institutions in Bethlehem Governorate?
3. What are the skills of administrative communications in private sector institutions in Bethlehem Governorate?
4. What are the characteristics of information resulting from administrative communications in private sector institutions in Bethlehem Governorate?

5. To what extent does administrative communication contribute to the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate?

1.4 Study Hypotheses

1. There are no statistically significant differences at the significance level ($\alpha \leq 0.05$) regarding the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate attributed to the gender variable.
2. There are no statistically significant differences at the significance level ($\alpha \leq 0.05$) regarding the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate attributed to the educational qualification variable.
3. There are no statistically significant differences at the significance level ($\alpha \leq 0.05$) regarding the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate attributed to the years of experience variable.
4. There are no statistically significant differences at the significance level ($\alpha \leq 0.05$) regarding the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate attributed to the job title variable.
5. There are no statistically significant differences at the significance level ($\alpha \leq 0.05$) regarding the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate attributed to the monthly income variable.

2 Study Methodology

The research team utilized the descriptive analytical methodology, which aims to identify the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in Bethlehem Governorate. The descriptive analytical methodology attempts to compare, interpret, and evaluate in order to arrive at meaningful generalizations that enhance the knowledge about the subject.

2.1 Study Population

This study addressed the topic of the role of administrative communication in achieving the effectiveness of managerial decisions in private sector institutions in

Bethlehem Governorate. Accordingly, the study population consisted of employees of private sector institutions in Bethlehem Governorate.

2.2 Study Sample

The study was conducted on a random sample of (58) questionnaires distributed among the study population of employees of private sector institutions in Bethlehem Governorate.

2.3 Study Instrument

The questionnaire was constructed to obtain the perspectives of respondents on the study topic.

2.4 Study Instrument Reliability

The reliability of the study instrument was verified by examining the internal consistency of the instrument items by calculating the Cronbach's Alpha coefficient on the total study sample, where the reliability value was (0.93), indicating a very high degree of reliability.

3 Results

Study Question 1: What is the degree of the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate?

The degree of the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate was significant, with the mean score for this degree on the total scale of the study measure being (3.97), with a standard deviation of (0.48).

Study Question 2: What are the most important aspects of employee evaluation of administrative communication patterns?

The degree of employee evaluation of administrative communication patterns was significant, with the mean score for this degree being (4.09). The most common aspects were facilitating communication from managers to employees to obtain necessary information for decision-making, with an average of (4.26), followed by

facilitating communication among employees at the same administrative level to obtain information before making decisions, with an average of (4.19).

Study Question 3: What are the most important aspects of administrative communication means?

The degree of administrative communication means was significant, with the mean score for this degree being (3.94). The most common aspects were the contribution of social media among employees in providing the necessary information for decision-making, with an average of (4.12), followed by the contribution of oral communication among employees in providing necessary information for decision-making, with an average of (4.09).

Study Question 4: What are the most important aspects of employee evaluation of administrative communication skills?

The degree of employee evaluation of administrative communication skills was significant, with the mean score for this degree being (3.82). The most common aspects were employees considering written communications more accurate and secure, with an average of (3.93), followed by employees having writing skills that clearly express what they want, with an average of (3.93).

Study Question 5: What are the most important aspects of employee evaluation of characteristics of information resulting from administrative communication?

The degree of employee evaluation of characteristics of information resulting from administrative communication was significant, with the mean score for this degree being (3.93). The most common aspects were internal communication information being characterized by timely availability, with an average of (4.31), followed by internal communication information being characterized by accuracy, with an average of (3.93).

Study Question 6: What are the most important aspects of the effectiveness of managerial decisions?

The degree of the effectiveness of managerial decisions was significant, with the mean score for this degree being (4.04). The most common aspects were administrative communication contributing to providing information that aids in making timely managerial decisions, with an average of (4.31), followed by administrative communication contributing to providing information that facilitates the implementation of managerial decisions, with an average of (4.21).

Hypothesis 1:

- Hypothesis: There are no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to gender.
- Findings: The results revealed statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to gender, with differences favoring females.

Hypothesis 2:

- Hypothesis: There are no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to educational qualification.
- Findings: The results showed no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to educational qualification.

Hypothesis 3:

- Hypothesis: There are no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to job title.
- Findings: The results indicated no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to job title.

Hypothesis 4:

- Hypothesis: There are no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to monthly income in shekels.
- Findings: The results revealed no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to monthly income in shekels.

Hypothesis 5:

- Hypothesis: There are no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to years of experience.
- Findings: The results indicated no statistically significant differences at the $\alpha \leq 0.05$ level in the role of administrative communication in achieving the effectiveness of managerial decisions in the private sector in Bethlehem Governorate attributed to years of experience.

4 Conclusion

In conclusion, the study findings indicate that private sector institutions in Bethlehem Governorate place a strong emphasis on the role of administrative communication in achieving the effectiveness of their decision-making processes. The results demonstrate that employees highly evaluate the patterns of communication from managers, which facilitate access to the necessary information for informed decision-making. Additionally, the study reveals that the institutions leverage a variety of communication means, including social media and oral channels, to enable information sharing among workers and support the decision-making requirements. Furthermore, the workforce appears to have strong written communication skills, which they view as a key factor in conveying information accurately and clearly for decision-making purposes. Overall, the findings suggest the private sector organizations recognize the critical importance of robust and effective administrative communication in enhancing the quality and outcomes of their decision-making, which is vital for organizational success and competitiveness. Maintaining these communication best practices seems to be a strategic priority for the institutions examined.

5 Recommendations

Based on the study findings, the following recommendations can be made:

- Utilize the expertise of communication technology specialists to establish a communication system linking the private sector to enhance the effectiveness of managerial decisions.
- Address deficiencies and obstacles hindering the efficiency of communication technologies, including technological, personal, and organizational obstacles.
- Develop written, verbal, and electronic administrative communication methods to provide necessary information and train employees to master these methods for more accurate and beneficial information outcomes.
- Provide financial and moral incentives to encourage employees to rely on technology in communication.
- Increase focus on administrative communication patterns among employees at the same managerial level and between managers and employees to provide information with specific characteristics that make managerial decisions more effective.
- Consider precision in timing during administrative communication between supervisors and subordinates, as this positively impacts the nature of the relationship with employees, as long waiting times for communication with supervisors and imprecision in timing lead to a lack of desire to communicate, thus losing the desired benefits of communication.

The Extent of Application of IFRS to SMEs: A Case Study of a Dairy Company

Nidal Mahmoud Al-Ramahi, Alaa Ahmad Al-Mbaideen, and Tareq Hammad Almubaydeen

Abstract The objective of this study is to assess the implementation of the IFRS for Small and Medium-sized Enterprises (IFRS for SMEs) in Jordan, which was issued by the International Accounting Standards Board in 2009. To achieve this objective, a descriptive inferential approach is employed, with the Jordanian Dairy Company selected as a representative case study. A total of 41 questionnaires were collected, representing a response rate of 95.3%. After ensuring the validity of the retrieved questionnaires for analysis, it was determined that all of them were suitable for analysis. The data obtained is analyzed using the SPSS program. The findings of the study reveal that the Jordanian Dairy Company demonstrates a high level of compliance with the IFRS for SMEs. The study participants confirmed that their organization adheres to the specific items of the standard that were examined, including the adopted policies, disclosed information, and presentation of financial statements. Based on the results, several recommendations are put forth. These recommendations encompass both the general application of the IFRS for SMEs and the specific actions that the Jordanian Dairy Company should undertake. They emphasize the importance of providing ongoing support to small and medium-sized enterprises, facilitating their transactions and financing. Additionally, the evaluation of the accounting systems of these establishments in accordance with international accounting standards was deemed necessary.

Keywords IFRS for SMEs · Jordan · Implementation · Accounting standards · Small and medium-sized enterprises

1 Introduction

SMEs, which encompass industrial, commercial, and certain service sectors, are categorized based on their size, with distinctions made in terms of employee count and annual revenues. Throughout the twentieth century, there was a notable increase in the recognition and focus placed on these enterprises, leading researchers and economic specialists to promote their establishment and facilitate their growth.

The significance of SMEs in driving economic growth, fostering employment opportunities, enhancing value creation, and facilitating export activities is widely acknowledged, making them a fundamental component of numerous global economies. Recognizing the unique reporting needs of entities without general-purpose financial reporting, the International Accounting Standards Board sanctioned the IFRS for SMEs in 2009, outlining the overarching objectives of financial statements.

In light of the transformation of the accounting field resulting from the global expansion of financial markets, the IFRS for SMEs was formulated with the aim of addressing the requirements of financial statement users for SMEs. However, in order for these financial statements to effectively fulfill their intended purpose, they must encompass information that possesses a notable degree of quality and comparability. As a result, small and medium enterprises face the difficulty of covering the expenses related to complying with these standards.

When nations embrace the IFRS for SMEs interesting things can happen. For instance, a positive outcome could be favorable loan conditions extended by major lenders like the IMF and World Bank, as indicated by Tyrrell et al. [5]. These standards are more than just numbers on a page. They act as a tacit agreement between organizations and their stakeholders through the accounting process. A promise made that those who rely on these reports will benefit from others' commitment to honesty (integrity) and justice (fairness) without compromising any aspect that is substantial.

The economy of Jordan greatly depends on SMEs as a vital part of its economy. Jordan has been demonstrating its adherence to international laws and regulations for more than ten years with regard to implementation of international accounting standards. Nevertheless, these enterprises encounter significant challenges when it comes to the practical application of these standards.

The primary objective of this research is to evaluate the degree to which the IFRS for SMEs has been implemented in Jordan. The research problem revolves around the obstacles encountered by the SME sector in Jordan when it comes to adhering to IFRSs and their preparedness to embrace these standards, as mandated by the Securities Commission instructions. Consequently, the research aims to address the following central inquiry:

- What is the extent of the implementation of the IFRS for SMEs in Jordan?

1.1 Previous Studies

The employment of SMEs holds a prominent position in the country, making it a crucial sector. Consequently, numerous researchers have directed their attention towards this sector, particularly focusing on the adoption of IFRS by SMEs. In a study conducted by Khalifa and Abdullah [4], they examined the application of the International Accounting Standard for SMEs in Libyan enterprises, highlighting the absence of full compliance with Libyan standards. Their findings revealed both similarities and disparities between the complete international standards and the SME standard. Similarly, Almasmari [2] discovered that the implementation of IFRS enhances current expectations and facilitates informed decision-making, as the accounting information prepared in accordance with these standards accurately reflects the company's operations and economic events. In the context of emerging economies, Albu et al. [1] confirmed strong support from these countries for the adoption of international standards for SMEs. However, Gonçalves et al. [3] pointed out logistical deficiencies in the mandatory application requirement in certain nations.

This particular study distinguishes itself from previous research endeavors by delving into a relatively unexplored area which is the IFRS for SMEs. This standard holds substantial importance within the global economy, making it a topic of great significance. The study aims to assess the level of implementation of this standard specifically within the context of Jordan.

1.2 Research Hypotheses

Based on the study problem and its questions, the study hypotheses were formulated as follows:

- HO: "The IFRS is not fully implemented in SMEs in Jordan."

1.3 Research Methodology

The study relied on the descriptive inferential approach.

1.4 Community and Study Sample

The research sample encompasses the entire workforce employed in the finance division of the Jordanian Dairy Company PLC. The audit and analysis team encompasses various job roles, including the financial manager, department head, internal auditor, and accountant, resulting in a total of forty-three employees as reported by the Human Resources Department for the year 2022. A survey instrument was developed and disseminated to all finance department personnel at the Jordanian Dairy Company PLC, with a retrieval of forty-one completed questionnaires, representing 95.3% of the total sample size.

1.5 Data Collection Sources

To achieve the study objectives, the researchers utilized two main sources:

1. **Secondary Sources**: In order to establish the theoretical framework, various secondary data sources were employed, encompassing books, both Arabic and foreign references, peer-reviewed scientific journals, publications, official documents, research papers, and theses. Furthermore, electronic information sources and websites accessible through the World Wide Web were consulted to acquire pertinent information, grasp associated concepts, and remain abreast of the most recent advancements.
2. **Primary Sources**: The research utilized a specifically designed questionnaire that was tailored to match the focus and title of the study. The questionnaire consisted of two sections: a personal data section with five questions, and a second section comprising a total of twenty-nine questions. The questions' response choices were organized in Likert scale to determine whether the participants agreed or disagreed with the statements and to what degree. The Likert scale was composed of five response options: strongly agree, agree, neutral, disagree, and strongly disagree.

