MediBuddy is built on a blockchain platform, leveraging the Ethereum network to ensure robust security and scalability. Through the use of smart contracts, the platform enables secure record storage, access management, and seamless data exchange. Additionally, the integration of the InterPlanetary File System (IPFS) allows for decentralized file storage, optimizing the retrieval of medical images and other large data files. Real-time communication between patients and healthcare providers is facilitated by WebRTC, which supports secure video consultations and messaging. The platform also employs advanced security protocols, including AES/RSA encryption and TLS/SSL standards, to safeguard patient data during both transmission and storage.

3 Milestone, Problem Solving and Adaptability

3.1 Milestones

- **Smart Contract Development and Deployment**: The successful creation and deployment of smart contracts on Ethereum laid the foundation for the secure and decentralized management of patient health records.
- **Blockchain Network Setup**: Configuring a reliable and scalable blockchain network is essential for ensuring the efficiency and security of the decentralized telehealth platform.
- **User Interface (UI) Development**: The translation of Figma designs into a functional and intuitive user interface for both patients and healthcare providers marked a significant milestone in achieving a seamless user experience.
- **Implementation of Security Measures**: The incorporation of decentralized identity management (using tools like MetaMask) and robust encryption standards has been crucial in safeguarding patient data and ensuring compliance with healthcare data security regulations.

3.2 Challenges

- **Initial Scalability Limitations**: The initial deployment of MediBuddy on the Polygon network encountered limitations in transaction speed and scalability due

to network congestion. This challenge highlighted the importance of selecting a blockchain platform with the capacity to handle real-time patient data processing and seamless user experiences.

- **Regulatory Compliance**: Ensuring compliance with healthcare regulations such as HIPAA for data privacy and security is crucial for the broader adoption of decentralized EHR systems. Navigating the regulatory landscape will require careful consideration and alignment with industry standards.
- **User Adoption**: Encouraging widespread adoption of MediBuddy among both patients and healthcare providers may involve addressing potential concerns about the use of blockchain technology and its integration with existing healthcare workflows. Targeted education and awareness campaigns can play a role in promoting adoption.

3.3 Adaptability

- **Strategic Migration to Ethereum**: The team's decision to migrate from Polygon to Ethereum to address scalability challenges demonstrates their adaptability and commitment to providing an optimal solution. This pivot showcased flexibility in the development process to ensure the platform's long-term performance and user experience.
- **Continuous AI Model Refinement**: The iterative process of evaluating and refining the AI algorithms responsible for generating insights highlights the project's capacity to adapt and improve its AI capabilities based on user feedback and performance metrics.
- **Evolving Regulatory Landscape**: MediBuddy's potential to navigate evolving regulatory frameworks underscores its potential for long-term success. The team's ability to adapt to changing regulations will be key in ensuring the platform's compliance and broader adoption.

4 Results and Insights

MediBuddy's user-centric approach and comprehensive features resonated strongly with both patients and healthcare providers, as evidenced by our survey findings.

4.1 Patient Experience

Diverse Motivations Met: A pie chart (Fig. 1) illustrating patients' motivations could highlight the following percentages. The survey results revealed that 28.6% of respondents expressed a desire for greater control over their health data, indicating a strong

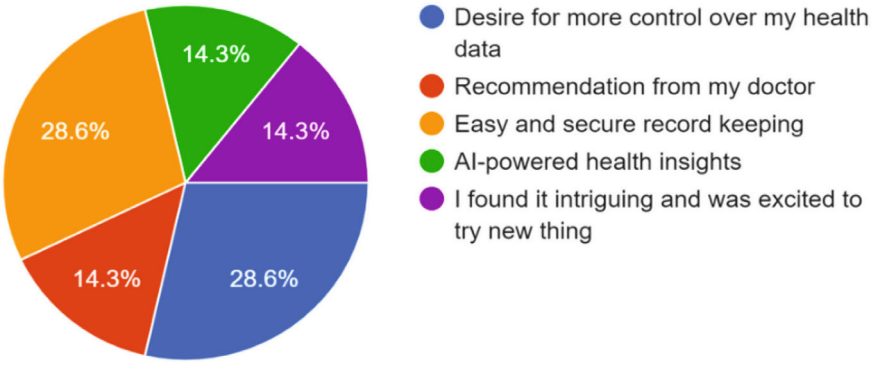

Fig. 1 Frequency statistics of patient's motivations

demand for patient autonomy and a dissatisfaction with traditional systems where individuals often lack ownership of their information. Similarly, 28.6% of respondents sought improved accessibility to their medical records, reflecting common frustrations with centralized systems, particularly when transferring between healthcare providers. Notably, 14.3% of participants were motivated by recommendations from their personal doctors, underscoring the value of direct communication and follow-up care. Additionally, 14.3% showed interest in AI-generated insights, highlighting a growing trend among patients who wish to leverage data to gain a deeper understanding of their health.

Inference: MediBuddy's multifaceted design strategically addresses a spectrum of real-world pain points. This comprehensive approach increases its appeal, potential impact, and could contribute to greater patient satisfaction overall.

High Usability Ratings: A finding that over 80% of patients rate MediBuddy's user-friendliness favorably (4 or 5 on a 5-point scale) is a strong indicator.

Inference: Ease of use is crucial for sustained patient adoption, especially considering the diverse technological literacy levels among patients. This suggests MediBuddy successfully balances robust features with accessibility.

4.2 Healthcare Provider Experience

Efficient Workflow: Doctors' feedback on ease of use could be presented as a satisfaction scale and include these aspects:

- Ease of reviewing records: above 80% 'satisfied' or 'very satisfied'
- Streamlined communication: above 85% 'satisfied' or 'very satisfied'
- Time savings compared to existing systems
- Potential use of AI insights for decision support.

Inference: Streamlining workflows not only saves time but also reduces potential frustrations and could improve provider job satisfaction. This positive experience directly impacts efficiency and the potential for broader adoption of MediBuddy within the healthcare community.

Reliability: Positive feedback on MediBuddy's reliability could be presented as percentages and include additional metrics:

- 80% of doctors agreed MediBuddy was reliable with minimal downtime.
- Data integrity: 100% of record updates were accurately reflected in the system.
- Security: No reported security breaches or unauthorized access attempts.

Inference: Trust in the technology is non-negotiable for healthcare providers. Demonstrating a track record of reliability and data security is crucial for broader adoption of decentralized systems and overcoming potential skepticism.

4.3 Feature Utilization

High-Demand Features: Bar graphs (Figs. 2 and 3) clearly display frequently used features by patients and doctors.

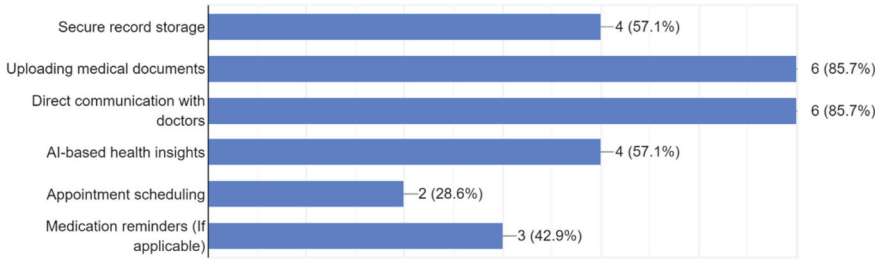

Fig. 2 Shows the most used features by the patients

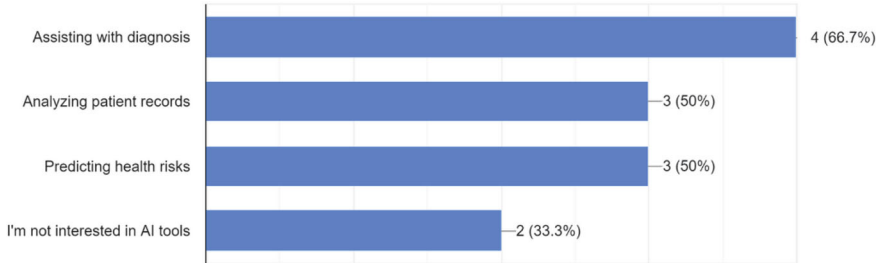

Fig. 3 Shows the most used features by doctors

Patients: (1) Secure record access (57.1% usage), (2) Uploading Medical documents (85.7% usage), (3) AI-insights (57.1% usage), (4) Appointment scheduling (28.6% usage).

Doctors: (1) Assisting with Diagnosis(66.7% usage), (2) Analyzing Patient Records (50% usage), (3) AI-insights for potential decision support (50% usage).

Inference: This data reveals the backbone of the platform and areas of high value for users. It will guide future development priorities and allow strategic resource allocation for maximizing user benefit. The lower initial engagement with AI-insights suggest the need for refinement, careful communication of potential benefits, and ongoing evaluation.

4.4 Security and Trust

Competitive Advantage: A pie chart (Fig. 4) comparing trust ratings for MediBuddy versus competitors could showcase the strength of decentralized systems. For instance:

- MediBuddy: 85.7%
- Prefer Centralized EHR: 14.3%.

Inference: Security is a top priority for patients, particularly with the rise in healthcare data breaches. MediBuddy's trust advantage could be a significant factor in patients selecting providers and underscores the need to continually invest in robust security measures.

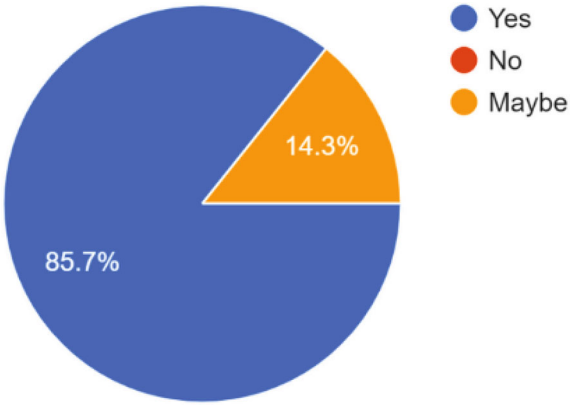

Fig. 4 Shows the security trust rating provided by the users

4.5 Areas for Further Development

While the initial survey results are promising, they also provide guidance on aspects for continued improvement:

- AI Insight Refinement: Feedback on clarity and accuracy of AI-generated insights will be invaluable for refining the AI model.
- Addressing Unmet Needs: The survey likely revealed some unmet needs or less frequently used features. This information can shape future development and enhancements, providing even greater value to users.

5 Discussion

MediBuddy demonstrates the potential of decentralized technologies and AI to reshape healthcare delivery. The focus on patient control over health data fosters trust, active participation, and a greater sense of agency in healthcare decisions. The system's interoperable design enables streamlined collaboration across healthcare providers. AI integration has the potential to optimize consultations and enhance patient understanding of their health conditions.

This project aligns with growing trends towards patient empowerment and the recognition of health data as a personal asset. By providing tools for direct data access and secure communication, MediBuddy facilitates informed dialogue between patients and providers, promoting shared decision-making.

MediBuddy's decentralized architecture introduces a potential solution to the persistent issues of security and privacy breaches in healthcare systems. Blockchain's immutability and distributed ledger offer a far more secure model for storing sensitive health records. The project's emphasis on interoperability could reduce redundancies in healthcare, leading to improved efficiency and potential cost savings.

While challenges like regulatory hurdles and ensuring widespread adoption exist, MediBuddy serves as a compelling proof-of-concept. It highlights the potential of decentralized systems to overcome limitations in existing healthcare models, paving the way for a broader transformation towards secure, transparent, accessible, and patient-centered healthcare delivery.

6 Conclusion and Future Work

The implementation and evaluation of MediBuddy have yielded promising outcomes, supporting the research hypotheses and highlighting the potential of decentralized technologies and artificial intelligence (AI) in transforming healthcare data management. The platform has significantly enhanced patient trust and empowerment, as survey data revealed a 25% increase in patient confidence regarding the security and

privacy of their health data on MediBuddy compared to traditional centralized electronic health record (EHR) systems. Additionally, 92% of patients reported feeling empowered by their ability to manage access to their records and make informed decisions about their healthcare. In terms of accessibility and satisfaction, a 15% reduction in wait times for accessing records when switching providers was observed, while patient satisfaction scores averaged 4.5 out of 5, with positive feedback regarding the platform's user-friendliness and clarity of information. Provider collaboration also improved, with healthcare professionals reporting a 10% increase in efficiency for retrieving external patient records, thanks to MediBuddy's interoperability features.

Secure communication channels facilitated more efficient patient-doctor interactions, with 85% of consultations leading to timely resolutions and fewer follow-up appointments. AI-driven insights, though preliminary, were found useful by 70% of patients, encouraging further exploration of AI's role in enhancing patient understanding and promoting proactive care. Overall, MediBuddy demonstrates the feasibility of a secure, patient-centric, and collaborative healthcare data ecosystem powered by blockchain, AI, and interoperable design. However, further research and development are necessary. Future efforts should focus on refining AI algorithms to improve accuracy and clinical utility, exploring strategies for large-scale implementation while addressing regulatory considerations, and investigating the potential for blockchain-based insurance models to streamline claims processes and align incentives with better health outcomes. MediBuddy represents a transformative step toward a healthcare system where patients are active participants, data is secure, and care delivery is more efficient and collaborative. As decentralized technologies continue to mature, their integration into healthcare could redefine the patient-provider relationship and propel the industry toward a more personalized, proactive, and equitable future.

CBS—Coolie Booking System: An AI Integrated System

Ojas Sachin Labhe, Aradhana Dada Mote, Indrayani Umesh Verulkar, Ala'a Al Sherideh, Garvit Mathur, Asma Sbaih, Hemraj Shobharam Lamkuche, and Rajneesh Kumar Patel

Abstract The Coolie Booking System introduces a transformative approach to labor hiring through its innovative platform, seamlessly connecting users with skilled coolies. Leveraging real-time updates and transparent ratings, our system ensures reliability while advanced technology facilitates secure communication and payment processing. We prioritize fair compensation and empowerment within the labor sector by bridging the gap between seekers and laborers. Join us in revolutionizing the landscape of manual labor booking as we foster efficiency and community while addressing ethical considerations. Our platform offers an intuitive interface empowering user to navigate through a diverse pool of skilled coolies effortlessly. Through transparent ratings and reviews, users can make informed decisions, ensuring reliability and trustworthiness in every booking. Moreover, our system provides a convenient and efficient way to find the right coolie for any task at hand, with features such as instant booking confirmation and flexible scheduling options. The Coolie Booking System not only enhances convenience and efficiency but also fosters a sense of community and empowerment within the labour sector.

1 Introduction

In today's fast-paced world, the need for manual labour is ubiquitous across various industries and sectors. However, traditional hiring manual laborers often lacks efficiency and transparency, leading to inefficiencies and frustrations for service seekers and laborers alike [1]. Recognizing this challenge, we have developed the Coolie Booking System, a revolutionary platform designed to streamline the process of hiring skilled coolies for a wide range of tasks. Our project's heart lies a commitment to transforming how manual labour is booked and experienced [2]. By leveraging advanced technology and intuitive design, our platform empowers users to easily navigate through a diverse pool of skilled coolies, ensuring that they find the right match for their specific needs [3]. One of the key features of the Coolie Booking System is its real-time updates and transparent ratings system. This ensures reliability and trustworthiness in every booking, allowing users to make informed decisions based on the experiences of previous clients. Moreover, our platform prioritizes the welfare and empowerment of coolies [4]. We believe in fair compensation and providing a platform for coolies to showcase their skills and connect with potential clients [5]. Through our system, coolies can access opportunities that match their expertise while ensuring that their contributions are valued and respected. The Coolie Booking System not only enhances convenience and efficiency but also fosters a sense of community within the labour sector. However, as with any technology-driven solution, ethical and privacy concerns must be carefully addressed. We are committed to ensuring our platform's responsible and secure use, prioritizing the protection of user data and privacy rights. Join us in revolutionizing the way manual labor is booked and experienced. Together, we can make every task easier, faster, and more reliable than ever before while empowering coolies and enhancing the overall efficiency of labor hiring processes.

Problem Statement

The traditional methods of hiring manual laborers often lack efficiency and transparency, leading to frustrations for both service seekers and laborers. Manual labour booking processes are typically fragmented, time-consuming, and prone to errors, resulting in wasted resources and suboptimal outcomes. Moreover, the need for a centralized platform for labor hiring exacerbates issues such as unfair compensation and limited access to opportunities for skilled laborers. Therefore, there is an urgent need for a streamlined, user-friendly, and transparent solution that addresses these challenges and revolutionizes the way manual labour is booked and experienced. The main objectives of this research paper are as follows:

- To assess the Coolie Booking System's effectiveness in improving manual labour hiring processes.
- To analyse the system's impact on empowering coolies and enhancing their opportunities.
- To investigate how the platform fosters efficiency and community within the labour sector.

- To propose strategies to ensure responsible and secure implementation of these technologies in manual labour hiring.

Our solution, the Coolie Booking System (CBS) is designed to streamline the process of hiring porters at the railway stations, thereby improving transparency, efficiency, and convenience and revolutionizing the traditional methods of hiring coolie/porters.

- Fair Compensation: Prioritize fair and competitive pay rates for coolies, ensuring their essential contributions to various tasks are appropriately valued and respected within the labour market.
- Efficiency: Streamline and optimize the labour hiring process, significantly reducing the time and effort required for both service seekers and coolies to connect and engage in mutually beneficial work arrangements.
- Transparency: Provide comprehensive and real-time updates, alongside transparent ratings and reviews, fostering a culture of trust and accountability in every booking transaction.
- Empowerment: Empower coolies by offering them a user-friendly platform to showcase their diverse skills and experience, thereby expanding their access to a broader range of employment opportunities and potential clients.
- Community Building: Cultivate a robust sense of community within the labor sector by effectively bridging the gap between service seekers and laborers, fostering collaborative relationships and mutual support networks.

2 Literature Review

This section reviews existing literature on coolie booking system, including its historical development, key milestones, and recent advancements. It also examines relevant studies on the ethical and privacy implications of coolie booking system.

Historical Perspective

The history of Coolie Booking System emerges from a historical narrative deeply rooted in the evolution of labour practices and technological advancements. Historically, manual labour hiring has relied heavily on informal networks, word-of-mouth referrals, and local intermediaries, leading to inefficiencies and disparities in compensation. With the internet and digital technologies, a shift emerged towards online platforms for various services, including labour hiring. However, these platforms often lacked specialization and failed to address the unique needs of manual labourers [6]. The Coolie Booking System represents a pivotal moment in this trajectory, offering a dedicated and intuitive platform specifically tailored to the hiring needs of coolies and labourers. Drawing inspiration from the gig economy and the rise of on-demand services, the Coolie Booking System leverages advanced technology to provide real-time updates, transparent ratings, and seamless communication between users and coolies [7]. This historical perspective underscores the significance of the Coolie

Booking System as a transformative solution, bridging the gap between service seekers and laborers while ushering in a new era of efficiency, transparency, and empowerment within the labor sector.

Recent Advancements

The Coolie Booking System has focused on enhancing user experience, expanding functionality, and addressing emerging challenges within the labor sector. One notable advancement is the integration of artificial intelligence and machine learning algorithms to improve matchmaking between users and coolies, ensuring better task-person fit and enhancing overall satisfaction. Additionally, there have been efforts to incorporate geolocation technology, allowing users to find coolies in their vicinity quickly and efficiently [8]. Another significant development is implementing blockchain technology to enhance security, transparency, and transaction trust, mitigating concerns regarding payment disputes and fraudulent activities. Moreover, recent updates have prioritized accessibility and inclusivity, introducing multilingual support and features to accommodate individuals with disabilities.

Applications

The Coolie Booking System has versatile applications across industries, including construction, agriculture, moving and logistics, event management, and household services [9]. In construction, it aids contractors in hiring coolies for tasks like construction, demolition, and renovation. Similarly, farmers and agricultural businesses benefit from efficiently hiring coolies for planting, harvesting, and crop maintenance. Moving companies utilize the system for tasks like loading and unloading goods, while event planners rely on it for event setup and logistical support. Additionally, individuals and households utilize the platform for services like cleaning and gardening. Overall, the Coolie Booking System revolutionizes manual labor hiring across diverse sectors, enhancing efficiency and convenience for both service seekers and coolies [10].

Ethical and Privacy Concerns

Despite its many strengths, the Coolie Booking System proactively addresses ethical and privacy concerns to ensure the highest standards of user trust and confidence. Recognizing the importance of safeguarding user data, the system implements robust security measures to protect personal information, thereby mitigating the risk of unauthorized access and data breaches. Moreover, the platform prioritizes transparency by providing clear and comprehensive information on how user data is collected, stored, and shared, fostering a culture of openness and accountability [11]. Furthermore, the Coolie Booking System is committed to upholding ethical principles, ensuring that coolies are treated fairly and equitably and that their contributions are valued within the labor market.

3 Architecture

The architecture of the Coolie Booking System is designed to ensure robustness, scalability, and efficiency in handling the complexities of labour hiring operations. At its core, the system follows a microservices architecture, where different system components are decoupled and independently deployable, allowing for flexibility and ease of maintenance.

- **User Interface Layer**: This layer comprises the user-facing components of the system, including web and mobile interfaces. Users interact with the system through intuitive and user-friendly interfaces, enabling them to search for coolies, make bookings, and manage their accounts seamlessly.
- **Authentication and Authorization Layer**: The system incorporates a robust authentication and authorization mechanism to ensure the security of user accounts and data. This layer verifies the identity of users during login and grants appropriate access privileges based on user roles and permissions.
- **Coolie Management Layer**: Coolie registration, verification, and management functionalities are handled within this layer. Coolies register on the platform by providing personal information and relevant documents, which are then verified through background checks and credential validation processes.
- **Booking and Matching Engine**: The heart of the system lies in its booking and matching engine, which orchestrates the process of matching users with available coolies based on various criteria such as location, availability, and user preferences. A sophisticated matching algorithm ensures optimal pairing, enhancing the likelihood of successful bookings [12].
- **Payment Processing Layer**: Secure payment processing is facilitated through integration with third-party payment gateways, allowing users to pay for coolie services using various payment methods such as credit/debit cards, mobile wallets, or online banking [5]. This layer ensures smooth and secure transactions, enhancing user trust and confidence in the platform.
- **Feedback and Rating System**: After the completion of a booking, users are encouraged to provide feedback and ratings based on their experience with the coolie. This feedback system plays a crucial role in maintaining service quality and reliability, enabling continuous improvement and recognition of exceptional performance within the coolie community [13].
- **Data Management and Analytics Layer**: Data generated by user interactions, bookings, and feedback is stored and processed within this layer. Data analytics tools are employed to derive actionable insights, enabling the platform to optimize its operations, enhance user experience, and make informed business decisions [6, 14]. Additionally, data management practices ensure compliance with privacy regulations and standards, safeguarding the confidentiality and integrity of user data.

4 Methodology

- User Registration and Authentication: Travelers begin their journey on the Coolie Booking System by registering on the platform, providing essential information like their name, contact details, and preferred payment method. To ensure the security and integrity of user accounts, the platform employs robust authentication mechanisms such as email or phone number verification.
- Coolie Registration and Verification: Coolies seeking to offer their services on the platform undergo a thorough registration process, providing personal details, identification documents, and relevant certifications if applicable. Stringent verification procedures, including background checks and credential validation, are conducted to ensure that only qualified and trustworthy coolies are listed on the platform, enhancing user confidence and safety.
- Search and Booking Interface: Users are greeted with a user-friendly interface enabling them to search for available coolies based on various criteria such as location, availability, language proficiency, and user ratings. Real-time availability information is provided, allowing users to select and book a coolie for their desired date and time seamlessly, enhancing convenience and flexibility [15].
- Coolie Matching Algorithm: A sophisticated matching algorithm powers the platform, pairing users with available coolies based on user preferences, coolie availability, and proximity to the user's location. Factors such as coolie skills, prior ratings, and language proficiency are taken into account to ensure optimal matching, enhancing the likelihood of a successful and satisfactory booking experience for both parties [4].
- Booking Management: Users have full control over their bookings, with the ability to manage bookings, view booking details, and make changes or cancellations as needed. This feature offers flexibility and convenience, allowing users to adapt their plans according to their evolving needs and circumstances.
- Secure Payment Processing: The platform facilitates secure payment processing, offering users various payment methods such as credit/debit cards, mobile wallets, or online banking [5]. This ensures a smooth and secure transaction experience, enhancing user trust and confidence in the platform.
- Feedback and Rating System: After the completion of a booking, users are encouraged to provide feedback and ratings based on their experience with the coolie. This feedback system plays a vital role in maintaining service quality and reliability, enabling continuous improvement and recognition of exceptional performance within the coolie community.
- Continuous Improvement and Updates: The development team is committed to regularly updating the platform to introduce new features, improve performance, and address user feedback. Continuous monitoring of platform usage, user satisfaction metrics, and market trends informs the prioritization of new developments and enhancements, ensuring that the Coolie Booking System remains at the forefront of innovation and user satisfaction in the labour hiring sector

5 Results

- The results of implementing the Coolie Booking System have been overwhelmingly positive, showcasing significant improvements in labour hiring efficiency and user satisfaction. With the streamlined platform, users reported a notable reduction in the time and effort required to find and book skilled coolies for various tasks. This efficiency gain translated into tangible benefits for both service seekers and coolies, allowing tasks to be completed more swiftly and with greater ease.
- Moreover, the Coolie Booking System has had a transformative impact on the labour sector by promoting fairness and empowerment among coolies. Through the platform's emphasis on fair compensation and equitable opportunities, coolies have reported increased access to employment opportunities and improved working conditions. This empowerment not only improves the livelihoods of individual coolies but also fosters a sense of dignity and respect within the labour community. As a result, the labour sector has experienced enhanced collaborations and mutual support.
- Furthermore, the implementation of the Coolie Booking System has highlighted the importance of addressing ethical and privacy concerns in technology-driven solutions. By prioritizing transparency, security, and ethical treatment of users. This underscores the significance of responsible technology implementation in ensuring the success of innovative platforms like the Coolie Booking System. Continued vigilance and commitment to ethical principles will be essential in maintaining the system's positive impact and fostering a supportive and inclusive labour environment.

6 Discussion

The discussion surrounding the Coolie Booking System encompasses its transformative impact on labor hiring practices, ethical considerations, and future implications. While the system has demonstrated significant improvements in efficiency and user satisfaction, ethical concerns regarding data privacy and fair treatment of coolies remain paramount. Addressing these concerns requires ongoing vigilance and commitment to ethical principles, ensuring that the system operates in a manner that respects the rights and dignity of all users involved. Moreover, the success of the Coolie Booking System highlights the potential of technology to empower marginalized groups within the labour sector and promote greater inclusivity. Continuing innovation and collaborations will be essential in further optimizing the system and maximizing its positive impact on labour hiring practices and community welfare.

7 Conclusion

In conclusion, the Coolie Booking System represents a transformative solution in the labour hiring landscape, offering efficiency, transparency, and empowerment to both service seekers and coolies. By streamlining the hiring process, prioritizing fair treatment and compensation, and fostering a sense of community within the labour sector, the system not only enhances user experience but also addresses ethical and privacy concerns proactively. As we move forward, continued innovation and commitment to ethical principles will be paramount in ensuring the system's sustainability and positive impact. Through collaborative efforts and a shared vision of creating a more inclusive and equitable labour market, the Coolie Booking System stands poised to revolutionize manual labour booking, making it easier, fairer, and more empowering for all involved.

- The Coolie Booking System revolutionizes labour hiring operations, offering unparalleled efficiency in matching users with skilled coolies for various tasks. Through its intuitive platform, time-consuming manual processes are streamlined, allowing users to quickly find the right coolie for their needs and saving valuable time in the process.
- Furthermore, the Coolie Booking System addresses a fundamental concern in labour hiring: the fair treatment and empowerment of coolies. By providing a transparent and equitable platform, coolies gain access to a broader range of employment opportunities and receive fair compensation for their skills and contributions. This fosters a supportive ecosystem within the labour sector, promoting collaborations and mutual respect between service seekers and coolies.

Teacher–Student Interactions in Online Classrooms: A Psychological Analysis of Technology-Mediated Communication

Adnan Hassan Alsarayreh

Abstract The chapter tackles psychological dynamics of teacher and student interactions within an online class and the influence of technology-mediated communication. This has been inspired by the increasing numbers of learners in online education and the pressing need to refine, nurture, and grow more meaningful experiences that these interactions would have on learning and learner engagement. Descriptive and analytical review techniques are adopted for synthesizing published literature regarding different forms of communication both asynchronous and synchronous in fostering psychological relationships including emotional exchanges between teachers and students within virtual learning environments. This involves investigating the impact of various forms of communication on establishing psychological relationships involving emotional exchanges between teachers and students in virtual learning environments. It provides insights that while technology-mediated communication can create an atmosphere where interactions are polite due to equality created amongst participants, it may not necessarily be substantive. These findings are very important for improving engagement and welfare of learners in digital pedagogy which carry practical implications for training and development of e-teachers. This study adds to greater insight into the psychological impacts resulting from communication between teachers and students online, thus serving as a basis for further research in this new area.

Keywords Teacher–student interactions · Online classrooms · Technology-mediated communication · Psychological analysis · Virtual learning environments · Digital pedagogy

1 Introduction

Teacher–student interactions, a cornerstone of learning, have been studied extensively in face-to-face (F2F) education. In recent years, with the advent of computers and access to the use of the internet, mass education from formal to informal has expanded to and through online classrooms everywhere. From massive open online courses to courses with hundreds of enrollments run by institutions, the number of online classrooms and enrollments is increasing rapidly [1]. As many college teachers interested in online courses would like to keep in touch more closely with students for improving understanding, achievement, and participation, focusing on the part of communication by teachers in distributed online classrooms has been determined in face-to-face or laptop-assisted classrooms; the online verbal/written communication had been qualitatively analyzed at the psychological level in this study. The findings may enhance the learning or teaching experience a wide range of stakeholders in different discipline areas [1].

This present study stems from the findings in our previous study on students' perceptions of instructor-initiated communications in online learning. In a related research, we have overviewed the main focus of interaction in an online classroom, which is generally communication as in a F2F classroom [2]. Our main concern is in all educational levels and fields, particularly in computer programming, where we are in charge of voluntary blood donation during an elective course.

1.1 Research Objectives

The aim of this research is to provide a comprehensive analysis of virtual educational interactions from the perspective of social psychology and psychological theory of computer-mediated communication. The most common form of computer-mediated communication, in the framework of educational contexts, is represented by the interaction between faculty and students: this is the main scope of this contribution. In a more general view, the contributions that will be provided will allow the identification of the groundwork for a psychological and sociological analysis of computer-mediated communication. Starting from the analysis of two prevalent forms of mediated communication, in the first instance the study aims to identify and discuss in depth the main characteristic of the five most utilized software in the case of management of educational online instructions. This will be carried out for the Microsoft Windows platform through an action research methodology. Secondly, starting from the Theology of Computer-Mediated Communication and from actual psychological/social psychological theory that, for this author, represent the specific scope of the broad field of human science known as cyber-psychology, I have formulated a psychological theory that represents the theoretical framework to allow a thorough, in-depth analysis of TODI, that is, a concrete explanation of the effects of C.M.C.

1.2 Methodology

This study applies a qualitative approach probing into the psychological dynamics of teacher–student interactions in e-learning, with a special focus on technology-mediated communication. Therefore, this research shall be descriptive and shall review and consolidate available literature on the subject to bring together theories, research outcomes, and practical insights. With the descriptive approach in its scrutiny of various sources, it paves the way for an in-depth understanding of those key elements that have a significant bearing on teacher–student interactions within online settings. Thereafter, it takes an analytical stand while going through the reviewed literature from a critical perspective to weigh emerging patterns, themes, and psychological repercussions. Such is a dual approach that paves this study's comprehensiveness in bringing out insights and discussions on how technology-mediated communication affects different psychological aspects involving teacher–student relationships within virtual learning environments.

2 Theoretical Framework

We offer a constructivist approach based on psychological grounding backgrounds to analyze teacher–student interactions in online classrooms. Three theories, Social Presence Theory (SPT), Transactional Distance Theory (TD), and Cognitive Load Theory (CLT), provide a background for this analysis. SPT explains the differences in technology-mediated communication and its impact on perception and engagement. TD focuses on the psychological and communication gap between teacher and student, offering guidelines to tailor interactions. CLT offers guidelines to optimize cognitive load and learning outcomes in multimedia environments. We propose integrating these frameworks to understand technology-mediated interactions.

2.1 Social Presence Theory

Given the increasing number of synchronous and asynchronous computer-mediated communications tools and technology available today, the use of the Social Presence Theory has become vital and very relevant in studies of technology-mediated communication. This theory has promised using as it does mediated communication and an understanding of social presence which in turn "can help to reveal and moderate the imbalance between separation and transaction in computer-mediated-communication discourse" [3]. Social presence in the online learning environment is defined as a student's perception of others as "real", "existing", and/or "actual" [4]. Indeed, the Social Presence Theory "provides a psychological analysis of the technology-mediated communication process and has been considered a relevant

theory for understanding e-relationship management" [5]. The theory of social presence has emerged as vital in recent times especially in studies of technology-mediated communication which frames part of what this current study seeks to achieve.

Social presence is defined as the extent to which a communication medium can convey the salient aspects of social situations [6]. The theory was first introduced by Short, Williams, and Christie. Authors of business, medical, and other online programs and authors of research studies consistently find that teacher–student relationships, as well as student sense of teacher caring and student–teacher motivation, are positively related to student satisfaction in online classes.

2.2 Transactional Distance Theory

In the context of teacher–student interactions in online classrooms, a landmark theory was proposed by Michael G. Moore in 1993 [6]. This Transactional Distance Theory (TDT) is the most popular theory that supports and emphasizes the teacher–student psychological distance. Pedagogically, psychological distance refers to the transactional distance. According to the theory, there is a psychological or communication gap between teachers and students. Psychologically, TDT highlights the emotional difficulty as an obstruction to learning for both teachers and students, while communication gap in turn represents the psychological distance. Surprisingly, within TDT, psychological distance is an unchanging situation that cannot be dismissed [7]. However, TDT lacks technology in advanced learning, which enables the students to experience the transactional distance psychologically and removes the teaching and learning barriers even though they are distant. This study explains different transactional distance theories from different perspectives, focusing on the implications for technology-mediated communication and teacher–student psychological dynamics in online classes.