1.6 Reliability of the Study Instrument

What defines the reliability of a scale is its ability to provide consistent results when measurements are repeated under similar conditions. The Cronbach's Alpha coefficient is used for the assessment of reliability; any value above 70% in a test of reliability is good enough, while higher values would denote more likelihood of the instrument being reliable. The outcome of this test is presented in Table 1.

Upon analyzing the information presented in Table 1, it is evident that the Cronbach's Alpha value obtained is 0.896, which signifies a high level of reliability. As a result, it can be concluded that the research instrument utilized in this study can

Table 1 Results of reliability test based on Cronbach Alpha

Statement	Number of items	Cronbach Alpha
The implementation of the IFRS for Small and Medium-sized Enterprises, which was released by the International Accounting Standards Board in the year 2019	29	0.896

be deemed reliable, and the data collected can be considered suitable and highly reliable, surpassing the minimum threshold of 70%.

2 Results and Indicators of Descriptive Statistics for the Study Scale

In this section, the second part of the questionnaire is described and analyzed in which, the arithmetic means and standard deviations are computed to evaluate the level of consensus and ascertain the significance of these questions. Through the execution of these procedures, the findings yield the following outcomes:

The findings presented in Table 2 demonstrate that the study sample placed a relatively high level of importance on adhering to the IFRS for SMEs. The average score for the total sample was 4.05, with a standard deviation of 0.405. The individual question scores ranged from 3.32 to 4.46. Question (16), which assesses whether the institution prepares its financial statements for both the parent entity and its subsidiaries using consistent accounting policies, received the highest ranking with an average score of 4.46 and a standard deviation of 0.552, indicating a high level of importance. Following closely behind in the second rank was Question (17), which focuses on whether the institution discloses whether the financial statements are consolidated or separate, with an average score of 4.44 and a standard deviation of 0.550, also indicating a high level of importance. Conversely, Question (19) obtained the second-to-last rank, addressing whether the institution accounts for all changes in accounting policies retrospectively, with an average score of 3.41 and a standard deviation of 1.117, indicating a moderate level of importance. Lastly, Question (5) received the lowest ranking, which explores whether the institution recognizes its assets as assets even if they are not owned by the institution, with an average score of 3.32 and a standard deviation of 0.934, also indicating a moderate level of importance.

3 Statistical Inference Results

In this section, the main hypothesis was tested using statistical inference through a One Sample T-Test, aiming to answer the study question based on decision rules.

Table 2 Results and indicators of descriptive statistics for study tool questions

#	Question	Mean	Standard deviation	Percentage	Level	Rank
1	The institution does not delete any financial data suitable for users' needs even if it is difficult for some users to understand	4.15	0.615	83	High	12
2	The institution presents its financial data neutrally that does not influence decision-making and judgments	4.34	0.728	86.8	High	4
3	The institution accounts for transactions and events and presents them in financial statements according to their essence, not just form	3.95	0.631	79	High	20
4	Employees do not exert significant effort and cost to obtain less important information for users	3.98	0.821	79.6	High	19
5	The institution recognizes its assets as assets even if they are not owned by the institution	3.32	0.934	66.4	Medium	29
6	The institution declares its acceptance of specific responsibility within its financial statements	3.73	0.975	74.6	High	26
7	The institution does not prove any assets, liabilities, income, and expenses that have no cost or measurable value	3.90	0.583	78	High	23

(continued)

Table 2 (continued)

#	Question	Mean	Standard deviation	Percentage	Level	Rank
8	The institution does not make a trade-off between its assets and valuation allowances like depreciation and uncollectible amounts	4.32	0.986	86.4	High	6
9	The institution makes a clear statement without reservation in the disclosures showing its commitment to the IFRS for Small and Medium-sized Entities	4.15	0.792	83	High	13
10	The institution discloses the number of its authorized shares within the financial statements or disclosures, matching the number of shares outstanding at the beginning and end of the financial period	4.44	0.634	88.8	High	3
11	The institution presents an analysis of expenses based on their nature or function	4.00	0.837	80	High	18
12	The institution presents the effects of changes in accounting policies and corrections of errors in the statement of changes in equity	4.07	0.755	81.4	High	14
13	The institution provides explanations about the preparation principles of financial statements and the accounting policies used	4.15	0.853	83	High	11

(continued)

Table 2 (continued)

#	Question	Mean	Standard deviation	Percentage	Level	Rank
14	The institution discloses in the explanations the estimates and judgments made by management that have a significant impact on the amounts reported in the financial statements	3.95	0.835	79	High	21
15	The institution prepares its financial statements for the parent entity and its subsidiaries with the same reporting date	4.29	0.750	85.8	High	7
16	The institution prepares its financial statements for the parent entity and its subsidiaries with consistent accounting policies	4.46	0.552	89.2	High	1
17	The institution discloses whether the financial statements are consolidated or separate	4.44	0.550	88.8	High	2
18	The institution selects and applies accounting policies consistently for similar transactions and events	4.22	0.652	84.4	High	9
19	The institution accounts for all changes in accounting policies retrospectively	3.41	1.117	68.2	Medium	28
20	The institution discloses the nature of changes in accounting estimates and their impact on financial statement items	4.07	0.877	81.4	High	16

Table 2 (continued)

#	Question	Mean	Standard deviation	Percentage	Level	Rank
28	The institution discloses events occurring after the end of the reporting period that do not require adjustments	4.05	0.865	81	High	17
29	In the event that the establishment is not using the standard for small and medium-sized enterprises and adopts it, or vice versa, it shall disclose this and the reasons behind it	3.88	0.748	77.6	High	24
The total average score		**4.05**	**0.405**	**81%**	**High**	

3.1 Main Hypothesis Test Result

- HO: "The IFRS is not fully applied in small and medium-sized enterprises in Jordan.
- Ha: The IFRS is fully applied in small and medium-sized enterprises in Jordan."

In order to assess the validity of the primary hypothesis and ascertain the extent to which small and medium-sized enterprises in Jordan adhere to the IFRS, a One Sample T-Test was conducted. The purpose of this statistical test is to analyze whether the mean of the sample significantly deviates from the mean of the population. The outcomes of this analysis are presented in Table 3.

The statistical test results for the main hypothesis model are displayed in Table 3, revealing that small and medium-sized enterprises in Jordan completely adhere to the IFRS (IFRS). The calculated T-value (16.591) surpasses the critical T-value (2.021), signifying the significance of this model at a one-degree of freedom, with a significance level (Sig = 0.00) lower than (0.05).

Table 3 Main hypothesis testing results

T. calculated	T. critical	T. SIG	Degree of freedom (DF)	Test result
16.591	2.021	0.00*	40	Rejected

* Statistically significant at the 0.05 level

T. Critical value at one degree of freedom (N − 1)

According to Leech et al., the extent of application can be determined using the formula:

$$\text{Application Extent} = \text{T-value}/\sqrt{\text{n}}$$

where

T = test value
n = sample size.

Upon computation of the value denoting the degree of application, it is possible to derive its interpretation. A value below 0.20 is classified as low, while a value between 0.20 and less than 0.80 is categorized as medium. Conversely, a value surpassing 0.80 is deemed high. In the present scenario, the degree of application is classified as high, given that it exceeds the threshold of 0.80.

According to the findings derived from the One Sample T-Test, the null hypothesis (HO) is rejected in favor of the alternative hypothesis (Ha), which posits that the IFRS (IFRS) is comprehensively implemented within the context of small and medium-sized enterprises located in Jordan.

4 Discussion of Results

1. The results of the study showed that the attitudes of financial department employees at Jordan Dairy Company reached a high, 81%, level of application of the IFRS in small and medium-sized enterprises, as defined by the International Accounting Standards Board in 2009.
2. The study results also showed that Jordan Dairy Company presents its financial data fairly and impartially, without influencing decision-makers, making their decisions more appropriate and credible.
3. The Company provides all information necessary for users to understand the financial impact of current and deferred taxes on all transactions and events in the Company.
4. The Company presents its assets and liabilities separately in its financial statements, without offsetting them, unless the standard allows it.
5. The Company recognizes its financial assets or liabilities under contracts in the amount required in cash, without any deductions.

4.1 Results Related to the Study Hypothesis

According to the outcomes of the One Sample T-Test, we can conclude that the null hypothesis (HO) is rejected and the alternative hypothesis (Ha) is accepted. This alternative hypothesis asserts that the application of the IFRS is prevalent among

small and medium-sized enterprises in Jordan. These findings align with earlier investigations conducted by Al-Abayji, Abu Risha, and Kilic et al..

5 Recommendations

Taking into account the research results and the research tool, the researchers formulated several recommendations and proposals:

1. Identify compatible methods and procedures for solving the financial problems of small and medium-sized enterprises in a way that contributes to their development and strengthens their economic role.
2. Develop studies and research focusing on the weaknesses of small and medium-sized enterprises that make it difficult for them to apply the IFRS.
3. Establish a consensus-based standard for the classification of Jordanian small and medium-sized enterprises, consistent with international standards, in particular the standard set for this purpose in the International Accounting Standards for these enterprises.
4. Assessing Jordan's financial accounting system to align it with international standards to facilitate global integration.

The Greening of Finance: Including Sustainability in the Banking Environment

Islam Abdeljawad, Muiz Abu Alia, Aladdin Dwekat, and Samah Mohammed Herzallah

Abstract This study examines the integration of sustainability into the Palestinian banking sector, with a specific focus on the principles and practices of green banking. The research explores implementation strategies and evaluates the potential of green banking to align with the United Nations Sustainable Development Goals (UN SDGs), thereby promoting a more sustainable future for Palestine. This conceptual study conducts an in-depth analysis of the landscape of green banking including a comprehensive review of recent literature, an examination of financial institution websites, and a scrutiny of relevant documents from the Palestinian Monetary Authority (PMA). The research assesses theoretical frameworks, practical implementation strategies, and real-world outcomes. The findings suggest that Palestinian banks, given their substantial financial influence, can play a pivotal role in addressing sustainability development through the adoption of "green banking" practices. This entails prioritizing sustainable investments, advocating for environmental protection, and fostering economic growth by supporting green businesses. The adoption of green banking emerges as a mutually beneficial solution for both the environment and future prosperity. Consequently, this study serves as a baseline for evaluating the effectiveness of Palestinian banking initiatives in promoting a more sustainable environment. Its significant contribution lies in advancing long-term societal benefits by fostering climate improvement and ensuring a sustainable future.

1 Introduction

Today, the financial landscape is evolving fast towards Green practices and the incentive is to consider sustainability concerns on a global scale [1, 2]. Green banking, a topic of great prominence at both the international and local scale, shows how financial institutions are actively pursuing a path that is in line with the principles of sustainability [3]. Basically, green banking is a concept that has two main objectives: to foster the growth of sustainable development and to minimize climate change, especially its negative effects [3]. This shift will highlight the fact that the economic and ecological priorities are now converging, meaning that for stakeholders, policymakers, and researchers alike, there must be a thorough understanding of green banking [4].

The financial crises, along with the growing economy complexities and the fact that the sustainability, the contemporary marketing strategies and the innovative methodologies are crucial for the national development, is what pushed the banking system to that metamorphosis [1, 2]. Besides, the emerging issues of the credit crisis have created doubts about the usual banking framework, demanding the inclusion of ethics into financial operations [2].

Green banking is built on the greener finance base which comprises of the less frequent green deposits and credits as well as the green investment strategies that aim at the environmental conservation. This integrated or complete approach, which is now an inextricable part of the financial services field, has been brought about by Zhelyazkova and Kitanov [5]. As stated by Dafermos and Nikolaidi [6], green loans' function is to channel the investments to ecologically-sensitive infrastructure. This serves the purpose of lessening the ecological footprint through the non-fossil-fuel utilization. In the meantime, the case on point is markedly distinct from the case of the conventional loan, which is in a class of its own. The environment is the direct link between the loan and global warming.

Financial institutions increasingly advocate for green loans by imposing lower interest rates and less restrictive limits compared to their conventional counterparts. These decisions not only influence investment patterns but also directly impact carbon emissions, shaping the trajectory of global warming. Furthermore, such choices significantly affect the financial health of institutions, potentially altering their leverage through varying credit provisions [7]. Proposals to assess the macroeconomic and financial system implications of favoring green loans via the Green Supporting Factor (GSF) and penalizing conventional loans through the Dirty Penalizing Factor (DPF) highlight this dynamic. The GSF suggests a 25% reduction in risk weight on green loans, while the DPF proposes a reciprocal 25% increase in risk weight on conventional loans based on their environmental footprint [6].