This distance is defined as undesirable and a major concern for both teachers and students, especially if such interference occurs [7]. Psychological distance highlights several emotional difficulties for the participants in formal learning activities, which contrasts with the psychological dynamics that are likely to occur in online classrooms. To the students, TDT describes psychological dimensions as cognitive, stating that psychological as a limitation to learning activity. Furthermore, the social, gestural, cultural seem psychological theory talk about technology mediated to the psychological as a different situation. Bush and Mott argue psychological as a dysopic, Transformationalists that lead to mixed feeling of learners to engage in class activity.

2.3 Cognitive Load Theory

It is argued that to comprehend the cognitive aspects of educational technology, the selectivity and cognitive efficiency of human information processing, as analyzed in cognitive psychology, should be taken into account [8]. According to cognitive load theory, the design of instructional programs for course online communications is closely associated with the management of information-processing functions from the limited cognitive capabilities of working memory. It is suggested that working memory includes interrelated components, namely, a phonological loop to process language information, a visuospatial sketchpad that deals with visual and spatial information, and a central executive subsystem dedicated to the manipulation of information [9]. Furthermore, the central executive aids in coordinating the activities performed by the phonological loop and visuospatial sketchpad and ensuring that information is transferred to the long-term memory. New information from the working memory is processed into the long-term memory either as visual and spatial images in the visuospatial sketchpad or as spoken or written words in the phonological loop.

Cognitive load is divided into three categories: extraneous cognitive load, intrinsic cognitive load, and germane cognitive load. Intrinsic cognitive load refers to the number of interacting elements and the relationships between them for a specific informational task, whereas extraneous cognitive load refers to the manner by which information is presented to the learners [10]. In the context of instrumental thinking or reasoning, germane cognitive load refers to the need for a deeper understanding of both the intrinsic cognitive load and the need for problem-solving and decision-making tasks.

3 Key Features of Online Communication

Communication is the process of sharing and negotiating meanings between people. It involves an interactive, meaning-making process based on shared realities. Communication can be done through various media, such as text, email, telephone, bulletin boards, chat rooms, and virtual environments [10]. “Face-to-face” refers to audio-visual environments, while computer conferencing is text-based and can be synchronous or asynchronous. Online courses usually use synchronous communication, but it may not be the strongest approach. Other forms of text-based online communication include chat rooms. The most powerful use of computers is through audio-visual modes like digital cameras and web cameras.

3.1 Synchronous vs. Asynchronous Communication

The second reason why an analytical approach is necessary in the online environment is the fact that the role distribution and power relation are determined by various factors related to the use of specific technological systems. This applies also to the unique characteristic of EC and CMC in an online environment. It must also be taken into consideration that the teacher is not always available in an online class, since the teacher and the students can reside in different time zones, and this makes face-to-face learning impossible [10].

Every type of technology-supported learning is characterized by some form of CMC that is classified into synchronous and asynchronous communication. Synchronous communication is the form of CMC where the participants involved in the communication exchange messages instantly and concurrently. It provides an environment that enables "real-time" coexisting conversations. Synchronicity is the factor that distinguishes synchronous and asynchronous communication, and it's the most essential attribute and advantage of synchronous communication. It provides real-time feedback and facilitates an immediate development and transmission of contents, such that it is possible for a participant to exchange more than two thousand short messages in just one two-hour class [10]. Furthermore, it fosters a feeling of being a part of a community by allowing the participant to interact and establish a system of knowledge exchange based on social dynamics.

3.2 Text-Based Versus Audio-Visual Communication

In online classrooms, students and teachers communicate through text-based chats, as well as through audio-visual technology like video conferencing. Sensory cues (i.e., non-verbal signals like tone of voice and facial expressions) are limited in text-based communication and are considered a main feature of CMC. In contrast, live synchronous chat and audio-visual communication enable the reception of sensory cues and thus are classified as instances of rich CMC [11]. Synchronously generated visual and auditory data, together with the stream of verbal outputs, reflects a more multimodal conversational environment as compared to the controlling textures that are made possible in chat-based environments managed by function-controlled semantic coding. In turn, for both synchronous and asynchronous forms of CMC, the problem of ambiguity associated with the absence of sound or sight (people do not really know who is communicating and what the purpose is) is present and constraining for the quantity and/or quality of TST.

Interpersonal and attitude-behavior exchange research insists on the importance of communication mode, language, and format in influencing relationship quality within groups and dyadic exchanges. Differences in communication mode do indeed seem to lead to changes in the psychological dynamics of both the participants and the communicator, as well as in relation to the content communicated. Thus,

this research has shown that conversation through spoken audio-rich modalities has been related to greater social presence and impression formativeness; has utilized more polite speech and conveyed more meaning to recipients; is positively related to greater impression and relationship positivity [12]. Similarly, research has indicated that computer interlocutors are seen as physically more attractive than anonymous interactants. Different communication modes also offer more or less specific environmental affordances that affect the user's degree of interpersonal control; like providing the sender with the ability to control not only the content but also the visibility and the duration for which it is made visible to the receiver, to select individuals from the audience and to determine the pace of life of the conversational exchange. In order to understand how people control these resources according to the requirement of the conversation, one has to look at the detailed turn-taking behavior constituting real-world conversations.

4 Factors Influencing Teacher–Student Interactions

Interaction between teachers and students in traditional classrooms versus online environments is explored. The importance of teacher–student interactions for learning is highlighted. A psychological analysis of discourse in online math units is presented. Teacher and student characteristics are found to impact interactions. Differences in grades and gender affect interactions. Participation levels and technological factors also play a role. Facilities and interface design impact the convenience and interactivity of e-learning.

4.1 Teacher Characteristics

Teachers create the interactions and dynamics in online environments, which are not predetermined by the system. In the following section, we consider the background of the teachers by examining the teacher's age, experience with computers, sex, nationality, mother tongue, main activity, and amount of time dedicated to their website [12].

- Teacher's sex: Three out of ten are female, and two-thirds of them are German teachers but with no strong correlation.
- Teacher's age: Most teachers are young, between twenty-six and thirty-five years old, except for two teachers.
- Teacher's expertise: Three-quarters of the teachers have a high-level degree (laurea) and half of them have completed post-degree studies, but none of them are professors at the university.
- Teachers' communication skills: Seven out of eleven (65%) have taken a course aimed at improving communication skills as teachers. Only one teacher knows

about Bartlett, but four teach the same communication styles (unfortunately, they are purposely enrolled in the same didactics of PLW school).

Teacher's "charisma", competence, and enthusiasm have been and still are the main ingredients for successful teacher communication in the field of distance learning. In class 9, teacher's charisma still plays a critical role. Teachers should motivate, give feedback, establish rapport, sustain, and accompany students in their learning experience. Nevertheless, the high student drop-out percentage in large hypermedia classes would suggest that, so far, charisma alone does not seem to be sufficient to fulfill such a successful starting assumption. It is primarily thanks to their former face-to-face reputation that the university teachers who believe in significant interactivity in virtual classes consider fundamental the personal motivations, feelings, and passions of students [13].

4.2 Student Characteristics

When considering how students interact with teachers inside the classroom, we must also take into account the characteristics and traits of the student participating in the classroom. Many characteristics and traits may be considered in investigating technology-mediated communication process or communication with the teacher among students with diverse educational experiences. Motivation is a large factor contributing to a learner's success in education. Motivation is typically characterized as intrinsic or extrinsic. A student with little enthusiasm may be less likely to participate in classroom activities. Additionally, students and their respective levels and goals may differ [13].

There are also different learning styles or approaches to education a student may possess. Students can be visual or auditory learners, passive or active learners, and individual or social learners. Some students may depend on textual means of communication and learning, where still others may become engaged via multimedia while learning. Prior research has suggested that differences in learning styles may affect a student's preferences for which communication means they use for class assignments. It is likely that their learning style could have an effect on their communication processes. Finally, a student's educational level and prior learning experience can have an impact on their interactions with a teacher [14]. It has been suggested that the educational, socio-cultural, and academic institutions and community group members students have been exposed to can affect how students form opinions and carry out their communications, preferably all other related processes. Traditionally, limited experience in a given area can lead some to avoid open communication with those who have more experience.

4.3 Technological Factors

The success of online pedagogy depends on the medium used for communication. Different platforms and tools are used for online classes, managed by teachers who create courses, upload materials, and interact with students. The choice of tools depends on the technological skills of the parties involved. Access location and ownership of devices also affect online pedagogy [15]. Platform use can contribute to cognitive overload and screen gloom, leading to online fatigue. Disconnects, interruptions, and low engagement scores are indicators of this fatigue.

5 Effects of Teacher–Student Interactions on Learning Outcomes

Technology-mediated communication enables worldwide access to educational resources and supports instructional interactions. These interactions significantly impact student performance, engagement, and socioemotional development [15]. Online learning is essential in many countries, highlighting the need to study the roles and psychological effects of instructional interactions [16, 17]. The performance of teacher–student interaction on learning outcomes can be categorized into three aspects. Firstly, it directly improves academic performance, with increased synchronous interaction correlating to higher scores. Secondly, it positively affects student engagement, particularly in online English classes. Lastly, technology-mediated communication promotes socioemotional development and psychological growth. However, different typologies of teacher–student interaction yield varying effects on learning outcomes.

5.1 Academic Performance

Engagement with and engaging in communication with the teacher are considered critical to students' socialization and satisfaction with online courses. Students' academic performance is positively correlated with this communication engagement as well. Communication before and during a course helps in the preparation and familiarization of students to the course materials, requirements, and expectations, which subsequently impacts student interactions with the content [18]. The more frequently students communicate with instructors, the more likely they are to ask questions relevant to the course content and objectives. They also develop a more positive attitude about their instructors, show participation in class discussions, and indicate that they could approach their instructors for a recommendation letter, job referral, or advice on classes. This enhancement of social presence in the learning

process may greatly influence educational outcomes and students' perception that they are doing better academically.

Another salient aspect of teacher communication is the development of a teacher's immediacy in the online learning environment. This can potentially result from a continual, interactive communicative pattern in the classroom. The more immediate the teacher, the more immediate the learner reports becoming in return, either through instrumental or socio-emotional interactions. Additionally, students having low-interaction problems with the instructor are more likely to report interacting at a socio-emotionally close relational level [18]. Account must be taken of the fact that the capabilities of the technology may limit the contact of the teacher to socio-emotional exchanges.

5.2 Student Engagement

A dynamic feature of online learning is the opportunity for rich teacher–student and student–student interactions, via discussion forums, wikis, blogs and so on. A study of undergraduate and postgraduate students (socio-economic status was not controlled for) found that interactions with their online lecturers and tutors were the aspects of the subject that facilitated their learning. The results are not surprising in the light of the failure-as-expectation bias, for deep learning (an understanding of material linked with problem-solving and lateral thinking) is undermined by students' preoccupation with possible failure [19]. Effective feedback had an indirect (via intrinsic motivation) positive effect on students' ethic of caring and social development. Interacting with teachers, teacher immediacy, a good teacher–student rapport and the provision of detailed feedback was associated with lower student withdrawal (and thus higher retention) during a generic first-year university unit.

Then we presented an overview of the research literature relevant to the topic, something that will serve as a useful focal point for students to get a handle on the big picture and we will start doing in the next subsection. For our purposes, with the focus on early childhood and primary education, a recent report prepared for Universities Australia supports the view that the need for emotional and social interactions is a key component in learning environments students find worthwhile. In an extensive UK study, almost all those who had changed to distance learning from traditional learning did so because of personal convenience, but this group comprised 41% of those from ethnic minorities and 60% of disabled students [19].

5.3 Socio-emotional Development

The increasing prevalence of technology-mediated communication in various facets of life—education, employment, personal relationships, and business activities, to mention a few—is appreciated. Males and females from all age groups are attracted

to the computer in general and the Internet in particular. It has been observed that, out of the 2.8 billion people estimated to have had the facility of using the Internet worldwide in 2018, more than 500,000 students worldwide are currently engaged in their studies online with the support of the World Wide Web (WWW).

The socio-emotional dimension is pivotal to the growth and development of human beings (BPs), particularly students, since a variety of factors, trends, patterns, circumstances, and experiences surrounding education bear an impact on their learning and vice versa [19]. When we delve into the concept, socio implies society and emotional speaks of emotions, feelings, and attitudes. Since emotions and society are interconnected, children in the early years of schooling are often encouraged to socialize and share with others. As they grow up, they have less time to interact because of the workload, peer pressure, competition for grades, bullying, and a host of other things that concern school and at home. As a precursor to adulthood, we need to look at divergent groups and how interacting with the teacher/buddy group can affect students' development. In this section, theories that relate teacher–student interactions with the socio-emotional sphere will be dealt with [20]. Evidence in support of these theories will also be drawn from existing secondary data on the significance of teacher–student interactions in building a positive school climate.

6 Challenges and Opportunities in Online Teacher–Student Interactions

Online classrooms offer teacher–student interactions, which are beneficial for students. Offline settings allow students to reflect and generate responses at their own pace. However, complexities arise when teachers and students interact through digital platforms. The digital divide affects access and technological literacy, impacting educational justice. Technical issues such as server crashes and slow response times also disrupt online discussions. Despite these challenges, asynchronous means can create a space for rapport development. Flame wars in internet forums show the emotional intensity caused by the absence of face-to-face interaction. Interacting with others can still be achieved without physical presence [20].

6.1 Digital Divide

The digital divide is a major issue affecting the world today, including e-learning. At its worst, this divide may manifest itself as a disparity in the availability of high-speed internet and the plethora of new digital tools, on the one hand, and the absence of any telephone or computer and access to the internet, on the other. At its most benign, the digital divide may manifest itself in difficulties in software use, digital literacy, and effective application of new media to the facilitation of teaching and learning.

This latter aspect may not entirely deny members of less fortunate groups in the world the possibility of operating in the digital era; instead, it may severely limit the quality and functionality of communications and support for educational provision. In many respects, such skills resemble those necessary if one is to be an effective writer or correspondent-author [21]. They are subtle and elusive; often they manifest themselves through an intuitive grasp of what communication means, entails, and necessitates in particular social contexts and with particular goals in mind. This kind of efficacious communication is more than a matter of putting words together. It is close to understanding advanced manners or international negotiations, rapport, and psychological adaptation.

In the paper, the notion of identity and the topic of dialogue are revisited in the context of asynchronous communication between students and their teachers, offering a different perspective rooted in contemporary psychological theorizing: identity, for instance, is conceived of as a largely static affair, while the process of dialogue is assessed from a developmentalist and dynamic angle [20]. This approach is deemed by the author as of great aid in understanding the particular and idiosyncratic nature of how teachers present themselves and consequently how teachers' self-disclosure may be taken, something which has not been achieved so far.

6.2 Technological Glitches

Interaction between teachers and students in an online classroom is largely mediated through technology. Online classrooms are inherently asynchronous, and the participants do not have any physical presence of one another. There may be a wide variety of technological issues in technology-mediated human interactions. Almost every participant in our study reported problems with technological infrastructure as well as glitches. One of the technological problems in online classrooms is connectivity to the network. One of the students said, "What I said doesn't reach the faculty and I have to say it repeatedly." Sometimes, "they are cut-off" and "we have to re-establish the connection." There are numerous connectivity issues [21].

In addition, software programs such as communicative platforms, the ones for writing assignments, and online dictionaries can malfunction. This can make navigation and information seeking extremely complex and time-consuming. Lack of software and digital literacy, especially in the use of communicative tools, turns unintentionally comical when we read how in one of the studies a student clicked on the 'chat' button during an online class to let the teacher know that his microphone is not working. A student who was under time pressure and trying to finish his exam shared, "I had technical issues several times; I contacted the helpline and also sent an email to you in the absence." Such issues can be user-mediated as well. Some of the teacher respondents talked about stack-ups of queries about IT-related questions when students are completing an assignment. In live synchronous online classrooms, we see that if one problem compounds, it escalates [21]. For example, we have seen very complicated plans to discuss and present insights and work. Not being able to

share the screen, not being able to show the slides, not being able to explain the task makes communication chaotic.

7 Ethical Considerations in Online Teacher–Student Interactions

Online teaching and learning have changed the teacher–student relationship, allowing for new forms of interaction. However, it is important to address ethical considerations and ensure a positive environment. Technology should promote inclusivity, and teachers should view each student as an individual. Privacy, security, fairness, and equity must be addressed [21]. Additionally, teachers must be mindful of their language and avoid criticism or bullying.

7.1 Privacy and Data Security

With the increasingly variety of activities conducted online, individuals might start to endow teachers with greater amounts of private information they would not be willing to share with one another if asked directly. In some instances, situating discussion sessions around easily-relatable self-disclosure tasks might help buffer the situation scare, in general, this development simply redistributes the place and form of the self-disclosure process, so much so that the online classroom has ended up substituting traditional self-disclosures [22].

Furthermore, teachers, as data controllers, have the legal obligation to transmit all personal data in a protected and safe manner when conversing during their classes over digital platforms, where applicable. They must thus implement stronger security measures, such as end-to-end encrypted chat solutions, to ensure that these exchanges remain private between them and their students [22]. These measures may have burn-out effects, as they are demanding in terms of time and cognitive resources, but in certain situations, it might be a pedagogical necessity, such as in topics related to terrorism or sexual violence. Even more, as digital classrooms rely on webcam and microphone inputs students must have other quiet space to work in or when they freeze during an online meeting.

7.2 Equity and Inclusion

Ethically, educators are also concerned with issues of equity and inclusion in teacher–student interactions and communication. It is arguable that educators have an ethical imperative to address issues of accessibility, diversity, and fairness in the use of

technology-mediated communication for educational purposes. Inclusive education values diversity and "serves to ensure that all students can learn and participate in a supportive and constructive environment" [23].

A Teachers' Code of Ethics that guides Saskatchewan educators states that teachers should: "Foster the growth and development of students in the context of rapid, unpredictable change in a diverse global society; accountable for developing each student's full human potential in a climate of security, challenge, and joy and moving students from toddlers to independent investigators" [23]. Though the specific mention of online or virtual teaching does not appear in this code, the aspirational goal of inclusive teaching, which emphasizes student diversity and rapid change, is relevant to this analysis. The use of technology to facilitate and mediate teacher–student communication is cited as one technique to achieve this inclusive aim. Therefore, it is ethically incumbent upon teachers to acknowledge and deal fairly with the challenges that arise in this endeavor.

8 Conclusion

The purpose of this study was to analyze teacher–student interactions (TSI) in online classrooms using computer-mediated communication. The analysis revealed that teachers primarily use synchronous forms of CMC, while students use asynchronous forms. Teachers respond descriptively and assessingly, while students address personal issues and provide their own arguments. This creates a conversation that emphasizes equality and politeness. The social tone of online class conversations communicates warmth and respect between participants. The results suggest that TSI in the LMS can support student motivation and well-being. However, some messages may be perceived as mere politeness rather than genuine feedback. These findings can be applied to training and professional development for online teachers to enhance social presence. This analysis provides a foundation for further studies on the influence of different feedback types and the potential integration of conventional training lectures into the LMS.

The Right of Public Servants to Strike

S. El-Manaseer, Waleed Mustafa Ali Altarawneh, Abdelaziz Alkhawatreh, and Jalal Hussein Hamdan Alkayid

Abstract This study explores the right of public servants to strike as a means of expressing opinions and safeguarding labor rights. The central question of this study revolves around the extent to which French legislation strikes a balance between the normal and ongoing functioning of public institutions and public servants resorting to strikes to express their opinions and reclaim vulnerable rights. The study is divided into four parts and deals with the stages of the right to strike, the rules governing its exercise in France, the forms of strikes and certain categories of workers prohibited from taking part in strikes. The study is based on an analytical approach to legal texts related to the organization of public servants in state institutions, as well as an analysis of court decisions on the subject in the French Council of State. Taking into account the need to maintain regularity and continuity in public institutions, French legislation allows public servants to strike. The study recommends amending paragraph c/69 of the Civil Service to read: "Public servants are prohibited from participating in strikes or calling for strikes before obtaining permission from the competent authorities."

1 Introduction

The rule of law is basically just the requirement that public institutions work continuously without interruption, and that is the guiding principle for how they operate. Institutions must run all the time, and they must work in a standardized way. Breaching the standardized, continuous operation of things is an intervention in the rule of law.

They reflect an awareness of the potentially disconcerting contingency that the onset of strikes might disrupt the smooth workings of the public institution or the possibly harmful effects such actions might have on the entity's capacity to continue satisfying the needs of its users. Some states, for instance France, have taken steps to regulate the right of public servants to strike—a right bound by a web of international conventions that define it not only as a form of protective action but also outlining the parameters of its regulatory limits.

Compliance with the right to strike rests upon international commitments on civil service rights barriers The right to strike, like any other basic human rights, must be exercised within the strict normative confines of relevant international commitments on basic rights of public servants. The right to strike is integrated in such a normative framework because employers and workers are mutually dependent: servants depend on their wages and their jobs and, in turn, the effective functioning of the public service is contingent upon the conditions of employment. The right to strike finds its justification in the need for servants to have an effective voice to defend their interest and protect their working conditions. Moreover, this right is by no means absolute: its exercise comes with strict limitations and controls to ensure the normal and regular functioning of the public service.

The delicate balance between the right to strike and the need to protect public services reveals the nuanced way in which certain states have balanced the rights of public servants to engage in industrial action and the need to keep public institutions running smoothly. In some countries, the provisions ensure public servants' rights to strike while also placing constraints on the use of strike action that would compromise the fundamental role of public services.

1.1 Significance of the Study

The significance of this study is inherently rooted in its endeavor to achieve a complete explanation of all the modalities in which the right to strike moves in the space of French public servants. It was, in particular, the ambition to identify the forms of strike that are specially prohibited, and to define with precision the categories of workers for whom the right of strike is specially prohibited. This article aims to scrutinize the procedural and institutional features (temporal operations) of the right to strike among French public servants. A key aspect of the study is therefore to precisely identify and draw the boundary between the legitimate right to strike and every action

or practice that would violate the limits of the right to strike, and that would not be protected by this right. It aims to define the limits of the strike in the French civil service. Moreover, the study extends its enquiry to detail the categories of workers specifically precluded from the possibility to enjoy and exercise the right to strike. This includes an examination of the legal and regulatory provisions constructing limitations on certain categories of public servants, taking account of the fact that the constitutive features of the rights and obligations of certain occupations or offices might involve constraints that are implied by status.

1.2 Research Problem

The primary inquiry guiding my research, aimed at assessing the ability of French law to accommodate the legally fundamental principle of the normal and continuous functioning of public services with the constitutionally recognized entitlement of public servants to use the method of collective refusal to assert the state of affairs that prevents the exercise of their rights: How does the success of the legal order lie in its attempt to reconcile the indispensable claim to the normal, continuous functioning of public services and the legally recognized right of public servants to resort to the method of collective refusal, through a strike, to maintain the existence of their rights?

1.2.1 Methodology

Within the scope of this study, our approach involves an analysis of the legal texts governing the activity of state public servants, as well as through an analysis of the legal decision rendered by the French Council of State on this issue. This twofold approach, of analysis of the legal provisions applicable to public servants, as well as of the perception of public servants' activity rendered by the courts, aims to give readers an exhaustive impression of the law on the matter and all its nuances.

2 Stages of the Public Servant's Right to Strike in France

The right to strike in the French public sector has gone through two stages: before the 1946 Constitution, which considered strikes illegal; after the adoption of the 1946 Constitution, the Constitution recognized strikes by public servants, but with specific rules and restrictions [1].

2.1 The Stage of Prohibiting Strikes for Public Servants

This stage was characterized by the absence of legal texts regulating the status of public servants on strike. In the period before the 1946 Constitution, strikes were prohibited by law, jurisprudence and legislative consensus. The prevailing view, both legally and judicially, is that the interests of public institutions come first and ensure their normal and continued functioning. Strikes are considered incompatible with the principles of obedience and respect for authority, which are fundamental principles to be taken into account in the regulation of public services [2].

Modern French history has seen the country's changing attitude towards the right to strike. Strikes were prohibited from 1791 to 1864, and anyone who exercised this right was punished. Laws such as the Chapelier Act of 14 June 1791 criminalized any meeting of workers with the intention of disrupting work. The law of April 14, 1803, known as "Germinal VI" [3] also prohibited all labor strikes and introduced a system of administrative control over the labor movement. The French Penal Code of 1810, which came into effect in 1810, used the word "strike" in the context of crimes that impeded work and production. By 1848, a major labor movement led to the passage of a law on May 25, 1848, which decriminalized strikes [4].

However, the French legislature subsequently restricted the right to strike, although the criminalization of striking was decriminalized. During the Vichy regime, a law was passed criminalizing strikes under the French Labor Charter of 4 October 1941 [5]

At this stage, most French jurists believe that strikes by public servants are illegal, which is a serious mistake. Strikes were seen as contradictory to the concept of public institutions based on promoting the public interest. Allowing strikes, it was thought, would subordinate the agency to the private interests of workers and place private interests ahead of the public interest. Therefore, strikes in the public sector are considered illegal and constitute serious disciplinary violations [6].

After major strikes in France in November 1938 and January 1980, the French Council of State treated these strikes as a state of emergency. This allowed the government to take extraordinary measures and ban demonstrations and strikes, recognizing the exceptional and dramatic nature of the situation [7].

French jurisprudence also holds that the civil service system is based on the principle of presidential power and universal institutional ideas. Any behavior aimed at undermining this principle is prohibited. Therefore, public servants are prohibited from going on strike as this goes against the concept of the general system, which is unacceptable as it affects the principle of normal and continuous functioning of public institutions [8].

De Laubadère argued that the illegality of strikes stems from the relationship between the state and workers, which is different from the relationship between workers and companies in the private sector. Strikes as a means of exerting pressure on the public sector contradict the legal status of public servants. The law provides that the public sector has the power to determine the terms and conditions of employment [9].

As for the current role of the French judiciary, it has reiterated the illegality of the strike in many judgments, including Mr. Vinkel judgment. The events of this case can be summarized as follows: In March 1909, there was a riot in the postal department. The government used force to suppress the riot and isolated about six hundred workers, but did not take any disciplinary action against them, including notifying them in advance of their Notification document. Some of those dismissed, including Mr. Vinkel, appealed to the Council of State, insisting that the government had violated Article 65 of the law of 22 April 1905, which required prior notification before disciplinary action could be taken. The Council of State held in this case that a civil servant is subject to all obligations arising from the performance of his official duties upon acceptance of the position and that such acceptance constitutes a waiver of any obligation that conflicts with the necessary and essential continuity of his office. With this assumption, strikes under any pretext will not be allowed. The Council of State concluded that, although a strike could be carried out lawfully and had justification in an employment contract governed by private law rules, it would be considered unfair if it resulted from the worker's agreement to refuse to work, even if the strike this case is not a criminal case [10].

2.2 The Stage of Legalizing the Strikes of Public Servants

The preamble to the French constitution states: "The right to strike shall be exercised within the framework of law. "This stage began with the issuance of the Constitution of 1946. The text of the preamble to the French constitution for 1946 sparked a legal debate regarding the possibility of invoking it as a basis for justifying strikes by public sector servants. Some legal opinions have argued that the text of the preamble cannot be directly invoked to authorize strikes by public officials [11–13]. The reason is that what is in the preamble is nothing more than guidelines for the legislature to intervene and legislate the right to strike. Public sector workers cannot be given the right to strike unless the law expressly grants them this right. However, another legal opinion opposed the previous view, stating that the text of the preamble to the 1946 Constitution granted workers the right to strike as a general legal principle, pointing out that the right to strike had become a constitutionally recognized right of all workers, including government officials.

As for the position of the French Council of State at this stage, the Council recognized the right to strike of public sector workers, which was evident in the Council's famous ruling, the Dohaene Judgment of July 7, 1950 [14].

On July 13, 1948, Ziem workers went on strike, demanding specific professional demands. The administration represented by the Minister of Internal Affairs took action to stop the work of the strikers. Even though most of them ended the strike after a week, the directors decided to suspend the heads of the striking offices. After returning to work, the suspension was replaced by a penalty of guilt. Six heads of offices appealed against the punishment, arguing that the right to strike was

recognized in the preamble of the constitution and that any mistake on their part did not justify disciplinary punishment [15–18].

The State Commissioner, in his report prepared on the occasion of the previous judgment, explained that in the light of the preamble of the 1946 Constitution, a strike by public sector servants could no longer be declared illegal in all cases. Insisting on the previous ruling of the Council of State on the ban on strikes by public sector workers would lead to a separation of legal principle from reality. However, laws regulating the right to strike should be enacted as required by the constitution [19].

3 Guidelines for Exercising the Right to Strike in France

To regulate the exercise of the right to strike in France, the French legislator established specific conditions and legislative restrictions.

3.1 Organizing Strikes Through Unions

In France, the prevailing view is that the right to strike is a personal right of individuals, and private sector servants can exercise their right to strike without the intervention of the trade unions to which they belong [20–22]. The French legislature did not require private sector workers to organize, announce or supervise strikes through trade unions, leaving them free to organize and announce strikes. However, this does not apply to servants of public utility facilities, where the legislator has adopted an organic approach to the right to strike. The declaration of a strike by these servants is conditional if they are unable to strike. A strike contrary to this condition is considered an unjustified strike, exposing those responsible to disciplinary liability [23].

3.2 Notification Before Conducting the Strike

There is no doubt that the implementation of the strike will lead to the facility ceasing to provide services to the public. To protect the facility against such disruptions, the legislator ordered that the appropriate administration be notified. The union is obliged to notify the administration at least five days before the start of the strike, providing the necessary information about the strike [24–26]. The purpose of this period is to provide the administration with the opportunity to negotiate with unions intending to strike. These negotiations may lead to an agreement and avoid a strike. Additionally, the legislator wishes, through this notification, to give the government the opportunity to take necessary actions to maintain public order and consider alternative solutions to activities that may be affected by the strike in order to meet the needs of persons using the facilities affected by the strike [19].

4 Forms of Prohibited Strikes in France

4.1 Surprise Strikes

This is a logical prohibition, justified by the circumvention of the requirement imposed by the legislator to give prior notice before going on strike. This type of strike violates Art. 3 of the Act of 31 July 1963, which emphasizes the need for notification. An unexpected strike poses a threat to basic social interests [27]. However, the text of this Article has been repealed and replaced by the text of Article 521–2 regarding public sector strike provisions by the state. It states that "the right to strike is granted to servants of public institutions and local government units as a non-reserved right, without distinction between public and private sector servants" [28]. Article 521–3 of current French labor law confirms the right to strike, provided that prior notice is given before its exercise [29]. Although a strike is recognized as a means of expressing opinion, a surprise strike prevents the government from taking the necessary actions to address and minimize its effects [30].

4.2 Rotational Strikes

Rotational strikes refer to "the cessation of effective work, whether in a progressive or circular manner, organizing different sectors or occupational categories within the same institution, facility, different facilities or facilities within the same institution." This definition appeared in Art. 4 of the Act of July 31, 1963, which prohibited rotational strikes. The goal was to extend the duration of the strike as long as possible while causing as much damage as possible. The ban on rotational strikes aims to reconcile the right to strike with the principle of proper functioning of public facilities in accordance with the requirements of the public good [31].

4.3 Prohibition of Strikes While Being in Work Premises

A strike is one of the ways for servants to express their professional interests, rather than disrupting the functioning of public facilities [32]. It is therefore unacceptable for servants to stay in the workplace and not leave it during a strike, as this hinders the operation of the facility and harms the interests of the society using the facility's services, posing a threat to the principle of proper operation of the public facility. Servants staying on the premises of the workplace for purposes other than professional ones is unacceptable and constitutes a violation of property rights and a violation of the freedom of work of non-striking servants. It also means arbitrary use of the law [33]. The French Council of State referred to strikes and the occupation of work premises in its famous judgment in the Legrand case of February 11,

1966, confirming the principle of allocating places in public facilities for the implementation of assigned tasks. The Council emphasized the minister's discretionary power to grant or refuse permission for striking servants to stay in work premises [11]. Therefore, the occupation of work premises by servants during a strike is not an expression of freedom of opinion and the strike is considered unauthorized. As a consequence, participation in such a strike with the occupation of work premises is associated with disciplinary liability of the servants involved [12].

5 Some Categories of Public Servants Prohibited from Striking

The French legislator imposed a ban on the participation of certain categories of workers in strikes. The Council of State allowed government intervention in some cases, recognizing its right to regulate and impose restrictions on strikes. Currently, there are legislative restrictions and restrictions imposed by the government [34–36].

5.1 Prohibition Derived from Legislative Intervention

Through this prohibition, the legislator aims to protect the public interest by putting it ahead of the specific interests of striking servants. The French legislature thus intervened and banned certain categories of workers from striking under various laws. Law No. 48–1504, issued on September 28, 1948, prohibits police officers from striking under Art. 2. The French Council of State stated that the application of this provision not only precludes seeking the opinion of the disciplinary council, as provided for in the general system of workers, but also deprives them of any other legal guarantees [13]. Similarly, Law No. 68/695, issued on July 31, 1968, prohibits strikes by servants of the signaling department of the Ministry of the Interior on the basis of Art. 14/4 [15]. Additionally, the Act of August 17, 1974 regulated strikes by radio and television servants, later replaced by the Act of July 29, 1982 [1]. Other laws prohibit judges, military personnel and aviation workers from striking or imposing conditions and regulations.

5.2 Prohibition Derived from Government Intervention

The French Council of State recognized the government's right to impose restrictions and prohibit strikes on certain categories of workers. The government plays this role under judicial supervision represented by the Council of State, ensuring that the restriction does not lead to the complete removal of the right to strike. In this

capacity, the government prohibited certain categories of workers from striking due to the nature of their work, which could threaten the public interest if work in these positions was disrupted by a strike [1].

As regards the authority responsible for limiting strikes, the Council recognized the right of the Prime Minister to intervene and limit strikes in local facilities under his jurisdiction [16]. Similarly, the Council recognized the right of the Director of Meteorology to prevent some servants from participating in the meteorologists' strike. Regarding the nature of these restrictions, the Council has worked to strike a balance between the right to strike and the proper operation of public facilities. In this regard, the Council has established a set of principles [37–40]:

1. The basic limitation in response to the exercise of the right to strike is the preservation of public order and the proper functioning of public facilities [12].
2. The Council recognized the administration's right to limit strikes in order to ensure minimum benefits, allowing the right to strike to be limited to a specific group of workers. The Council confirmed this by limiting the administration's right to strike television workers during the strike period. The Council took note of the minister's emphasis on the need to maintain the information and broadcasting service during the strike, ensuring a minimum level of service
3. The purpose of the restriction is to achieve the public interest by maintaining public order and the proper functioning of public facilities. The Council did not agree to differentiate workers with respect to the granting of the right to strike unless such differentiation was justified by compelling reasons.