Understanding the dynamic landscape of green banking is essential for shaping effective policies and strategies to promote environmental sustainability. This study addresses this imperative by exploring the status of green financing in Palestine. We leverage the current knowledge on green finance to benchmark the landscape specific to the Palestinian banking sector. This exploratory approach delivers valuable

insights for stakeholders, policymakers, and researchers aiming to advance green banking in Palestine towards a more sustainable future. It is useful to raise such an issue in Palestine because of its exceptional circumstances represented by political instability resulting primarily from the occupation [8–11]. The restrictions imposed by the occupation undoubtedly affect all sectors, including the banking sector [12, 13]. Besides, Palestine lacks resources and suffers economic backwardness [14–17]. Therefore, evidence presented by this study provides an important contribution to the literature on green finance taking into account the generalizability of its findings to similar countries in term of economic, cultural and political aspects [18–20].

Through this in-depth investigation, we not only contribute to the theoretical understanding of green banking but also provide practical implications for real-world applications. Our findings can guide the development of targeted policies, effective green financing strategies, and innovative banking practices aligned with environmental responsibility.

2 Literature Review

2.1 Sustainability

The urgency of sustainability has become a fundamental imperative in the face of escalating climate crises. Droughts, extreme storms, coastal flooding, rising sea levels, and tsunamis pose significant threats to the viability of our current way of life and the growth potential of all nations [21]. This stark reality calls for bold, long-term initiatives centered around green solutions, not only implemented by businesses but embraced by a global coalition of stakeholders. Investing in sustainable practices is no longer optional,it is our collective responsibility to safeguard our shared future and planetary well-being [22, 23].

Within this global imperative, green banking emerges as a powerful force for positive change. Given the financial sector's central role in resource allocation and influence on economic activities, the embrace of green principles by financial institutions can catalyze a systemic shift towards sustainable development [6, 24]. Green banking practices, including green loans, investments in renewable energy projects, and sustainable product offerings, can incentivize businesses and individuals to adopt environmentally responsible practices. Furthermore, by leveraging their risk management expertise, green banks can identify and mitigate environmental risks, fostering a more resilient and sustainable financial system [21]. This partnership between sustainability and green banking becomes a dynamic engine, propelling us towards a future where economic prosperity and environmental well-being are mutually reinforcing, rather than at odds [25].

This shift towards sustainability represents a profound transformation in global discourse and action, driven by the vital need to balance economic growth with social well-being and environmental care [26]. This commitment translates into ensuring

the fulfillment of present needs while also preserving resources and opportunities for future generations [4]. Consequently, sustainability has become a criterion by which businesses assess their operations and activities, striving to align them with the ethical imperative of protecting people, planet, and the environment [27].

2.2 Green Finance

Green finance encompasses a range of financial services dedicated to environmental improvement, climate change mitigation, and efficient resource utilization. Its fundamental objective is to achieve long-term sustainable development by striking a balance between economic progress, environmental stability, and ecological conservation [28]. This emerging financial trend seeks to harmonize economic gains with environmental preservation, making it a preferred means of supporting environmentally conscious initiatives and organizations dedicated to ecological protection. As defined by the European Commission, green finance within financial services entails investment strategies that integrate environmental, social, and governance (ESG) factors to ensure both customer satisfaction and societal well-being [21].

Amidst the burgeoning field of green finance, Inclusive Green Finance (IGF) emerges as a beacon of hope, illuminating a path towards a sustainable future. Zetzsche et al. [28] introduce a robust framework built on six pillars, meticulously designed to foster a vibrant green finance ecosystem. This architecture balances environmental responsibility with financial inclusion, recognizing that empowering individuals and communities is crucial for tackling pressing challenges like climate change and biodiversity loss. The "Strategy" block sets the foundation with a dedicated roadmap and consistent classification systems, ensuring clarity and direction for IGF implementation. "Prioritization" tackles potential resistance within financial institutions and regulatory bodies through education and engagement, while "Classification" establishes clear boundaries for IGF-compliant products and services, guiding responsible investment and lending. Data-driven decision-making takes center stage through the "Data & Models" pillar, equipped with specialized tools and integrated data flows. A thriving "Ecosystem" brims with expert services and technology providers, fueling innovation and market-driven solutions. Finally, the "Infrastructure" block forms the bedrock for secure transactions and financial services, laying the groundwork for universal access.

However, each pillar faces challenges like limited expertise and stakeholder reluctance. Zetzsche et al. [28] equip policymakers with five potent tools to overcome these hurdles: advocacy and education to raise awareness, voluntary standards to incentivize best practices, financial incentives to catalyze green lending, and when necessary, mandatory regulations to address market gaps and ensure compliance. Importantly, the framework acknowledges the unique challenges and priorities of each country, emphasizing the need for tailor-made solutions. This adaptable approach paves the way for Alliance for Financial Inclusion (AFI) member countries and beyond to achieve sustainable development by harmonizing their financial systems

with environmental responsibility, ensuring a future where economic progress thrives alongside ecological well-being. This notion gained traction during international meetings, notably the 2017 Sharm El Sheikh conference and its 2022 reaffirmation at the Dead Sea conference [28].

2.3 Green Banking

Positioned as a robust response to escalating environmental challenges, green banking (GB) transcends conventional financial transactions, embracing terms such as socially responsible and sustainable banking. This redefinition of the banking landscape prioritizes environmental preservation and resource protection alongside economic growth [29, 30]. Acknowledging the dual role of the banking sector—simultaneously driving economic progress through industrial funding and contributing to environmental concerns through emissions—GB serves as a critical bridge, fostering a paradigm shift within the banking system through responsible investment practices. By emphasizing green loans, integrating eco-friendly technologies into internal and external operations, and promoting environmentally and socially responsible investments, GB charts a course for sustainable development [31, 32].

Pioneered by the visionary Triodos Bank in 1980 [33], GB extends beyond financial transactions, embodying a proactive approach. It actively integrates green technologies to reduce carbon emissions, enhance environmental management, and mitigate the negative impacts of banking activities [31]. This proactive stance yields benefits not only for the planet, contributing to climate change mitigation and sustainable development [30] but also for the banking sector itself. Green banks, by showcasing their commitment to environmental responsibility, enhance their brand image and attract socially conscious customers, fostering a mutually beneficial scenario for both the environment and the financial world [34].

While some argue that financial development inherently leads to increased carbon emissions [35], studies suggest a potential for greener growth. Using econometric tools, researchers have found that specific measures of financial development, such as responsible lending practices and channeling funding towards green sectors, can decrease carbon emission intensity [36]. This underscores the importance of the direction and instruments employed in financial development for its environmental impact.

The growing momentum of green finance policies strengthens the case for GB. Central banks and national regulatory bodies are increasingly implementing mandatory requirements for banks to achieve green certifications, improve environmental credit scores, and demonstrate innovation and social inclusion [34]. These regulations are often complemented by tax benefits and other incentives for compliant banks, while intense competition within the sector fuels “mimetic pressure” to adopt successful green practices [36]. This dynamic interplay of regulatory pressure,

economic incentives, and competitive forces is propelling the exponential growth of green finance initiatives within the banking industry.

In conclusion, the diverse tapestry of research on green banking depicts its potential to address pressing environmental challenges. While financing sustainable projects remains a cornerstone, the literature explores innovative financial products, collaborative initiatives with local communities, and the crucial role of transparency and responsible regulations. Notably, the emphasis on empowering individuals and fostering grassroots adoption of green practices through microloans and accessible financial tools paints a promising future for widespread social and environmental impact [37]. Moving forward, further research exploring the long-term financial viability of green banking initiatives, alongside a continued focus on ethical considerations and equity in access to green finance, will be crucial to ensure its sustainable and impactful implementation. Ultimately, the burgeoning field of green banking offers a compelling alternative, weaving together economic development, environmental responsibility, and individual empowerment into a vibrant tapestry of a greener future.

2.4 Prominence of Green Banking

Green banking goes beyond being a mere buzzword; it represents a transformative force rewriting the script of the financial industry. It signifies a conscious shift towards integrating sustainability into the very fabric of how banks operate, where environmental responsibility becomes as essential as risk management. This integration safeguards not only the future of our planet but also the health of the financial system itself [33].

Banks serve as conduits of economic lifeblood. Through the embrace of green practices, they actively contribute to sustainable development, nurturing industries to grow not only in size but also in environmental responsibility. This proactive approach future-proofs their asset quality, minimizing risks and paving the way for long-term prosperity [30].

The benefits of green banking extend far beyond the balance sheet. It crafts a greener image for the bank, attracting environmentally conscious customers and investors. Green banking streamlines operations by reducing resource consumption, spanning from paper to energy to water. It enhances employee morale through eco-friendly workplaces and tech-empowered efficiency. Additionally, it mitigates risk by investing in renewable energy and sustainable ventures [3]. Green banking fosters environmental awareness through customer education programs, reducing the likelihood of non-performing assets due to unsustainable practices [25]. It promotes responsible lending that prioritizes green projects, further amplifying its positive impact.

Green banking isn't merely a checklist of technical upgrades like energy audits and carpools; it signifies a paradigm shift. It involves rewiring client behavior, promoting responsible consumption, and embracing innovation to build a financial future in

harmony with our planet. With stricter environmental regulations on the horizon, green banking isn't merely an option; it's an imperative. By consciously weaving this thread of sustainability into their operations, banks can transform from financial stewards to environmental champions, safeguarding both profits and the planet for generations to come [30].

3 The Palestinian Green Initiatives

In the complex context of Palestine, adopting the 17 UN SDGs promises a future woven with equity, resilience, and environmental harmony. However, one of them remains frayed: SDG 7, Affordable and Clean Energy. Despite electrification rates surpassing 99%, nearly 1.8 million Palestinians, mostly in Gaza strip, linger in the shadows, their lives dimmed by the lack of persistence of this fundamental necessity [38]. This energy deficit, not only impedes livelihoods but also fuels environmental challenges.

In this context, an important solution emerges—green banking. Imagine microloans empowering families to install rooftop solar panels, turning their homes into micro-powerhouses. Energy-efficient technologies, prompted by eco-friendly loans, leaving lighter consequences on the land and on the Palestinian economic opportunities, health, and competence [38].

In Palestine, green banking shapes a future where SDG 7 becomes a cornerstone of growth. A future where environmental responsibility and economic prosperity are not conflicting threads. By embracing this green future, Palestine can transform from a tapestry of challenges into an example of human ingenuity and environmental stewardship.

4 Green Banking in Palestine

Green banking in Palestine represents a significant step towards integrating environmental sustainability into the financial sector [39]. This encompasses initiatives like funding renewable energy projects, supporting eco-friendly ventures, and considering environmental criteria in investment decisions, aligning the sector's operations with environmental responsibility and contributing to regional sustainability efforts [40].

Despite these positive developments, there are notable challenges in quantifying the progress of green banking in Palestine [39]. A recent survey covering nine microfinance institutions and 13 banks in the West Bank and Gaza highlighted some critical insights [40]. According to the survey, a significant proportion of banks (62%) and microfinance institutions (44%) reported financing for green purposes, including solar energy and climate-smart agriculture. However, a major challenge lies in the inadequate technical capacity to assess and implement green finance projects, along

with a lack of specialized staff and a deficiency in bankable green projects. The survey further revealed that over 60% of financial institutions recognize the high to moderate risks posed by climate change to their clients. However, a striking 67% of microfinance institutions and 54% of banks do not incorporate these risks into their strategic planning. This indicates a gap in integrating climate-related risks into core financial strategies, compounded by the absence of technical tools, guidelines, and data [40].

In response to these challenges, the PMA is making commendable efforts, including the establishment of a comprehensive electronic database for green finance, set to launch in 2024. This database is expected to provide detailed information on all aspects of green finance, thereby addressing the current data gap [41].

Furthermore, there is a critical need for banking facilities and incentives specifically designed to promote green loans [33]. Implementing targeted banking facilities focusing on aspects like reduced interest rates and extended repayment periods could accelerate the adoption of green finance. Additionally, more than 80% of financial institutions agreed that establishing a dedicated green credit guarantee program could significantly increase the flows of green finance [40].

The banking sector's role in mobilizing climate finance is increasingly important, given the fiscal constraints in Palestine. As per the World Bank report, covering the financing needs identified would require about 50% of the banking sector's lending capacity. This necessitates a national strategy for greening the financial sector, with the PMA and Palestine Capital Market Authority (PCMA) playing key roles in developing this green finance ecosystem [40].