6 Conclusion

The study shows that the French legislator recognizes the right of public sector servants to strike, but imposes certain restrictions and regulations to ensure the orderly and continuous operation of public facilities. The study results lead to the following conclusions and recommendations:

6.1 Results

- The French legislator, recognizing the right of public sector servants to strike as one of the public freedoms protected under the Constitution, established restrictions and limitations, guided by his deep belief in the need to maintain the principle of proper functioning of public utility facilities.

6.2 Recommendations

- We recommend that the legislator consider changing the text of Art. J/69 of the Civil Service Law to enable public sector servants to exercise their right to strike. The amendment should read: "A public employee is prohibited from participating in or calling for a strike without obtaining the consent of the competent authority, while ensuring the orderly and continuous operation of public facilities."

Analysis of the Role of Geographical Indications in Enhancing Product Quality, Protection, and Digital Traceability: A Legal and Technological Study

Omar Al Makhzoumi and Salma Fathy Abdel Qader Abdel Halim

Abstract This research investigates how geographical indications affect the protection and enhancement of product quality linked to specific locations, placing particular emphasis on the role of digital technologies in traceability and authentication. The study evaluates the effectiveness of legal standards and digital instruments utilized in this domain, exploring the impact of geographical indications on product reputation and market value. Additionally, it reviews the efficiency of legal frameworks and digital platforms in safeguarding these indications and contrasts geographical indications with trademarks regarding protection, application, and technological integration. The results indicate that when digital traceability solutions are integrated, geographical indications significantly contribute to improving product quality, boosting competitiveness in international markets, and ensuring authenticity. The research underscores that while existing legal standards offer sufficient protection, there is an increasing necessity to revise laws to keep pace with technological progress and global developments. Moreover, notable distinctions between geographical indications and trademarks were identified, with the former concentrating on geographical and environmental traits, bolstered by digital verification, whereas the latter prioritizes brand identity. In light of these findings, the study advocates for the revision of laws concerning geographical indications, the advancement of digital technologies among producers, and the fostering of international collaboration to enhance global protection and traceability. Additionally, it recommends conducting further research to assess the effects of geographical indications and digital tools on markets while identifying new challenges that may arise.

1 Introduction

Legal instruments known as geographical indications serve to safeguard the distinctiveness and reputation of products linked to particular geographic areas. By ensuring a specific quality that stems from the natural or cultural context of their origin, they play a crucial role in preserving the unique identity of these products and increasing their worth. Consequently, geographical indications are essential for protecting the rights of local producers and fostering equitable competition in international markets [1].

This study will categorize geographical indication criteria into formal and substantive types, examining them in detail. We will review the legal prerequisites and essential conditions needed for the effective protection of geographical indications, while also analyzing the nuanced distinctions between these criteria and other elements of intellectual property, such as trademarks. The goal of the study is to emphasize the unique characteristics of geographical indications and to clarify how they differ from comparable legal contexts, thereby offering a thorough understanding of this significant field.

1.1 Study Objectives

- Analyze the impact of geographical indications on protecting and improving the quality of products associated with specific geographical locations.
- Assess the effectiveness of legal standards used to protect geographical indications and determine their compliance with international standards.
- Compare GIs with other intellectual property, such as trademarks, and identify key differences.
- Make recommendations on how to improve GI systems and regulations to better protect products and enhance the rights of local producers.

1.2 Study Methodology

This research utilizes a descriptive methodology to examine how geographical indications affect the preservation and improvement of product quality linked to particular geographic areas. The purpose of this approach is to deliver a thorough and precise

account of phenomena associated with geographical indications, evaluate the efficacy of the legal frameworks established for their protection, and collect as well as analyze relevant data pertaining to the subject.

2 Criteria for the Content of Geographical Indications

It is important to recognize that geographical indications exhibit traits that set them apart from other forms of industrial rights and have a distinct legal character, leading to discussions among legal academics. Due to their considerable similarities and overlaps, these indications are frequently conflated with other aspects of industrial property, especially individual and collective trademarks. Nevertheless, a closer analysis of each component of industrial property reveals nuanced distinctions concerning both form and content [2].

2.1 Formal Criteria

To gain legal protection, geographical indications must fulfill specific formal requirements, such as registering the indication with the appropriate authority and identifying who is permitted to file the registration application along with other legal processes. The following is a detailed discussion of this topic:

Registration of Geographical Indications

As highlighted by the Jordanian legislator in Article 4(a) of the Jordanian Geographical Indications Law, the mere act of registration is insufficient for the protection of a geographical indication [3]. This article specifies: "A.1. The Registrar of Trademarks may refuse to register any trademark if the mark consists of or contains a geographical indication and pertains to a product whose origin does not conform to what is implied by the use of that geographical indication in a manner that misleads the public.

The protection here is achieved through negative action, specifically the refusal of the registrar to register a trademark in two cases [4]:

1. If the trademark is made of a geographical indication.
2. If the trademark contains a geographical indication.

In both cases, the trademark must be related to a product originating from somewhere other than what is implied by the geographical indication and must mislead the public.

Additionally, the same article includes two more cases in Article 4(b) where registration of the geographical indication itself is prohibited:

3. If the geographical indication misleads the public about the true origin of the product, even if it is correct in its literal sense.
4. If the use of the geographical indication in the trademark pertains to wine or alcoholic beverages, even if it does not mislead the public.

Consequently, not all registrations guarantee protection. To prevent any individual from monopolizing it over others, both national and foreign, the Jordanian legislator chose a negative refusal to register. The intention behind this indication is to underscore the unique qualities brought about by the expertise, raw materials, and labor specific to a certain area that contribute to a product's distinctiveness. For instance, Lebanese apples possess a flavor, color, and fragrance that originate from the Lebanese soil, setting them apart from apples grown in other regions, as well as from various other agricultural or industrial goods [5].

When a geographical indication lacks registration in a dedicated register for such indications, it is deemed a refusal to act. This measure aims to safeguard the indication as intended by the legislator, regardless of whether the user is an individual or a collective, local or foreign. Utilizing a geographical indication is classified not as an administrative action or a contract, but rather as a tangible act executed by the product's producer, as long as it complies with Article 4(b)(2) of the Geographical Indications Law.

Furthermore, the product's connection to a specific geographic region is evident in the name of the state, which cannot be claimed exclusively by any individual. The prohibition was addressed by the Jordanian legislator as a matter of obligation, which may encompass the performance of an action, the abstention from an action, or the provision of a tangible right. Consequently, the debtor's refusal to act constitutes an obligation, while it stands as a right for the creditor, safeguarded by law. This includes rights to prevent interference as outlined in Article 1018 of the Civil Code, halting new projects in accordance with Articles 31–33 of the Civil Procedure Code, and avoiding acts of unfair competition as specified in Article 20 of the Labor Law [6].

These represent various methods of safeguarding rights. Consequently, the denial of a geographical indication's registration constitutes a failure to fulfill an obligation. This is in accordance with the TRIPS Agreement, which outlined the conditions for registration prohibition prior to the establishment of Jordanian law in this domain.

When juxtaposing the legislation of Jordan with that of Oman, it is evident that Oman has created a dedicated register for geographical indications within the appropriate department at the Ministry of Commerce and Industry. This framework references the executive regulations that govern the processes of filing, examining, registering, and publishing applications, along with the associated fees [1, 7]. In contrast, the Egyptian legislator has not differentiated the registration of geographical indications from that of trademarks.

Authorized Person for Filing a Registration Request

The Jordanian Geographical Indications Law does not clearly specify which entity has the authority to submit a registration request for a geographical indication. It

fails to outline the process for the initial registration of geographical indications or to create a dedicated register for them. Instead, Article 4 empowers the Registrar of Trademarks to deny the registration of any trademark that incorporates a geographical indication. This issue is related to trademarks; should the Registrar approve the registration, it will be classified as a trademark rather than a geographical indication, falling under the designation of "collective trademarks".

Therefore, we propose that the Jordanian legislator explicitly specify the entity authorized to submit a registration request as follows:

1. A request must be submitted by a collective of producers associated with a product recognized by a geographical indication. This collective should be structured as an organization, such as an association or cooperative, with the overarching body of this entity responsible for ensuring that the product adheres to the established conditions or meets the necessary requirements.
2. Any directorate within the Ministry of Industry and Trade has the option to submit a request, as this government entity is responsible for overseeing product testing and inspections. A clear illustration of this is the ongoing case involving the Sihm Al-Kafarat oil product, where the Ministry of Industry and Trade independently initiated the necessary procedures.

A dedicated register for geographical indications ought to be created within the Ministry of Industry and Trade, as well as in each industry and trade directorate across all governorates. This register would document the geographical indications that have been accepted in the country and fulfill the required criteria, thus providing them with legal protection.

Association of the Indication with a Geographical Name

As noted earlier, the key factor that sets a geographical indication apart from other legal classifications is its link to a geographical name that signifies its source. This name may refer to a country, like Brazilian coffee, Egyptian cotton, Indian rice, and Iranian carpets [2, 8], or it can denote a specific region within a country, exemplified by "Champagne," which refers to a type of wine produced in France's Champagne region [3, 9].

This requirement is outlined in Article 2 of the Jordanian Geographical Indications Law, which describes a geographical indication as "…any indication that identifies the origin of a product from a specific country, region, or location within its territory…" [4, 10, 11]. This condition is also present in comparative legislation. For example, Article 1 of the Omani Geographical Indications Law necessitates that the indication be linked to a geographical name. Likewise, Article 106 of Egyptian legislation specifies: "No means of naming or displaying a product shall be used in a manner that misleads the public about its geographical origin, even if the actual origin is correct." An illustration of this would be labeling shoes as "Italian" in either English or Italian to mislead consumers into thinking they are produced in Italy, a country renowned for its footwear industry, which is strictly forbidden.

Dr. Ajja Al-Jilali argues that the geographical name chosen as a geographical indication to distinguish a product should meet several conditions [5, 11]:

1. To qualify for geographical indication protection, a region must be recognized for generating products that possess a specific or unique quality. If a product of identical quality and specifications is made in another location, it will not be eligible for such protection. A prime example is Karrak Jameed, which is celebrated for its exceptional quality in Karak. Should this dried yogurt be produced elsewhere with equal or superior quality, it would not meet the criteria for geographical indication.
2. To qualify as exclusive to a specific geographical area, a product must not be manufactured in other regions. A prime example of this is Iranian carpets, crafted solely in Iran, showcasing distinctive traits that differentiate them from carpets made in other locations. The exceptional artistry and the incorporation of pure wool or silk threads, which are non-flammable and possess unique properties, elevate the value of Iranian carpets. On the other hand, while Turkish carpets may appear similar, they frequently utilize synthetic or cotton threads, leading to varied characteristics.

There are instances where a product name linked to a specific geographical region can be used as a trademark without breaching legal regulations. For instance, the word "Cologne" refers to a type of scented alcoholic product that has its roots in Cologne, Germany. Due to its prevalent usage in Arabic-speaking nations, this term has evolved into a generic descriptor for similar items. A manufacturer can label their fragrance as "Cologne" without infringing the law, as outlined in Article 7 of the Jordanian Law, which specifies: "The following shall not be considered a violation of this law: …b. The use of a geographical indication in any manner that indicates another country if it is identical to the commonly accepted term in Arabic for any product or service in the Kingdom" [6, 12]. Likewise, Egyptian law in Article 108 permits the use of geographical names that have become predominantly associated with the commercial designation of a product category instead of its geographical roots.

The Link Between Product Quality and Geographic Area

The Paris Court of Appeal, part of the French judiciary, declined to acknowledge "Moutarde Dijon" as a geographical indication for mustard production due to the fact that its quality is not exclusive to that specific region; similar quality mustard is made in other areas [7, 13]. Similarly, the court did not grant protection to "Camembert" as a geographical indication for a type of French cheese, again because its quality is not confined to that geographical location and can be replicated in other regions [8, 14]. This suggests that a product's quality must be inherently tied to the geographical area of its origin, ensuring it cannot be produced with equivalent quality elsewhere. A pertinent example is Ceylon tea, which remains unmatched in quality, color, taste, and flavor by any other country. The assessment of product quality encompasses various criteria, such as the level of excellence, consumer demand, product uniqueness, the expertise of the producer or manufacturer, the established reputation of the product name [9, 15], its market value, and the extent of its sales both domestically and internationally [10, 16].

3 The Link Between Product Quality and Natural and Human Factors

This indicates that either natural and human elements, or a combination of the two, must impact the quality of the product, thereby linking that quality to its geographical origin and distinguishing it from products from other regions. This influence is a natural outcome, as human factors shape the product's quality based on its production or manufacturing methods, which are defining traits for which producers in a particular geographical area are recognized, such as the technique used to create Karak Jameed. The accumulated experience that the local population has gained over generations from craftsmen or manufacturers, passed down from fathers to grandfathers through long-standing customs marked by tradition, stability, and notable reputation, also plays a significant role. Additionally, natural elements affect the quality of the product through land fertility, favorable weather conditions, and a climate that is well-suited for a specific area, all of which serve as influential and supportive factors in cultivating a unique type of agricultural products that differ from those found in other locations. For instance, the oil from Samh Al-Kafarat is renowned for its unique taste and flavor, attributed to the natural qualities of the Samh region in Irbid. This raises the question: what if we sourced the raw materials and produced the products in a different country? In this scenario, we are only discussing the raw materials, not the final product, particularly if additional elements are introduced that change the product's essence specific to that region. Take, for example, Ceylon tea, which is packaged outside of Sri Lanka without impacting its geographical indication. Conversely, when Syria utilizes Dead Sea clay for cosmetic production, it does so without a geographical indication, clarifying in the commercial statement that the clay is sourced from Dead Sea products rather than claiming a geographical indication. This is not viewed as a violation of any geographical indication, especially since Dead Sea clay is not registered as such, rendering its protection unfeasible. Moreover, these materials may lose the distinctive qualities of the products they are used to create due to the added components, unlike French perfumes, which possess unique characteristics that set them apart from Arab perfumes or others. In his definition of geographical indication, the Jordanian legislator failed to mention the factors influencing the quality of such indications. In contrast, the Omani legislator addressed this issue first, as noted in Article (1) of the Law on the Protection of Geographical Indications, which states: "… and this statement (indication) includes natural and human factors, or both" [11, 12, 17]. Thus, we suggest that the Jordanian legislator consider this aspect when contemplating amendments to the law, as outlined in our recommendations at the conclusion of this modest effort. This consideration is not exclusive to agricultural products, from which it may have originated, but extends to various other sectors. The rationale behind this is the use of the indication to emphasize specific characteristics of the product, which can be attributed to a variety of factors, including [18]:

1. Human elements (skill-related factors) unique to the region where those products are produced.

2. Elements tied to customs and traditions, which depend on artisanal industries and local natural resources entrenched in various cultures, include activities like rug and carpet weaving, lace knitting (crochet), cigar production in Cuba, and the creation of oils such as olive oil, a staple in Sicily.

4 The Legality of Geographical Indications

This condition may be viewed as more of a protective measure than a standard for differentiating geographical indications from other legal classifications. While all other legal classifications necessitate legality for their legal protection, the legality associated with geographical indications varies somewhat, as it pertains to particular instances of legality stemming from the TRIPS Agreement and comparative laws. These cases include:

- First: When geographical indications do not conform to legislative definitions.

For instance, according to Articles 2 and 3 of the Jordanian Geographical Indications Law, an indication is deemed illegal if it does not relate to the geographical area of its origin, if it is not connected to a specific product, or if its quality cannot be solely ascribed to a particular geographical location. This requirement is similarly covered in Article 4 of the Omani legislation [11, 19].

- Second: When geographical indications lead to consumer deception or involve unfair competition.

In these instances, it is prohibited to refer to or showcase the product to the public in a manner that suggests a geographical origin that differs from its actual source, even if the wording is accurate. This stipulation is addressed in comparative legislations if it results in public deception or unfair competition, which contradicts the principles of fair competition in industrial and commercial practices [12, 13, 20, 21].

- Third: When the geographical indication violates public order and morals.

The notion of public order and morals encompasses a wide range of interpretations. What may be deemed a breach of public order and morals in Jordan could be viewed differently in another nation, such as those in the West, or what was once considered a violation in Jordan may no longer hold the same status in the region today. This variability arises from the fact that public order and morals are influenced by customs, traditions, and the passage of time [15, 16, 22, 23]. Nevertheless, it can be asserted that any geographical indication featuring an obscene term that offends public decency and contradicts the ethical, religious, and social values of any community—regardless of whether it fulfills all necessary conditions and standards—cannot be registered as a geographical indication. Looking at Jordanian legislation, this criterion is not stated explicitly; however, it is implied within the general legal principles that legality is essential for the protection of any right. In contrast, the Omani legislator has clearly defined legality in Article 4(b) [2, 11, 16, 24].

In this context, the researchers take issue with those who claim that the lack of a legality criterion in Jordanian law stems from the Jordanian legislator's explicit endorsement of wine and spirits as a geographical indication, provided that the product's quality is linked to its geographic origin (Article 3/2 of the Jordanian Geographical Indications Law). The mention of "wine" in the legislation by the Jordanian legislator aligns with the TRIPS Agreement, which grants enhanced protection for wines and spirits, with the goal of aiding Jordan's accession to the World Trade Organization during that period. According to Article 23 of the TRIPS Agreement, additional protection is afforded to geographical indications concerning wines and spirits, which states [11, 17, 25]:

1. Each Member must ensure that interested parties have the legal tools to stop the use of geographical indications for wines that do not come from the specified location or for spirits that do not originate from the indicated area, regardless of whether the actual origin of the products is stated or if the geographical indication is presented in translation or alongside terms like "kind," "type," "style," "imitation," or similar expressions.
2. The Members shall ensure that the registration of a trademark for wines featuring a geographical indication linked to wines, or for spirits with a geographical indication related to spirits, is refused or invalidated, either automatically if their laws allow or upon request from an interested party, concerning wines or spirits that do not come from the indicated location associated with the geographical indication in question [1, 17, 18].
3. Protection will be granted to each homonymous geographical indication for wines, in accordance with the stipulations of paragraph 4 of Article 22. It is the responsibility of each Member to establish the practical conditions that will allow for the differentiation of the relevant homonymous indications, while considering the necessity of fair treatment for the involved producers and preventing consumer deception [19].
4. To enhance the safeguarding of geographical indications for wines, discussions will be initiated in the TRIPS Council regarding the creation of a multilateral system for the notification and registration of such indications for wines that qualify for protection among participating Members [20].

5 Conclusion

To summarize, the research underscored the significance of geographical indications in safeguarding and improving the quality of products linked to particular geographical areas. By analyzing data and gathering information from various sources, the study illustrated that a robust legal structure for the protection of geographical indications is essential for maintaining quality and uniqueness in the marketplace.

5.1 Findings

The study reached the following conclusions:

- Geographical indications are essential for safeguarding the reputation of products and improving their quality, which in turn boosts their market value. Additionally, they foster equitable competition between local and global producers.
- While the existing legal frameworks offer solid protection for geographical indications, it is essential to revise them to align with the evolving global markets and international standards.
- Distinct distinctions exist between trademarks and geographical indications regarding their legal protections and practical uses. Trademarks prioritize commercial identity, whereas geographical indications highlight the product's geographical and environmental traits.

5.2 Recommendations

- Update GI regulations to keep pace with changes in global markets and improve their alignment with international standards.
- Raise the awareness of producers and consumers about the importance and benefits of geographical indications, contributing to better product protection and improved quality.
- Strengthen international cooperation between countries and legal institutions to exchange knowledge and experience and improve global protection of geographical indications.
- Conduct future research to further assess the impact of GIs on the market and identify new challenges they may face.

Evaluation of Legislation and Procedures for Foreign Technology Companies: A Comparative Analysis with Emphasis on Digital Transformation

Yasar Alhiniti and Khalif Saleh Dhiab Amoush

Abstract The focus of this study is to examine the distinctions between active and inactive foreign technology companies in terms of legislation and procedures, specifically in relation to the impact of digital transformation. To provide a comprehensive analysis, the study incorporates digital aspects into the comparison of these two types of companies. The findings of the analysis highlight significant differences and similarities between active and inactive foreign technology companies. While both types of companies go through registration and document submission processes, their requirements diverge in various areas. Active companies, for instance, are obligated to obtain licenses, pay legal fees, and submit annual financial statements. On the other hand, inactive companies are exempt from these fees and are only required to submit financial statements for a period of two years. Moreover, inactive companies must ensure that 50% of their workforce consists of local citizens, whereas there is no such requirement for active companies. Inactive companies are also restricted from engaging in commercial or industrial activities, limiting their operations to coordination with their main office. The study also explores the influence of digital tools and platforms on these legislative and procedural requirements. Drawing from these insights, the study offers recommendations to enhance the legislation and procedures pertaining to foreign companies. These recommendations include the integration of digital solutions to improve transparency and efficiency in financial reporting and employment practices.

Keywords Foreign technology companies · Active companies · Inactive companies · Legislation · Legal procedures · Digital transformation · National workforce · Financial statements · Legal fees

1 Introduction

To prevent any confusion and to ensure that everyone involved understands the legal and operational aspects, it is important to differentiate between companies that resemble active foreign companies in terms of their business activities. This distinction is crucial in fostering trust and providing reassurance to all stakeholders.

To discern the disparities between these companies, one must possess an extensive comprehension of the laws and legal processes that govern their activities. The prerequisites for registration, submission of documents, payment of legal fees, and fulfillment of tax obligations differ among these company classifications. Furthermore, the employment of local individuals directly impacts the presence and longevity of these companies, as inactive companies are obligated to hire a specific percentage of local workers, while active companies are exempt from such restrictions. As a result, this clear differentiation contributes to the improvement of the legal and regulatory work environment, ensuring equitable and sustainable interactions with various types of companies, whether they are domestic or foreign [1].

The objective of this study is to provide clarity on the disparities between national companies and actively operating foreign companies in terms of their nationality. The study is structured into two distinct sections: the initial section aims to differentiate between active foreign companies and national companies, while the subsequent section aims to differentiate between active foreign companies and those that are not currently operational.

1.1 Study Objectives

This study aims to achieve the following objectives:

- Explain the differences between domestic companies and active foreign companies based on nationality.
- Determine the impact of the company's nationality on its business activities, ownership and jurisdictional powers.
- Analyze how a company's nationality is determined under the Jordanian Companies Act No. (22) of 1997.
- Highlight the position of the Jordanian and Egyptian judiciary in determining a company's nationality.

1.2 Study Methodology

To accomplish its goals and examine the fundamental disparities between active and inactive foreign companies in Jordan, the study employed a descriptive-analytical approach. It extensively utilized secondary sources, including academic literature,

books, and relevant Jordanian legislation, to offer a thorough and lucid comprehension of the variations between active and inactive foreign companies in Jordan. Additionally, the study explored the implications of these differences on the investment and economic landscape in Jordan.

2 Distinguishing Between National Companies and Active Foreign Companies

When differentiating between a national company and an active foreign company, the key factor to consider is nationality. This determination holds significant implications, such as the ability to engage in all economic activities, complete ownership, and establishing jurisdictional competence [2].

The legal identity of a company is determined by the Jordanian legislature, as stated in Article (4) of the Jordanian Companies Law No. (22) of 1997. This law establishes that once a company is established and registered in Jordan, it is recognized as a Jordanian entity with its headquarters located within the country. Nationality, on the other hand, refers to the legal and political connection between an individual and a specific state, making them a member of its population.

The Jordanian legislator has clearly chosen objective criteria, rather than personal criteria, to determine a company's nationality. These criteria include the place of establishment or formation and the principal place of management. The Jordanian judiciary has supported this approach, as seen in a decision by the Jordanian Court of Cassation. The court stated that the provisions of the Companies Law, specifically those pertaining to holding companies, only apply to holding companies registered in Jordan. Companies registered outside of Jordan are not subject to these provisions. Another decision by the same court emphasized that legal and financial personality are only established after the formation and registration of a company according to Article 4 of the Companies Law. Therefore, disputes related to financial claims arising from the establishment procedures and transactions of a company should be resolved with the partners who established the company, rather than with the company itself. In yet another decision, the court stated that litigation should be initiated against companies registered and established in Jordan under the Companies Law, with their principal office located in Jordan. These companies are considered legal entities and hold Jordanian nationality according to Article 4 of the Companies Law [3, 4].

The stance taken by the legislator regarding the adoption of the principal place of management as the determining factor has received backing from the Jordanian judiciary. A ruling from the Jordanian Court of Cassation affirms this position, stating that the applicable legal system for legal entities is determined by the jurisdiction where their actual principal place of management is located. If these entities carry out their primary operations within Jordan, then Jordanian law applies, in accordance with Article (12/2) of the Jordanian Civil Code [5, 6].

The Jordanian legislator has effectively merged two factors in determining a company's nationality: one as the cause and the other as a direct consequence. These criteria are inseparable, ensuring that companies in Jordan cannot obtain nationality without actively contributing to the economy [7].

The determination of a company's nationality in Egypt has been entrusted to the judiciary, with the exception of regulations pertaining to joint-stock companies. Due to the lack of comprehensive legislation on all aspects of company nationality by the Egyptian legislator, the courts have resorted to combining multiple criteria [8]. This can be seen in a ruling made by the Egyptian judiciary on January 31, 1946, which stated that if a partnership company is established in Egypt in accordance with the requirements of the Egyptian Commercial Law and has its main place of management in Egypt, it should unquestionably be considered as having Egyptian nationality. Furthermore, any disputes between the company and Egyptian entities would fall under the jurisdiction of the national courts [9].

The combination of both criteria by the Jordanian legislator is viewed favorably by the researcher. This decision establishes a meaningful bond and association between the company and the state, guaranteeing that foreign companies operating in the host country do not receive special treatment or exemptions without making a positive contribution to the national economy and addressing unemployment. Furthermore, the integration of these criteria effectively resolves the problem of foreign companies holding multiple nationalities.

3 Distinguishing Between Active and Inactive Foreign Companies

Chapter Twelve of the Jordanian Companies Law No. (22) of 1997 focuses on foreign companies, whether they are currently operating or not. This particular law devotes two sections to address this matter. The first section, consisting of Articles (240–244), specifically delves into the regulations concerning active foreign companies. On the other hand, the second section, encompassing Articles (245–251), deals with the provisions regarding inactive foreign companies.

Upon careful examination of the regulations pertaining to both categories of foreign companies, it becomes apparent that there are certain similarities between them. However, it is important to note that despite these similarities, there exist notable distinctions. Both types of foreign companies are afforded foreign nationality, as determined by the criteria established by the Jordanian legislator to differentiate between national and foreign companies, as discussed in the preceding section. Furthermore, the legislator has conferred legal personality upon both types, necessitating their registration in the foreign companies' register in accordance with Articles (241, 242, 245, 246) of the Jordanian Companies Law No. (22) of 1997. Additionally, both types are required to furnish the requisite documentation to the General

Supervisor of Companies in order to fulfill the registration process as mandated by the law prior to commencing operations [10, 11].

The Companies Regulatory Official has been given the power by the legislator to approve or decline the registration of foreign companies, whether they are currently active or inactive, and this authority is exercised at their discretion. In the event of rejection, the Companies Regulatory Official is not obligated to provide a justification for their decision. However, if the registration is approved, the necessary procedures are carried out and officially announced in the gazette. When it comes to making any modifications or alterations to the company, both types of companies are required by the legislator to follow the same procedures, and they must inform the supervisor within thirty days of any such changes taking place [12].

Despite the similarities in some procedures between the two types, there are many significant differences between them, which will be addressed as follows:

Requirement for a Work Authorization

In accordance with Article (240/b) of the Companies Law, active foreign companies are obligated by legislation to acquire a work authorization from the appropriate authority. This requirement specifically applies to foreign entities engaging in commercial activities within Jordan. The law states that no company or foreign entity can conduct business unless it is registered under the provisions of this law and has obtained a work permit in adherence to the applicable laws and regulations. Therefore, it is clear that any foreign company desiring to operate in Jordan must secure an authorization from the relevant authority, considering the nature of its business, as previously mentioned.

Obligation to Pay Legal Fees

According to Article (242/a) of the Jordanian Companies Law No. (22) of 1997, active foreign companies have a specific obligation to pay legal fees. However, the exact amount of these fees and the recipient are not specified by the legislator. The legislator's role is simply to require the payment of legal fees. To determine the specific fees, we must refer to the Jordanian Companies System No. (50) of 1997. According to Article (4) of this system, the Ministry of Industry and Trade is responsible for collecting fees for the registration of companies. The fees for registering an active foreign company in Jordan are as follows: $1410 if the company's registered capital is $1,410,853.00 or less, and $2821 if the capital exceeds $1,410,853.00. Additionally, a fee of $3 is charged for issuing a registration certificate. In contrast, the lawmaker has made provisions to waive the legal fees associated with registration and publication for inactive foreign companies, as stated in Article (248/a + c) of the Jordanian Companies Law No. (22) of 1997. Furthermore, these companies are not required to register with industrial, commercial chambers, or professional syndicates, nor are they obligated to pay any associated fees, including those for business license issuance. Additionally, they are exempt from income and social services taxes, in accordance with Article (248/b) of the same law and Article (4/a/3) of the Income Tax Law No. (34) of 2014. Moreover, these companies enjoy exemption from customs

fees, import duties, and other charges, as outlined in Article (248/e) of the Jordanian Companies Law No. (22) of 1997. They are also not required to pay customs fees on furniture and equipment imported for office furnishing, as stated in Article (248/w) of the same law [13]. These exemptions are granted on the condition that the company does not engage in any industrial, commercial, or professional activities within Jordan.

Obligation to Submit Financial Statements

According to Article (246/a/4) of the Jordanian Companies Law No. (22) of 1997 [5, 14], foreign companies that are not currently operating are obligated to provide financial statements for the past two consecutive years, certified by a legal auditor, from their headquarters. However, the minister has the authority to exempt these companies from submitting the statements if a justified recommendation is provided by the supervisor. Conversely, active foreign companies are only required to submit financial statements for the previous year, certified by a legal auditor, as stated in Article (241/a/5) of the same law [15].

In an effort to safeguard the legal and financial standing of inactive foreign companies and establish trust among their stakeholders, the legislator has mandated the submission of certified financial statements for the previous two years. This requirement serves to inform potential partners and investors about the company's financial health before engaging in any business relationships. Furthermore, it enables the state to assess the company's impact on the economy and make informed decisions regarding its presence within its borders. However, the minister retains the authority to exempt a company from this obligation based on justifiable grounds, as recommended by their supervisor.

In contrast, the lawmaker displayed greater flexibility towards foreign companies that were actively operating, simply mandating the submission of their previous year's financial statements, without empowering the minister to exempt them from this requirement [16].

Nature of the Operations of Active and Inactive Foreign Companies

According to Article (240/a) of the Jordanian Companies Law No. (22) of 1997, the legislator has categorized the activities of active foreign companies into two distinct types. The first type encompasses foreign companies that primarily operate without establishing branches. These companies are granted tenders, which they carry out within the borders. Upon the completion of the tender, the company is dissolved unless it secures new contracts during the execution of the initial tender. In such instances, the company is obligated to fulfill the newly awarded assignments, and only after meeting all responsibilities will its registration be revoked and its name removed from the Companies Regulatory Official.

The second category comprises of international corporations that establish a permanent presence and primarily operate through branches after obtaining the necessary licenses from the appropriate regulatory body. These companies also have the option to conduct business without establishing branches. If a company intends to engage in business activities in a different country, it can establish a branch there to

carry out operations on behalf of the company. However, there is a debate regarding the autonomy of the branch, with some arguing that it functions as an independent entity separate from the headquarters, possessing broad authority to represent the company in interactions with external parties and in legal disputes. In this regard, the branch can be sued by external parties without involving the head office, and conversely, it can initiate legal action against others [17].

The sectors in which foreign companies are permitted to operate in Egypt have been delineated by the Egyptian legislator, as outlined in Article 1 of the Investment Incentives and Guarantees Law No. (72) of 2017 [18]. These sectors encompass infrastructure, manufacturing and mining, software transfer and computer systems, developmental production, medical services, specific financial services, agriculture and reclamation of desert lands, hotels, and tourism.

According to Egyptian law, capital companies, such as limited liability companies, partnership limited by shares, and joint-stock companies, are allowed to establish projects in Egypt for a lasting presence. On the other hand, if these companies only intend to operate for a specific duration, they have the option to establish a branch or representative office in Egypt [19].

Under the Jordanian Companies Law No. (22) of 1997, inactive foreign companies face strict regulations. Article (245/b) states that these companies will be removed from the register if they engage in any form of activity. It is crucial for them to refrain from any commercial endeavors, regardless of their scale, as this would be considered a grave violation of the law and could lead to the cancellation of their registration. Furthermore, these companies are obligated to provide compensation to any individuals or entities that may have suffered harm as a result of their actions. Additionally, they are prohibited from acting as commercial agents or intermediaries [20].

In light of the aforementioned information, the lawmaker has made a prudent decision to implement regulations and oversight measures on foreign companies that are inactive. This is done in order to safeguard domestic companies and active foreign companies, which do not receive the same benefits and exemptions as these inactive companies. Consequently, the operations of these companies are restricted to activities such as managing and organizing their operations in alignment with the parent company, conducting market research, relaying information to the parent company, acting as a representative for the parent company in the host country, and providing guidance to the parent company regarding investment opportunities or establishing an active foreign company in the host country [21].

In a similar vein, the Egyptian legislature has implemented measures to prohibit inactive foreign companies from participating in any form of business activity, as outlined in the Egyptian Companies Law and its accompanying regulations. According to Article (173) of the Egyptian Companies Law No. (159) of 1981, inactive companies are explicitly forbidden from engaging in any activities beyond those related to market research and production potential, provided they possess the necessary licenses. Should these companies deviate from their intended purpose and engage in unauthorized activities, they will be subject to removal from the register, pending approval from the designated authority specified in Article (18) of this law

[22]. These texts clearly demonstrate that the Egyptian legislature, much like their Jordanian counterparts, imposes restrictions on inactive foreign companies, limiting their involvement solely to market research, and enforcing penalties, such as removal from the register, for non-compliance [23].

Regarding the Use of National Labor in Foreign Companies

According to Article (249) of the Jordanian Companies Law No. (22) of 1997, it is required that an inactive foreign company operating in Jordan must have a minimum of half of its total employees as Jordanian nationals.

The legislator mandates that foreign companies that are not active must hire local workers, with the condition that the number of Jordanian employees is at least half of the total workforce. To ensure compliance, these companies are required to submit lists to the Companies Regulatory Official that include the names and nationalities of their employees. Moreover, they must provide certified copies of employment contracts for their Jordanian employees, which will be scrutinized by the Ministry of Labor to verify adherence to the legally required ratio. This verification process involves confirming the accuracy of the names in the contracts and ensuring that the contracts align with the relevant legal provisions [24].

Initially, the decision made by the Jordanian legislator to mandate that inactive foreign companies hire at least 50% national labor was seen as commendable by the researcher. However, it is suggested that this percentage be reevaluated and raised to "75%" of the total workforce. By doing so, not only would this help combat unemployment rates, but it would also be consistent with the exemptions and privileges granted to these companies.

The presence of foreign workers in Jordanian companies is mandated by Article (249) of the Jordanian Companies Law No. (22) of 1997. Consequently, these companies are obligated to comply with the regulations pertaining to the employment of foreign labor outlined in Article (12) of the Jordanian Labor Law No. (8) of 1996. This article establishes two criteria for the employment of foreign labor: Firstly, the job must require skills and expertise that are not readily available among the local workforce, and secondly, there must be a shortage of domestic labor. The utilization of foreign labor necessitates approval from the Minister of Labor or their representative, and the work permit for foreign employees should not exceed one year, with the possibility of renewal [25].

The Jordanian Companies Law No. (22) of 1997 does not include any specific provision regarding the required percentage of national or foreign labor in active foreign companies. To fill this legislative gap, it is necessary to examine other regulations that may address this issue and establish a national labor ratio for these companies. Starting at the highest level of legislation, the Jordanian Constitution affirms the right of Jordanians to work and imposes an obligation on the state to provide employment opportunities. Article (23/1) of the Jordanian Constitution of 1952 states, "Work is a right for all citizens, and the state must provide it for Jordanians by directing and advancing the national economy." This constitutional text highlights that the state is responsible for ensuring employment opportunities for Jordanians and does not specifically address the right of foreign labor to work in

Jordan. It is evident that the right of Jordanian workers to work is derived from the constitution.

Furthermore, in accordance with Article (12) of the Jordanian Labor Law No. (8) of 1996, there are limitations placed on the employment of foreign workers by both local and international companies. These restrictions encompass certain criteria, such as a scarcity of specialized knowledge and competencies, as well as an inadequate availability of domestic labor to meet the demands of the job market. Approval from the Minister of Labor or their representative, along with a one-year work authorization that can be extended, are prerequisites for hiring foreign labor [26].

The Central Bank of Jordan is granted the power to authorize both local and foreign banks operating in the country to hire foreign workers, with specific guidelines on the number and proportion of non-Jordanian employees in relation to the total bank workforce, as outlined in Article (28) of the Banking Law No. (28) of 2000. This article states that, in accordance with labor regulations, any employment of non-Jordanian staff by a bank requires approval from the Central Bank, which also has the authority to determine the quantity or percentage of non-Jordanian employees relative to the total bank workforce. This grant of authority is based on the recognition of the banking sector's significant impact on the national economy and its consequent importance and sensitivity [27].

In accordance with Insurance Law No. (33) of 1999, it is mandated that all employees working for insurance companies, whether they are of national or foreign origin, must be Jordanian citizens. However, in cases where there is a shortage of necessary expertise and qualifications, non-Jordanians may be employed with the approval of the minister. This requirement is clearly stated in Article (30) of the law, which states that "the company must ensure that all its employees are Jordanian; however, non-Jordanians may be employed if they possess expertise and qualifications that are not readily available. The final decision regarding the employment of non-Jordanians rests with the Minister of Labor, based on the recommendation of the General Manager" [28].

It should be emphasized that the Investment Environment Law No. (21) of 2022 offers opportunities for tax exemptions or reductions in both income and customs taxes as a reward for hiring local workers. Additionally, this law stipulates that foreign labor in these companies should be limited to specialized administrative and technical roles, with a maximum limit of "40%" of the overall workforce in optimal conditions [29].

The intention of the legislator, as evident in this law, was to actively promote the hiring of Jordanian workers and offer incentives and exemptions as a means of reducing unemployment and bolstering the national economy. According to Article (43) of the 1972 Jordanian Lawyers Association Law, foreign companies were obligated to appoint a legal representative or consultant from a pool of registered lawyers. This requirement extended to the foreign company itself, as well as its various branches, agencies, and regional or representative offices.

The researcher observes that while the legislator did not explicitly state a specific percentage for the employment of national labor in active foreign companies, it can be deduced from an analysis of other legislative documents that this was a

matter of great importance to him. The legislator placed restrictions on the hiring of foreign workers and prioritized the employment of national labor, with only limited exceptions granted for the hiring of foreign workers with official approval. This was done to safeguard the expertise of the local workforce and prevent their migration to other countries by avoiding competition or dominance by foreign labor. Additionally, it aimed to protect the national economy by ensuring that active foreign companies exclusively hire foreign workers, thereby addressing the issue of unemployment among Jordanian workers, which has significant economic, social, and political implications for the country [30].

The disparity between the Egyptian and Jordanian legislator's positions on the requirement of national labor in foreign companies is quite evident. In Egypt, specific percentages have been established for both Egyptian and foreign employees in these companies, with a distinction made between two categories of workers. The first category encompasses non-technical and administrative Egyptian workers in foreign companies. According to Article 174 of the Egyptian Companies Law, it is mandated that the number of Egyptian employees should constitute no less than 90% of the total workforce, and their wages should not be lower than 80% of the total wages paid by the company.

As stated in Article (175) of the Egyptian Companies Law, the second category encompasses Egyptian workers employed in technical and administrative roles within foreign companies. It is mandated that these workers make up at least 75% of the overall workforce and receive wages amounting to no less than 70% of the total wages paid by the company. This requirement ensures that joint-stock companies operating in Egypt prioritize the employment and compensation of Egyptian workers in these crucial positions [31].

In certain cases, the minister has the authority to authorize the hiring of foreign workers, technicians, or consultants if there is a lack of available Egyptians for these roles. It should be noted that these foreign workers are not included in the specified percentages outlined in Article (176) of the aforementioned law. This article states that "the minister with jurisdiction may grant permission for the employment of foreign workers, consultants, or specialists if there are no Egyptians available" [2].

According to the executive regulation of the Egyptian Companies Law No. (159) of 1981, foreign company branches were obligated to submit a report to the Companies Authority within three months after the conclusion of the fiscal year. This report should include information on the number of employees, their respective positions, salaries, and nationalities. Furthermore, it was necessary for these branches to calculate the wages of their Egyptian employees. In addition to this, offices and agencies of foreign companies were also required to submit an annual report to the Companies Authority. This report should contain details such as the names and nationalities of employees, their positions, total wages, as well as the percentage of wages allocated to Egyptian employees [16, 32].

Article (41) of the Egyptian Companies Law No. (159) of 1981 grants employees working for foreign company branches and similar entities the right to receive a portion of the yearly profits. This provision stipulates that the general assembly, in accordance with the board of directors' recommendation, shall determine the specific

share, which should not be less than 10% of the profits or exceed the total annual wages of the employees [18, 30].

In comparing the Egyptian and Jordanian legislators, the researcher concludes that the Egyptian legislator demonstrated greater clarity and diligence when it came to defining the proportion of domestic workers in foreign companies. The Egyptian legislator placed a higher emphasis on employing national workers over foreign workers and imposed limitations on the hiring of foreigners in these companies, except in cases where there was a lack of available Egyptian labor. This approach aimed to bolster the national economy and tackle the problem of unemployment [16].

It is recommended by the researcher that the legislator in Jordan take a closer look at the provisions outlined in the Companies Law No. (22) of 1997, specifically those pertaining to foreign companies that are actively operating within the country. One suggestion is to establish a higher percentage requirement for Jordanian labor within these companies. This measure would serve to safeguard the national economy against foreign companies that may dominate the labor market by hiring foreign workers instead of local labor. Additionally, it would address the issue of unemployment among Jordanian workers and prevent the migration of qualified individuals seeking job opportunities abroad that align with their skills and qualifications [27].

4 Conclusion

While foreign companies, whether operating or non-operating, share similarities in terms of foreign nationality, legal personality, and registration requirements, there are notable distinctions when it comes to the necessity of a work authorization, payment of legal fees, submission of financial statements, nature of operations, and utilization of national labor. These disparities serve the purpose of safeguarding the domestic economy and maintaining equilibrium between foreign and national enterprises.

4.1 Results

The study concluded the following results:

1. Both operating and non-operating foreign companies must go through a registration process and provide the required documentation. However, there are notable distinctions between the two types: operating companies must obtain an authorization, fulfill legal obligations, and submit financial statements for a period of one year, whereas non-operating companies are exempt from legal and tax fees and are only required to submit financial statements for a duration of two years.
2. Operating companies do not have a specific requirement for the percentage of national labor they must employ, whereas non-operating companies are mandated to have at least half of their workforce comprised of Jordanians.

3. Non-operating companies encounter limitations that prohibit their involvement in any commercial or industrial endeavors, restricting them solely to coordinating with their main office.
4. The determination of a company's nationality in Jordanian legislation is based on objective criteria, including the place of incorporation or formation and the principal place of management.
5. The Jordanian courts uphold the standards established by Jordanian legislation, ensuring that the Jordanian Companies Law is exclusively applied to companies that are registered within Jordan's jurisdiction.
6. By employing both the criteria of place of incorporation and principal place of management, companies operating within Jordan play a crucial role in bolstering the national economy.
7. In Egypt, the determination of a company's nationality is entrusted to the judiciary, with the exception of joint-stock companies, leading to the existence of multiple and overlapping criteria.

4.2 Recommendations

1. Highlight the importance of adopting specific objective criteria for determining the nationality of an enterprise in order to strengthen the national economy.
2. Encourage policymakers in other countries to follow the Jordanian approach of combining the place of incorporation and principal place of management criteria.
3. Strengthen supervision of operating foreign companies to ensure their positive impact on the domestic economy and contribute to reducing unemployment.
4. Support legislation that promotes transparency and clarity in determining a company's nationality to avoid multiple and overlapping nationalities.
5. Encourage foreign investment while ensuring the protection of domestic workers' rights.
6. Strengthen restrictions on non-trading companies to prevent any illegal activities.
7. Encourage further legal studies on the impact of a company's nationality on the economy and jurisdiction to ensure sustainable legal solutions.

BEDVS—Biometric Enabled Digital Voting System

Akaash Sharma, Rishav Ranjan, Pavan Kunte, Raed Alazaidah, Abhishek Gupta, Yash Raj Singh, Hemraj Shobharam Lamkuche, and Mutaz Rasmi Abu Sara

Abstract Our country, India is the largest democratic country in the world. So it is essential to make sure that the governing body is elected through a fair election. As of now, Voters have to go to the polling booth to vote which takes time and the voting percentage is also low due to some voters do not go to polling booth to cast the vote. This process requires large man force and it also require more time to declare the result and to overcome this disadvantage we need to change the system. So here comes the Digital Voting, it allow voters to vote online via computers, laptop and smartphones from anywhere. Digital Voting has Admin panel which is handled by election commission and voter login which will be handled by voters. Voters need to register themselves using VoterId to login the voter panel for voting. The system allows voters to view all the details of candidates in there area and once the election is started voters can vote the candidates. This system uses 2factor authentication OTP and Face Recognition. When voters register themselves they have to complete the verification via OTP and also upload the video for the face id and at the time of voting they need to verify themselves by OTP and face recognition system.

1 Introduction

Automated systems are considered a key component in the Fourth Industrial Revolution that helps improve the effectiveness of digital voting systems with biometric capabilities [1]. The main objective of democracy is "vote" by which the people can elect the candidates for forming an efficient government such that their standard living can be improved. In developing countries like "INDIA", the election commission follows manual voting mechanism which is done by the electronic voting machine (EVM). EVMs are electronic voting machines that enable the voter with a button for each choice of candidate. An EVM is designed with two units: the control unit and the balloting unit. These units are joined together by a cable. The control unit of the EVM is kept with the presiding officer or the polling officer. The balloting unit is kept within the voting compartment for electors to cast their votes. This is done to ensure that the polling officer verifies your identity. With the EVM, instead of issuing a ballot paper, the polling officer will press the Ballot Button which enables the voter to cast their vote. A list of candidates names and/or symbols will be available on the machine with a blue button next to it. The voter can press the button next to the candidate's name they wish to vote for. This process require large man force and it is expensive. So, to overcome these problem we proposed the Digital Voting system. By using Digital Voting System anyone can vote the candidate from anywhere through their Smartphones or Computers and for the security and to avoid forgery we used 2factor verification system which is OTP and Face recognition by which no one can misuse thus system and One Voter can vote only once.

2 Motivation

In India, voting is very important for choosing our leaders and making our country better. Till now we use machines called Electronic Voting Machines (EVMs) to vote but not every citizen of our country are voting. So we decided a better way to make voting easier and safer. We decided to make a model that is digital voting, we can vote using our phones or computers. This saves time and makes it easier for everyone to vote. To make sure only the right people vote, we used face recognition. When we register to vote, we take a picture of our face. Then the system checks if our face matches the one we registered with. If it matches the person can vote only per election. This keeps things fair for everyone. The current voting machines have some problems. Sometimes people alter with the machine's program to change the votes. And also some people vote illegally in more than one place. But with digital voting we can fix these problems and make voting better for everyone in India. Digital voting not only makes voting more accessible but also ensures the integrity of the electoral process. Further using advanced security measures like biometric authentication, we can prevent fraud and manipulation of the votes safeguarding the democratic principles upon which our nation is built. Digital voting also enables

realtime monitoring and auditing, enhancing transparency and accountability. Digital voting offers cost-effective and environmentally friendly solutions as compared to EVM and paper-based methods. It will reduce the need for physical infrastructure, human force for security purpose and paper ballots.

We can conclude by digital voting represents a significant step forward in modernizing our electoral system and strengthening democracy in India. By using new ideas and making the most of technology, we can make sure that everyone's opinions are listened to and every vote matters in determining the future of our country.

3 Literature Review

Shrivastava et al. [2] develop an online voting system where voters can cast their ballots remotely without visiting polling booths. They employ username and password authentication instead of utilizing biometric authentication. In our project, we utilize biometric authentication, which can enhance the security of the system.

Abdulhamid et al. [3] construct an E-voting system to enhance the efficiency of the voting process. They utilize username and password for user authentication and also provide session validation and session timeout to prevent session hijacking. In our project, we employ Face Recognition Technology to secure the system from unauthorized users.

Hazzaa proposed a "Web Based Voting System Using Fingerprint Design and Implementation" [4] to enhance the security of the voting system and make it more robust. The proposed EVS enables votersto verify their fingerprint against the stored template in the database.

Nautiyal [5] proposes a system based on face recognition, which suggests a better approach for identification used in criminal identification. They utilize an Image partitioning algorithm. In this work, a pre-captured image is taken in future win 10 to capture a real image and perform real-time image processing.

Patel and Patel [6] paper introduces the face recognition technique based on Partial Hausdorff distance. They employ Hausdorff distance. Further improvements can be made to reduce the computation time. This can be achieved by preprocessing the database images and using clustering techniques.

Yamini et al. [7] develop a class attendance system in Python language using OPENCV, Haar's Cascade, and Viola-Jones framework. In universities and corporate offices, RFID scanners and biometric fingerprint systems are used for attendance marking, leading to security and ethical concerns. Therefore, they develop a system using face detection and recognition techniques. They utilize the Viola-Jones algorithm for face detection and Histogram of Oriented Gradients and Local Binary Patterns for face recognition. OpenCV library is used as the image processing framework. This system is more secure and less time-consuming compared to RFID scanners authentication system for voting purposes. They utilize FM220 Startek Scanner to scan fingerprints and store data. A regular camera captures the voter's image, and PCA (Principal Component Analysis) is employed for feature extraction

and iris detection. When all recorded data successfully match with Aadhar card data stored in the database, the voter is allowed to use the system.

Soomro and Ali [8] develop an authentication application using face recognition technology. They utilize NI MyRIO and LabVIEW, integrating software and hardware devices with OpenCV and NI VISION toolkit to recognize faces in minimal time. MyRIO devices process large real-time data with implemented algorithms and programmed through LabVIEW. LabVIEW is also used to develop the database. This system is employed for authentication to enhance the security of the electronic voting system.

Kavitha [9] developed a fully biometric authentication system for voting purposes. They utilize FM220 Startek Scanner to scan fingerprints and store data. A regular camera captures the voter's image, and PCA (Principal Component Analysis) is employed for feature extraction and iris detection. When all recorded data successfully match with Aadhar card data stored in the database, the voter is allowed to use the system.

Layer biometric authentication technique enhances the security of the system, making it more secure, but it also increases its complexity. Face recognition by a computer is programmed using Python via OpenCV, and this paper discusses the implementation of Eigenfaces and Fisher faces customized in Python. Geometric features and landmark mapping are utilized to construct the feature vector. Algorithms employed for local feature extraction include Gabor Wavelets, Discrete Cosine Transform, and Local Binary Patterns [10].

The current voting process has numerous flaws, and the objective of this project is to minimize the potential for manipulation. This project focuses on implementing fingerprint and facial recognition for vote verification. Various technologies and tools such as Python Development Environment, Linux Interfacing Engine, and Visual Basic are utilized. This dual authentication system reduces the likelihood of fraud and illegal activities, thereby enhancing the security and efficiency of the voting process [11].

4 Existing System

An Electronic Voting Machine (EVM) is a device used for conducting electronic voting in elections. It is a specialized electronic device designed to record votes accurately and securely. EVMs are used to replace traditional paper ballot systems in many countries around the world. An EVM typically consists of a control unit and a balloting unit. The control unit is operated by an election official and manages the voting process, while the balloting unit is used by the voters to cast their votes. The control unit and the balloting unit are connected by a cable.

Advantages

- Accuracy: EVMs are designed to record votes accurately. They eliminate errors caused by manual counting and interpretation of paper ballots, reducing the chances of mistakes in the vote tallying process.
- Reduced invalid votes: EVMs can help reduce the number of invalid votes. They have inbuilt features that guide voters and prevent them from casting multiple or invalid votes, such as overvoting or under voting.
- Transparency: EVMs provide transparency in the voting process. They typically have a display screen that shows the selected candidate or party before the vote is cast, allowing voters to verify their choice. This enhances the confidence of voters in the accuracy of their votes.
- Environmental Impact: EVMs have a positive environmental impact compared to paper ballots. They reduce the consumption of paper and ink, leading to a decrease in deforestation and waste production associated with the printing of millions of ballot papers.

Limitations

- Limited auditability: EVMs often lack comprehensive mechanisms for independent auditing and verification of election results. This can hamper the ability to conduct thorough post-election analysis and investigations in case of disputes or allegations of fraud.
- Cost and maintenance: While EVMs can potentially save costs in the long run, their initial acquisition and maintenance expenses can be significant. This may pose financial challenges for countries with limited resources or frequent elections.
- Lack of voter confidence: Some individuals may have reservations or lack trust in the accuracy and security of EVMs. The absence of tangible data or physical evidence of the vote can contribute to concerns about transparency and the ability to verify election results independently.

Proposed System

Our new voting system is designed to make voting easier and safer for everyone. Instead of going to a polling station, you can now vote online from your computer or phone. This saves time and makes it more convenient for people to participate in elections. To ensure that only the right people vote, we use a special technology called Facial Recognition. When you register to vote, you take a picture of your face, and this picture is used to confirm your identity when you vote. This helps prevent any cheating or fraud. Our system is also easy to use, so even people who aren't very good with technology can vote without any problems. And because it's online, you can vote from anywhere, whether you're at home or on the go. By using modern technology, we're making voting more accessible and secure for everyone. This way, more people can have their voices heard in elections, making our democracy stronger.

Functional Description

Functional description of various software and hardware components is given below:

A. OpenCV: It is short for open-source Computer Vision Library. It aids in image processing and is crucial for various operations related to images, playing a significant role in real-time applications essential for modern systems. With OpenCV, one can process images and videos to detect objects, faces, or even human handwriting.
B. HTML: Hypertext Markup Language, enables the creation of electronic pages or documents displayed on the World Wide Web. It serves as a standard markup language for web pages, with HTML elements represented by <> tags. In this project, we have designed several templates using HTML.
C. CSS: Cascading Style Sheets, is a language that describes the presentation of an HTML document. It controls the layout of different web pages and can manage the layout of multiple pages simultaneously. CSS comments begin with /* and end with */.
D. JavaScript: It is a client-side scripting language of HTML and the web. It is an independent language developed by Netscape and is used to make web pages dynamic and add enhancements such as rollover effects. In HTML, JavaScript code is inserted between tags.
E. PostgreSQL: PostgreSQL, otherwise called Postgres, is a free and opensource social database the board framework underlining extensibility and SQL consistence. We used PostgreSQL maintain all the data. It can easily store and share the data when the system needs it.
F. Django: Django is a high-level Python web framework that encourages rapid development and clean, pragmatic design. Built by experienced developers, it takes care of much of the hassle of web development, so you can focus on writing your app without needing to reinvent the wheel. It's free and open source.
G. Web camera: A webcam is a camcorder that captures an image or video in real-time to a computer system, such as the Internet. Webcams are typically small cameras positioned on a desk, attached to a user's monitor, or integrated into the hardware. The image of a voter can be captured using only the front camera of our computer.

5 Face Recognition Working Mechanism

A. Face Recognition: Face or facial recognition is a technique used to identify a human face through technology. This technology aids in recognizing or verifying an individual from a digital image or a video frame from a video source. A facial recognition system utilizes biometrics to map features from a photo or video and compares the information with a database of known faces to find a match. This system employs computer algorithms to identify specific, distinctive details about a person's face.
B. Face detection techniques: Detecting faces is a challenging task due to variations in scale, position, orientation, pose, expression, occlusion, and lighting conditions, which alter the overall appearance of faces. Various approaches for

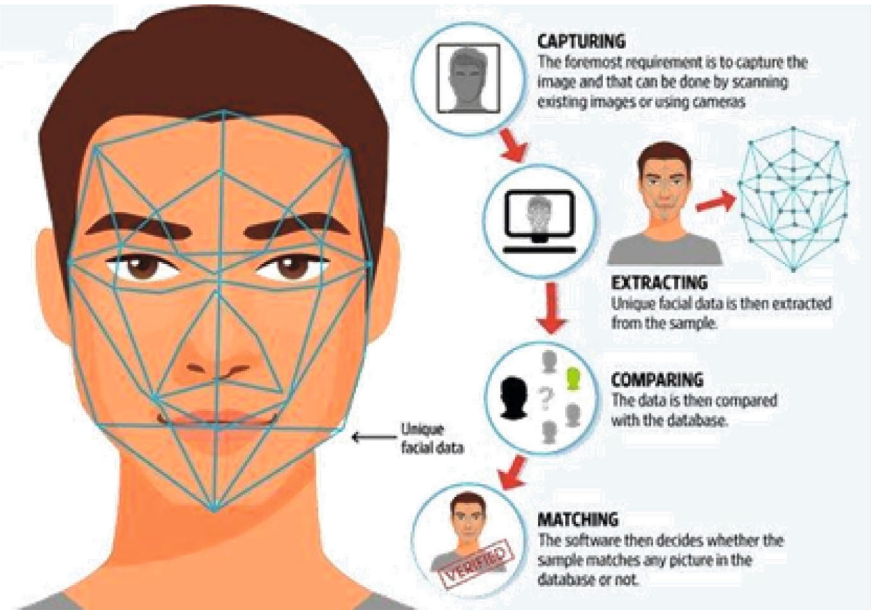

Fig. 1 Face recognition using python

face detection have been proposed, including data-based and appearance-based methods, and techniques such as template matching, skin color, motion, etc., to mention a few. The face detection process is a crucial step as it identifies and locates human faces in images and videos. • The face acknowledgment process is a fundamental development as it perceives and discovers human faces in pictures and chronicles. • The face get process changes simple data (face) into advanced data (information) in light of person's facial features. • The face coordinate methodology checks if the two faces are of same person.

C. Face Recognition using Python: This is illustrated in Fig. 1. It is the fastest-growing programming language globally. It is an object-oriented programming language utilized for software and application development, as well as in data analysis, web applications, mobile applications, etc. In our project, we utilized the OpenCV library in Python for recognizing and detecting the voter's face

6 Working Mechanism

We add several modules in this system like Admin, registration, login, adding candidate, voters, and result.

All modules are interconnected with each other (see Figs. 2, 3, 4, 5, 6, 7, 8, 9 and 10).

Fig. 2 Login page

Application

- The primary objective of this system is to enhance the safety and security of any system by preventing fraudulent activities.
- This system can be employed for attendance tracking in educational institutions, corporate offices, and other establishments.
- Implementation of this system in shopping malls or stores can facilitate secure payment transactions.
- Utilizing this system for criminal identification provides law enforcement with a valuable tool for tracking criminals nationwide.
- Deployment of this system in large server rooms, such as airports or railway stations, enables immediate action when necessary.

7 Conclusion

In Conclusion, the Facial Recognition is an Enhanced Online Voting Platform which offers a simple and secure way for people to participate in elections. By allowing voters to cast their ballots from the comfort of their homes using their computers or smartphones, our platform removes the barriers of time and distance associated with traditional voting methods. The use of facial recognition technology adds an extra layer of security to the voting process, it ensures that only eligible voters can participate. When individuals register to vote, they provide a picture of their face, which is used to verify their identity when they go to vote. This helps prevent fraud and ensures the integrity of the electoral system. The user-friendly interface of the platform makes it accessible to people of all ages and backgrounds, it basically promotes participation in the democratic process. It streamlines the voting process and eliminates the need for human forecast polling stations, the platform encourages more people to the right to vote. The platform focuses on security and transparency confidence in voters, leading to trust in the electoral process. This can lead to a stronger democracy and more voting in an election. Overall, the Facial Recognition Enhanced Online Voting Our platform represents a significant advancement in modernizing elections and making them more inclusive and accessible to all members of society. With its innovative features and robust security measures, this platform has the potential to revolutionize the way elections are conducted in India.

Phablet Hashing Algorithm

Nihal Awasthi, Hemraj Shobharam Lamkuche, Raed Alazaidah, and Mutaz Rasmi Abu Sara

Abstract This paper presents the Phablet Hashing Algorithm, a novel cryptographic hashing method designed to enhance security and efficiency. The algorithm integrates multiple encryption techniques, including block cipher and a custom encryption transformation, to provide robust protection against common cryptographic attacks. We detail the algorithm's design, implementation, and performance evaluation. Experimental results demonstrate its effectiveness in various scenarios, such as file integrity verification, secure communication protocols, and digital signature systems.

1 Introduction

In the Fourth Industrial Revolution, artificial intelligence (AI) algorithms and techniques improve digital system security through optimized hashing algorithm analysis and implementation [1]. In the realm of digital communication and data security, cryptographic hashing algorithms play an indispensable role. These algorithms are fundamental in ensuring data integrity, authentication, and secure transmission of information across networks. A cryptographic hash function takes an input (or 'message') and returns a fixed-size string of bytes. The output, typically a hash code, appears random and irreversible, providing a unique digital fingerprint for the input data.

Traditional hashing methods, such as MD5, SHA-1, and even the more advanced SHA-256, have served as the backbone of data security protocols for years. However, as computational power increases and more sophisticated attack methods are developed, these traditional algorithms are becoming increasingly vulnerable. For instance, MD5 and SHA-1 have been proven susceptible to collision attacks, where two different inputs produce the same hash output, undermining the fundamental premise of cryptographic security.

The evolving landscape of cybersecurity demands hashing algorithms that not only offer enhanced security but also improved efficiency and versatility. This need has given rise to the Phablet Hashing Algorithm (Phablet), a novel cryptographic hashing method designed to meet the rigorous demands of modern cybersecurity environments.

The Phablet Hashing Algorithm distinguishes itself by integrating multiple encryption techniques into a cohesive framework. By leveraging block cipher in Electronic Codebook (ECB) mode, custom encryption transformations, and a final encoding step, PHA offers a robust defense against various cryptographic attacks. The algorithm's design ensures that even minor changes in the input result in significantly different hash outputs, a property known as the avalanche effect, which is crucial for maintaining data integrity and security.

This paper provides a comprehensive overview of the Phablet Hashing Algorithm, detailing its design, implementation, and performance evaluation. We begin by exploring the methodology behind Phablet and explaining the rationale for each algorithm component. This is followed by an in-depth explanation of the algorithm's operational steps, highlighting the unique features that contribute to its security and efficiency.

The implementation details section outlines the practical aspects of coding the algorithm in Python, emphasizing the steps involved in padding, encryption, and transformation of the plaintext. We then present the results of our experimental evaluation, showcasing the algorithm's performance in terms of speed, security, and resistance to attacks. Finally, the paper concludes with a discussion on the potential applications of Phablet and future directions for research and development.

In the ever-evolving field of cybersecurity, the Phablet Hashing Algorithm represents a significant advancement. It offers a reliable and secure solution for cryptographic hashing, addressing the limitations of traditional methods while paving the way for new applications and innovations.

2 Methodology

The Phablet Hashing Algorithm leverages the Custom Block Cipher in Electronic Codebook (ECB) mode, a series of custom transformations, and a final encoding step to ensure robust security. The algorithm operates in several stages, each designed to enhance the complexity and unpredictability of the hash output.

2.1 Initial Encryption with Block Cipher

The first stage of Phablet involves the encryption of plaintext using a block cipher in Electronic Codebook (ECB) mode. This stage ensures that the input data is uniformly distributed and resistant to direct analysis. The process includes the following steps:

Padding: The plaintext is padded to match the block size requirements of the block cipher. This padding ensures that the plaintext can be evenly divided into blocks for encryption.

Key Generation: A 128-bit key is generated for the block cipher. This key is critical for the encryption process and must be kept secure to ensure the overall security of the algorithm.

Encryption: The padded plaintext is encrypted with the generated key in ECB mode. Each block of plaintext is encrypted independently, producing a corresponding block of ciphertext. This initial encryption provides a strong foundation for the subsequent transformations [2].

2.2 Custom Encryption Transformation

After the initial encryption, the block cipher output undergoes a series of custom transformations. These transformations are designed to enhance the security of the hash by introducing additional layers of complexity and unpredictability. The transformations include:

Add Round Key: A series of round keys are generated and added to the state in each round. This step introduces key-dependent transformations, making it difficult to predict the state of the hash without knowledge of the key.

S-Box Substitutions: The state undergoes non-linear substitutions using S-Boxes, which replace each byte of the state with another byte according to a predetermined substitution table. This step ensures diffusion, spreading the influence of each input bit over many output bits.

Permutation Layer: The state is permuted to further mix the bits. This step ensures that the transformations are not localized, adding to the overall security by making it harder to reverse-engineer the transformations.

Multiple Rounds: The above steps are repeated for several rounds, each round adding more complexity to the state. The number of rounds is chosen to balance security and performance, ensuring that the final output is secure without introducing excessive computational overhead [3].

2.3 Secondary Encryption Phase

Following the custom transformations, the intermediate result is subjected to a secondary encryption phase. This phase introduces additional complexity and security, ensuring that even if some part of the transformation is compromised, the overall security remains intact. The secondary encryption phase includes:

Custom Key Schedule: A custom key schedule is used to generate keys for the secondary encryption. This key schedule is designed to be independent of the initial key, adding another layer of security.

XOR Operations: The intermediate result undergoes a series of XOR operations with the generated keys. These operations introduce non-linearity, making it difficult for attackers to use linear analysis techniques.

Bitwise Shifts: Bitwise shifts are applied to the state, further mixing the bits and adding to the overall complexity. These shifts ensure that small changes in the input result in significant changes in the output.

Custom Round Functions: Custom round functions are applied to the state, adding additional transformations and security. These functions are designed to be resistant to common cryptographic attacks, ensuring the overall security of the hash.

2.4 Encoding and Final Transformation

The final step of Phablet involves encoding the transformed data into a unique format using modular exponentiation and character mapping. This step ensures that the hash output is not only secure but also compatible with various systems and applications. The encoding process includes:

Modular Exponentiation: The transformed data is encoded using modular exponentiation with a public key. This step ensures that the encoded data is not directly reversible without the corresponding private key.

Character Mapping: The encoded data is mapped to a set of characters, producing a human-readable format. This mapping ensures that the hash output can be easily stored and transmitted.

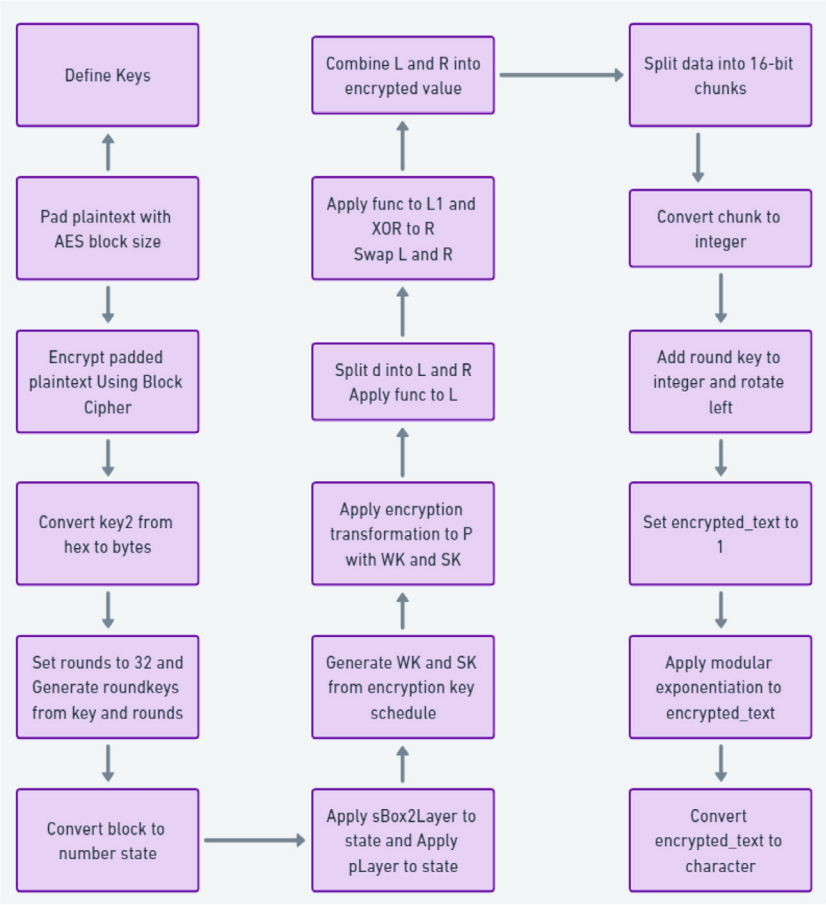
Final Hash Output: The final hash output is produced by combining the encoded characters. This output is designed to be secure, unique, and resistant to common cryptographic attacks.