Despite the limited uptake of green finance, successful local initiatives demonstrate the effectiveness of combining financing with targeted technical assistance. Key opportunities include expanding green finance beyond solar energy to water management, clean-tech solutions, and nature-based tourism [40].

In summary, while green banking in Palestine is advancing, there are considerable challenges, including technical capacity, risk assessment, and the need for targeted banking facilities and incentives [39]. With initiatives like the upcoming comprehensive green finance database and the potential of a green credit guarantee program, there is a path forward to strengthen green banking practices in Palestine. However, significant efforts are required from financial institutions, regulatory bodies, and stakeholders to integrate environmental sustainability more deeply into the financial sector.

4.1 The Palestinian Monetary Authority Initiatives

The Palestinian Monetary Authority (PMA) has demonstrated leadership in enhancing economic resilience amidst various challenges, notably the COVID-19 pandemic and regional conflicts. The PMA's strategic response includes diverse funding initiatives to bolster the Palestinian economy.

In May 2020, the "Sustainability" program was launched by the PMA, featuring a $300 million fund focused on aiding small and medium-sized enterprises (SMEs) and microprojects affected by the pandemic's economic impacts. With $210 million directly provided by the PMA, this initiative channeled support through banks and specialized lending institutions to offer vital low-cost funding. This initiative was instrumental in sustaining affected businesses, including women-led projects, by providing accessible liquidity at nominal interest rates, thus facilitating extended economic stability [42].

Expanding its economic support, the PMA introduced the "Sustainability Plus+ (Istidama+)" fund in November 2023. With a substantial allocation of 500 million NIS, this fund targeted various sectors, particularly those suffering from war repercussions. It aimed to invigorate the market with necessary liquidity, aiding in the recovery and enduring financial sustainability of impacted enterprises. The "Sustainability Plus+" fund offered low-interest financing with accommodating repayment terms, including grace periods, effectively supporting key sectors like health, agriculture, renewable energy, and environmental conservation [42].

The "Sustainability Plus+" fund encompassed several programs, each tailored to specific recovery needs: aiding businesses in overcoming the effects of political and economic crises, supporting the health sector, enhancing agricultural initiatives, and funding renewable energy and environmental projects. The fund's comprehensive criteria ensured that beneficiaries were equipped with sustainable business models and contributed positively to national economic growth and sustainable development.

These PMA initiatives, through the "Sustainability" and "Sustainability Plus+" funds, underscore a multifaceted approach to tackle Palestine's economic challenges. Launched in May 2020 and November 2023, respectively, these programs signify the PMA's dedication to targeted financial support for critical sectors, enhancing resilience and contributing to broader regional economic stability. By focusing on essential areas like health, agriculture, and renewable energy, these programs resonate with the global move towards sustainable development and environmental conservation. The PMA's active role in deploying these funds illustrates a strategic pivot in using monetary policy instruments for promoting economic growth and stability, aligning with the Sustainable Development Goals.

4.2 SUNREF Program

Palestine's banking sector is witnessing a significant shift towards embracing sustainability and green energy initiatives, a change spearheaded by the SUNREF program. Developed by the French Development Agency (FDA) and backed by local Palestinian banks, the SUNREF program has been instrumental in promoting the adoption of renewable energy and energy efficiency solutions in Palestine, acknowledging the region's energy dependency and climate change vulnerability [43].

Initially, SUNREF Palestine, operational from 2017 to 2021, laid the groundwork with a €25 million credit line from FDA and an €8 million contribution from the

European Union. This support enabled partner banks to offer loans for green projects, encompassing renewable energies and energy efficiency. The program also provided investment premiums and technical assistance, strengthening the capacity of both the banks and the Palestinian Energy and Natural Resources Authority (PENRA) in identifying and assessing potential projects [43].

Building on the success of SUNREF I, SUNREF II was launched in collaboration with the Bank of Palestine and Cairo-Amman Bank, supported by Proparco and the European Union. This second phase, announced in March 2022, further elevates the scope of green finance in Palestine. SUNREF II combines a USD 30 million credit line from Proparco with EUR 11.5 million in technical assistance and premiums financed by the European Union. The program's focus on energy efficiency, a relatively nascent sector in Palestine, signifies a deepened commitment to green finance and SME development [44].

Nura Treish, Proparco's investment officer in Palestine, highlights that SUNREF II aims to facilitate investments in energy efficiency and renewable energy, particularly beneficial for Palestinian SMEs. The anticipated impact includes adding significant renewable energy generation and energy efficiency gains, benefiting a substantial number of users, primarily SMEs. The approach for SUNREF II involves extensive marketing and technical support to ensure the successful implementation and uptake of energy-efficient projects [44].

Additionally, as of December 2021, the project has taken a gender-sensitive approach, supporting the employment of women in the Bank of Palestine, which plays a significant role in executing SUNREF II. This aspect underscores the project's commitment to broader social and economic impacts, including job creation in the SMEs benefiting from the credit line [45–47].

In summary, the SUNREF program in its first and second phases, supported by entities like the FDA, the European Union, and Proparco, has established a robust framework for sustainable energy financing in Palestine. This initiative aligns with global environmental goals and demonstrates a strategic evolution in Palestine's banking sector, fostering a market for green investments and contributing to sustainable economic development.

5 Conclusion

This paper has profoundly analyzed the trends in green banking in Palestine that reveal a possibility of the integration of sustainable development with environmental responsibility. The PMA in combination with other stakeholders has been the centerpieces of this transformation, which has shown a dedication to move beyond regulation, but to governance as well as facilitation and encouragement of sustainable banking strategies.

The potential achievement of the environmental revolution by green banking is largely dependent on equity and inclusivity. Customized financial products and services, which address specific circumstances of the diverse population groups in

Palestine, must be part of the picture. This calls for stakeholder participation which comprises of capacity building of the PMA and the financial institutions as well as other stakeholders who are directly or indirectly involved. It is the crucial role of supervision by the PMA to set up a framework, develop internal expertise, and create supportive networks within the community.

The practical effects of these programs are immense. The creation of risk management tools, innovative marketing strategies and specialized training programs are the essential elements if the green banking paradigm is to be successfully adopted and thrived. Such efforts must be supported by the data-driven approach on the basis of which the corrective measures can be taken and tangible results obtained.

The study also deals with the challenges concerning implementing the green banks initiatives especially the insufficient data. The envisaged debuting of an in-depth green banking database in 2024 is the most crucial action to overcome this limitation. This database will not only offer important information on the state of the green banking currently, but also will help to conduct a thorough research and make prudent choices in the future.

Finally, the trip of green banking in Palestine, which has started with the initiatives of PMA and positively received by the financial community, demonstrates the way of green banking development based on sustainable and inclusive economic growth. Though there is still ground to cover, the continual efforts and forthcoming future developments will place Palestine as an influential example of green banking that is not only effective but also socially responsible. The sustainable development, fully in line with global environmental aims and Sustainable Development Goals, has great prospect to bring about a new type of economic development which also includes environmental care.

The Role of Service Marketing Mix Elements in Achieving Healthcare Service Quality: Hospitals Patients as a Case Study

Zakaria Azzam and Manahi AlMaaytah

Abstract The objective of this study is to investigate the role of service marketing mix elements in the attainment of healthcare service quality. In order to achieve the study's objectives, a descriptive-analytical approach is employed. A questionnaire consisting of 51 items is utilized to collect data, which was distributed among 500 hospital patients in Al-Zarqa Governorate using a purposive sampling method. After excluding 105 incomplete or non-serious responses, a total of 395 valid responses are considered for analysis. The collected data is analyzed using appropriate statistical methods through the utilization of the SPSS program. The study yields several significant findings, indicating a statistically significant contribution of the healthcare service marketing mix elements (namely healthcare product, pricing, distribution, promotion, personnel (service providers), physical evidence, and processes) both collectively and individually in the achievement of healthcare service quality in hospitals within Al-Zarqa Governorate. Furthermore, the study reveals that these marketing mix elements are implemented to a high extent, with an average mean score of 3.79. Among the elements, the physical evidence variable obtains the highest mean score of 3.97 and is implemented to a high degree, while the personnel (service providers) variable obtains the lowest mean score of 3.60 and is implemented to a moderate degree. Additionally, the level of healthcare service quality implementation is found to be high, with an average mean score of 3.92. In light of the aforementioned discoveries, it is suggested by the study that government hospitals in Al-Zarqa Governorate concentrate on the advancement of healthcare services through regular campaigns aimed at reminding patients about the available hospital services. This is due to

the evident influence of the promotional factor in enhancing the quality of healthcare services from the patients' perspective. Furthermore, government hospitals can address the challenge of distribution, which was found to have the least impact on healthcare service quality, by establishing geographically dispersed outpatient clinics that cater to all areas within Al-Zarqa Governorate. Additionally, the improvement of healthcare service delivery processes (operations) can be achieved by providing training to service providers in effective communication skills with patients.

Keywords Service marketing mix elements · Healthcare service quality · Government hospitals · Al-Zarqa Governorate · Jordan

1 Introduction

The success of organizations is influenced by numerous factors, and healthcare organizations hold significant importance within society. A key aspect that demands attention is the service component, which necessitates the integration of complementary elements. Service organizations of various types face considerable challenges in the field of marketing, which serves as a fundamental criterion for distinguishing between successful and unsuccessful organizations, as well as leaders within the service industry and their counterparts. Recognizing the significance of studying and implementing marketing strategies, many organizations have come to understand that their growth and sustainability hinge upon the development of effective marketing systems.

Despite facing various marketing challenges related to their services and beneficiaries, non-profit healthcare organizations have not received sufficient attention in terms of marketing strategies. This lack of focus often hampers their marketing efforts. Therefore, it is imperative to explore and implement concepts and methods that can effectively address these marketing issues and enhance the quality of services provided by these organizations [11]. The concept of marketing in the healthcare sector is multifaceted and encompasses elements such as product, pricing, distribution, promotion, physical evidence, processes, and personnel/healthcare providers. It is a complex concept that also intersects with areas like social marketing. While the healthcare sector draws inspiration from commercial marketing, the objectives pursued by service organizations set it apart [5].

Given the critical nature of the healthcare sector as it pertains to human life, the advancement of this sector to achieve exceptional medical services is a paramount objective for any organization [20]. Consequently, numerous organizations, including hospitals, strive to enhance the quality of their services in order to attain a level of excellence that satisfies both healthcare providers and patients. To improve their performance, these organizations employ various strategies, with an emphasis on quality as a significant approach that enables hospitals and other entities to deliver services that fully meet patients' desires, fulfill their requirements, and surpass their

expectations. As a result, quality emerges as a paramount concern for healthcare organization.

The Zarqa Governorate is distinguished by its notable population density and limited provision of public healthcare services. With an approximate population of 1.58 million individuals, Zarqa represents approximately 14% of the overall population of the Kingdom. Within the governorate, around 67% of the population possesses health insurance coverage, a figure that falls below the national average of 75.8% for insured individuals [12]. This situation prompts inquiries regarding the efficacy of the healthcare service marketing mix components in attaining the desired level of quality in healthcare services within government hospitals.

1.1 The Problem and Questions of the Study

In light of recent global changes in the healthcare industry, the significance of marketing for the survival and expansion of hospitals has significantly increased. However, there are numerous challenges that must be addressed, particularly when it comes to establishing small-scale hospital projects. The primary obstacle to their growth is the lack of sufficient cash flow to acquire high-quality healthcare resources. Healthcare marketing encompasses the provision of medical services to various user groups, ensuring their access to top-notch healthcare services. Several studies have highlighted a decline in the quality of services offered in the Hashemite Kingdom of Jordan, as demonstrated by the research conducted [3, 8–10, 19], resulting in a decrease in patient satisfaction, as indicated [1]. A drop in the use of healthcare service marketing mix elements is accountable for this dwindling rate and in turn has a negative impact on quality of services which affect patient satisfaction levels. The previous works have brought to light the significance of placing emphasis on marketing mix within health care organizations and gauging its effect on health care service quality. It is thus worth our while to explore this aspect given its role in Zarqa Governorate, highly populated with limited hospitals.

In light of the above, the problem of the study has emerged to investigate the role of elements of the healthcare service marketing mix in achieving healthcare service quality. The study questions can be formulated as follows:

- Primary Research Question: What is the role of elements of the healthcare service marketing mix in achieving healthcare service quality in hospitals in the Zarqa Governorate?