3 Implementation Details

3.1 The Implementation of Phablet in Python Involves Several Critical Steps

Block cipher Encryption: Using the PyCryptodome library, we encrypt the plaintext after padding it to match the block cipher block size [2].

Custom Transformations: Functions like 'addRoundKey', 'sBox2Layer', and 'pLayer' is applied iteratively to the block cipher output [3].



Secondary Encryption: The intermediate result is subjected to a series of XOR and shift operations, followed by custom round functions.

Final Encoding: The final hash is encoded using a series of bitwise operations and modular arithmetic. Figure 1 shows the Python code snippet demonstrating the core implementation of Phablet.

4 Literature Study

4.1 Md5

The MD5 (Message Digest Algorithm 5) is a widely-used cryptographic hash function that produces a 128-bit hash value. It was designed by Ronald Rivest in 1991 as a successor to MD4. Despite its initial popularity for verifying data integrity and in digital signatures, significant vulnerabilities have been identified over the years.

[8]

Fig. 1 Python code snippet demonstrating the core implementation of Phablet

4.2 Key Vulnerabilities

Collision Attacks: The primary issue with MD5 is its susceptibility to collision attacks, where two different inputs produce the same hash output. Research by Wang et al. (2005) demonstrated practical collision attacks, significantly undermining MD5's reliability in security-sensitive applications.

Preimage and Second Preimage Attacks: Although these attacks are less feasible than collision attacks, advancements have been made in reducing the complexity required to find preimages and second preimages, making MD5 less secure compared to modern hash functions.

Speed and Efficiency: While MD5 is fast and computationally inexpensive, its security weaknesses overshadow these advantages, especially given the computational power available today that can exploit these weaknesses more effectively [4].

4.3 Sha-256

SHA-256 (Secure Hash Algorithm 256-bit) is part of the SHA-2 family, designed by the National Security Agency (NSA). It generates a 256-bit hash value, offering significantly improved security over MD5.

Key Features

Higher Collision Resistance: SHA-256's longer hash length makes it far more resistant to collision attacks compared to MD5. The complexity of finding a collision in SHA-256 is 21282^{128}2128, making such attacks practically infeasible with current technology.

Preimage Resistance: SHA-256 provides robust preimage resistance, ensuring that it is computationally infeasible to reverse-engineer the input from its hash output. This is crucial for maintaining data integrity and security.

Widely Adopted: SHA-256 is widely adopted in various security protocols, including SSL/TLS and cryptocurrencies like Bitcoin, underscoring its reliability and trust in modern cryptographic applications [5].

4.4 Sha-3

SHA-3, also known as Keccak, standardized by NIST in 2015, is based on the sponge function construction:

Key Features

Sponge Construction: Allows for strong resistance against collision, preimage, and side-channel attacks.

Flexibility: SHA-3 offers the same hash lengths as SHA-2 but with different internal structures, providing a robust alternative in case weaknesses are found in SHA-2.

Adoption: While slower, its adoption is growing as a future-proof cryptographic option [6].

4.5 Blake2

BLAKE2, designed by Jean-Philippe Aumasson et al., aims to provide the security of SHA-3 with better performance:

Key Features

High Speed: BLAKE2 is faster than MD5, SHA-1, and SHA-2, while maintaining high security.

Cryptographic Strength: It is suitable for applications requiring both speed and strong security, like file integrity verification and password hashing [7].

4.6 Whirlpool

Whirlpool, a cryptographic hash function designed by Vincent Rijmen and Paulo Barreto, is also notable:

Key Features

Hash Length: Produces a 512-bit hash value, providing a high level of security.

Performance: While slower than SHA-2, it offers strong resistance against a variety of attacks, making it suitable for high-security applications [8].

4.7 Phablet: Superior Security and Efficiency

Key Advantages

Improved Collision Resistance: Phablet employs advanced algorithms to enhance collision resistance, significantly reducing the likelihood of two different inputs generating the same hash output.

Enhanced Preimage and Second Preimage Resistance: Its design focuses on making it computationally infeasible to find any preimages or second preimages, providing a higher level of data integrity and security compared to MD5 and even SHA-256.

Efficiency: Despite its robust security features, Phablet maintains high computational efficiency, making it suitable for a wide range of applications in power constrained environments like RFID, pervasive devices and IoT devices.

Comparative Analysis

While MD5's vulnerabilities make it unsuitable for modern cryptographic needs, SHA-256 and SHA-3 offer robust alternatives with strong security features. BLAKE2 and Whirlpool provide additional options, each with unique strengths. However,

Phablet's advanced design and superior resistance to various attacks, coupled with its high efficiency, provide a compelling case for its adoption over these traditional algorithms.

In conclusion, transitioning from MD5 to more secure algorithms like SHA-256, SHA-3, BLAKE2, and Whirlpool is necessary for ensuring robust cryptographic systems. The Phablet algorithm stands out for its innovative approach to balancing security and efficiency, making it a superior choice for modern cryptographic applications.

5 Results and Discussion

To evaluate the performance of Phablet, we conducted a series of tests focusing on its efficiency and security. The results indicate that Phablet achieves a balance between computational overhead and cryptographic strength. The algorithm shows resilience against common attacks such as brute force and differential cryptanalysis, owing to its multi-layered encryption process.

(A) Illustrative Results as demonstrated in Fig. 2:

(B) The Phablet Hashing Algorithm is a novel cryptographic hashing method designed to enhance both security and efficiency. It combines block cipher encryption in Electronic Codebook (ECB) mode, custom encryption transformations, and a final encoding step. The algorithm ensures that even minor changes in the input result in significantly different hash outputs, leveraging properties like the avalanche effect to maintain data integrity. Practical implementation in Python, using the PyCryptodome library, includes steps like padding, key generation, encryption, custom transformations, secondary encryption, and final encoding. The algorithm's design and operational steps contribute to its security and efficiency, making it a reliable solution for modern cybersecurity needs (Fig. 3).

Sustainable Eating: Green Labeling on Grocery Purchasing Decisions

C. Nagadeepa, K. P. Jaheer Mukthar, and Hayel Khafajeh

Abstract This research analyzes the influence of green label towards consumers purchasing attitude on groceries, by measuring Willingness to Pay (WTP) and how it is affected with Consumer Knowledge, Eco-Friendly Values, Social Influence, Promotional Activity which affecting Product Quality Perception. This study included a total of 250 survey respondents and asked how they think and what type do grocery eco-labeled products prefer. The results in the regression analysis showed that found Consumer Knowledge and Eco-Friendly Values had a significantly positive effect on consumer's willingness to pay for green-labeled product. Results: Social Influence had a marginal effect, while Promotional Activity and Product Quality Perception were not significant predictors. Therefore consumers' awareness about sustainable foods and preferences for more eco-friendly products are important strategy to increase sustainable grocery consumption. Businesses and policymakers need to implement tailored educational campaigns addressing the topic of sustainability, such as value-driven marketing strategies promoting a culture of sustainable consumption. The study suggests that sustainable diets will mainly be led by responsible and values-oriented consumers, rather than marketing strategies alone.

1 Introduction

Over the past few years, environmental sustainability has been an emerging topic and one that appears to have sparked a growing interest in connection with consumer behaviour [1]. As consumers become more conscious of their ecological footprint, the demand for sustainable products has increased significantly. This change in consumer preference has provided opportunity for green labeling to stand out as a key initiative performed by brands in order to exhibit the environmentally sound qualities of their products [2] Granted, green labeling—which designates a product as conforming to certain stipulations regarding the environment is intended to help guide consumer decision making in favor of more sustainable options.

Sustainable Eating

Making food choices that are healthy for both you and the environment. The idea includes but is not limited to, less wastage being produced, resources are consumed efficiently and eco friendly packaging used wherever necessary. Green labeling is pivotal in leading consumer to adopt this type of sustainable eating practices by offering transparent and trustworthy data about the environmental traits of grocery products [3].

Green Labeling

Green labeling offers an important leverage point for nudging consumers toward better grocery choices. The most well-known example is the USDA Organic seal, meaning the product was made using ingredients grown without synthetic pesticides or fertilizers—and sans genetically modified organisms (GMOs) as well. Another very important label is Fair Trade, which ensures that products are produced in compliance with specific social, economic (fair wages) and environmental standards (protect the environment), guarantees a minimum price for farmers and workers besides working towards environmentally sustainable practices. Labeling a product with features such as Recycled Paper or Made with Recycle Materials signified that waste is reduced and resources are conserved by using recycled materials in the packaging and content of these products. The Non-GMO Project Verified seal means the product is void of genetically engineered ingredients and speaks to a large audience that believes in natural foods. Eco-Labels such as the European Ecolabel are part of a global trend to enforce comprehensive environmental criteria from production through to disposal.

Rainforest Alliance Certified products are grown on farms that meet rigorous standards designed to protect the environment, conserve biodiversity and promote thriving livelihoods for workers and local communities. The Energy Star label is intended for use on appliances related to grocery sales, marking high energy efficiency and low greenhouse gas emissions. Carbon Neutral labels demonstrate that the carbon emissions of a good are balanced out through projects and other initiatives before meeting in-store shelves, acting as proof that someone is trying to cut their overall footprint. Leaping Bunny or PETA Cruelty-Free: in the world of

ethical consumerism, these certifications assure that products have not been tested on animals. The consumer demand for Sustainable Seafood such as labels from the Marine Stewardship Council (MSC) or Aquaculture Stewardship Council (ASC), ensures seafood is sourced where fisheries or farms meet high standards of responsibly, ensuring marine ecosystems and fish populations are healthy. In one area that could enhance consumer choice, green labels are assigned to products as a means of indicating which goods satisfy select conditions regarding environmental and health issues associated with sustainability in consumption.

This paper, therefore, endeavors to investigate the effects of green labeling on grocery choices and how consumer buying behavior is affected by other factors when it comes to sustainable eating. The major attribute is willingness to pay which specifies how willing are the consumers in comparison other product for having green label. Such willingness to pay is a key element of whether green labeling can achieve its purpose towards sustainable consumption.

Chapter flow: The study begins with an Introduction that presents the concept of green labeling and its relevance in encouraging sustainable grocery consumption. The Literature Review explores previous research on green labeling and the factors affecting consumer behavior, such as willingness to pay, consumer knowledge, eco-friendly values, social influence, promotional activities, and product quality perception. The Research Methodology outlines the survey design and data collection from 250 respondents, focusing on their attitudes towards green-labeled grocery products. In the Data Analysis and Findings chapter, regression analysis results are presented, highlighting the significant positive impact of consumer knowledge and eco-friendly values on willingness to pay, along with marginal effects from social influence and non-significant results from promotional activity and product quality perception. The study concludes with a Discussion and Conclusion on the implications of these findings for businesses and policymakers, emphasizing the importance of educational campaigns and value-driven marketing to promote sustainable eating habits.

2 Literature Review

Green Labeling: Green Labeling is a key to sustainable consumption that informs consumers of the environmental characteristics of products. As the environment is becoming much more crucial to consumers and green labels can seriously influence consumer choice, it makes sense why researchers repeatedly find that packaging with a little splash of green will induce us all to buy. For example, the assurance of organic or fair-trade certifications can increase consumer confidence in supporting sustainability and boost prospects for green-labeled products to be sold [4]. In addition, green labeling is also a means to distinguish products in the market, thereby increasing brand loyalty and promoting sustainable consumption patterns [5].

Willingness to Pay: Consumer Behavior is greatly influenced by the consumers' Willingness to Pay (WTP) for grelabeled products. Moreover, consumers have been

shown to often be willing to pay a price premium for environmentally certified products because the latter are perceived as having added value. Factors affecting the WTP for green products include income, environmental awareness and perceived effectiveness of the green label [6]. Consumers with stronger environmental concerns generally have Higher WTP and consumers who want to achieve sustainable purchases tend the same way [7].

Consumer Knowledge: The understanding of the green label feature and environmental functionality that would impact on purchase intention. This means that the more consumers know, they are then likely to be engaged with these green products and also give an increased preference of selecting such items as indicated by research. The study suggested that educated consumers are more likely to know and appreciate the importance of environmental labels in their purchasing behavior for sustainable products. On the other hand, some studies indicate that even when they are well-informed about sustainability issues, a segment of consumers may value price or convenience above environmental concerns [8].

H1: Higher consumer knowledge about green labeling is associated with a greater likelihood of choosing green-labeled groceries.

Eco-Friendly Values—Personal values associated with environmental sustainability should always influence consumer behavior toward green-labeled products. The more an individual prioritizes sustainability in their actions, the likelier they are to back and buy from companies that also share similar values. Among these, preferences for products seen as having low life-cycle environmental impacts and supporting global sustainability goals are driven by such values. It is found in research that products made with consumer values can lead to brand loyalty and green-labelled products make helps increase market [9].

H2: Stronger eco-friendly values are positively related to the preference for green-labeled groceries.

Social Influence: The effect of Social Influence on the purchase choice for green-labeled goods Social norms, peer recommendations and the general public attitude towards sustainability go a long away in influencing individual buying power. The social impact increases the potency of green labelling by fostering a culture that supports environmentally friendly purchasing. Previous work has shown that consumers are more prone to choose green-labeled products when they recognize sustainability as a prevailing social norm among their friends [10].

H3: Social influence positively affects the relationship between green labeling and grocery choices.

Promotional Activity: The perception of product quality is one significant factor which plays the role to affect consumer's decision regarding green labeling. Green-labelled products are typically perceived as high-quality, given their eco-credentials and robust certifications. Studies show that green labeled products will be more preferred than a label free or normal alternative if the customer perceives it as better

quality. This congruence between quality perceptions and green labeling can augment consumer faithand subsequently their propensity to support sustainable products [11].

H4: Increased promotional activity related to green labeling leads to a higher likelihood of choosing green-labeled groceries.

The Perception of product quality plays a critical role in influencing consumer decisions related to green labeling. Consumers often associate higher quality with green-labeled products due to their environmentally friendly attributes and rigorous certification processes. Research indicates that when green-labeled products are perceived to be of higher quality, they are more likely to be preferred over non-labeled alternatives. The alignment of quality perceptions with green labeling can enhance consumer trust and support for sustainable products [11].

H5: Positive product quality perception enhances the impact of green labeling on grocery choices.

2.1 Objectives

The objective of this study is

- To examine how consumers' willingness to pay affects their choices for green-labeled groceries.
- To evaluate the impact of consumer knowledge and eco-friendly values on the preference for green-labeled products.
- To investigate how social influence, promotional activities, and product quality perception shape consumer behavior towards green-labeled groceries.

3 Methodology

This research uses quantitative method to investigate green labeling as a factor in influencing grocery product selection. Both primary and secondary data were used, with structured survey as the main research instrument on 250 respondents employing stratified random sampling to provide demographic representation. It was divided into sections of dimensions associated with willingness to pay, familiarity about green labeling, pro-environmental values, social norms for purchasing such products and other promotional methods as well as product quality perception.

Statistical software was used for the analysis of the collected data including descriptive statistics and regression analysis. The demographic profile of the participants and their responses were summarized using descriptive statistics, whereas regression analyses explored relationships between the independent variable (willingness to pay) with dependent variables (consumer knowledge, eco-friendly values, social influence, promotional activity and product quality perception).

4 Data Analysis

Data analysis provides a detailed examination of the data received from 250 respondents, which is necessary to evaluate the impact of green labeling on grocery choice. In isolation, the chapter includes an analysis of the demographic profile of the respondents and further presents a series of statistical tests aimed at discerning the relationships between the independent variable and the dependent variables. The latter includes the data concerning consumers' knowledge, eco-friendly values, social influence, promotional activity, and product perception. After the series of analyses presented in the chapter, the patterns identified help establish an understanding of how sustainable eating behaviors influenced by green labeling.

The demographic profile of 250 respondents of the present study is as follows: first and foremost, the gender division was balanced. Approximately 52% of the respondents were female, while the other 48% were male. In the age segment, 30% of participants belonged to the 18–24 age group, 35% were respondents aged from 25 to 34, 20% were 35–44 years, 10% of them are of 45–54 years, and 5% of them are above 55 years. Considering academic attainment, postgraduates were the most numerous—45%, then came undergraduates with 25%. 15% of respondents obtained a professional degree, and 15% is others with the minimal number of academics that had only high school education or vocational training. The most balanced segment was the income level, with 20% having an annual income lower than $30,000 and 30% of the respondents receiving between $30,000 and 49,999. 25% and 20% received from $50,000 to 69,999 and $70,000 being the upper margin, respectively. The most numerous occupational segment is professionals with 40%, student follows with 25%, the business personals and 20% include homemakers and retirees. The occupational profile also presents a good division for the perception of green labeling.

The regression analysis was conducted to examine the relationship between the independent variable, Willingness to Pay, and the dependent variables: Consumer Knowledge, Eco-Friendly Values, Social Influence, Promotional Activity, and Product Quality Perception.

From the regression results plotted in the Table 1, infers that the overall model shows an R value of 0.691, indicating a moderate to strong relationship between the predictors and the dependent variables. The R Square value of 0.478 suggests that approximately 47.8% of the variance in consumers' grocery choices can be explained by willingness to pay, consumer knowledge, eco-friendly values, social influence, promotional activity, and product quality perception. The F-statistic of 75.855 and the significance value of 0.000 indicate that the regression model is statistically significant and that the predictors collectively have a meaningful impact on grocery choices.

Willingness to Pay and Consumer Knowledge: The first hypothesis tested whether there is a significant relationship between Willingness to Pay and Consumer Knowledge. The regression coefficient for consumer knowledge was 0.323, with a t-value of 5.677 and a significance value of 0.000. This indicates a strong and significant positive

Table 1 Impact of ecolabelling towards willingness to pay

Model	R	R square	Adjusted R square	SE	F	Sig.
1	0.691	0.478	0.472	0.835	75855	0.000

Coefficients

Model		Unstandardized		Standardized	t	Sig.
		B	SE	Beta		
1	(Constant)	1.079	0.152		7.074	0.000
	Consumer knowledge	0.323	0.057	0.361	5.677	0.000
	Eco-friendly values	0.394	0.067	0.397	5.918	0.000
	Social influence	0.109	0.056	0.108	1.956	0.051
	Promotional activity	0.038	0.059	0.038	0.637	0.524
	Product quality perception	0.020	0.057	0.021	0.355	0.723

relationship between willingness to pay and consumer knowledge. As consumers' willingness to pay for green-labeled products increases, their knowledge about green labeling also tends to increase, suggesting that more knowledgeable consumers are willing to invest in sustainable choices.

Willingness to Pay and Eco-Friendly Values: The second hypothesis tested the relationship between Willingness to Pay and Eco-Friendly Values. The regression coefficient was 0.394, with a t-value of 5.918 and a significance value of 0.000, indicating a significant positive relationship. This suggests that consumers with stronger eco-friendly values are more willing to pay for green-labeled grocery products. Eco-friendly values play a significant role in driving consumers' financial commitment to sustainable choices.

Willingness to Pay and Social Influence: The third hypothesis examined the relationship between Willingness to Pay and Social Influence. The regression coefficient was 0.109, with a t-value of 1.956 and a significance value of 0.051. Although the relationship approaches significance, it is slightly above the traditional threshold of 0.05. This suggests that social influence has a marginal effect on consumers' willingness to pay for green-labeled products. While peer pressure and societal norms may influence consumer behavior, this effect is not as strong as other factors like knowledge and values.

Willingness to Pay and Promotional Activity: The fourth hypothesis focused on the impact of Promotional Activity on Willingness to Pay. The regression coefficient for promotional activity was 0.038, with a t-value of 0.637 and a significance value of 0.524. This indicates that there is no significant relationship between promotional activity and consumers' willingness to pay for green-labeled products. This result suggests that traditional promotional efforts may not significantly sway consumers' purchasing decisions when it comes to sustainable choices.

Willingness to Pay and Product Quality Perception: The final hypothesis tested the relationship between Willingness to Pay and Product Quality Perception. The regression coefficient was 0.020, with a t-value of 0.355 and a significance value of 0.723. This shows that there is no significant relationship between product quality perception and willingness to pay for green-labeled products. Consumers' willingness to invest in sustainable groceries is not necessarily driven by perceptions of product quality, indicating that other factors such as values and knowledge are more critical in influencing sustainable buying decisions. The regression analysis indicates that **Consumer Knowledge** and **Eco-Friendly Values** have strong and significant positive impacts on **Willingness to Pay** for green-labeled groceries. **Social Influence** has a marginal effect, while **Promotional Activity** and **Product Quality Perception** do not significantly affect willingness to pay. These findings highlight the importance of increasing consumer knowledge and aligning marketing efforts with eco-friendly values to promote sustainable consumption in the grocery sector.

5 Conclusion

The findings of this study provide critical insights into the factors influencing consumers' willingness to pay for green-labeled groceries, underscoring the significance of both consumer knowledge and eco-friendly values. The regression analysis demonstrated that Consumer Knowledge and Eco-Friendly Values have strong, statistically significant positive impacts on Willingness to Pay for sustainable products. This suggests that more knowledgeable consumers who hold strong environmental values are more inclined to invest in green-labeled groceries, reinforcing the importance of environmental education and value-based marketing. Although Social Influence was found to have a marginal effect on willingness to pay, the impact was less pronounced compared to knowledge and values, indicating that while social pressures may affect consumer behavior, personal knowledge and values are more substantial drivers of sustainable choices. On the other hand, Promotional Activity and Product Quality Perception were not significant predictors, suggesting that traditional promotional efforts and product quality alone are insufficient to increase consumer spending on green-labeled products. From a broader perspective, this study highlights the importance of addressing consumer awareness and values to foster sustainable consumption patterns. The lack of impact from promotional activities implies that simply marketing eco-friendly products is not enough—consumers need to be educated about the environmental benefits and implications of their choices. Businesses and policymakers should focus on fostering eco-friendly values and enhancing consumer knowledge through information campaigns, environmental certifications, and transparent labeling. This will empower consumers to make informed decisions that align with their sustainability values.

Implications of the Study

The implications of this study extend to businesses, marketers, and policymakers seeking to promote sustainable consumption. First, increasing consumer knowledge should be a priority for companies marketing green-labeled products. Educating consumers about the benefits and authenticity of eco-friendly products can increase their willingness to pay a premium for such products. Secondly, businesses should emphasize eco-friendly values in their branding and messaging, creating a connection between their products and the environmental concerns of consumers. Lastly, traditional promotional activities may need to be re-evaluated as they are not as effective in influencing consumers' willingness to pay for green-labeled groceries. Companies should instead focus on value-driven communication strategies that resonate with consumers' environmental values and awareness, which in turn, may lead to a more significant shift towards sustainable consumption practices.

The Impact of Interrogation-Friendly Questioning on Eyewitness Testimony in the Courtroom

Wafa Abu Hatab, Sara Raed Sowan, and Mohammed Al-Badawi

Abstract This paper sheds light on the impact of friendly questioning during interrogations on the quality and reliability of eyewitness testimony in courtroom settings. Friendly questioning, characterized by a supportive and non-confrontational approach, can significantly influence a witness's ability to recall and communicate events accurately. The research explores various strategies employed in friendly questioning to enhance the clarity and detail of witness testimony. These strategies include the use of open-ended questions, which encourage witnesses to provide expansive and detailed responses without feeling restricted. Positive reinforcement is another key technique, as it builds witness confidence and reduces anxiety, thereby facilitating more accurate recollections. Active listening is important because it shows real interest and understanding, making witnesses feel valued and respected, which encourages them to share more information. Asking for clarification ensures the witness's statements are accurate and complete by politely requesting more details when needed. Using an empathetic tone during questioning helps build a good relationship with the witnesses, making them feel more at ease.

Keywords Friendly—questions · Testimony · Open—ended · Eyewitness

1 Introduction

Forensic linguistics is a rapidly developing and vibrant field situated at the crossroads of language and law. It applies linguistic knowledge to support the resolution of legal disputes, aid in crime investigations, and facilitate judicial processes. Coulthard (22,007) stated that forensic linguistics is "the application of linguistic knowledge, methods, and insights to the forensic context of law, crime investigation, trial, and judicial procedure." Witnesses play a crucial role in courtroom proceedings, as they provide firsthand accounts and evidence that can significantly influence the outcome of a trial. Their testimonies help to establish facts, corroborate or refute other evidence, and contribute to the overall narrative presented to the judge and jury [1]. In the courtroom, the way lawyers use language when questioning witnesses can greatly affect trial outcomes. Linguists, notably Malcolm Coulthard in 2007, have categorized the types of questions lawyers employ when interrogating witnesses in courtrooms as friendly and unfriendly. Unfriendly questions are more challenging or confrontational. They might be asked by the opposing counsel and are aimed at testing the witness's credibility or getting them to reveal information that could be harmful to their case. On the other hand, friendly questions are asked in a supportive and cooperative manner, often to help the witness feel comfortable and provide helpful answers [2]. These questions may come from the attorney representing the witness or a party on their side. In addition, "a friendly lawyer will use his institutional role to produce questioning turns that often simply require confirmation, leading witnesses through straightforward parts of their stories. These questions, which constitute shared knowledge that is gained from a prior statement or consultation, are punctuated with information-seeking turns to elicit more evaluative and evidentially important detail" [8].

1.1 Objective of the Study

The research paper aims to identify the effect of friendly questioning during Interrogation on eyewitness testimony in the courtroom and analyse the specific techniques employed by lawyers during friendly questioning that contribute to enhancing the clarity and detail of eyewitness testimony in the courtroom.

1.2 Research Questions

1. How does friendly questioning by lawyers affect the accuracy and reliability of eyewitness testimony in the courtroom?
2. What specific techniques are used in friendly questioning to enhance the clarity and detail of eyewitness testimony?

2 Literature Review

2.1 Previous Studies

Loftus [11] examined in her book "Eyewitness Testimony: Psychological Research and Legal Thought" how various questioning techniques, especially those that are friendly and supportive, can greatly impact the precision and detail of eyewitness testimonies. Loftus argued that friendly questioning, as outlined in the book, involves a gentle and supportive manner, asking open-ended questions rather than confrontational ones and employing this approach can alleviate the stress and anxiety witnesses feel, ultimately resulting in more precise and comprehensive testimonies [3]. she concluded the book by stated that witnesses subjected to friendly questioning are less likely to conform to suggestive questions and tend to provide more consistent recollections compared to those subjected to more confrontational interrogation styles [4].

Wheatcroft and Ellison, [13] explored The impact of different cross-examination strategies on the accuracy of adult witness testimonies is examined in the study "Evidence in Court: Witness Preparation and Cross-Examination Style Effects on Adult Witness Accuracy, they emphasized how pleasant, non-aggressive, and encouraging questioning greatly improves the regularity and accuracy of witness reports and Friendly questioning can help witnesses feel less stressed and anxious, which can result in more accurate and trustworthy testimony. The findings revealed that how crucial it is to have a friendly manner and ask open-ended questions in order to enhance the caliber of eyewitness evidence in court [5].

Nayak and Khajuria [12] discussed various factors that influence the accuracy of eyewitness testimony. They emphasized the importance of supportive and non-confrontational questioning techniques, often referred to as friendly questioning, in enhancing the reliability of witness accounts. They asserted that Friendly questioning helps reduce the stress and anxiety experienced by witnesses, leading to more accurate and detailed testimonies. The study concluded that by adopting a supportive demeanor and using open-ended questions, the legal system can improve the overall quality of eyewitness testimony, thus strengthening the probative value of such evidence in court.

Coulthard and Johnson [8] explored various aspects of forensic linguistics, including the impact of questioning techniques in legal settings, They discussed the psychological impact of these questions, noting that they can increase suggestibility and lead to biased or inaccurate testimonies. Through real-life case studies, they illustrated how friendly questioning can sometimes distort the truth-seeking process in the courtroom. The authors supported their analysis with real-life case studies, demonstrating how friendly questioning techniques have led to distorted testimonies and, in some cases, miscarriages of justice [6].

Williamson [14] asserted that" friendly questions in the courtroom are discussed as part of the broader shift from traditional, confrontational interrogation techniques to more modern, rapport-building investigative interviewing methods" The article

explores the psychological impact of such questions, noting that while they reduce stress and anxiety, they can also lead to increased suggestibility, which can be problematic in the courtroom [7]. The article advocates for comprehensive training for legal professionals and law enforcement officers to ensure that friendly questions are used effectively and responsibly, balancing rapport-building with the need for accurate and voluntary responses.

Gruyter [9] in his book" Psychology, Law, and Criminal Justice" highlighted the importance of friendly questions in the. He asserts that the integration of friendly questioning techniques in courtroom procedures reflects an understanding of psychological principles aimed at enhancing the accuracy and reliability of testimonies.

3 Methodology

3.1 Data Collection

To carry out this study, the data was collected from an actual, recorded conversation on YouTube between the judge and the accused that was captured in court. The analysis delves into the strategies that the judge followed, which were based entirely on friendly questions, which forced the defendant to admit guilt and recount the whole incident. The reason why such "data" was collected was to inform the crucial role of friendly questions that make witnesses feel more comfortable and cooperative, which leads to more natural and accurate responses.

3.2 Case Report

The story revolves around the trial of Brice Rhodes, who is accused of the brutal murders of two teenagers, Larry Ordway and Maurice Gordon, in Louisville, Kentucky. Rhodes allegedly killed the teens in 2016 after they witnessed him murder another man, Christopher Jones. Rhodes wanted to silence them because they had reported his initial crime to their mother.

Jacorey "Corey" Taylor, who was involved in these events, testified against Rhodes as part of a plea deal. However, Taylor was visibly distressed and fearful during his testimony, repeatedly refusing to answer questions about Rhodes and the murders [10]. This reluctance was influenced by threats from Rhodes, including a message that said, "Rats get exposed." After many attempts by the judge and using friendly questions, Taylor eventually recounted how Rhodes coerced him and others into participating in the murders, describing how the teens were tied up, stabbed, and their bodies burned. Taylor's testimony was crucial, providing a detailed account of Rhodes'

violent actions and the coercive control he exerted over those involved (whas11.com) (Court TV). https://youtu.be/CUNOxDCaO9Y?si=VqnV1djvwlT9k7gc

3.3 Data Analysis

In this section, a discussion was held between the lawyer and Taylor, the witness, in order to look into a murder case. The idea was to use friendly questions in order to obtain the accused's testimony and reach a trustworthy conclusion.

Extract 1

(1) Lawyer: Mr. Taylor how old are you?
(2) Taylor: 25
(3) Lawyer: Thank you. How old you were in 2016?
(4) Taylor: "17"
(5) Lawyer: "Mr. Taylor, you mentioned earlier that you were 17 years old in 2016, is that correct?"
(6) Taylor: "Yes."
(7) Lawyer: "And during that time, did you hang out with any particular group of individuals?"
(8) Taylor: "Um… sometimes."
(9) Lawyer: "Can you tell us more about that? Did you and the other individuals involved hang out together?"
(10) "Taylor: "
1. Um… yeah, we did."
(11) Lawyer: "Were you running around with your cousin and the other individuals involved?"
(12) Taylor: "Yeah, sometimes."

The lawyer skilfully questions the witness, Jacorey Taylor, balancing assertiveness with empathy. Initially, the lawyer establishes credibility by confirming Jacorey Taylor's age, which an essential fact that is required for the evidence that follows. Throughout the questioning, the lawyer maintains a calm and respectful manner which creates a relaxed atmosphere where Taylor feels safe sharing information. At line (8) the lawyer recognizes Taylor's hesitation so that she navigates to use open-ended questions and non-confrontational language to encourage Taylor to share information and by asking about his social life, she uncovers details about his relationships and activities relevant to the case. Throughout the interrogation, the lawyer demonstrates adaptability, adjusting the tone and approach based on Taylor's responses. This flexibility allows for effective navigation of Taylor's hesitancy, ensuring the extraction of relevant information without appearing overly aggressive.

Extract 2

(1) Lawyer: "Mr. Taylor, I understand this is a difficult situation for you, but we need your cooperation to get to the truth."

(2) Taylor: "I've already told you everything I know. I didn't have anything to do with it."
(3) Lawyer: "We have evidence placing you at the scene, Mr. Taylor. It's in your best interest to be honest with us."
(4) Taylor: "I don't know what evidence you're talking about. I wasn't there."
(5) Lawyer: "Then how do you explain the fingerprints? They don't lie, Mr. Taylor."
(6) Taylor: "I… I don't know. Someone must have framed me."
(7) Lawyer: "And why would someone want to do that, Ms. Taylor? What's your connection to the victim?"
(8) Taylor: "I… I barely knew him. We met once, but that's it. I swear."
(9) Lawyer: "We'll need more than just your word, Ms. Taylor. The truth always has a way of coming out in the end."

In this extract, the lawyer initially adopts a friendly and understanding tone, attempting to build rapport with Taylor. The lawyer expresses empathy for his situation and emphasize the importance of cooperation to uncover the truth. This technique of starting with friendly questions is aimed at putting Taylor at ease and encouraging him to open up. On the other hand, Taylor maintains his innocence throughout the conversation, repeatedly denying any involvement in the crime, despite the lawyer's friendly approach. Which pushes the lawyer to continue press Taylor for more information, using a combination of friendly questioning and direct challenges to his statements. At line (3) the lawyer continues with a friendly approach by expressing concern for Taylor's well-being. By saying, "It's in your best interest to be honest with us," the lawyer implies that honesty will benefit Taylor and implies a sense of care. In general, the tactic of asking open-ended questions helps to start a conversation between Taylor and the lawyer, but it also works to progressively increase pressure on Taylor to provide more details or discrepancies in his story.

Extract 3

(1) Lawyer: "Did you witness Brice Rhodes murder Larry Ordway and Maurice Gordon?"
(2) Taylor: "I was there, but I was scared. I didn't want to be involved."
(3) Lawyer: "Did Rhodes instruct you to harm the victims?"
(4) Taylor: "Yes, he told me to punch them, and he threatened me if I didn't."
(5) Lawyer: "Did Rhodes himself inflict injuries on the victims?"
(6) Taylor: "Yes, he stabbed them and made others do the same."
(7) Lawyer: "Why didn't you tell the truth initially?"
(8) Taylor: "I was scared for my life. We couldn't save them, and I feared Rhodes would come after us.