1.2 Study Model

Based on the findings of previous studies and making adjustments suitable for the current study, the study model has been designed as shown in Fig. 1.

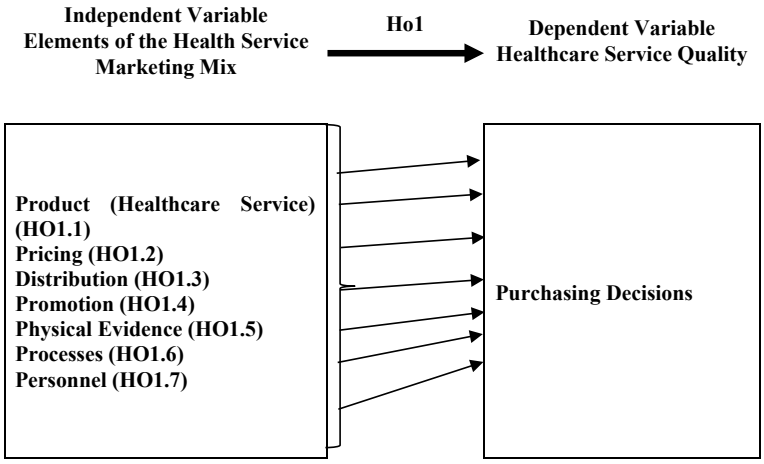

Fig. 1 Study model. *Source* [2–4, 6, 7, 15, 16, 22]

1.3 Study Hypotheses

Based on the research questions, the main hypothesis developed is as follows:

- H0: "There is no statistically significant role for the elements of the healthcare service marketing mix (Product (healthcare service), pricing of healthcare services, distribution of healthcare services, promotion of healthcare services, physical evidence, processes personnel (Service Providers)) in achieving the quality of healthcare services in hospitals in Zarqa Governorate."

From the main hypothesis, the following sub-hypotheses are derived:

- H0.1: "There is no statistically significant role for the healthcare service product provided in achieving the quality of healthcare services in hospitals in Zarqa Governorate."
- H0.2: "There is no statistically significant role for the pricing of healthcare service in achieving the quality of healthcare services in hospitals in Zarqa Governorate."
- H0.3: "There is no statistically significant role for the distribution of healthcare service in achieving the quality of healthcare services in hospitals in Zarqa Governorate."
- H0.4: "There is no statistically significant role for the promotion of healthcare service in achieving the quality of healthcare services in hospitals in Zarqa Governorate."
- H0.5: "There is no statistically significant role for physical evidence in achieving the quality of healthcare services in hospitals in Zarqa Governorate."
- H0.6: "There is no statistically significant role for service delivery processes in achieving the quality of healthcare services in hospitals in Zarqa Governorate."

- H0.7: "There is no statistically significant role for healthcare service providers (personnel) in achieving the quality of healthcare services in hospitals in Zarqa Governorate."

2 Theatrical Framework

2.1 Concept of Healthcare Service Marketing Mix

The healthcare service marketing mix, encompasses the analysis, planning, execution, and control of programs that aim to achieve optimal exchange value with target markets. The primary objective of healthcare organizations is to satisfy the needs and desires of these target markets, utilizing pricing, communication, and distribution strategies effectively. This, in turn, informs the market and creates motivation among individuals to seek and utilize healthcare services. Furthermore, the healthcare service marketing mix serves as a tool to assess the value, risks, and effectiveness of marketing efforts. It differs from primary and secondary research data, as it focuses on obtaining data to enhance organizational performance in the future, taking into account both past and present perspectives.

2.2 Importance of Healthcare Service Marketing Mix

According to [5], the significance of the healthcare service marketing mix became prominent during the 1980s due to the escalating cost of healthcare. This prompted researcher to focus on strategies to mitigate healthcare expenses. Consequently, healthcare organizations can benefit from employing marketing techniques to exert influence over costs and enhance the efficiency of specialized centers. Additionally, legislation mandating the evaluation of healthcare providers' performance has necessitated the provision of supporting information for additional services and resource allocation. The proliferation of medical facilities under diverse ownerships has further intensified interest in studying the healthcare service marketing mix.

2.3 Elements of Healthcare Service Marketing Mix

The marketing mix for both healthcare services and non-healthcare services encompasses seven essential components, as identified by reputable scholars such as [5, 8, 10, 11, 14, 13]. These elements include the product (service), pricing, distribution, promotion, physical evidence, processes, and personnel responsible for delivering the service. The following is a detailed explanation of these elements:

- **Healthcare Service (Product)**: The cornerstone of a successful marketing mix lies in the products themselves. Pricing, promotion, and distribution strategies that yield positive results are contingent upon the inherent qualities, features, functionalities, or advantages offered by the goods or services being marketed.
- **Pricing of Healthcare Service**: The aforementioned statement refers to a comprehensive management procedure that encompasses multiple factors in order to establish pricing for healthcare services.
- **Distribution of Healthcare Service**: According to [14], the selection of healthcare distribution channels is influenced by various factors, including the characteristics of the market, the type of healthcare services offered, the capabilities of the healthcare organization, the market position of the organization, legal obligations, and the electronic distribution of healthcare services. Direct distribution channels in the healthcare sector encompass public and private hospitals, medical clinics affiliated with hospitals, private physician clinics, home healthcare centers, care centers, and nursing homes. Indirect distribution channels within healthcare organizations may involve pharmacies, drug warehouses, and sales centers for medical devices and supplies.
- **Promotion of Healthcare Service**: The term encompasses a comprehensive range of endeavors and forms of communication with the primary objective of providing information and education to healthcare professionals, patients, and the general public regarding the classification and utilization of medications, the specific ailments or conditions for which they are designated, and the potential adverse effects associated with their usage.
- **Personnel (Healthcare Providers)**: The element being referred to in this context pertains to the collective group of individuals who are actively involved in delivering healthcare services to patients. These individuals, which encompass doctors, nurses, administrators, support service providers, and technicians, possess a significant degree of influence when it comes to the acceptance of these services by patients. Their primary objective is to establish a sense of belonging and loyalty between the patient and the healthcare organization through the provision of high-quality healthcare services. In order to ensure that patients are able to make informed decisions regarding their treatment and its potential risks, it is imperative for these individuals to assist patients in understanding and clarifying the nature and extent of the healthcare services being offered. This is particularly important due to the intangible and non-routine nature of healthcare services. Consequently, each medical case possesses its own unique characteristics and specifications, which are contingent upon the individual differences between patients.
- **Physical Evidence**: The concept of physical evidence in the context of healthcare services pertains to the tangible symbols or products utilized in the process of communication and delivery of these services [16]. Given the inherent intangibility of healthcare services, there is a need to imbue them with a certain level of tangibility through the use of various tools such as diagnostic and treatment equipment, clinical supplies, furniture, buildings, air conditioning, and other amenities provided by healthcare organizations. These elements play a crucial role in

creating a sense of comfort and satisfaction for patients, both during their actual receipt of healthcare services and in the period preceding and following it.

- **Processes**: According to the definition, processes encompass all activities and events that occur prior to and during the delivery of healthcare services, as well as the management of interactions between healthcare providers and recipients. The management of these processes commences from the moment the patient enters the healthcare facility, specifically in the reception area. The early perception of the quality of service provided is influenced by various factors, such as the accuracy of appointment scheduling, the promptness of response to healthcare requests, the manner in which healthcare professionals address and communicate with patients, the ability to deviate from routine tasks to acknowledge the patient's health condition, and the embodiment of human characteristics within the medical profession.

2.4 Quality of Healthcare Services

The quality of health care is a comprehensive definition according to the World Health Organization [21]. It refers not only to standard compliance and effectiveness in service delivery but also to safety as well as social acceptability plus cost benefit. Furthermore, it encompasses the impact of healthcare services on key health indicators such as morbidity, mortality, disability, and malnutrition. Procedurally, quality of healthcare services also involves ensuring the safety of both service providers and recipients. In the context of this study, the term refers to the range of practices implemented by hospitals in Zarqa Governorate, across all levels, with the ultimate goal of achieving optimal healthcare service provision to patients.

3 Study Methodology

The research methodology employed in this study is the descriptive-analytical method, chosen based on the nature of the study and the researchers' examination of prior research. The descriptive method is characterized as an approach that relies on comprehensive and precise information about a particular phenomenon or topic, gathered over established time periods, in order to derive practical outcomes that are objectively interpreted in accordance with the actual data of the phenomenon [18].

Table 1 Numbers of healthcare service beneficiaries in Zarqa Government Hospital and Prince Faisal Hospital

Hospital	Number of admissions	Percentage (%)
Zarqa Government Hospital	39,398	72
Prince Faisal Hospital	15,204	28
Total	54,602	100

Source Ministry of Health [12]

3.1 Study Population and Sample

The research encompasses the entire population of individuals residing in Zarqa Governorate who avail themselves of healthcare services, which amounts to approximately 1.58 million people. In line with Sekaran's and Bougie [18] recommendation that sample sizes in studies typically range from 30 to 500 participants, the survey instrument was distributed to 500 recipients of healthcare services in government hospitals within Zarqa Governorate. This was facilitated through the dissemination of an electronic link by the Public Relations Department of Zarqa Government Hospital and Prince Faisal Hospital, both of which are prominent healthcare facilities in the governorate. Table 1 provides an overview of the numbers of individuals benefiting from healthcare services at Zarqa Government Hospital and Prince Faisal Hospital in the year 2021.

A purposive sample, deemed suitable for the study, was employed, yielding a total of 467 responses. Following a thorough examination, it was determined that 72 responses lacked sufficient information for statistical analysis and were subsequently excluded. As a result, a total of 395 valid surveys were available for analysis, signifying a response rate of 79%.

3.2 Study Instrument

The construction of a measurement instrument to evaluate the impact of the elements constituting the marketing mix and service quality in the health care sector was preceded by no less than identification of related literature—[3, 16]. The survey instrument used in this study consists not just of one or two but three main dimensions.

3.3 Instrument Reliability

To ensure the reliability of the study instrument, Cronbach's alpha coefficient was computed for each axis of the study instrument and also for the total instrument. The results are presented in Table 5.

Table 2 Reliability of the study instrument

Axis	Number of items	Cronbach's alpha coefficient
Elements of healthcare service marketing mix	34	0.81
Healthcare service quality	12	0.78

Based on the data presented in Table 2, it can be concluded that the reliability coefficient of the test instrument axis is greater than 0.70 [17, 18]. Since the coefficient is higher than 0.7, it is confirmed that the instrument is valuable and can achieve the study's purpose, therefore it can be used. Using the research instrument was distributed to our participants to complete.

3.4 Internal Consistency Validity

Internal consistency reliability was used to validate the study instrument's reliability. A sample of 25 respondents, chosen randomly from both within and outside the study community, was administered the instrument. The correlation coefficient was then calculated between each statement's score and the total score of the instrument. The results are as shown in Tables 3 and 4.

By examining Table 3, it becomes apparent that there exists a positive correlation between all statements assessing the elements of the service marketing mix and the overall score of the axis. This correlation suggests that these statements effectively measure the intended constructs within this axis.

Based on the data presented in Table 4, it is evident that there exists a positive correlation between all the statements assessing the healthcare service quality axis and the overall score of the said axis. This correlation indicates that the statements effectively measure the intended aspects within this particular axis.

3.5 Descriptive Analysis of the Study Sample

The characteristics and personal information of the study sample were identified, including gender, age, employment sector, income, health insurance availability. Table 5 illustrates the frequencies and percentages describing the personal information of the study sample.