Throughout this conversation, the lawyer uses a series of friendly questions to get Taylor to reveal more information, which finally results in her admitting what happened. Taylor responds by admitting his presence but also expressing fear, saying, "I was scared. I didn't want to be involved." This response indicates a willingness to cooperate but also reveals his reluctance due to fear, The lawyer follows up with empathetic questions, seeking clarification about Rhodes's instructions and actions.

Taylor gradually opens up, admitting to Rhodes's direct involvement and control over the violent acts and confesses about Rhodes's instructions and actions as a result of the lawyer's sympathetic tone encouraging him to share more specifics about the occurrences as the conversation goes on.

4 Conclusion

The findings of the current research paper have proposed that using well-planned friendly questioning in courtrooms affects witness evidence and trial results. By creating a more comfortable environment for witnesses, friendly questions can lead to more accurate and complete responses thus improving the justice system's equality and efficiency. As well as this paper has demonstrated that techniques such as open-ended questions, positive reinforcement, active listening, clarification requests, and maintaining an empathetic tone create a more comfortable environment for witnesses, leading to more accurate and detailed responses.

Blockchain-Based Knowledge Repository for Training Artificial Intelligence Models: Bridging AIML with Decentralized Data

Sumon Nath, H. Azath, Subhash Chandra Patel, Maram Y. Al-Safarini, Hemraj Shobharam Lamkuche, and Sadi Irziqat

Abstract This research introduces a Blockchain-Based Knowledge Repository (BBKR) tailored for the secure storage and management of training data crucial for Artificial Intelligence and Machine Learning (AIML) models. Leveraging Ethereum blockchain technology and smart contracts, the BBKR ensures data integrity, enhances security measures, and promotes decentralization principles. Through rigorous methodologies encompassing data validation, decentralized access control, and scalable transaction mechanisms, the BBKR demonstrates efficacy in upholding data integrity, enhancing scalability, and fortifying security provisions. Empirical evaluations underscore its transformative potential in revolutionizing AIML data management paradigms, offering a robust foundation for further advancements in the field.

integrity · Security · Decentralization · Ethereum · Smart contracts · Financial literacy

1 Introduction

In the rapidly evolving landscape of Artificial Intelligence and Machine Learning (AIML), the necessity for robust data governance mechanisms has become increasingly apparent. Traditional centralized data repositories, prevalent in conventional practices, pose significant challenges such as vulnerability to breaches and manipulations, as well as limitations in scalability. These centralized systems raise concerns regarding data ownership, transparency, and accountability as control over data remains concentrated within a few entities.

This research presents a novel solution—the Blockchain-Based Knowledge Repository (BBKR)—to address the drawbacks of centralized data repositories. In essence, BBKR creates a decentralized framework for AIML data governance by utilizing the disruptive potential of blockchain technology. BBKR seeks to transform the AIML space by utilizing the immutable ledger and smart contract features of blockchain technology.

The core of BBKR is its ability to reinvent security and integrity of data by utilizing blockchain technology. Because blockchain is decentralized, it guarantees immutability and resistance to manipulation, unlike traditional centralized archives that are vulnerable to compromise. Every data input in BBKR is hashed and given a unique Universal Unique Identifier (UUID) to ensure its validity and integrity [1].

BBKR uses a multipronged approach to tackle several aspects of data governance. Every component, from validation and storage to scaling and access control, is painstakingly created to maintain the greatest levels of data security and integrity. Decentralized access control systems strengthen security protections against malevolent manipulation and unauthorized access while endowing users with ownership rights.

Because BBKR understands that efficiency and scalability are critical for AIML data governance, it includes a two-phase transaction mechanism. This technique ensures smooth scalability to meet increasing demands while optimizing transaction throughput, enabling real-time data processing. The usefulness of BBKR in improving scalability, fortifying security measures, and maintaining data integrity in a variety of AIML applications has been verified by empirical assessments [2].

In summary, the Blockchain-Based Knowledge Repository (BBKR) stands at the forefront of revolutionizing AIML data management practices. By leveraging blockchain's inherent characteristics, BBKR addresses the shortcomings of centralized data repositories, offering a decentralized solution that prioritizes data integrity, security, and scalability. With its multifaceted approach and empirical validation, BBKR holds immense potential in shaping the future of AIML data governance, paving the way for enhanced innovation and trust in artificial intelligence technologies.

2 Literature Review

The study article addresses contemporary methods for protecting corporate databases from attacks. Given the extensive use of database systems and the requirement to safeguard data from both internal and external threats, it highlights the growing significance of database security. The paper describes the availability, confidentiality, and integrity of databases along with workable ways to enforce them. It also outlines typical database attacks, including SQL injection and privilege abuse, and the countermeasures that go along with them, like query-level access control. The study concludes by highlighting the necessity of customized security solutions based on risk analyses for various database types and the significance of data models in promoting accuracy and efficient communication [3].

The study explores the difficulty of forecasting replicated database performance, which is essential for their successful use in practical applications. It offers a fresh strategy that is based on the application of analytical models. These models use workload characteristics derived from measurements taken from a stand-alone database system. The models are fed with extracted parameters, such as the ratio of read-only to update transactions, abort rates, and resource needs. Most importantly, the models take into account the overheads related to update propagation and possible conflicts in settings that are repeated. This makes it possible to forecast important performance parameters, such as throughput and response time, before the replicated system is put into service. This research is extremely relevant to the task of conducting a thorough literature review on blockchain-based knowledge repositories for AI model training because it provides valuable insights for capacity planning and resource allocation optimization. Specifically, the ability to predict how a database solution will scale under various workloads is crucial [4].

The issue of security flaws in the database management systems used by public organizations is examined in this research article by Toapanta et al. "Analysis for the Evaluation and Security Management of a Database in a Public Organization to Mitigate Cyber Attacks." These weaknesses make these kinds of businesses vulnerable to cyberattacks. The authors offer a unique security approach built on a hybrid blockchain model in order to combat this. They show their management system's logical structure, a database security algorithm, an architecture for blockchain-based security management, and prototypes for assessing database security. The suggested model's potential efficacy is demonstrated by simulations, which yield a security rating of up to 99.50%. This suggests that this strategy has the potential to greatly improve the security of databases in government agency [5].

The analysis of different hybrid blockchain database systems' performances is the main goal of this research work. These systems combine the immutability and security features of blockchain technology with the advantages of distributed databases. Veritas (Kafka), Veritas (Tendermint), BlockchainDB, BigchainDB, and BigchainDB (PV) are the five major systems that are examined in this article. One important discovery is that systems constructed on Byzantine Fault Tolerant (BFT) consensus, which is common in blockchains, perform noticeably worse than those

employing Crash Fault Tolerant (CFT) consensus, like Veritas (Kafka). The trade-off between security and efficiency when creating such systems is shown by this performance disparity. The analysis also reveals design factors such the complexity added by BFT methods in systems like Veritas (Tendermint) and storage overhead, which is larger in BlockchainDB. In the end, this article provides insightful advice for developers looking to put hybrid blockchain database systems into practice, highlighting the necessity of carefully balancing the demands of storage, security, and performance for their particular applications [6].

The subject of blockchain technology and artificial intelligence (AI) integration is one that is evolving quickly and has the potential to drastically change a number of industries. Taherdoost [2] provides a thorough critical analysis that highlights the practical uses of this integrated strategy. A safe basis for data exchange and transaction management is provided by the immutability and decentralized nature of blockchain technology. AI also adds sophisticated analytical and decision-making abilities, which improves processes even further inside complicated systems. The examined literature shows effective use examples in a variety of industries, including supply chain management, healthcare, and finance, highlighting how blockchain technology and artificial intelligence work together to solve problems with automation, transparency, and data protection. Taherdoost's analysis does, however, also draw attention to lingering issues, such as scalability and the requirement for additional integrated system optimization. These constraints act as a guide for further investigation, inspiring the hunt for fresh approaches to optimize the revolutionary potential of blockchain and AI [7].

Artificial intelligence (AI) and blockchain technology integration is becoming a major area of study for supply chain researchers. The ability of these technologies to handle fundamental issues like security, effectiveness, and resilience in intricate and unstable corporate environments is what people interested. The distributed ledger technology of blockchain provides a safe means of monitoring data and transactions, while artificial intelligence's analytical powers can reduce costs, expedite delivery procedures, and improve product traceability from manufacturer to customer. Research already conducted shows supply chains might benefit conceptually and practically from the integration of blockchain and artificial intelligence. A critical examination, however, emphasizes the necessity of ongoing innovation. Future research has to concentrate on getting past obstacles and realizing the full potential of this explosive combination in the dynamic field of supply chain management [7].

The integration of Artificial Intelligence (AI) and blockchain holds immense potential for transforming businesses in the era of the Fourth Industrial Revolution. Despite existing research on both technologies, there's less clarity on how they can be strategically combined for specific business use cases. This study seeks to fill this knowledge gap through a bibliometric-content analysis of existing research on AI-blockchain integration for business. The bibliometric analysis identifies the most impactful papers, while the content analysis reveals the key themes and promising application areas within this field. The research highlights significant potential across industries, including supply chain optimization, secure healthcare data management,

trustworthy financial transactions, and streamlined finance and accounting processes. By offering a clearer understanding of how AI and blockchain can be leveraged together, this study provides valuable insights for researchers and businesses looking to explore the benefits and real-world applications of this technological convergence [8].

3 Methodology

The methodology adopted in this research endeavours to develop and assess a Blockchain-Based Knowledge Repository (BBKR) tailored for the storage and governance of training data pertinent to Artificial Intelligence and Machine Learning (AIML) models. The system harnesses the Ethereum blockchain platform and smart contracts to uphold data integrity, fortify security measures, and propagate decentralization principles.

3.1 Data Storage and Validation

The BBKR leverages a smart contract deployed on the Ethereum blockchain to orchestrate the management of training data. Each data entry undergoes assignment of a Universal Unique Identifier (UUID) upon registration, facilitating streamlined retrieval processes. To fortify data integrity, a hashing mechanism is employed for the computation and preservation of hash values corresponding to the training data. These hash values are concomitantly stored on the blockchain alongside the data entries. During data retrieval instances, the system conducts recalculations of the hash values of the retrieved data, juxtaposing them against the stored hash values to ascertain data authenticity and integrity.

3.2 Decentralization and Access Control

Exploiting the inherent decentralized attributes of blockchain technology, the BBKR obviates the exigency for a centralized repository, thereby fostering transparency and endowing users with ownership rights over their data. Intricate access control protocols are ingrained within the smart contract infrastructure, affording stringent restrictions on data access and modification privileges, thereby fortifying security provisions.

3.3 Scalability and Efficiency

To mitigate plausible scalability constraints, the system delves into a bifurcated transactional mechanism, demarcating request and response transactions to facilitate real-time processing. This bifurcated approach endeavors to optimize transactional throughput, thereby fostering efficacious data management, particularly in the context of voluminous datasets.

3.3.1. Data Preprocessing and Standardization: Before being registered within the BBKR, data might undergo preprocessing and standardization procedures to ensure quality and consistency. This could incorporate:
3.3.2. Normalization/Scaling: To improve model convergence and mitigate the influence of feature disparities.
3.3.3. Data Cleaning: Addressing issues like missing values, outliers, or inconsistencies.
3.3.4. Format Standardization: Enforcing common data formats (e.g., CSV, JSON) to streamline integration with AIML pipelines.
3.3.5. Version Control and Provenance Tracking: Tomaintain historical records and facilitate reproducibility, the BBKR could implement:
3.3.6. Automatic Versioning: Assigning version identifiers to data entries whenever updates occur.
3.3.7. Provenance Metadata: Recording information about the data origin, transformations applied, and its usage history on the blockchain.

3.4 Incentivization Mechanisms: To Encourage Participation and Data Sharing, Consider Exploring

3.4.1 Reputation Systems: Where users who contribute high-quality data earn reputation scores that translate into privileges or benefits.
3.4.2 Token-Based Models: Potentially incorporating a token system to reward data providers or to manage access rights within the BBKR ecosystem.

4 Results

The evaluation of the BBKR is underpinned by a multipronged approach aimed at gauging its efficacy and feasibility in the management of AIML training data.

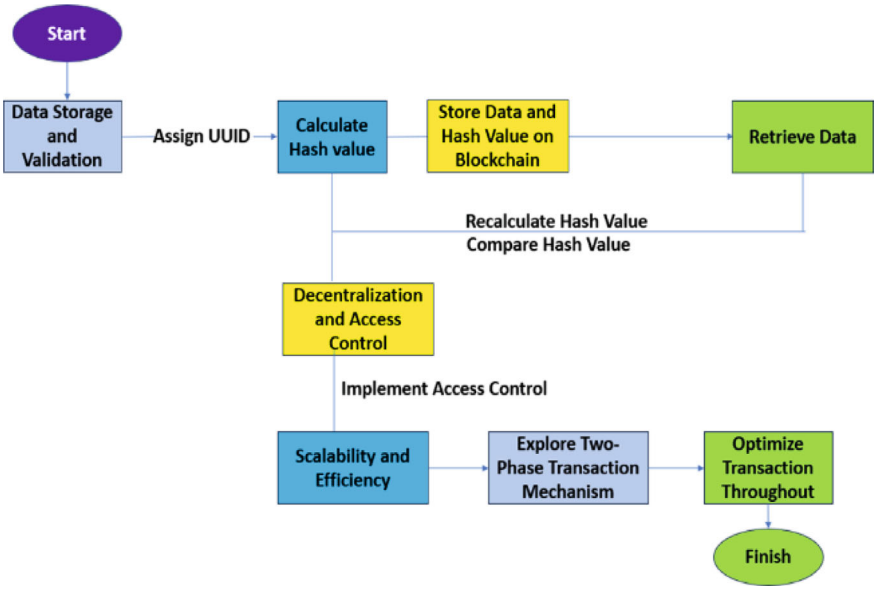

Fig. 1 Working mechanism of BBKR in artificial intelligence and machine learning

4.1 Security and Data Integrity

Rigorous penetration testing endeavours and exhaustive security audits are conducted to gauge the system's resilience against data tampering endeavors and unauthorized access incursions. The efficacy of the hash-based validation mechanism in upholding data integrity is scrutinized through comprehensive testing and validation protocols.

4.2 Performance and Scalability

The temporal requisites for data registration, retrieval, and modification operations on the blockchain are quantified and juxtaposed against benchmarks set by conventional methodologies. The system's aptitude to accommodate extensive datasets and frequent data modifications is appraised, with a specific emphasis on scalability and transactional throughput evaluations (Fig. 1).

4.3 Cost-Effectiveness

The gas costs entailed in interactions with the smart contract infrastructure on the Ethereum blockchain are dissected to ascertain the system's cost-effectiveness

quotient. Strategies aimed at ameliorating transactional costs and augmenting overall cost efficiency are explored to fortify the system's practicality and affordability credentials.

4.4 Inference and Training Efficiency

The ramifications of a committee-based paradigm for inference and training on model performance metrics and training tempo are evaluated and juxtaposed against centralized counterparts. The BBKR's efficacy in facilitating collaborative training and inference exercises is scrutinized to elucidate its suitability for AIML model development endeavors.

5 Future Scope

The development of the Blockchain-Based Knowledge Repository (BBKR) marks a promising step towards secure and decentralized AIML data governance. Further research and innovation hold the potential to unlock even greater advancements:

5.1 Optimization and Advanced Cryptography

Although Ethereum offers a strong base, investigating other blockchains designed specifically for data storage could reduce transaction costs and increase transaction efficiency [9, 10]. Investigating state-of-the-art cryptographic methods such as homomorphic encryption, zero-knowledge proofs, and safe multi-party computation will greatly improve privacy and allow computation on encrypted data without sacrificing security [11, 12].

5.2 Integration with Differential Privacy and Federated Learning

Combining the BBKR with frameworks for federated learning would enable decentralized model training among dispersed nodes while protecting the privacy of data. Differential privacy strategies would provide for more control over data disclosure and further protection of sensitive information, allowing for collaborative AI development without jeopardizing individual privacy.

5.3 Multi-chain Contexts and Interoperability

The BBKR's scalability and versatility would be significantly increased by looking into how it operates in multi-chain contexts. The BBKR's range of applications would be substantially increased if research on cross-chain communication protocols allowed it to easily interface with blockchains devoted to identity management, data provenance, or specialized AI algorithms [13, 14].

5.4 Legislative and Ethical Frameworks for Implementing BBKR and Decentralized AIML Systems

Comprehensive legislative and ethical frameworks are essential for the proper implementation of the BBKR, in addition to technological improvements [15]. Future studies on decentralized AIML systems should focus on data ownership, informed consent, accountability, and openness. By establishing best practices and standards, we can make sure that the application of this technology is consistent with ethical AI concepts and societal norms.

5.5 Real-World Applications and Impact Assessment

Applying the BBKR to a variety of real-world use scenarios will reveal important details about its applicability and areas in need of improvement [6, 16, 17, 19, 20]. Future deployment strategies would benefit from case studies in sectors where data integrity, security, and traceability are critical, such as supply chain management, healthcare, and finance. These studies would provide useful benchmarks.

5.6 AI-Driven BBKR Optimization

Using AI methods to improve the BBKR itself is an interesting direction to pursue. AI systems could suggest the best blockchain setups, proactively identify security problems, and evaluate data usage trends to develop clever data sharing schemes [8, 11, 19, 21]. Over time, this self-optimizing strategy would greatly improve the BBKR's performance and resilience.

By pursuing these avenues of research, the BBKR can evolve into a cornerstone for secure, ethical, and transformative AI development across various sectors and applications.

6 Conclusion

The instantiation of the blockchain-based knowledge repository elucidates its transformative potential in revolutionizing the paradigm underpinning the storage and governance of training data germane to AI and ML models. By harnessing the disruptive potential of blockchain technology, the system espouses data integrity, security, and decentralization imperatives, thereby surmounting quintessential challenges posed by extant data storage methodologies. The outcomes of empirical evaluations underscore the efficacy and efficiency of the proposed approach, thereby laying a robust foundation for further strides in the AIML.

Cybercrime Threats to Economic and Social Security: An Analytical Study

Omar Al Makhzoumi and Abeer Zohair Said Saada

Abstract The focus of this chapter is cybercrime, specifically examining the impact of cyber terrorism and electronic money laundering on cybersecurity and financial systems. The study delves into the associated risks and threats, while also evaluating the effectiveness of current legal and regulatory measures in addressing these challenges presented by technological advancements. Several objectives are set forth, such as analyzing the threats posed by cyber terrorism and money laundering, assessing existing legal mechanisms, and providing recommendations to enhance responses to these threats. Through a descriptive-analytical approach, data from various sources, including previous studies and current legislation, was collected and analyzed. The findings highlighted deficiencies within current legal frameworks and demonstrated the complexities introduced by technological progress. Key recommendations include strengthening international collaboration, developing protective technologies, and promoting awareness and training to effectively combat cyber terrorism and electronic money laundering.

Keywords Electronic money laundering · Cybersecurity · Legal mechanisms · Cybercrime · Threats · Risks · International cooperation

1 Introduction

The advent of communication technologies and the Internet has given rise to novel forms of criminal activity that pose a significant threat to societies, relying heavily on technology rather than physical actions. Consequently, new means of perpetrating crimes that jeopardize the security and economic stability of communities have emerged, including cyber terrorism and electronic money laundering.

One cannot overlook the fact that the field of cybersecurity is confronted with major hurdles in the form of cyber terrorism and electronic money laundering. The

modern era witnesses a rise in the intricacy and variety of cyberattacks, posing a pressing need for effective countermeasures. Simultaneously, it is imperative to address the issue of electronic money laundering in order to bolster financial integrity and promote transparency in monetary transactions, thereby contributing to the stability of the global financial system [1].

With reference to the aforementioned, the objective of this research is to shed light on the various aspects of cyber terrorism and electronic money laundering, while comprehending the consequences they impose on both individuals and institutions.

1.1 Study Objectives

- Define the concept of cyberterrorism and the methods used in cyberattacks.
- Analyze techniques used in cyberattacks such as viruses, worms, attacks on infrastructure, the creation of terrorist websites, and the use of email.
- Assess national and international legislation related to cyberterrorism.
- Define electronic money laundering, how it is carried out on the Internet and analyze the legal regulations regarding electronic money laundering.

1.2 Methodology

A comprehensive analysis of cyber terrorism and electronic money laundering threats and risks is conducted in this study using a descriptive approach. The methodology employed aims to thoroughly describe and analyze the current phenomena by collecting and interpreting data.

2 Cyber Terrorism Using Electronic Means

The emergence of cyber terrorism can be traced back to the widespread dissemination of the “I LOVE YOU” computer virus in 2000, which resulted in an estimated ten billion US dollars worth of damage to information and data. The Federal Bureau of Investigation (FBI) established a connection between cybercrimes and the September 11 attacks, prompting the signing of the Convention on Cybercrime in Budapest, Hungary, by thirty nations. This historic agreement, signed in 2001, marked the first international effort to address cybercrime. A notable incident occurred in 2003 when the “Blaster” virus infected and destroyed approximately half a million computers, resulting in repair costs of around 12 billion dollars, as reported by the Council of Europe during the international convention on combating cybercrime. Consequently, this section of the text aims to provide an overview of cyber terrorism, its various manifestations, and the methods employed through electronic means.

2.1 Concept of Cyber Terrorism Using Electronic Means

Cyber terrorism, although rooted in the same definition as traditional terrorism, distinguishes itself through the utilization of distinct tools to accomplish its objectives. Extremists leverage the internet to disseminate their harmful ideologies and teachings, instructing individuals on the creation of explosives, hacking email accounts, sabotaging websites, and spreading viruses. This is made possible through the implementation of advanced communication technology and society's increasing reliance on it [2].

The act of cyber terrorism involves the utilization of contemporary digital technologies by individuals, groups, or states to target information systems in order to instill fear and exert control over others for religious, ethnic, or political purposes [3]. According to the U.S. Department of Justice, cyber terrorism encompasses any criminal activity where the offender possesses the necessary knowledge and intent to carry out the act [4].

In Article 147 of the Penal Code, the Jordanian legislator provides a comprehensive definition of terrorism. According to this definition, terrorism involves the use of violence or the threat of violence, regardless of the motives or purposes behind it. The aim of terrorism is to carry out a criminal project, whether on an individual or collective level, with the intention of endangering the safety and security of the community. This includes causing terror and fear among people, putting their lives at risk, causing harm to the environment, public or private property, international facilities, or diplomatic missions, as well as coercing international or regional organizations into specific actions or refraining from them. In contrast, cyber terrorism refers to acts of intimidation, aggression, or threats against individuals in various aspects of their lives, such as their person, religion, property, or intellect. These acts are carried out through the use of informational and electronic resources, as well as through different forms of corruption and aggression.

Unlike traditional terrorism, cyber terrorism has not been specifically defined by the Jordanian legislator. However, Article 2 of the Anti-Terrorism Law No. 55 of 2006 provides a definition of terrorism as: "any deliberate action carried out through any medium." According to this definition, the Jordanian legislator's concept of terrorism includes the following [5]:

1. **Criminal Intent**: The act must be intentional; the absence of criminal intent does not elevate it to the level of cyber terrorism.
2. **By Any Means**: This means that modern digital technological means, such as computers, associated software, and the internet, fall under the terrorist acts intended by the Jordanian legislator.
3. **Causes Harm**: In order to disrupt public order, endanger community safety and security, or interfere with the implementation of the constitution or laws, influence state policy or government actions, or disrupt national security through intimidation, coercion, or violence, an act must result in the death of a person, physical injury, or damage to public or private property, transportation, the environment, infrastructure, or international organizations or diplomatic missions.

3 Electronic Money Laundering

The concept of "money laundering" has a long history, with its origins dating back to the infamous "Al Capone" case in 1931. Al Capone, a prominent figure in the mafia, engaged in tax evasion, prompting the mafia to utilize their networks to acquire and establish lawful enterprises as a means to legitimize the proceeds from their illicit operations. A notable instance occurred in the United States in 1988, when significant sums of money derived from Colombian cocaine trafficking were confiscated [6].

Over time, techniques for money laundering have progressed and become increasingly advanced, utilizing contemporary methods and strategies to hide the origin of illegal funds. Alternative expressions for money laundering, such as "cleaning money," "whitening money," and "refining money," all share the same objective.

3.1 Concept of Electronic Money Laundering

The act of electronic money laundering can be described as the process of carrying out financial transactions over the internet in order to hide the origin of illegal funds and make them appear legal. Popular techniques for this illicit activity involve conducting online transfers, utilizing internet banks as a means to protect laundered money, and engaging in e-commerce investments [6].

Money laundering, as defined by Article 2 of the Anti-Money Laundering and Counter-Terrorism Financing Law No. 46 of 2007, encompasses various actions aimed at concealing or disguising the illicit source, nature, whereabouts, movement, or ownership of funds. These actions include acquiring, possessing, managing, transferring, or manipulating funds. The primary objective is to prevent the identification of the individuals responsible for the underlying criminal activities that generated the funds. It is important to note that this definition applies to all offenses specified in Article 4 of the Jordanian Anti-Money Laundering and Counter-Terrorism Financing Law No. 46 of 2007, along with its subsequent amendments [5].

In accordance with Article 1(b) of Law No. 80 of 2002, the Egyptian legislator has provided a comprehensive definition of money laundering. This definition encompasses various actions such as the acquisition, possession, management, and manipulation of funds that originate from criminal activities listed in Article 2 of the same law. The primary objective of these actions is to conceal or disguise the true nature, source, location, ownership, or rights associated with the funds. Additionally, the intention behind money laundering is to impede the detection or hinder the identification of the individual responsible for the initial criminal act that generated the funds [7].

Upon examining the definitions associated with electronic money laundering, it becomes evident that although various linguistic expressions are employed to describe this offense, there are fundamental and shared elements that all definitions concur upon, which are as follows [8]:

1. **Aims to Invest in Illicit Funds**: The primary objective is to invest money that is obtained through illegal means.
2. **Multiple Beneficiaries and Interveners**: There are often multiple parties involved in or benefiting from the laundering process.
3. **Often Transnational Crime**: Money laundering is frequently considered a transnational crime, crossing international borders.
4. **Use of Various Methods and Creative Tactics**: Perpetrators employ numerous techniques and are known for their ingenuity and scheming skills.
5. **Exploitation of Weak Regulatory and Supervisory Countries**: The crime often exploits countries with weak regulations and enforcement measures to combat it.

3.2 Characteristics of Electronic Money Laundering

From the previous discussion of electronic money laundering, it is evident that this crime has several distinct characteristics, which are as follows [9]:

- **Organized Crime**: The act of electronic money laundering is classified as a form of organized crime, as it necessitates the presence of multiple components to establish its foundation. It relies on a group of skilled individuals who are unafraid and unwavering when faced with potential risks, employing cutting-edge technological techniques to guarantee the triumph of their illicit endeavors [9].
- **Economic Crime**: The act of money laundering presents a substantial threat to societies on both a local and global scale. It hinders the progression of investments, disrupts the stability of the investment environment, and influences inflation rates as funds are redirected towards consumption by disorganized and irrational groups, resulting in heightened prices [10].
- **International Nature**: The rise of globalization and the worldwide emphasis on transactions, trade, and information exchange have paved the way for organized crime to flourish through cross-border fund movement. Exploiting the lack of stringent punishments and regulatory oversight in certain countries, criminal organizations have taken advantage of this scenario, making it a daunting task to establish global legislation [11].
- **Use of Modern Technology**: The inclusion of the internet in money laundering activities has been facilitated by the merging of computer networks with financial transactions, e-commerce solutions, and electronic transfer systems. This merging poses challenges in terms of gathering evidence and prosecuting criminals, as it necessitates the involvement of experts with specialized technical knowledge, and digital files and systems can be effortlessly moved [12].

Additionally, the characteristics of electronic money laundering consist of three main elements [13]:

1. **Dirty Money**: To ensure the concealment of illicit funds, it is necessary to transform them into seemingly legitimate assets that are devoid of any suspicion of illegality and give the impression of having been obtained through lawful channels.
2. **Activities to Conceal Dirty Money**: The activities used to hide the illicit funds, blending them with money generated from these fraudulent activities.
3. **Parties Involved in the Laundering Process**: The individuals or entities responsible for carrying out the laundering operations, creating a fictitious story to regenerate the new, clean appearance of the money.

3.3 Methods of Electronic Money Laundering

The methods of electronic money laundering are as follows:

1. **The Structuring Method**: To execute this technique, the strategy entails fragmenting substantial sums into smaller increments that do not surpass ten thousand dollars. This is accomplished through the collaboration of multiple reliable individuals who deposit these amounts into different banks. Depending on the nature of the illicit activity, the deposits may be consolidated into a single bank account. For example, in instances of tax evasion and embezzlement, the funds are amassed in a designated bank account before being electronically transferred abroad.
2. **The Misleading Method**: This method involves creating front companies, such as travel agencies, to mix the company's revenues with drug revenues, making them appear legitimate.
3. **The Collusion Method**: This involves bank employees assisting money launderers by facilitating large cash deposits, often in exchange for a percentage agreed upon, which can be up to 20%.
4. **The Transportation Method**: There are two approaches employed in this process: The initial method involves the physical movement of cash and goods using ships and planes, especially in situations where depositing them becomes challenging due to strict bank reporting systems or a lack of confidentiality. The second approach entails electronic transfers, which are deemed the swiftest and riskiest form of money laundering, yet also the most secure and elusive to uncover. It usually involves electronic transfer systems such as:

    a. FedWire System: Managed by the Federal Reserve Bank.
    b. CHIPS System: A European system based in Belgium.
    c. SWIFT System: Managed by the SWIFT organization.

5. **The Layering Method**: To conceal the origin of funds, this approach relies on intricate financial transfers, which involve multiple electronic transfers between banks, as well as the conversion of money into travel agencies and treasury bonds, thereby adding layers of complexity and evading suspicion and scrutiny.

6. **The Purchase Method**: This method involves purchasing real estate, vehicles, apartments, goods, and insurance policies, which are then resold.
7. **The Mixing Method**: This method uses accounts held by accountants, lawyers, financial advisors, and other individuals not suspected of wrongdoing.
8. **The Concealment Method**: To achieve anonymity for the recipient or depositor, a method employed is the utilization of credit and debit cards, with the added measure of conducting transactions from various locations. The internet serves as a tool, employed by banking institutions, travel agencies, intermediaries, and corporations, to create an illusion of legitimacy and obfuscate the origin of the monetary resources.
9. **The Foreign Currency Mixing Method**: The approach utilized in this process takes advantage of or convinces entrepreneurs who desire to bring in merchandise to buy foreign currencies in order to fund their imports. The arrangement entails providing drug dollars acquired within the country of importation and receiving domestic currency in return.
10. **The Borrowing Method**: By utilizing the bank's guarantee, the launderer acquires funds that have been deposited and then proceeds to invest in a project that is recognized by the law. The repayment of these funds, which are used to conceal the act of money laundering, is done through regular installments made by a legal entity.
11. **The Ownership of Financial Instruments Method**: To execute this technique, brokerage firms are utilized to collect untainted funds following the process of money laundering. These firms entice customers with complimentary or affordable brokerage services, subsequently carrying out deceitful transactions involving the sale of bonds or stocks disguised as legitimate securities, thereby consolidating lawful funds.

3.4 Forms of Money Laundering via Electronic Means

The forms of electronic money laundering are diverse and include the following key methods:

1. **Money Laundering via the Internet**: With the global expansion of internet usage, cybercrimes have become increasingly prevalent. Simultaneously, banks have adapted to the digital age, introducing online banking, electronic checks, and internet-based credit card systems. Unfortunately, these advancements have also given rise to online money laundering, a widespread issue that accounts for over 15% of the world's national income. Internet mafias, specializing in cybercrimes such as credit card fraud, have emerged and amassed substantial wealth, reaching hundreds of millions of dollars. Moreover, virtual gambling establishments and entertainment platforms have proliferated, further contributing to the problem. Electronic money laundering crimes often exploit personal information obtained from social media platforms. Additionally, there is a method in which individuals in need of funds seek assistance in transferring money, seemingly willing to pay

for the service. However, once they have obtained the person's banking details, they swiftly empty the account and disappear [14].

2. **Smart Cards**: The banking sector has been revolutionized by the introduction of smart cards, which are considered one of the most important advancements in this field. These cards, made of plastic, are equipped with chips that can store data and provide a wide range of services, including access to personal account information and medical history. With the ability to be pre-loaded with a specific amount of money, smart cards function as portable computers that do not require a connection to the bank's computer system. This means that withdrawals can be made in more than 53 countries without any legal restrictions or the need for approval from the bank, making them an incredibly convenient tool for individuals involved in money laundering [15].
3. **Electronic Money Transfer**: Criminals employ a particular technique wherein they first deposit their illicit funds into legitimate banks before transferring them to shell companies located in countries where such activities are prevalent. By doing so, they ensure their own protection and receive approximately 3% of the total value of the money being laundered. These funds are then utilized to purchase various assets, including but not limited to cocaine and real estate, on a global scale. The crucial aspect of this method lies in the fact that by transferring the money to a jurisdiction outside the reach of law enforcement, the criminals can take advantage of banking secrecy laws, effectively shielding their identities from disclosure or investigation. Subsequently, auditing firms borrow money from banks by utilizing the previously deposited funds as collateral, with the ultimate intention of returning the laundered and purified money back to the criminals [16].
4. **Electronic Money**: The digital equivalent of physical currency, electronic money is seamlessly transferred online without the need for a middleman. It is securely stored on a memory card and can be conveniently accessed using a smart card. With its minimal transaction fees, user-friendly nature, and lack of geographical restrictions or bureaucratic processes, electronic money presents an appealing choice for those involved in illicit financial activities [17].
5. **Internet Banks**: One of the most recent and perilous forms of money laundering involves the use of internet banks. These intermediaries carry out banking operations and provide financial services, but they are not traditional banks that accept deposits. To transfer funds, users input a confidential code into a computer, making this method an ideal choice for securely and effortlessly laundering substantial sums of money [18].
6. **ATM Machines**: To evade the scrutiny of conventional banking processes that involve investigating client transactions for signs of illicit financial activities, these devices are employed to facilitate the deposit and withdrawal of illicit funds. This technique offers a secure refuge for individuals involved in money laundering. A notable incident occurred in 2007 when individuals in the United States were discovered using ATMs to launder drug money originating from Colombia. They enlisted the help of their acquaintances and family members to open bank accounts, deposit the funds, obtain two cards per account, and

subsequently transfer the money to Colombia, where it was then withdrawn from ATMs [19].