The distribution of gender within the study sample, as depicted in Table 5, reveals that males accounted for 53.2% of the participants, while females constituted 46.8%. This balanced distribution signifies a commendable inclusivity within the sample. Moreover, the study highlights that individuals belonging to the age group of 30 to less than 40 years represented the largest proportion (31.6%) of the sample, thereby

Table 3 Internal consistency reliability of the study instrument: service marketing mix elements

Variable	M	Statement	Correlation
Product (services)	1	The hospital provides quality services to resident patients	796
	2	The hospital provides quality services to visitors	747
	3	The hospital provides diverse healthcare services in all specialties	816
	4	The hospital prioritizes the benefit of patients above all considerations	789
	5	The hospital provides sufficient information about its diverse healthcare services to patients	762
Pricing	6	The hospital clarifies its prices for visitors	763
	7	Prices are used to influence patients' choice of treatment at the hospital	820
	8	Prices of hospital services are tailored to the segments it serves	826
	9	The hospital aims to provide healthcare services regardless of the patient's financial ability	729
Distribution	10	The outpatient clinic location of the hospital is attractive	722
	11	The hospital's location is easily accessible	877
	12	All necessary equipment is available in hospital rooms	906
	13	Working hours are suitable for patients	869
	14	The hospital has a website providing all necessary information for patients	873
	15	The hospital provides its healthcare services around the clock	864
Promotion	16	Advertisements are used to introduce the healthcare services offered by the hospital	892
	17	There is a public relations department at the hospital	896
	18	The hospital cares about building a good reputation among the target audience	872
	19	The hospital offers incentive discounts to visitors	915
	20	Healthcare services offered by the hospital can be identified through available promotional media	895
Physical evidence	21	The hospital emphasizes general cleanliness	899

(continued)

	Private sector	65	16.5
	Self-employed	35	8.9
	Student	46	11.6
	Unemployed	17	4.3
	Other	15	3.8
	Total	395	100.0
Income	260–500	195	49.4
	501–750	123	31.1
	751–1000	45	11.4
	1001 and above	32	8.1
	Total	395	100.0
Health Insurance	Insured	236	59.7
	Not insured	159	40.3
	Total	395	100.0

indicating the youthful composition of the Jordanian society. Additionally, the findings demonstrate that 54.9% of the participants were employed in the public sector. This can be attributed to the comprehensive health insurance coverage provided by the government to all public sector employees and their families.

Furthermore, it was found that a significant proportion (49.4%) of the participants in the study had a monthly income below (500) Jordanian Dinars, indicating the relatively low salary levels within this particular sector. Additionally, the findings indicate that a majority (59.7%) of the participants in the study possessed health insurance, which is consistent with the nature of their employment. This can be attributed to the fact that government-provided health insurance extends coverage to employees and their dependents within the public sector.

The study considers the above results indicative of the diversity and inclusivity of the study sample, which may contribute to the ability to generalize its findings.

3.6 Study Results and Testing of Hypotheses

- Primary Research Question: What is the role of elements of the health service marketing mix in achieving the quality of healthcare services in hospitals in Zarqa Governorate?

The resolution to this inquiry can be found through the examination of the primary hypothesis of the research (H01): The elements comprising the health service marketing mix (healthcare product, healthcare service pricing, healthcare service distribution, healthcare service promotion, Personnel (healthcare service providers), physical evidence, processes) do not play a statistically significant role in the attainment of healthcare service quality in hospitals located in Zarqa Governorate.

The study utilized multiple linear regression analysis to test this hypothesis, and Table 6 illustrates the test results:

Based on the findings presented in Table 6, it can be observed that the value of F was recorded as 53.803, with a significance level of 0.00, which is below the predetermined significance level of 0.05. This outcome leads to the rejection of the null hypothesis, which suggests that there is no statistically significant relationship between the elements of the health service marketing mix and the quality of healthcare services in hospitals within Zarqa Governorate. Conversely, the alternative hypothesis is accepted, indicating that there is indeed a statistically significant association between the elements of the health service marketing mix and the achievement of high-quality healthcare services in hospitals located in Zarqa Governorate.

Moreover, the analysis conducted based on Table 6 established the significant influence of the independent variables, namely the components of the health service marketing mix (healthcare product, healthcare service pricing, healthcare service distribution, healthcare service promotion, Personnel, physical evidence, processes), in their combined effect on attaining the desired quality of healthcare services in

Table 6 Multiple linear regression analysis

Dependent variable	R	R^2	F	Significance	Independent variable	B	T	Significance
Quality of healthcare services	0.702	0.493	53.803	0.00	Healthcare Product	0.155	5.463	0.000
					Pricing	0.207	− 3.047	0.002
					Distribution	0.925	4.333	0.000
					Promotion	1.133	10.099	0.000
					Physical evidence	0.371	4.902	0.000
					Processes	0.795	− 4.177	0.000
					Personnel (healthcare service providers)	0.929	− 7.439	0.00

hospitals located in Zarqa Governorate. These elements collectively accounted for a substantial proportion (49.3%) of the observed variations in the quality of healthcare services within the aforementioned hospitals.

3.7 Results of Stepwise Linear Regression Analysis

Following the completion of the study's questionnaires and hypothesis testing, a stepwise linear regression analysis was employed to ascertain the most effective independent variables in elucidating the fluctuations within the dependent variable, ranked in order of decreasing significance. The results are presented in Table 7.

The stepwise linear regression analysis presented in Table 7 elucidates the relationship between independent variables and healthcare service quality. The analysis resulted in five models, each ranked according to the strength of their influence on healthcare service quality. The first model demonstrates that healthcare service

Table 7 Stepwise linear regression analysis

Model	Independent variable(s)	B	R	R^2	F	Significance
1	Healthcare service promotion	0.439	0.545	0.297	165.786	0.00
2	Healthcare service promotion Personnel (service providers)	0.981 − 0.523	0.620	0.385	122.524	0.00
3	Healthcare service promotion Personnel (service providers) Physical evidence	0.844 − 0.492 0.218	0.655	0.428	97.714	0.00
4	Healthcare service promotion Personnel (service providers) Physical evidence Healthcare service product	0.875 − 0.545 0.198 0.122	0.457	82.099	0.00	
5	Healthcare service promotion Personnel (service providers) Physical evidence Healthcare service product Pricing	0.805 − 0.493 0.385 0.153 − 0.199		0.468	68.544	0.00

promotion accounts for 29.7% of the variations in healthcare service quality. In the second model, the variable of Personnel (healthcare service providers) is introduced, leading to an increase in the explanation of variations to 38.5%. The third model incorporates the variable of physical evidence, further increasing the explanation of variations to 42.8%. The fourth model includes the healthcare service product variable, resulting in an explanation of variations of 45.7%. Finally, the fifth model incorporates the pricing evidence variable, leading to an explanation of variations of 46.8% in healthcare service quality.

The software utilized in this study excluded the variables of distribution and processes due to their perceived lower explanatory power for the dependent variable. Nevertheless, it is important to note that these variables still have an impact on healthcare service quality, as demonstrated by the results of simple regression equations. However, it should be acknowledged that the influence of these variables diminishes when other independent variables are taken into consideration.

3.8 Study Results Summary

- Elements of the health services marketing mix (product, pricing, distribution, promotion, personnel, physical evidence, processes) play a statistically significant role in achieving the quality of health services in hospitals in Zarqa Governorate.
- Elements of the health services marketing mix are used to a high extent with an average score of (3.79).
- There is a statistically significant role of health services in playing an important role in achieving the quality of health services in hospitals in Zarqa Governorate.
- The variable (health product-service) received an average score (3.89) and is used to a high degree.
- Prices of health services play a statistically significant role in achieving the quality of health services in hospitals in Zarqa Governorate.
- The variable (prices) received an average score (3.91) and is used to a high degree.
- The distribution of health services plays a statistically significant role in achieving the quality of health services in hospitals in Zarqa Governorate.
- The variable (distribution) received an average score (3.65) and is used moderately.
- Promoting health services in achieving the quality of health services in hospitals in Zarqa Governorate plays a statistically significant role.
- The variable (promotion) received an average score (3.75) and is used to a high degree.
- Physical evidence of health service delivery plays a statistically significant role in achieving quality health services in hospitals in Zarqa Governorate.
- The variable (physical evidence) had the highest mean score (3.97) and is used to a high degree.
- Health service delivery processes play a statistically significant role in achieving quality health services in hospitals in Zarqa Governorate.

- The variable (processes) received an average score (3.71) and is used to a high degree.
- There is a statistically significant role of health service providers (individuals) in achieving quality health services in hospitals in Zarqa Governorate.
- The variable personnel (Service Providers) received the lowest mean score (3.60) and is used moderately.
- The level of application of the quality of health services is high and amounts to an average of (3.92).
- The results of the stepwise linear regression analysis showed (5) models explaining changes in the quality of health services, ranked according to the strongest influence of the independent variable, with the first model showing that promoting health services explains (29.7%) changes in the quality of health services, while in the second model, a personnel (Service Providers) variable was added to determine the amount of explanation for changes in the quality of health services (38.5%), and in the third model, a physical evidence variable was added to explain changes in the quality of health services (42.8%).

4 Discussion of Results

The findings of the study revealed that the elements of the health service marketing mix, including healthcare product, pricing, distribution, promotion, personnel (service providers), physical evidence, and processes, collectively and individually play a statistically significant role in achieving health service quality in hospitals in Zarqa Governorate. These elements accounted for 49.3% of the variations in health service quality in the aforementioned hospitals. Furthermore, it was found that the elements of the health service marketing mix are implemented to a high extent, and the level of health service quality implementation is also high. The findings of this study align with previous research conducted [11], discovered a reciprocal relationship between health marketing and health service quality. Conversely, [1] explored the perceived quality of health care as the independent variable, with patient satisfaction and loyalty as dependent variables. Specifically focused on the role of social marketing, while investigated the impact of digital marketing strategies on international patient satisfaction. Additionally, [3] conducted a study to analyze the influence of health service quality on patient satisfaction in hospitals.

4.1 Recommendations

Based on the results of the study, the following recommendations are made:

- Hospitals in Zarqa Governorate should focus on promoting health services through periodic campaigns reminding patients about hospital services, given the clear

impact of variable promotion on improving the quality of health services from the patients' perspective.
- Hospitals can overcome the problem of distribution, which from the patients' point of view was one of the variables that had the least impact on the quality of health services, by opening geographically dispersed clinics covering all areas of Zarqa Governorate.
- Improving the service provision process(es) by subjecting service providers to training in communication skills with patients.
- Providing the necessary infrastructure to enhance physical evidence by ensuring hospital cleanliness, providing comfortable seating and waiting areas, placing directional signs in hospital corridors and lobbies, and using modern medical equipment.
- Ensuring the service is performed correctly the first time.
- Giving hospital staff appropriate authorizations to perform their duties.

4.2 Future Study Proposals

The current study proposes the following studies:

- Using the instruments of this study and applying them to other government service organizations, such as the General Revenue Office.
- Studying the impact of digital marketing elements on service quality in government hospitals in Zarqa Governorate.

The Reality of Field Training for Social Work Students at University

Wajde Omar Hassan Aljafari and Mahmoud Odeh

Abstract The study aimed to identify the reality of field training for social work students at the Al-Quds Open University—Bethlehem Branch. The study followed the quantitative approach, and the study sample consisted of a random sample of 41 male and 55 female students majoring in social work at the Al-Quds Open University—Bethlehem Branch. The study relied on a questionnaire tool, and the study found that the most important aspects of the institution where the student trains are providing an opportunity to participate in the social events of the institution, and the most important aspects of the institution providing an opportunity to participate in the social occasions of its employees. The problems and difficulties facing social work students are the lack of material resources necessary for training, and the problems and difficulties facing social work students are the duality of messages from the institution's supervisor and the university supervisor.

Keywords Field training · Social work · Human capital theory

1 Introduction

The education and preparation of social workers occupy theoretically and practically a prominent place among the concerns of those involved in social work education to localize the profession and increase its societal recognition in Palestinian society. Social work is a profession that is offered to individuals, groups, and communities with the aim of assisting them to contribute to improving their economic, social, and political well-being, and helping them to perform their roles in social reform.

Therefore, its integrated scientific base of knowledge derived from social, behavioral, medical sciences, technical methods, skills, techniques, objectives, and ethical standards makes its practitioners in need of special preparation. Thus, professional practice requires theoretical frameworks to guide it; it also requires skill in application. The purpose of social work education is to prepare specialists to practice the profession at a high level of proficiency. However, the professional preparation of social workers occupies a leading position in the list of problems facing the professional practice of social work. Stakeholders in the preparation of social workers agree on the necessity of professional preparation, considering it the professional practitioner of social work, its real interface, and the tool that sets its goals, principles, and implementation into action. The success of social work depends on the success of professional preparation; therefore, professional preparation of social workers represents the backbone of social work practice because it aspires to professional role practice, fulfilling the duties and responsibilities required by the movement of change [1–16].

This can only be achieved through field training, as it represents one of the important pillars in preparing social workers, as it is a technical process through which experience, skills, flexibility, and the ability to confront various professional practice situations are gained. Field training in the field of social work preparation is the cornerstone of the social work education process, as the preparation process contributes effectively through the practical training programs followed to develop the professional personality of male and female students at Al-Quds Open University in the Bethlehem region.