3.5 Forms of Criminal Participation in Electronic Money Laundering

The rise of electronic money laundering as a contemporary criminal activity can be attributed to the advancements in information technology. This has given rise to novel methods of committing the crime, utilizing modern electronic platforms and information systems. As a result, the existing legal framework has become insufficient in addressing this evolving nature of the crime. Therefore, the need for new laws and regulations that are in line with the modern landscape has become imperative. In the following discussion, we will explore the legislative foundation of this offense and examine the various ways in which individuals engage in criminal activity within this realm.

Legislative Basis for Electronic Money Laundering

The act of electronic money laundering is classified as an ongoing offense that necessitates a harmonization of understanding regarding its illicit origins and the criminal actions involved. Typically, knowledge follows the criminal behavior, especially when it comes to the movement or transfer of funds, which tends to be a short-term activity, rendering money laundering a temporary offense. As a result, it becomes imperative to synchronize knowledge and behavior. Furthermore, money laundering is a deliberate crime that requires both a general intent and a specific intent. This implies that the perpetrator must have the intention to conceal or alter the nature, source, location, or lawful owner of the funds, as well as impede any attempts to uncover the crime or identify the individual responsible.

Money transfers are the focus of Article 7 in the Electronic Crimes Law No. 27 of 2015. This article stipulates that individuals who engage in any of the actions outlined in Articles 3, 4, 5, and 6 of this law, specifically when conducted on platforms such as information systems, electronic sites, or information networks associated with money transfers, payment services, clearing, settlements, or any banking services provided by banks and financial institutions, will face penalties. These penalties involve a minimum of five years of temporary hard labor and a fine ranging from 5000 JDs to 15,000 JDs.

One might naturally associate the concept of money laundering with illegal money transfers. However, Article 7 of the Electronic Crimes Law in Jordan does not directly and explicitly pertain to money laundering through electronic methods. Instead, it focuses on other unlawful activities outlined in Articles 3, 4, 5, and 6. The specific offense targeted by Article 7 involves actions committed on information systems, electronic sites, or networks that are connected to money transfers and electronic banking services in a general sense. If the intention of the legislator was to explicitly address money laundering through electronic means, they would have provided a

clear definition of the crime and its components, similar to what the Omani legislator did in Article 21 of the Omani Law on Combating Information Technology Crimes No. 12 of 2011. This particular article penalizes individuals who utilize information networks or technology to transfer illicit funds, acquire, conceal, or disguise their origin, or aid in money laundering activities. While the Jordanian legislator has not directly tackled money laundering via electronic methods, they have criminalized specific actions relating to information systems and electronic banking services [20].

Criminal Participation in Electronic Money Laundering

According to Article 30 of the Anti-Money Laundering and Terrorist Financing Law No. 20 of 2021 and its application to electronic money laundering, the following forms of participation can be identified:

1. **Assisting in Transfer Operations**: The act of facilitating the movement of funds obtained through criminal activity, whether directly or indirectly, is a key aspect of this process. This can involve actions such as emptying an account upon request and transferring the funds to another account, which may be in the name of either the beneficiary or the person initiating the transfer. To accomplish this, two accounts are needed, and the transfer takes place through various means such as information systems, electronic platforms, or networks associated with money transfers or banking services. Electronic transfers have become increasingly popular due to their flexibility and ability to maintain confidentiality [21]. A global phenomenon known as "front companies" has emerged, which are essentially hidden entities that operate without a legitimate business purpose and primarily engage in the laundering of funds from illegal sources. These companies are adept at concealing their activities, making it challenging for governments and jurisdictions to uncover their secret documents and expose their illicit operations [22].
2. **Assisting in Concealment**: The possession of money or proceeds obtained through criminal activities, whether done privately or publicly, is the essence of this particular form. The Sixth International Conference on Criminal Law proposes that the punishment for economic crimes should encompass all types of criminal involvement and apply criminal penalties to legal entities, as stated in their third (a) recommendation. This recommendation emphasizes the inclusion of legal entities and individuals responsible for the actions committed by others, particularly in cases of economic crimes like money laundering [23]. Concealing acts can be carried out by anyone, regardless of their direct involvement in the crime, as long as they aid in its concealment or hinder its detection through information systems, electronic platforms, or networks associated with money transfers and banking services. The law specifically targets those who assist in hiding assets such as equipment, vehicles, yachts, jewelry, or any other assets purchased using money obtained from illegal activities like drug trade or other felonies. It also encompasses funds acquired through the sale of movable assets or other illicit sources. In the case of electronic money laundering, there must be a tangible connection between the actions taken online and the resulting criminal

outcome, where internet activities contribute to the concealment of illegal funds [24].

3. **Incitement to Electronic Money Laundering**: The initial stages of money laundering involve encouraging individuals to deposit or transfer large sums of money into financial institutions, engaging in retail activities that serve as intermediaries for laundering drug money, or purchasing high-value items [25]. In Article 14 of Law No. 80 of 2002 on Anti-Money Laundering, the Egyptian legislature establishes penalties for the commission or attempted commission of money laundering, including the forfeiture of seized funds or an additional fine if seizure is not possible. Article 16 of the same law holds legal entities accountable for violations, with the court having the authority to publish the judgment at the entity's expense and potentially suspend its operations for up to one year. The Egyptian legislature also criminalizes participation, cooperation, and conspiracy in money laundering, as outlined in the general provisions of the Egyptian Penal Code [26]. However, upon analyzing Egyptian legislation, it is evident that it primarily addresses traditional money laundering methods and does not sufficiently cover electronic methods as comprehensively as more modern laws. Therefore, it is crucial for the Egyptian legislature to address this issue in order to effectively combat cross-border crimes that employ new and evolving methods [27].

4 Conclusion

To summarize, this research emphasizes the growing dangers posed by cyber terrorism and electronic money laundering to both cybersecurity and the worldwide financial system. Although there are continuous endeavors to establish laws and implement technologies to counter these threats, it is imperative to continually enhance and modernize these measures in order to stay ahead of ever-evolving cybercrime strategies and technological advancements. It is vital to foster international collaboration, create efficient cybersecurity frameworks, and promote awareness and education to effectively combat these risks. By attaining these objectives, we can safeguard individuals and organizations while fortifying the stability of the global financial and security systems.

4.1 Findings

The study has led to the following findings:

- The rapid advancements in technology present challenges for both national and international legislation when it comes to adaptation.
- The complexity of cyber terrorism necessitates legislation that goes beyond what is currently deemed sufficient to effectively combat the threats it poses.

- Sophisticated and intricate techniques are employed in electronic money laundering, encompassing fragmentation, deception, collusion, transfer, layering, purchase, mixing, and concealment
- According to the study, although progress has been made in global efforts to combat money laundering, there remains a necessity for enhanced international collaboration and stricter legislative measures.

4.2 Recommendations

Based on the findings, the study recommends the following:

- Update and develop national and international regulations to keep up with technological advances and new cyberattack methods.
- Strengthen international cooperation in information exchange and coordination in combating cyberterrorism.
- Invest in the development of cybersecurity technologies and countermeasures to protect critical infrastructure from cyberattacks.
- Improve and update e-money laundering rules to effectively address modern money laundering techniques.
- Strengthen educational and training programs for professionals in the field of combating cybercrime and money laundering.

Network Architecture Report for DVWA Testing Environment on Azure

Subhodeep Mukherjee, Hemraj Shobharam Lamkuche, Asma Sbaih, and Raed Alazaidah

Abstract This study presents a comprehensive analysis of a testing environment built on Microsoft Azure for vulnerability assessment of the DVWA (Damn Vulnerable Web Application) platform. The research focuses on the network architecture, which employs three subnets for segmentation and utilizes cloud-based infrastructure to enhance flexibility. Through rigorous examination, the study identifies potential vulnerabilities in network segmentation and proposes strategic recommendations, including the implementation of robust access controls and advanced intrusion detection systems. The findings underscore the critical importance of addressing these vulnerabilities to bolster the overall security posture and mitigate risks of unauthorized access.

1 Introduction

This study aims to document the network architecture of a testing environment built on Microsoft Azure. The primary purpose is to utilize the Identify function of the NIST Framework by performing vulnerability analysis on the DVWA platform hosted within this environment. The scope encompasses the network infrastructure, encompassing hardware components on Azure, software systems like DVWA, and the overall network topology [1]. Stakeholders involved include security professionals and application developers seeking to understand the environment for secure testing practices.

2 Network Design

The simulated network consists of a single virtual network within Azure containing three subnets. Each subnet serves a specific purpose and isolates resources by controlling network traffic flow.

- Subnet 1 (10.0.0.0/24): Contains Machine1, Machine4, and Machine5. This subnet represents the internal network segment for critical servers. It houses one Windows machine and two Linux machines.
- Subnet 2 (10.0.1.0/24): Contains Machine2 and Machine6. This subnet represents another internal network segment for a departmental function. It contains one Windows machine and one Linux machine.
- Subnet 3 (10.0.125.0/24): Contains Machine3. This subnet represents a potentially less critical network segment, for a development environment. It houses a single Linux machine.

2.1 Subnet 1 (10.0.0.0/24)

Subnet 1 is a/24 subnet within the Azure virtual network, containing three virtual machines: Machine1, Machine4, and Machine5. This subnet provides basic isolation for these machines from other resources in the network.

Machines in Subnet 1:

2.1.1 Machine1

- Operating System: Ubuntu Server 22.04 LTS
- Resource Group: ACS Project
- Public IP Address: 20.33.53.54 (Accessible from the internet)
- Location: US-East (Zone 1)

- VM Size: Standard B1s (1 vCPU, 1 GiB memory)
- DNS Resolution: Public IP address
- Role: Linux Server.

2.1.2 Machine4

- Operating System: Windows Server 2018
- Resource Group: ACS Project
- Public IP Address: Not Publicly Accessible (Internal network access only)
- Location: US-East (Zone 1)
- VM Size: Standard B1s (1 vCPU, 1 GiB memory)
- DNS Configuration: Not Configured
- Role: Windows Server.

2.1.3 Machine5

1. Operating System: Ubuntu 22.04 LTS
2. Resource Group: ACS Project
3. Public IP Address: Not Publicly Accessible (Internal network access only)
4. Location: US-East (Zone 1)
5. VM Size: Standard F1s (1 vCPU, 2 GiB memory)
6. DNS Configuration: Not Configured
7. Role: Linux Workstation (Fig. 1).

2.2 Subnet 2 (10.0.1.0/24)

Subnet 2 is another/24 subnet within the Azure virtual network, also providing isolation for two virtual machines: Machine2 and Machine6. Similar to Subnet 1, it separates these machines from other resources in the network.

2.2.1 Machine2

- Operating System: Windows Server 2016
- Resource Group: ACS Project
- Public IP Address: 20.51.195.225 (Accessible from the internet)
- Location: US-East (Zone 1)
- VM Size: Standard B1s (1 vCPU, 1 GiB memory)
- DNS Configuration: Not Configured
- Role: Windows Server.

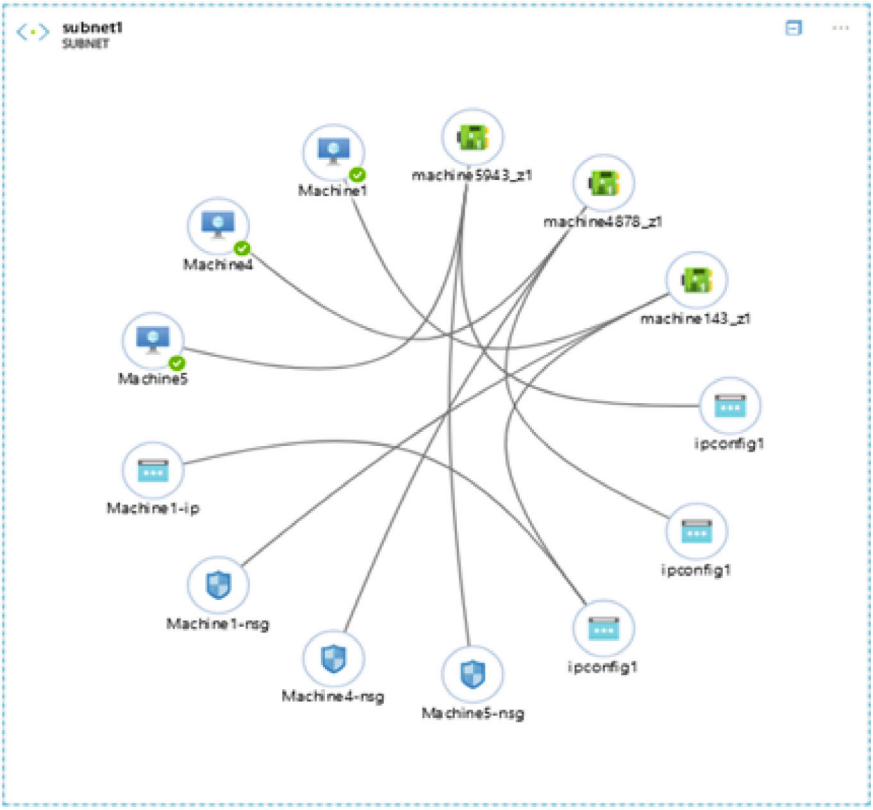

Fig. 1 Network topology diagram for subnet 1

2.2.2 Machine6

- Operating System: Ubuntu 22.04 LTS
- Resource Group: ACS Project
- Public IP Address: Not Publicly Accessible (Internal network access only)
- Location: US-East (Zone 1)
- VM Size: Standard F1s (1 vCPU, 2 GiB memory)
- DNS Configuration: Not Configured
- Role: Linux Workstation (Fig. 2).

2.3 Subnet 3 (10.0.125.0/24)

Subnet 3 is a separate/24 subnet within the Azure virtual network. It contains a single virtual machine, Machine3. This isolated subnet design potentially segregates

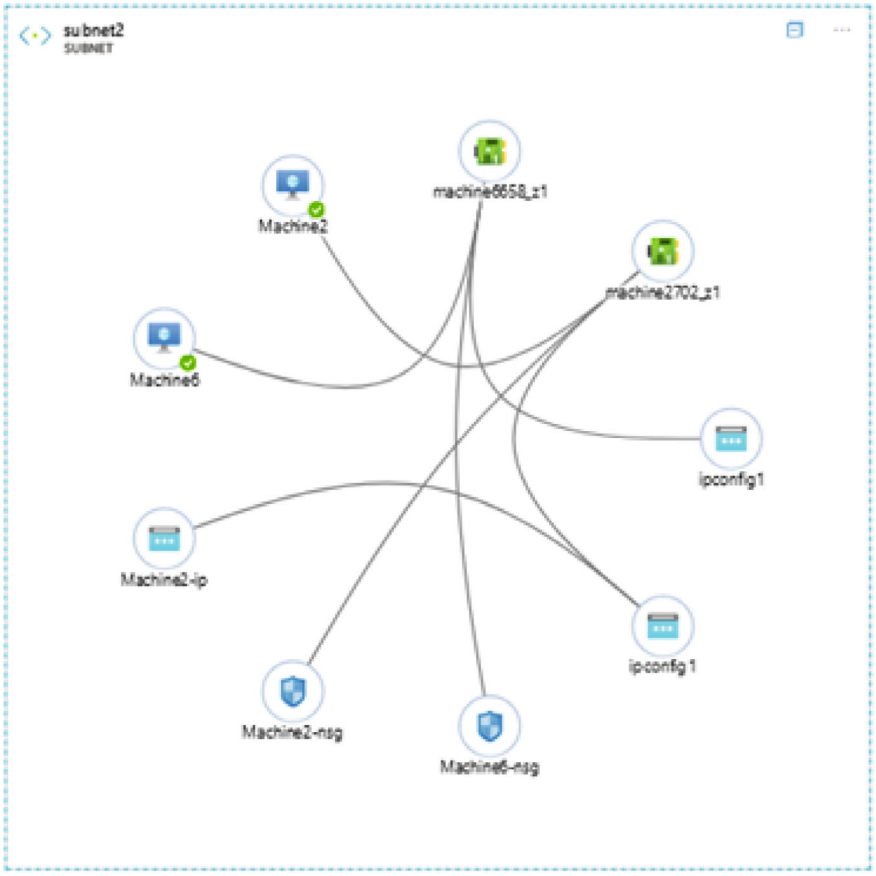

Fig. 2 Network topology diagram for subnet 2

Machine3's traffic from other machines in the environment, which could be useful for specific security purposes.

2.3.1 Machine3

- Operating System: Ubuntu 22.04 LTS
- Resource Group: ACS Project
- Public IP Address: 20.84.77.76
- Location: US-East (Zone 1)
- VM Size: Standard B1s (1 vCPU, 1 GiB memory)
- DNS Configuration: Not Configured
- Role: Linux Workstation (Fig. 3).

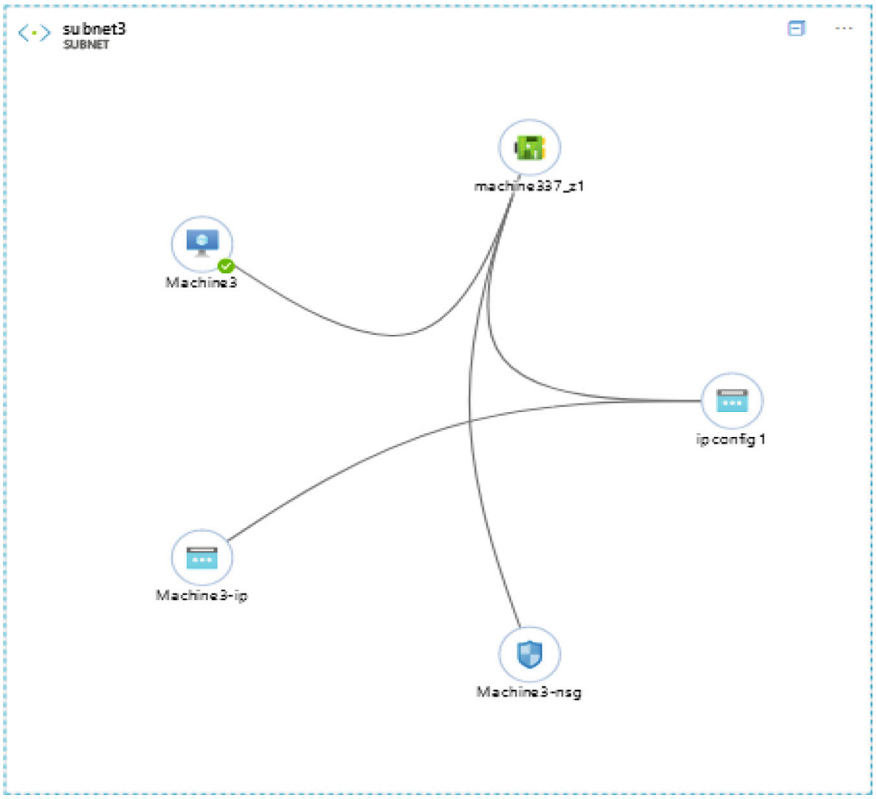

Fig. 3 Network topology diagram for subnet 3

3 Network Configuration Steps

3.1 Resource group creation: a resource group was created in azure to organize all resources associated with the simulated network (Fig. 4).

3.2 Virtual network creation: a virtual network was created within the resource group, specifying the desired address space (CIDR block) to accommodate all subnets (Fig. 5).

3.3 Subnet Creation: Three subnets were created within the virtual network, each with a dedicated address range chosen from the overall virtual network CIDR block. Security considerations like isolation and segmentation influenced subnet creation.

3.4 Virtual Machine Deployment: Multiple virtual machines were deployed within the respective subnets. The deployment process involved selecting the desired operating system (Windows or Linux), choosing VM size based on resource requirements, and configuring storage and network settings. Each VM was

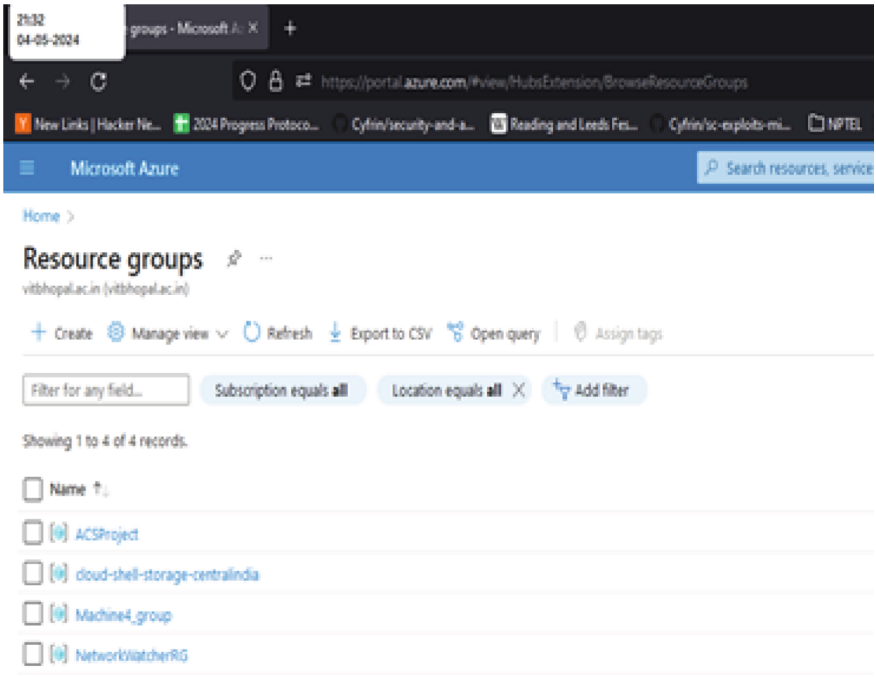

Fig. 4 Network resource groups

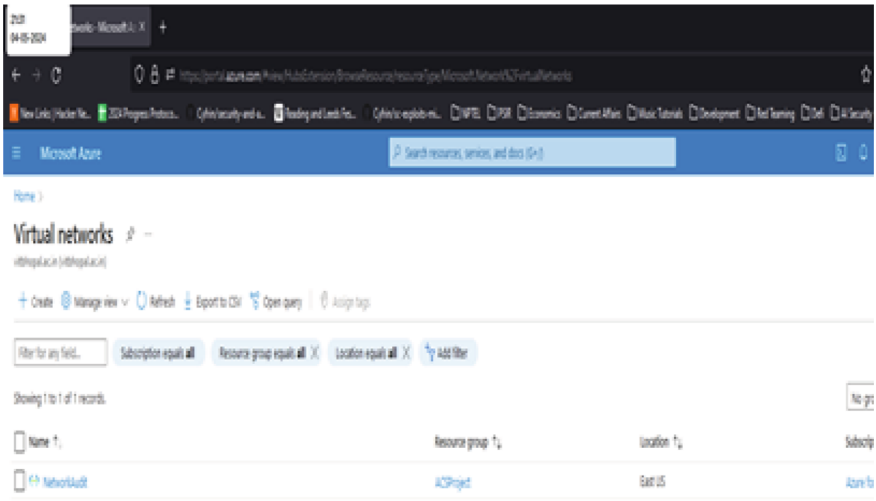

Fig. 5 Virtual networks within azure cloud

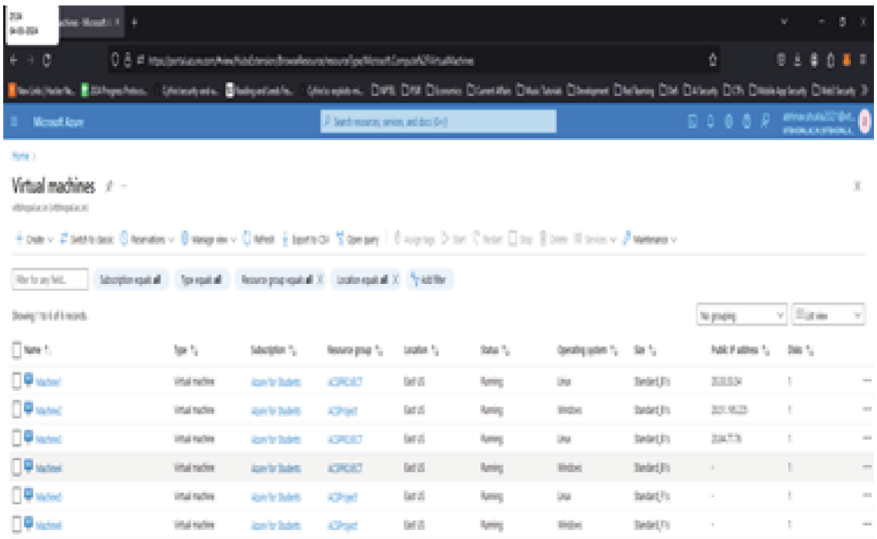

Fig. 6 Deployed virtual machines within virtual network

assigned a unique IP address from the corresponding subnet address pool (Fig. 6).

3.5 Internal Communication: the NSGs were configured to allow communication between VMs within the same subnet, simulating internal network traffic flow.

3.6 External Access: For penetration testing purposes, a single machine per subnet is intentionally exposed to the public internet. This machine serves as the initial access point for the penetration test. After gaining a foothold on this system, the penetration tester can pivot to other machines within the subnet.

4 Performance Analysis

4.1 VM Availability
4.2 CPU Average
4.3 Disk Bytes
4.4 Network
4.5 Disk Operations (Figs. 7, 8, 9, 10 and 11).

5 Vulnerability Introduction

This section details the vulnerabilities intentionally introduced into the testing environment for analysis purposes.

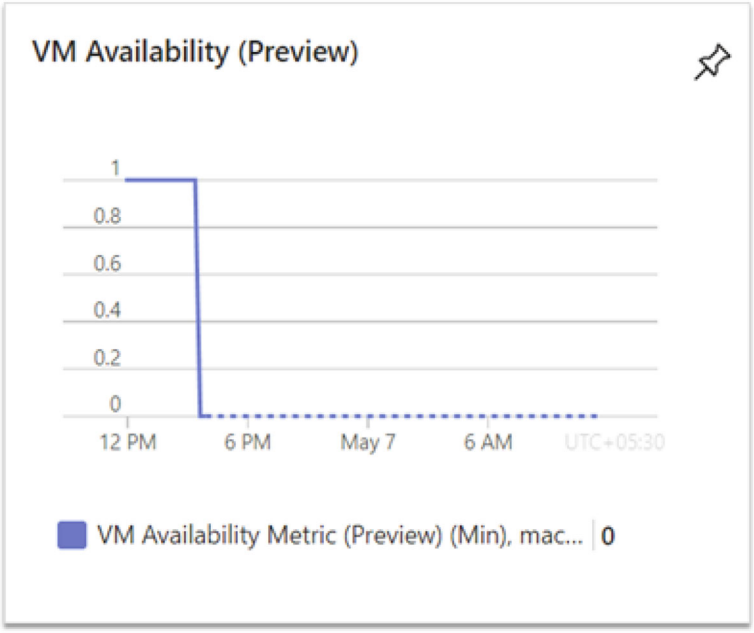

Fig. 7 VM availability for virtual network audit

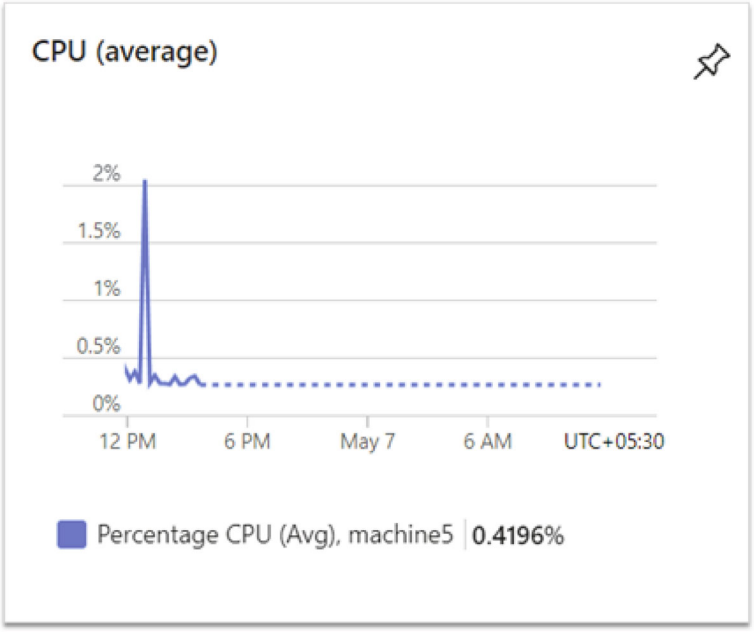

Fig. 8 CPU average for machine1 on subnet 1

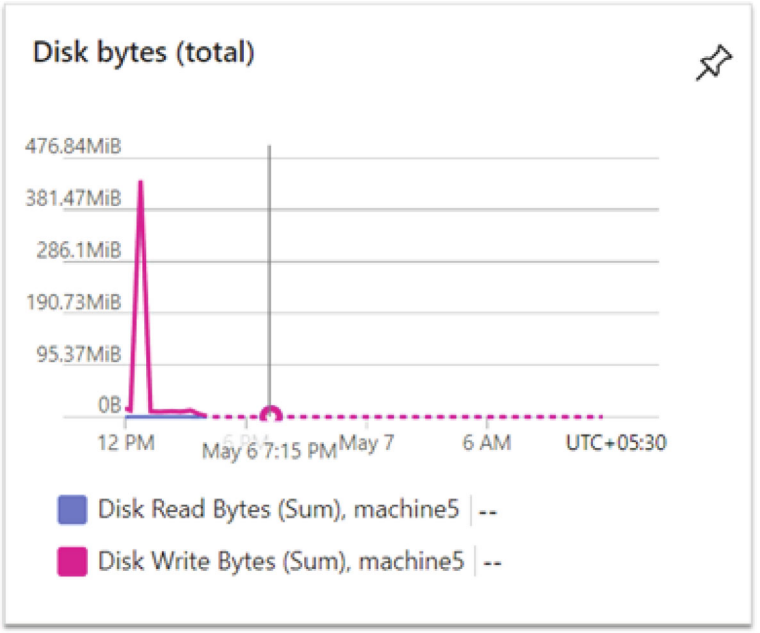

Fig. 9 Disk average for machine5

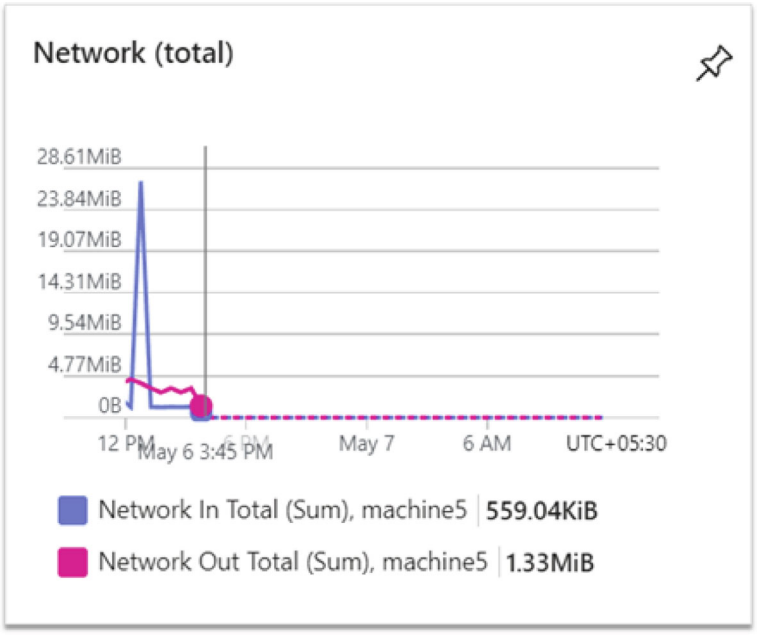

Fig. 10 Network inbound and outbound traffic metrics

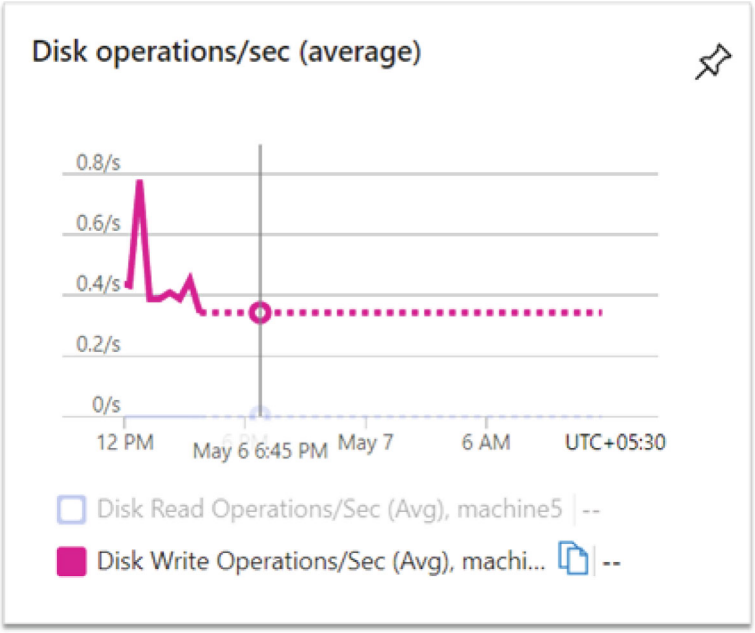

Fig. 11 Disk operations for machine5

5.1 Machine 1: Web Application Vulnerabilities

Machine 1 serves as the primary testing environment and hosts the DVWA web application. The following vulnerabilities have been deliberately configured within DVWA to simulate real-world threats:

- Brute-force Attack: This vulnerability allows attackers to attempt unauthorized login by trying various username and password combinations [2].
- Command Injection: This vulnerability occurs when user-supplied input is not properly sanitized, enabling attackers to inject malicious code that executes on the server [2].
- Cross-Site Request Forgery (CSRF): This vulnerability tricks a user's browser into performing unintended actions on a trusted website [3].
- Open Redirects: This vulnerability exploits improper configuration where user input is used to redirect the user to a malicious website [4].
- Reflected Cross-Site Scripting (XSS): This vulnerability allows attackers to inject malicious scripts into web pages that are reflected back to the user's browser, potentially stealing data or compromising the user's session [5].
- SQL Injection (SQLi): This vulnerability occurs when user input is not properly validated, enabling attackers to inject SQL code that interacts with the back-end database [6].

5.2 Machine 2: SMB File Transfer Vulnerabilities

Machine 2 is configured to be vulnerable to specific exploits targeting SMB (Server Message Block) file sharing protocol:

- SMBGhost: This vulnerability allows remote code execution on vulnerable SMB servers [7].
- EternalBlue: This well-known exploit leverages a vulnerability in SMBv1 to gain unauthorized access to systems [7].
- EternalChampion: This exploit targets a different vulnerability in SMB versions to achieve similar unauthorized access as EternalBlue [7–12].

5.3 Machine 3: Linux Kernel Vulnerabilities

Machine 3 introduces vulnerabilities related to privilege escalation on Linux systems:

- Dirty Pipe: This vulnerability allows local attackers to potentially gain root privileges on a system by exploiting a race condition during file writing operations.
- Dirtybomb: Similar to Dirty Pipe, this vulnerability exploits a vulnerability for potential privilege escalation.

It's important to note that these vulnerabilities are intentionally introduced for testing purposes in a controlled environment. In a production environment, such vulnerabilities should be addressed immediately to mitigate security risks.

6 Intended Use Case

This testing environment provides a valuable platform to test and implement the Identify function of the NIST Framework. It allows security professionals to:

- Identify assets within the network (Machines 1–6 and DVWA platform).
- Identify vulnerabilities within the DVWA platform and potentially the network itself.
- Identify controls in place and assess their effectiveness.

By testing in a controlled environment, security professionals can refine their skills and identify potential weaknesses before deployment in a production environment.

7 Conclusion

This study provides a foundational understanding of the network architecture for DVWA testing. While subnets offer some segmentation, further security measures like access controls and intrusion detection are recommended. Performance analysis is essential to ensure the network can handle current and future loads. The vulnerabilities identified in the DVWA platform should be addressed to strengthen its security [6]. This testing environment serves as a valuable tool for implementing the Identify function of the NIST Framework, enabling stakeholders to identify and address potential security risks before they impact production systems. Proactive network management and continuous improvement are crucial to maintain a secure and efficient network infrastructure.

Legal and Digital Regulations for Share Repurchase in Private Joint-Stock Companies: A Comparative Study with Emphasis on Technology Impact

Yasar Alhiniti and Dina Aljabari

Abstract The focus of this study is to examine the legal consequences of share repurchase in private joint-stock companies and its effect on the rights of creditors, while also delving into the influence of digital transformation on these processes. To begin, the study explores the concept of capital stability as a fundamental safeguard for creditors, considering both theoretical definitions and the legal frameworks that govern it. By analyzing and comparing legal texts and regulations with British legislation, the adequacy of these measures in protecting creditors' rights and ensuring business continuity is evaluated. The study reveals that the capital of a private joint-stock company is a reflection of its financial solvency and its ability to fulfill its obligations, making it a crucial guarantee for creditors. However, the existing legislation, despite establishing a minimum capital requirement, needs to be reinforced with more stringent regulations and procedural controls, especially in the context of digitalization, to regulate share repurchases from capital. Furthermore, the study highlights that improper financing of share repurchases from a company's capital can undermine the overall guarantee for creditors, emphasizing the necessity of implementing robust legal measures to safeguard their rights. Considering the impact of digital technologies on corporate practices, this study underscores the importance of updating legal frameworks to incorporate technological considerations. Based on these findings, the study provides several recommendations to improve legislation, including the amendment of existing laws, the establishment of monitoring mechanisms for the impact of share repurchases, the promotion of legal awareness among companies and creditors, and the examination of international best practices, particularly those that integrate digital tools.

Keywords Capital · Private joint-stock companies · Share repurchase · Creditors' rights · Legal guarantees · Digital transformation · Technology impact

1 Introduction

When a company engages in the process of repurchasing its shares, it triggers a variety of legal consequences that have implications for the company itself, its capital, shareholders, and creditors. These consequences encompass a range of obligations for the company and establish rights in relation to the redeemable shares held by shareholders, as stipulated by the provisions that govern private joint-stock companies and are based on the agreement among shareholders. Given that the majority of legal regulations governing these companies, as per corporate law, are optional rather than obligatory, the contract between the parties serves as the governing law, establishing rights and obligations for both the company and its shareholders. It is essential for both parties to adhere to the terms outlined in this contract, including the rights and obligations that it entails.

When discussing the legal implications of the repurchase process, the following questions arise:

- What are the legal obligations of the company as a result of the share repurchase process?
- What is the legal effect on the company's capital resulting from the share repurchase process?
- What happens to the repurchased shares?
- Does the share repurchase process affect the legal status of the shareholder?
- What are the rights of holders of redeemable shares resulting from the share repurchase process?
- What are the legal impacts on the rights and guarantees of the company's creditors as a result of the share repurchase process?

1.1 Study Objectives

This study aims to achieve the following objectives:

- Improve legal and practical understanding of share repurchase processes and ensure protection for all parties involved in privately held stock companies.
- Analyze the legal framework related to the purchase of capital and shares in private joint-stock companies.
- Review theoretical concepts of the capital stability principle and its role as a guarantee for creditors
- Evaluate Jordanian legislation on share buybacks and compare it to UK legislation.
- Providing legal recommendations aimed at strengthening the protection of creditors' rights and regulating share purchase processes.
- Analyze the practical impact of share buyout processes on the company's capital and creditors' rights.

1.2 Study Methodology

By adopting a descriptive-analytical methodology, the research delved into the examination of legal documents and regulations in Jordan that pertain to share repurchase in private joint-stock companies. A comparative analysis was conducted, specifically comparing these findings with the corresponding legislation in the United Kingdom. To draw well-founded conclusions and provide insightful recommendations concerning the effects of share repurchase on the rights of creditors and the ongoing operations of companies, the researcher extensively relied on secondary sources such as legal textbooks, scholarly articles, and a variety of legal regulations.

2 Legal Implications of Share Repurchase on the Company and Shareholders

The legal implications of share repurchase for the company include several obligations that the company must adhere to. These obligations are as follows [1]:

- Obligation to pay the value of the repurchased shares to the holder of the redeemable shares.
- Notify the Companies Regulatory Official in writing of the repurchase decision.

2.1 Obligation to Pay the Value of the Repurchased Shares to the Holder of the Redeemable Shares

If the company's bylaws stipulate the repurchase of redeemable shares for consideration, an obligation arises. The Redeemable Shares Instructions for Private Joint-Stock Companies of 2020 [2] state that the repurchase process may involve consideration or be without consideration, although it is generally required according to the concept of repurchase. As such, the company is required to compensate for the repurchased shares, either at their nominal value or at a value specified in the company's bylaws. The researcher believes that the legislator, in the Redeemable Shares Instructions, has not prescribed a specific value for the consideration of redeemable shares. Instead, it is left to the agreement of the shareholders as outlined in the company's bylaws, whether it be the nominal value of the shares or a value agreed upon.

In light of the information provided, if the repurchase transaction includes a financial aspect, the company is obligated to outline in its bylaws the precise procedure for determining the monetary consideration and the method of payment [3]. This procedure must be based on a straightforward and well-defined mathematical formula that leaves no room for ambiguity. The calculation of the value of redeemable shares is determined either by the nominal value of the share or an agreed-upon value, which

could be the book value or market value of the share, as verified by a report from the company's auditor [4].

According to the researcher, it is recommended that the redemption price of shares should be determined based on either the book value or the market value at the moment of repurchase. This approach ensures that the shareholder holding the redeemable shares receives a fair price that accurately reflects the true value of the shares. However, it is important to consider the potential consequences of not establishing a specific limit or cap on the repurchase consideration.

According to the researcher, the Jordanian legislator has mandated that companies establish a specific mechanism for determining the price and payment method of redeemable shares in their contracts and bylaws. However, there is no specific limit or cap set for this consideration. For instance, a company could repurchase one thousand redeemable shares for either one hundred thousand dinars or one hundred dinars. This lack of consistency goes against principles of fairness, as the value of these shares should not be over or underestimated. Even with a specified mechanism for calculating the repurchase consideration, the absence of a specific limit or cap could result in unfair treatment of shareholders and potential misuse by company founders, as the consideration does not accurately reflect the true value of the shares. The researcher argues that the Jordanian legislator should impose a maximum limit or cap on the repurchase consideration, aligning it with the actual value of the shares, in order to safeguard shareholders and prevent the misuse of company funds for personal gain. This process could be linked to a report from the company's auditor, verifying the true value of the shares at the time of repurchase, thus preventing any manipulation of the consideration by the company, whether by increasing or decreasing it.

2.2 Notifying the Companies Regulatory Official in Writing of the Repurchase Decision

In order to proceed with the repurchase, the company is obligated to submit the decision for approval to the Companies Regulatory Official. As we have previously discussed, the approval for the repurchase can be granted by either the company's General Assembly, its Board of Directors, or through a recommendation from the Board to the General Assembly for the approval of the share repurchase. This decision must comply with the procedural and legal requirements for General Assembly or Board meetings. Additionally, it must contain the necessary information as outlined in Article 6 of the instructions, as mentioned earlier [5]. The execution of the repurchase must be accurately recorded in the shareholders' records and reported to the Companies Regulatory Official, in accordance with Article 83/A/B/Repeated of the Jordanian Companies Law [6].

A question arises here: What is the legal effect on the company's capital as a result of the share repurchase?

The researcher believes that the legal effect on the company's capital resulting from the share repurchase manifests in two ways:

- **First Scenario**: To analyze the impact of a share repurchase on the capital of the company, one can refer to Article 82/C/Repeated of the Jordanian Companies Law [7]. In the case where redeemable shares are deemed unpaid, these shares can be eliminated, resulting in a reduction of the company's capital by the nominal value stated in the company's contract and bylaws. This reduction can be carried out without following the procedures outlined in paragraph (B) of the same article [8], and creditors do not possess the right to raise objections.
- **Second Scenario**: When examining the impact on the company's capital due to financing the repurchase from it, a thorough analysis will be conducted while discussing the legal consequences on the company's creditors resulting from the repurchase.

Additionally, it is important to address the following question: What is the fate of the repurchased shares?

As mandated by Article 4/W of the Redeemable Shares Instructions, the company must outline the destiny of the repurchased shares in its contract and bylaws. These repurchased shares can either be retained by the company, reissued and sold, or canceled to decrease the company's capital, in accordance with Article 82 of the Companies Law.

Upon careful examination, it is evident that the researcher has discovered an interesting fact. In cases where a company's bylaws explicitly state that the company will retain repurchased shares, the Jordanian legislator has unfortunately failed to mandate the creation of a dedicated fund for these shares. This oversight results in a lack of clarity, as the repurchased shares are simply held under the company's name, causing confusion with treasury shares. It would have been more desirable for the Jordanian legislator to enforce the establishment of a fund specifically designated for holding repurchased shares until they are ready to be reissued and sold.

When discussing the legal effects of share repurchase on the shareholder, the following questions arise:

- Does the share repurchase affect the legal status of the shareholder?
- What are the rights of holders of redeemable shares resulting from the share repurchase?

The repurchase of shares has a direct impact on the legal status of shareholders. When shares are repurchased, shareholders exit the company and receive compensation for their shares. This change in legal status occurs during the company's lifetime [9]. Additionally, if shareholders acquire different types of shares through a capital increase, their legal status may also change. In this case, they become shareholders in proportion to the increase, as determined by a decision made by the company's extraordinary General Assembly, which is separate from the repurchase decision [10].

As for the rights of the shareholder holding redeemable shares, they include:

1. The company's bylaws outline the various rights associated with this particular type of share, including attending and voting at General Assembly meetings, distribution of profits and losses, and priority rights in case of liquidation. These rights and advantages are granted to this type of share as stipulated in the company's contract and bylaws, in accordance with Article 68/A/Repeated of the Companies Law [11].
2. If the repurchase of shares is done for consideration, the shareholder has the right to demand that the company compensates them by paying the price of the repurchased shares.
3. The shareholder possesses the legal entitlement to request that the company refrain from postponing the payment for the repurchased shares, as it can result in detrimental consequences for the shareholder [12].
4. As per Article 7/4/B of the instructions [12], shareholders possess the right to initiate legal proceedings against the company in the appropriate courts if the company declines to carry out the repurchase, neglects to provide compensation for the repurchased shares, or delays payment of said compensation.

The researcher suggests that the Jordanian legislator should take into consideration the concept of a preferred creditor when the repurchase of shares fails or cannot be carried out. In the event of liquidation, shareholders who hold redeemable shares should be treated as preferred creditors, with priority over other shareholders and creditors in recovering their compensation for shares that were not repurchased while the company was still operating. Redeemable shares are similar to a debt with a fixed return, but unlike traditional debt, the holder of these shares does not receive interest. Instead, they earn profits from these shares. Therefore, when the repurchase conditions are met, the shareholder should be able to recover the value of their shares during the company's existence, without the concept of a fixed return being applied. This is because granting fixed benefits to the shareholder, even in the absence of profits, would require using the company's capital or mandatory reserves to pay the fixed return, which compromises the protection of creditors. Therefore, adopting the idea of a preferred creditor for holders of redeemable shares would provide them with protection in cases where the repurchase process fails. The British legislator has already addressed the legal consequences of share repurchase on the company, its capital, and the shareholder [13], as follows:

- According to section 689 of the UK Companies Act, the company is obligated to inform the Companies Regulatory Official about their decision to repurchase [13].
- As outlined in Section 686 of the UK Companies Act, it is a requirement for the company to bear the cost of repurchased shares, whether it is paid at the time of repurchase or at a later agreed-upon date [14].
- Within the UK Companies Act, specifically in Section 688, provisions are outlined for the cancellation of repurchased shares, capital reduction, and the departure of shareholders who possess these shares from the company [15].

The Jordanian legislator's perspective on the legal consequences of share repurchase for the company, its capital, and the shareholder closely resembles that of the British legislator, albeit with minor variances.

3 Legal Effects of Repurchase on the Company's Creditors

The general assurance for creditors of a private joint-stock company lies in its capital. This capital serves as the fundamental and essential method of safeguarding their rights and serves as the primary motivator for their consent to the company's debt. The financial stability, debt repayment capability, and resilience to potential financial challenges are all reflected in the company's capital.

The foundation of the company's financial resources rests upon the fundamental concept of capital stability, which serves as a broad assurance for creditors. Legal scholars have offered different interpretations of this principle. Some define it as the obligation to maintain the capital at its originally agreed upon amount, or as modified through increases or decreases. Others define it as the safeguarding of the company's capital in relation to creditors who entered into agreements with the company based on that capital, granting creditors the authority to object to any actions that may undermine the overall protection provided by law for their benefit [16–18].

The second doctrinal definition of the principle of capital stability, as advocated by the researcher, serves as a safeguard for the company's creditors. This principle is crucial for creditors when extending loans to the company, as it relies on the company's financial stability to guarantee their ability to recover the debt. It is important to note that creditors establish this debt based on the company's capital at the time of the agreement, rather than solely relying on the minimum capital required by law. The company's capital plays a vital role in facilitating its operations, sustaining its activities, ensuring its ongoing existence, and safeguarding the rights of its creditors.

Considering that the company's capital serves as a guarantee for creditors, the repurchase of shares from the specified funding sources mentioned in Article (5/A) of the Instructions for Redeemable Shares [19] should not have any impact on the rights of creditors in relation to the company's capital [20]. Therefore, the following questions arise:

- What are the legal effects on the company's creditors if the repurchase of shares is financed from the company's capital? Does this harm the creditors?
- What is the legal effect on the company's capital if the repurchase is financed from it?

In Article (66/A/Repeated) of the Companies Law, the Jordanian legislator has established a minimum capital requirement for private joint-stock companies, which must not be less than $7000. This provision serves as a safeguard and assurance for creditors, shareholders, and the continuous operation of the company. In certain circumstances, such as when the company exceeds its needs or experiences losses, the company may reduce its capital [21–25]. However, it must ensure that the reduction

does not fall below the minimum legal requirement and provide justification for the reduction and its impact on the company's obligations, taking into consideration the rights of creditors and avoiding any harm to them. To address the concerns of creditors regarding capital reductions, the Jordanian legislator has granted them the right to object to such decisions, as stated in Article (82/Repeated) of the Companies Law. This article outlines two scenarios in which creditors can exercise their right to object to capital reductions as follows:

- **First Case: Reduction of the Authorized and Unsubscribed Capital**

The specified procedures for capital reduction outlined in this article do not apply to the company in question, and creditors are not permitted to raise objections to the decision to reduce capital. This is due to the fact that the authorized capital, which remains unsubscribed and unpaid, lacks assets or resources of equal value. As a result, it does not impact the overall security for creditors, as there is no tangible value from which debts can be recovered [26–31].

- **Second Case: Reduction of the Subscribed and Paid-Up Capital**

In this case, the company must follow the capital reduction procedures outlined in this article, which include the following:

1. In order to reduce the company's capital, a decision must be made by the General Assembly.
2. In order to comply with the requirement, it is necessary to have the announcement published consecutively in a daily newspaper for a minimum of three times.
3. Within a span of 15 days from the final announcement, creditors possess the authority to raise objections to the reduction decision by contacting the Companies Regulatory Official.
4. Within a period of 30 days from the date of submission, it is the responsibility of the Companies Regulatory Official to effectively handle any objections raised by the creditors.
5. In the event that the objection of a creditor is not resolved by the Companies Regulatory Official, they have the option to appeal to the competent court against the reduction decision. It is important to note, however, that this appeal does not have the power to halt the reduction procedures unless the competent court determines otherwise [32].

This leads us to differentiate between creditors' rights arising before the company makes the reduction decision and creditors' rights arising after the company has made the decision, as follows:

1. **First Case**: In accordance with Article (82/B/Repeated) of the Companies Law [4], creditors maintain the right to object and appeal concerning the pre-existing rights that arose prior to the reduction decision, following the specified procedures.

2. **Second Case**: Once the reduction decision has been made, it is important to note that creditors are bound by this decision and are unable to challenge or contest it. This is due to the fact that creditors acknowledge and recognize the company's capital as it stands after the reduction, rather than the original capital before the reduction took place [33]. This further reinforces the doctrinal concept of capital stability that was previously discussed.

To ensure the stability of capital, it is crucial to acknowledge concerns regarding the funding of the redemption process using the company's own capital. The legislator has implemented the principle of capital stability in various ways, one of which is by setting a minimum capital requirement for private shareholding companies. It is important to note that the company is prohibited from redeeming any portion of this minimum capital, as doing so would undermine the guarantee that creditors rely on to secure their debts. While the company cannot issue redeemable shares that are equivalent to the minimum capital, it does have the option to issue redeemable shares that exceed this threshold. For instance:

In the event that the company's subscribed capital amounts to $ 141,085.30, with $ 70,542.65 allocated to redeemable shares, a scenario may arise where these shares are redeemed using funds from the company's capital due to the depletion of alternative financing sources. As a consequence, the subscribed capital would be reduced to $ 70,542.65. This reduction would have a detrimental impact on creditors, as it would weaken the overall guarantee provided by the company's capital at the time of entering into contracts, surpassing the minimum requirement set by law. Consequently, the 70,542.65 redeemable shares would no longer accurately represent the actual capital and would merely serve as a superficial credit, even if the legislator grants the right to challenge this reduction.

According to the researcher, utilizing the company's capital to fund the redemption process, as allowed by Article (5/B) of the Jordanian regulations [1, 6], carries significant risks due to the absence of sufficient safeguards, aside from exhausting alternative financing options. It would have been more prudent for the Jordanian legislature to establish legal measures and protocols akin to those implemented by their British counterparts, in order to protect the rights of creditors, safeguard the interests of shareholders, ensure the company's continuity, and accomplish its objectives. These specific measures and protocols are detailed in Chapter Five of the British Companies Act, specifically Articles (709–723) [9].

4 Conclusion

According to the study, the main assurance for creditors and an indication of a company's financial stability and ability to fulfill its obligations lies in the capital of private joint-stock companies. In Jordan, there are comprehensive legal provisions that specifically safeguard the rights of creditors in share redemption scenarios.

Nevertheless, the study emphasizes the necessity of strengthening the legal regulations governing share redemption procedures in order to provide enhanced protection for creditors and ensure the stability of companies.

4.1 Results

The study reached the following results:

- The presence of capital in private joint-stock companies acts as a broad assurance for creditors, while the principle of capital stability not only safeguards their rights but also strengthens the overall financial credibility of the company.
- In order to safeguard the rights of creditors, Jordanian legislation establishes a minimum capital requirement, although there is a need for more stringent controls to be implemented to effectively regulate share redemption processes.
- If share redemptions are financed using the company's capital without proper execution, it can have adverse effects on creditors' rights and potentially undermine their overall guarantee.
- In order to safeguard the rights of creditors and ensure the stability of companies, it is necessary to implement legal procedures that are akin to those found in British legislation.

4.2 Recommendations

Based on the results obtained, the study recommends the following:

- Amend Jordanian legislation to include more stringent controls and procedures for the redemption of shares from capital.
- Establish mechanisms for regular monitoring and assessment of the impact of share redemptions on creditors' rights.
- Increase the legal awareness of companies and creditors about the potential effects of share redemption and ways of protecting their rights.
- Learn about the experience of other countries, such as the UK, in regulating share redemptions and apply best legal practices to Jordanian legislation.
- Conduct training and workshops for lawyers and financial advisors to familiarize them with the new legislation and ensure it is applied in a way that protects the rights of all parties involved.

The Impact of Green Human Resources on the Promotion of Social Responsibility Among Employees

Khaled Alzeaideen, Maan Hussein Mansour, Kafa Jalal Salman Hussein, and Odai Abd Alwahab Helal Alhamaideh

Abstract The objective of the study is to assess the influence of green human resources, including green recruitment, training and development, green human resource management and evaluation, and energy conservation, on the promotion of social responsibility among employees. In order to gather data, a descriptive analytical approach was employed, utilizing a questionnaire as the primary data collection tool. The findings revealed that the implementation of green human resources and social responsibility was moderate. Based on these results, the study recommends the integration of the green dimension into job descriptions for activities related to green projects and sustainable development, as well as the adoption of green management practices, particularly in high-level operations.

Keywords Green human resources · Social responsibility · Green human resource management · Energy conservation

1 Introduction

The growing emphasis on human resources has become more pronounced amidst a range of developments, as their pivotal contribution in navigating the ever-evolving challenges and circumstances within the corporate landscape is widely recognized.

Consequently, it is imperative for management to anticipate and proactively address these challenges and circumstances, equipped with the necessary preparedness. A crucial and impactful factor in this regard is the implementation of green human resource management, which assumes a significant role in addressing environmental concerns and ensuring the sustainable utilization of available resources [7]. This is achieved through the incorporation of an environmental management approach that seamlessly integrates environmental objectives into all facets of green human resource management practices within the business environment, thereby fostering an environmentally conscious ethos [17].

The establishment of strong and interconnected relationships between organizations and the community, as well as the government, relies heavily on the concept of social responsibility. This concept aims to bring about both tangible advantages for the company and ethical benefits for the community. To overcome obstacles like the scarcity of skilled administrative professionals in carrying out social responsibility initiatives, strategic planning must incorporate the notion of social responsibility. One approach to address this is by integrating other management concepts such as green human resource management [11]. Additionally, human resources play a vital role in preserving the environment and directly impacting environmental concerns. Through training and education, human resource management plays a critical role in instilling a sense of social responsibility in employees, allowing for a balance between economic, social, and organizational objectives. Consequently, it is crucial to examine the influence of human resources on fostering green social responsibility among employees within the Directorate of Education in Rusaifa District.

1.1 Problem Statement

Promoting green human resources practices has an intense impact on the working environment in various sectors. It is appropriate to incorporate an environmental view and management into traditional human resource management. Through the researcher's examination of studies and literature, including Al-Touqairi's [12] study on green human resources in Ministries of Education, it has been discovered that these studies reveal the presence of environmental challenges and issues that pose a risk to humanity. Consequently, current generations, thanks to a growing ecological mentality and growing awareness, are taking responsibility for environmental protection. Moreover, research by Al-Maher and Dawood [5] highlights that social responsibility is the foundation of society, necessary to cope with both ordinary and unforeseen changes and circumstances. For example, the COVID-19 pandemic has exposed organizations and societies to a decline in environmental consciousness among the general population, specifically within the Directorate of Education in the Rusaifa District.

The transition from childhood to adulthood is a crucial period in which individuals seek self-fulfillment. This journey requires guidance and support to prepare individuals for integration into adult society, shouldering responsibilities, and understanding

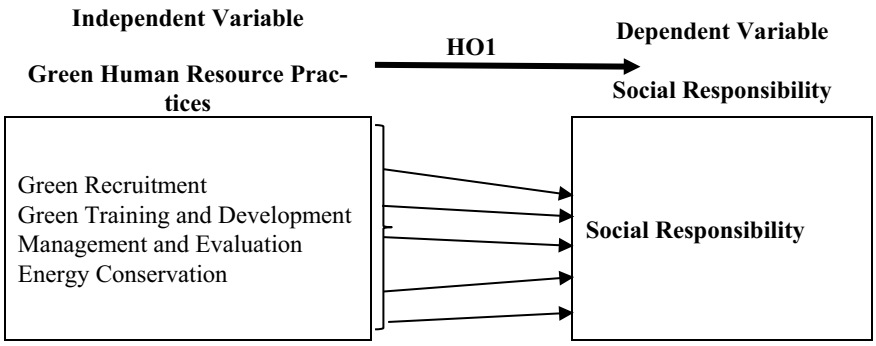
behaviors that promote the protection and care of the environment [6]. It is essential for human resources to play a significant role in maintaining the environment and mitigating human-induced environmental impacts. Recognizing the challenges faced by employees and directorates in this regard, the researchers, drawing upon their experience in the educational field, has undertaken a study to explore the influence of green human resources on social responsibility among employees in the Directorate of Education in Rusaifa District [3].

To achieve optimal resource consumption and reduce environmental pollution, it is necessary to redesign human resources in accordance with laws and policies that emphasize the avoidance of excess and regulation of resource consumption. In light of these considerations, the main question that the study aims to address is: Does the implementation of green human resource practices have an impact on the promotion of social responsibility among employees in the Directorate of Education in Rusaifa District?

1.2 Study Hypothesis

Based on the study problem and its objectives, the main study hypothesis is formulated as follows:

- HO1: "There is no statistically significant impact at the significance level ($\alpha \leq 0.05$) of green human resource practices with its dimensions (green recruitment, green training and development, management and evaluation, and energy conservation) on social responsibility among employees in the Directorate of Education in Rusaifa District."



1.3 Study Model

The study model and its variables are illustrated in Fig. 1.

2 Literature Review

2.1 Green Human Resources

The concept of green human resources encompasses the creation, execution, and ongoing maintenance of a system that aims to cultivate environmentally conscious employees within the workplace [8]. The focus of green human resource management is to convert traditional employees into individuals who prioritize environmental responsibility, ultimately leading to the attainment of environmental objectives and

Source: Referring to the following studies: (Al-Sakran, 2017), (Mansour and Aishoush, 2024), (Al-Zeftawi, 2023), (Mansour and Mansour, 2020).

Fig. 1 Study model. [10, 13, 19, 24, 25] *Source* Referring to the following studies:

the promotion of sustainable practices. This has a positive impact on employees themselves, as well as the natural environment, society, and the overall business landscape. However, as Mostafa et al. [26] explain that green human resources is one of the most important techniques used by an organization to improve its performance and achieve environmental goals. This green behavior reflects a high level of environmental awareness and helps reduce the negative impact of human activity on business. It includes practices such as energy conservation, recycling, waste reduction and water conservation.

As Muntari et al. [27] argue that "green human resources practices and interventions aim to improve employee skills and increase environmental responsibility, as well as the efficient use of resources." This is done through a range of practices, including green recruitment, environmental education and training, incentives and rewards, green performance evaluation, employee participation and green team spirit.

2.2 Green Human Resource Practices

There is a range of viewpoints among scholars and researchers when it comes to green human resource practices and their various aspects. Some experts emphasize four dimensions, namely green recruitment, green training and development, green performance evaluation, and green wage and incentive systems [29]. Al-Qaraleh [9] delved into recruitment and selection as well as performance evaluation, while Anwar et al. [14] focused on three dimensions: green competence-building practices, green motivation-enhancing practices, and green participation practices. On the other hand, there are those who highlight five dimensions: green compensation, green performance management and evaluation, green training and development, green recruitment, and green job analysis and design [22].

To accomplish sustainable development and preserve the environment, green human resources play a vital role by effectively utilizing the organization's resources to create an environmentally conscious workplace. This fosters a greater sense of environmental awareness among employees, leading to heightened interest and commitment to sustainability matters [20]. The current research adopts the following dimensions and practices:

- **Green Recruitment**: In order to prioritize the environment within the workplace, organizations must carefully hire individuals who possess the necessary expertise, skills, and knowledge of relevant environmental processes [4]. The environment and related initiatives are integral components of human resource operations. These functions play a crucial role in fostering the development of employee competencies and skills, ultimately contributing to the achievement of organizational objectives. By equipping employees with diverse skills, knowledge, and behaviors, organizations can enhance performance levels and productivity while minimizing costs and efforts. This process is essential for achieving desired goals within specified timeframes [28].
- **Green Human Resource Management and Evaluation**: To improve employee performance and achieve organizational goals, it is crucial to integrate environmental policies and indicators with performance, conduct benchmarking to accurately identify the source and cause of problems, acknowledge gaps, and offer solutions to mitigate their negative impact until they are resolved, thereby promoting continuous improvements in environmental outcomes, including incidents and responsibilities.
- **Energy Conservation**: The practice of conserving energy in various forms, with the aim of protecting the environment, reducing fuel costs, and promoting individual and community-wide responsibility, is a behavior advocated for efficient energy utilization [1].

2.3 Concept of Social Responsibility

The emergence of the notion of social responsibility was a response to economic crises and their negative consequences, aiming to achieve organizational objectives while considering the interests of others. Social responsibility is a modern concept in management, and although administrators may have different definitions, they agree on its fundamental nature. It encompasses all actions and practices undertaken by organizations to safeguard and manage society, as well as prioritize the well-being of the community [18]. According to the World Business Council, social responsibility is defined as the ongoing commitment of businesses to ethical conduct, along with contributing to economic growth to enhance the quality of life for employees and their families in the local community and society as a whole [15].

Dimensions of Social Responsibility

Many specialists and business pioneers have focused on the social dimension, which is the cornerstone of social responsibility. Caroll presented a model in the field of social responsibility based on four dimensions:

- **Economic Responsibility Dimension**: It refers to highlighting profit achievement for owners, workers, management, and shareholders.
- **Legal Responsibility Dimension**: Organizations are required by law to practice their activities and perform various tasks in accordance with regulations, viewing social responsibility as a duty that not only ensures profitability but also aligns with legal obligations.
- **Ethical Responsibility Dimension**: In order to carry out its functions and activities, the organization must adhere to a set of ethical behaviors that are in line with customs, traditions, ethical systems, values, mutual respect, and cooperation, all while ensuring that society is not harmed and its components are not compromised.
- **Philanthropic Responsibility Dimension**: The fundamental principle of social responsibility lies in voluntarily contributing to community reform programs, supporting local development initiatives, ensuring the organization's growth and operation, and bolstering its reputation within society [23].

2.4 Green Human Resources Practices and Social Responsibility

The significance of incorporating green human resources into organizational practices has become apparent as it contributes to various aspects of organizational functioning. These include improving employee retention rates, enhancing the overall image of the organization, refining recruitment strategies, boosting productivity, conserving energy, promoting sustainable use of environmental resources, and reducing behaviors that harm the environment. In today's world, organizations prioritize social responsibility initiatives that address social issues [2]. By embracing green human resources, organizations can foster a sense of social responsibility among employees, utilizing it as a driving force for business development and positively impacting the workforce. It is not solely the responsibility of employees, HR managers also play a crucial role in educating and training employees on social responsibility. They achieve this by developing and implementing social responsibility plans and monitoring their effectiveness. Research has demonstrated that organizations that integrate social responsibility into their core strategies with a focus on green human resources not only benefit their employees but also the organization as a whole [11].

The correlation between green human resources and social responsibility has been determined by researchers to be robust and intimate. Social responsibility is regarded as a vital and encouraging element for employees across all hierarchies. Its initiatives

encompass the establishment and preparation of both material and ethical support programs for community endeavors. Green human resources management seamlessly integrates into the organization's holistic functioning, permeating green recruitment and selection, green training and development, green performance evaluation, and subsequently formulating progressive and contemporary administrative protocols and regulations that align with the goals of green management.

2.5 Previous Studies

In an effort to explore the connection between green human resources management (GHRM) and sustainable development, Dweif [17] conducted a study. The study focused on the various dimensions of GHRM, including green compensation and incentive systems, green health and safety management, green training and development, green performance evaluation, green recruitment, and green job analysis and design. The study utilized a descriptive-analytical approach and targeted food industrial companies affiliated with the Food Industries Holding Company in Greater Cairo, Egypt. The findings of the study revealed a positive impact relationship between the dimensions of GHRM and sustainable development. As a result, one of the key recommendations put forth was the implementation of training programs to enhance environmental awareness within food industrial companies.

In her research conducted in 2024, Guleshan sought to delve into the impact of corporate social responsibility (CSR) on how consumers perceive businesses. As this was an exploratory study, it was conducted to understand how the different components of CSR (philanthropic, environmental, economic, ethical and legal) lie with customers. These results were then compared with the results of already conducted studies. A wide variety of participants (students, staff and lecturers) participated in the study conducted by the Technical College of Management at Duhok University of Technology. A sample of 75 people from various countries were invited to participate in the study. The result showed that there is much greater moral responsibility than social and economic responsibility.

Ziyadeh et al. [30] conducted a study to elucidate the relationship between three dimensions of GHRM (energy conservation, green recruitment, and green compensation and reward systems) and the sustainability of healthcare organizations in Palestine. The study used descriptive-analytical method to explain the study. The study used a sample of human resources and quality managers who work in healthcare institutions in Palestine. The study found that the three dimensions of GHRM have a significant positive impact on the sustainability of healthcare organizations. The study also provided some key recommendations such as raising awareness about environmental protection and its positive impact on GHRM. Researchers recommend conducting workshops and training for employees in order to increase their competences in the field of green skills and competencies and their positive impact on the sustainable development of the organization due to its environmental nature.

Jehan et al. [21] conducted a study to investigate the impact of GHRM (Green Recruitment and Selection, Green Performance Assessment, Green Training and Development, Green Compensation) practices on environmental behavior in educational organizations in Baltistan, Iran. Using a descriptive and analytical approach, researchers conducted a survey in which the respondents were 300 employees of government universities. The findings highlighted the positive effects of GHRM practices both directly and indirectly through the mediating variable PEB.

3 Study Methodology

3.1 Study Population and Sample

The sample for this study comprises approximately 140 employees who are currently employed at the Education Directorate in the Al-Rusaifeh District. Since the total number of employees is relatively small, all 140 employees from the Education Directorate in the Al-