The importance of field training in social work has been highlighted since ancient times, since the inception of social work. Social aids provided through the social dispensary's movement (1869) and through charity organizations (1877) were not based on scientific foundations due to their simplicity on the one hand and their scarcity or limitation on the other hand. However, all of this was successful until those aids became official systems in line with the development of human life and the development of social care activities (aids), and the emergence of social work as a humanitarian profession with its values, principles, ethics, and skills [17–26].

The beginnings of social work education were training courses that focused on methods of researching client cases, then training on report and record writing. However, this method did not suffice without theoretical education, prompting those interested in social work to lay down theoretical foundations to aid in a deeper understanding of human problems, social systems, and the nature of human personality components. With the development of social work in various practice fields and theoretical aspects, social work education has become what it is now: theoretical education and practical training [3, 27–35].

Study Problem:

The problem of the study revolves around the following question: What is the reality of field training for social work students Al-Quds Open University in the Bethlehem region?

Study Objectives:

- To understand the reality of field training for social work Al-Quds Open University in the Bethlehem region.
- To identify the institutions practicing social work.
- To identify the problems and challenges facing social work students.
- To explore students' proposals for addressing field training difficulties.
- To recognize the most important skills acquired by social work students during field training.

Study Importance:

The importance of the study lies in shedding light on the reality of field training Al-Quds Open University, particularly in the Bethlehem region, as training plays a crucial role in shaping the trainee's personality and acquiring skills and principles for scientific practice. It is necessary to understand the reality of field training, problems, and challenges to address them and achieve a high level of training.

2 Study Methodology

This study relies on using the descriptive-analytical method, which attempts to describe the research subject phenomenon and interpret, compare, and evaluate it in order to reach useful generalizations that increase knowledge about the research subject phenomenon. The study starts from the present to the past to extract lessons and insights, diagnosing strengths and weaknesses to strengthen all aspects of strength and confront weaknesses. It also projects from the present to the future, attempting to derive predictions from the study's reality and decisions regarding it in subsequent stages.

First: Study Population The study population consists of male and female students majoring in social work at Al-Quds Open University, Bethlehem branch.
Second: Study Sample Based on the study population, the study sample consisted of a random sample comprising 41 male students and 55 female students majoring in social work at Al-Quds Open University, Bethlehem branch. The training locations were in civil and governmental centers and institutions in the Bethlehem Governorate.
Third: Study Tool To accomplish the study's tasks and achieve its objectives, information was collected using a questionnaire as the primary source of data collection. The questionnaire was prepared, its sections formulated, and then distributed to the study sample.
Fifth: Study Tool Reliability The reliability of the study tool was verified by examining the internal consistency of the tool's items by calculating the Cronbach's Alpha coefficient on the entire study sample, where the reliability value was (0.93). Thus, the tool enjoys a very high degree of reliability.

3 Results

First: Answering the Study Questions.

First Study Question: What is the extent of the reality of field training for social work students at Al-Quds Open University?

To answer the above question, the numbers, means, and standard deviations of the field training reality for social work students at Al-Quds Open University were extracted based on the total score of the scale.

The reality of field training for social work students at Al-Quds Open University was significant, with the mean score for this degree on the study scale being (4.07), with a standard deviation of (0.36).

Second Study Question: What are the most important aspects of the institution where I train?

To answer the previous question, the means and standard deviations of the most important aspects of the institution where I train were extracted, ranked by importance.

The degree of the institution where I train was moderate, with the mean score for this degree being (3.17). The most common aspects were the opportunity to participate in social events at the institution, followed by the opportunity to participate in social occasions with its employees.

Third Study Question: What are the most important aspects of the problems and challenges facing social work students?

To answer the previous question, the means and standard deviations of the most important aspects of the problems and challenges facing social work students were extracted, ranked by importance.

The degree of the problems and challenges facing social work students was moderate, with the mean score for this degree being (2.97). The most common aspects were insufficient financial resources for training, followed by the lack of seriousness from trainees to benefit from training, and the duplication of messages from the institution's supervisor and the university supervisor.

Fourth Study Question: What are the most important aspects of the reality of field training?

To answer the previous question, the means and standard deviations of the most important aspects of the reality of field training were extracted, ranked by importance.

The degree of the reality of field training was significant, with the mean score for this degree being (3.57). The most common aspects were supervisors assigning trainees to write reports, followed by organizing field visits to social institutions, and then coordinating with the institution by the supervisor.

Secondly: Testing the hypotheses:

Hypothesis 1: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University

attributed to the gender variable. No statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the gender variable.

Hypothesis 2: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the age variable. No statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the age variable.

Hypothesis 3: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the academic year variable. Statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the academic year variable. To identify the source of these differences, a Tukey test was conducted for pairwise comparisons in the field training degree of Social Work students at Al-Quds Open University attributed to the academic year variable. The differences in the field training degree of Social Work students at Al-Quds Open University are attributed to the academic year, favoring first-year students over fourth-year students, where the field training degree was the highest for fourth-year students.

Hypothesis 4: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the type of training variable. No statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the type of training variable.

Hypothesis 5: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the supervisor's position in the institution variable. Statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the supervisor's position in the institution variable. To identify the source of these differences, a Tukey test was conducted for pairwise comparisons in the field training degree of Social Work students at Al-Quds Open University attributed to the supervisor's position in the institution variable. The differences in the field training degree of Social Work students at Al-Quds Open University are attributed to the supervisors position in the institution, favoring directors over coordinators, with the highest field training degree observed for students whose supervisor was a director.

Hypothesis 6: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the number of training days in the institution variable. Statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the number of training days in the institution variable. To identify the source of these differences, a Tukey test was conducted for pairwise comparisons in the field training degree of Social Work students at Al-Quds Open University attributed to the number of training days in the institution variable. The differences in the field training degree of

Social Work students at Al-Quds Open University are attributed to the number of training days in the institution, favoring students with two training days per week over those with three days per week, with the highest field training degree observed for students with two days of training per week.

Hypothesis 7: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the number of weekly training hours in the institution variable. Statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the number of weekly training hours in the institution variable. To identify the source of these differences, a Tukey test was conducted for pairwise comparisons in the field training degree of Social Work students at Al-Quds Open University attributed to the number of weekly training hours in the institution variable. The differences in the field training degree of Social Work students at Al-Quds Open University are attributed to the number of weekly training hours in the institution, favoring students with fewer than 5 training hours over those with 8–12 h, with the highest field training degree observed for students with fewer than 5 h of training.

Hypothesis 8: There are no statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the type of institution variable. Statistically significant differences at the $\alpha = 0.05$ level in the field training degree of Social Work students at Al-Quds Open University attributed to the type of institution variable. The differences favored secondary institutions, with the highest field training degree observed for students at secondary institutions (mean = 4.24) compared to primary institutions (mean = 3.98).

4 Conclusion

Key aspects of the institution where students undergo field training include providing opportunities for participation in social events within the institution and allowing participation in social occasions for the staff. The problems and challenges facing social work students include insufficient financial resources necessary for training and the dual messages from the institutional supervisor and the academic supervisor.

5 Recommendations

1 Increase attention to and clarify for students about field training institutions through lectures and workshops on the importance of benefiting from the field training period for their own benefit and advantage.

2 Understand individual differences among trainees and consider their abilities and circumstances in line with the nature of the activities practiced in the training institutions they are directed to.
3 Take into account the interests and preferences of students in choosing the field training institution, considering the proximity or distance of the institution to the trainees, which contributes to creating motivation to perform training tasks and attend regularly.
4 Understand the circumstances under which training takes place and recognize the factors that contribute to the success of training and development efforts, as well as those that hinder their effectiveness in imparting appropriate skills to students.
5 Develop professional models illustrating how to assist students in acquiring professional skills in social work, designed collaboratively by academics, practitioners, and training supervisors, to be used during the supervision process in field training.
6 Develop a joint action plan between the academic supervisor and the institutional supervisor for field training, strengthening positive relationships between college supervisors and the institution, resulting in a flexible plan that enables students to gain the necessary professional experience for proper professional practice after graduation.
7 Establish a predefined timeline for visits and supervision meetings between the college supervisor and trainee students from the beginning of the field training period, facilitating preparation for such supervisory meetings.

The Role of Language as Soft Power in International Relations: Analyzing Diplomatic Discourse and Public Communication Strategies

Aref A. Murshed, Aladdin Tarawneh, and Mohammed Al-Badawi

Abstract In the realm of international relations, the complexities that govern the interaction between language and soft power have risen to prominence, playing a significant role in shaping the intricate network of global connections. This extensive study aims to uncover the subtle and diverse aspects of language as a malleable tool of soft power, with a particular focus on its manifestations in diplomatic discourse and strategies for public communication. The research objectives are designed to cover a comprehensive exploration, delving into theoretical frameworks, conducting thorough analysis of diplomatic discourse, examining the intricacies of public communication strategies, and scrutinizing case studies from the real world. In this extensive research, the study aims to explore how nations use language to shape perceptions, form alliances, and have a significant cultural impact on the global stage. The well-thought-out methodology takes a qualitative approach, using detailed descriptive and analytical frameworks to carefully examine the subtle linguistic aspects found in diplomatic conversations and public communication. Real-life examples, such as the well-known Alliance Française and the widely spread Confucius Institutes in China, act as clear examples, vividly demonstrating the practical effects and complexities related to language-based influence. Ending with a thoughtful conclusion, the study emphasizes the importance of having a nuanced and ethical approach when using language for influential purposes, skillfully acknowledging and navigating through the intricate difficulties, obstacles, and possible outcomes that are deeply intertwined with the power of language in the ever-changing world of international diplomacy.

1 Introduction

In the complex and ever-changing world of international relations, the concept of power goes beyond just military strength and economic might. Soft power, a term coined by Joseph Nye in the later part of the twentieth century, has become an essential tool for nations that wish to expand their influence beyond traditional power dynamics [20]. At a time when international interactions are intensifying and diversifying, this analysis intends to contribute new perspectives of how soft power circulates and develops, offering particular attention to the multiplicity and specificity of language in international relations.

Soft power, as defined by Nye, is a transition from hard power conventions. The use of attraction and persuasion, rather than force and money, to get others to appreciate a country's values, merge interests, and follow its leadership—that's soft power. The allure of a nation's culture, values and its communications and public diplomacy strategies frame and guide the process of using soft power. In short, soft power is the psychological and cultural dimension that gives a nation an edge in power relations. While military hard power and economic hard power are important, soft power alludes to the deeper and more persuasive elements of a country's influence abroad or, as Nye [1] defined it, cultural attraction generated by the 'raw materials' of described civilization [17].

Language becomes that incredible humble yet very powerful basis for soft power, a medium through which the sweeping expressions of a nation are formulated, a true vessel for the principles that the countries embody, and well as the communication of the objectives they portray to the entire world. Then there's the delicate nuance of diplomatic discourse, public addresses and media interactions that surely account for the way that the International community sees things, and for the diplomatic ties valued above things beyond empty words that are formed as a result. Times now are more interconnected than ever before. If anything, we can't afford to understate the significance of the synergies that governments worldwide ride on in an effort to use effective communication practices to excel in language in establishing the desired soft power public standing. Data compiled by the Chatham House, a renowned think tank based in London, shows that countries that have a strategy in place also get unique opportunities to leverage effective language in establishing their soft power ranking with international audiences [11, 12].

1.1 Importance of the Study

This is a particularly significant study, helping us to understand the complex, multi-faceted concept of linguistic soft power in international relations. Taking place in a world that is more interconnected than ever and still facing numerous complex problems, enhanced insight into how nations manipulate and manage language to convey and create an impact holds great importance for policymakers, diplomats and scholars. Accordingly, the findings could potentially help policymakers and diplomats gain a deeper and more nuanced understanding of how language shapes perceptions, forms alliances and acts as an alternative channel for promoting national interests. The study of the applied techniques and treatments in diplomatic negotiations and public communication adds to the academic discourse on soft power and extends the existing theoretical understandings and our ability to comprehend the ways in which countries seek to influence the world around them without using force. The findings of this study could therefore be applied to help those pursuing national interests on the global stage; for example, in crafting better communication strategies and diplomatic tactics. The outcomes thus hold a great deal of importance not just for academic purposes but also in offering more effective guidance for the practitioners and policymakers engaged in an ongoing ambitious process of state building in order to create a better world for all..

1.2 Research Objective

In this ambitious research endeavor, we seek to approach a thorough analysis of the complex role that language in its formal sense plays as an instrument of soft power in complex international relations. A closer look at aspects of diplomatic discourse and the strategies countries adopt in public communication will allow us to trace how language intricately contributes to the phenomenon of soft power. In doing so, our goal is not only to identify the superficial characteristics of a successful—or not successful—linguistic soft power phenomenon, but also to uncover the human, technical and political mechanisms behind it. High-quality research implies a virtuous circle of influence in international diplomacy. Our intention, therefore, is to provide the field with a modern and nuanced understanding of the intricate relationship between language and soft power in international relations. We will do this by analyzing specific cases in detail, drawing on a solid theoretical framework and specific developments in the field.

1.3 Methodology

In this study, we decided to use qualitative methods to explore this question with as much precision as possible: how does the soft power of language shape itself in international relations? And who shapes it? This question is difficult to answer because diplomatic discourse and public communication are typically complex and nuanced. Therefore, in order to drill down into details, we must use qualitative methods: through data quality and descriptive analysis. We will therefore look at a range of public communications between nations, examining the language different countries use in their diplomatic speeches, public communications campaigns and media messages. We will look at how language is used as a tool of soft power and to what effect. Specifically, in this article we will use descriptive analysis to examine the main elements of the language used—vocabulary, words or artifacts that are manipulated (called topoi if they are nonverbal), metaphors, symbols, and other rhetorical elements. Characters and all linguistic norms (spoken and written) used in diplomatic speeches, public communication campaigns and media strategies of various nations. Analytical analysis methods will be used to analyze descriptive data to identify clusters or patterns, recognize the actors and contexts in which language-based soft power appears to be operating or not, and identify the general conclusions that can be drawn from the data. Generally speaking, we use qualitative methods to analyze this data in detail, which is an infinitely more worthy goal than rough or quantitative analysis. Using qualitative methods, we can begin to describe the complex and dynamic phenomenon that is language-based soft power in international relations, with all its implications and the interdependence it deserves. In turn, the analysis is conducted within an analytical framework that aims to extract knowledge from qualitative data and thereby contribute to a deeper understanding of the international language-based soft power domain.

2 Literature Review

If we look at the evolving landscape of international relations, language has quickly risen to the top of the list of emerging factors in soft power thinking. Scholars have confirmed its central importance. Nye's [1, 20] seminal work on extending and extending the essentialist ideas surrounding this idea has helped to create a new desideratum for unraveling the elusive concept while drawing our attention to soft, non-coercive influence through culture, value, and political means. In recent years, scholars have consistently begun to uncover the specific ways in which language contributes to the broader soft power ecosystem.

As Johnson [14] shows, her scholarly approach to broadly understood diplomatic communication begins with in-depth research on the role of language in constructing (and often manipulating) world opinion: through detailed case studies, she discovers

the ways (sometimes subtle, sometimes very overt) which states use strategic rhetorical expression to convey diplomatic messages and their profound impact on the course of international affairs. On the other hand, Smith's [21] study on "performance" in public communication examines how countries use their ability to use language in their speeches to effectively project their power through "performance strategies." Smith argues persuasively that the reception of a speech often depends on linguistic achievement as much, if not more, than on its discursive content.

Their groundbreaking study (2022) clearly demonstrates, with empirical evidence of concrete examples, how new diplomatic discourse shapes and is shaped by social media, with Twitter and Facebook becoming apparatuses for disseminating soft power in the new environment of globalized digital communications. The authors argue persuasively that social engagement measures require us to rethink traditional frameworks for analyzing ever-changing responses to digital social media [2].

The current collection of publications provides a good basis for understanding the comprehensive and multi-faceted role of language in constructing soft power. However, linguistic research in relation to soft power is an unstable field due to its internal dynamism, as is often the case in today's global interactions. We hope that this review will both summarize existing knowledge and, at the same time, serve as a propaedeutic that will pave the way for future academic research [4]. Based on the overall picture that emerges, it highlights the need for detailed research on the language of diplomatic dialogue and public communication policy as two of the most important ways to achieve an insightful understanding of the interconnected and complex links between language and soft power in the dynamically changing world of international relations [15].

3 Conceptual Framework

Tracing the international relationship between language and soft power also involves providing definitions of key terms. Language (in this science exercise) is a country's lexical arsenal used in diplomatic jargon and public discourse. Soft power, following [1], is the ability of one country to influence the preferences of other nations through cultural attractiveness and attraction rather than coercion or payment. Finally, diplomacy (where di refers to communication between two parties)—describes negotiations in international relations, dialogues or strategic communication between states to promote understanding and achieving diplomatic goals [17].

The intimate relationship between language and soft power comes from the persuasive and communicative power embedded in linguistic expression. Language choices represent how nations express their cultural values, present political positions, and cultivate relationships around the world. As Johnson notes in 2017, words remain an intangible part of the diplomatic arsenal, a strategic instrument that "can be used to shape perceptions and advance a nation's interests." The relationship between language and soft power rests largely on the ability of linguistic messages to resonate

with people, evoke emotions, and subtly shape the discursive tapestry that forms the backdrop for diplomatic elements [5].

Soft power is enhanced by a number of important factors, such as rhetorical devices and narrative structures, symbolic language, and popular cultural constructs; strengthening interchangeability as a key advantage of the language. The research of British linguist Rebecca Smith is based on Schelling's findings—apart from the military and economic potential of a nation, the most important thing for the world is how it speaks. Performative elements of language—timbre, rhythm and tone of speech; words, phrases and gestures; symbolism and allegory; literary devices and narrative structures all influence how a nation is perceived and represented, sometimes even more than its superpower status [22].

By combining these concepts, this robust framework provides a coherent frame of reference for analyzing the fluid and multifaceted relationship between language and power. It is also suitable not only for theorizing but also for a holistic understanding of the diverse dynamics of language strategically used by countries in the complex world of international relations.

4 Public Communication Strategies

This project is an in-depth analysis of the entire field of public communications strategies that are of course taken for granted, but upon closer examination can be considered essential elements of the nation's arsenal of soft power initiatives. Careful and in-depth research will soon reveal and expose countries' foreign policies communicated through a number of different multi-layered persuasion campaigns initiated by countries themselves through press releases, social media and official statements. By examining the intended causes of countries' campaigns, this study will allow us to examine and question the deliberate use of language and the impact of such rhetoric in shaping public opinion at home, but also abroad [15].

At the heart of this study is a careful consideration of the role of language in shaping public opinion. Drawing on the insightful work of Jones and Wang [16], who discuss recent developments in diplomatic communication in the context of changing digital trends, this study explores the details of how language support strategies in public communication can create national discourses. Analysis of the impact of language indicators on different target groups reveals the differentiated role of language in shaping collective opinion.

Drawing on theories outlined by Gilboa [13] that emphasize the role of media in soft power, this study goes beyond traditional means of communication and provides new insights into how nations leverage soft power through strategic manipulation of media strategy. These same media strategies focus on how nations use language to strategically organize and position themselves in relation to receptive audiences through mass media or private communications. Therefore, the examination of the media strategies analyzed in this study includes elements such as framing of content, salience of the issue or issue, contextualization of messages, as well as narratives

constructed and embedded in the image [6]. This provides a detailed understanding of the complex ways in which nations' language use shapes their soft power dynamics.

The aim of this study is to identify the characteristics of effective public communication that can increase soft power, through the analysis of several case studies, both successfully and unsuccessfully implemented. It looks for linguistic features that have acted as trigger mechanisms and would be similarly effective in other contexts to strategically and intentionally enhance a nation's soft power. A side effect of this endeavor will be insight into why certain attempts at public diplomacy are more or less effective than others. Combining this analysis with practical tips for policymakers and communicators, the second part aims to provide the reader with useful information and recommendations on how to increase a nation's "soft power" by making wise and intentional language choices. Comparing successful public diplomacy campaigns with cases of miscommunication provides practitioners with some interesting observations and advice on how nations can enhance their soft power through wise and intentional language choices.

We analyze language as a driving force of change in the world of international relations. A thorough examination of the mechanisms of public communication enables a significant contribution to the understanding of its continuous evolution.

5 Challenges and Critiques

Power, of course, is words: there is no more powerful tool in the soft power toolkit. However, there is no more challenging tool, as the instructive efforts of Johnson [14] and Smith [21] explain. And I have only scratched the surface of the challenges. We could go on like this. We could talk about ghosts in the machine, the linguistic ghost that appears when a nuanced headline in country A is misinterpreted by an individual reader in country B. We could address the limitations of cultural errors when one country tries to communicate in the given language of another without in-depth understanding of the cultural context of this language. But more than anything else in the world, I could talk about the English language. There's a reason why so many people tie their identity to speaking English: it takes an unlimited amount of time to master even one of the many variants of the language. However, even mastering one language family is not enough: it is necessary to familiarize yourself with the global catalog of courses in other foreign languages. And even then, you would be catching up on all the changes that are constantly taking place in everyone's language, especially in this rapidly changing digital age. This is the fickle nature of languages, which evolve and balance each other to provide the speech that individual nations and other collectivities use to guide the true purpose of national language policy: not the linguistic dialogues of citizens, but dialogues between groups quite different from themselves.

The ethical nature of language as a tool of influence is central to the analysis: as Lee and Kim [18] proudly state, this project "aims to explore the moral dimensions of the rhetorical choices made by practitioners of linguistic influence." I hope this

article will meet this standard by critically examining the ethical dimensions of rhetorical choices related to propaganda, disinformation, and the indoctrination and dehumanization of foreign adversaries that lead to political advantage.

Examining language as a tool of soft power, this section highlights the potential adverse consequences and hidden dangers of using certain languages for diplomatic purposes. Using existing literature, such as the insightful observations of Chen et al. [12] on borrowing as a soft power strategy that carries significant geopolitical implications, aims to uncover adverse effects such as diplomatic tensions or public opposition, offering thoughtful suggestions to policymakers. Firstly, approaching international relations (IR) theory through the grey areas of language as a power strategy offers a unique perspective on the consequences that arise when decision-makers try to attain diplomatic objectives through linguistic means. The goal is to bring something original to the global debate on international relations. Here we must indeed pause to examine the restrictions and failures by which a language so handy in many hands for soft power is encircled, limited even: to understand the terrain there is always need of more specific detail.

6 Case Studies

France on the other hand, is recognized as a purveyor of language-based soft power excellence on the global stage. A documented example of a language soft power strategy is the Alliance Française, or French language and cultural centers, a network of centers formed in 1883 to spread the French language and facilitate cultural exchange abroad. The Alliance Française now operates in more than 80 countries. In these centers, French is taught and foreigners are encouraged to visit France and participate in cultural exchange to spread the positive image of France abroad. This is done in at least four ways. In the first place, French language and culture is taught, and visitors are encouraged to undertake cultural tourism. Second, the promotion of cultural exchange is practiced. The stated mission of the Alliance Française is to ‘encourage the teaching of the French language, facilitate cultural exchanges and promote information on France and French civilization abroad’. Operating around the world, it stands out for its ability to maintain a global level of French language and culture. Simply by offering language courses, organizing cultural events and encouraging exchanges, France’s soft power support for its culture will continue far into the future, leaving its mark on the world stage [11]. Globalization of higher education. Baltimore: Johns Hopkins University Press.

Alliance Française demonstrates the enduring power of language as an instrument, not just a means of communication, for the development of cultural diplomacy. By promoting the French language abroad, France strengthens its soft power, raises its global prestige and strengthens significant cultural bridges. This active foreign policy betrays a deep-seated belief that language and culture go hand in hand to influence how the international community views other countries.

Another illustrative case is provided by the Chinese government's Confucius Institutes, language-oriented institutions whose purported raison d'être is to foster international exposure of Chinese language and culture. Modalities include providing language lessons, organizing cultural events, engaging in educational partnerships, and other practices, all aimed at strengthening China's soft power. Confucius Institutes are said to have generated controversy (particularly due to the potential political influence arising from their practices) and continue to attract considerable scholarly attention. Nevertheless, it can be seen as a remarkable example of the practice of culture-based soft power aimed at promoting China's linguistic and cultural appeal around the world.

Confucius Institutes are a powerful illustration of how language can function as a lever of soft power. By promoting the Chinese language and cultural values to a global audience, China is not only expanding its international standing but also attracting students and positive perceptions. But the example also highlights the challenges of soft power through language and the controversy it can create regarding academic freedom and potential political influence.

Ultimately, however, these case studies show that countries can use language to gain greater agency on the world stage and influence international perceptions—and these case studies offer lessons on this soft power technique in its most nuanced and effective form.

7 Future Trends and Implications
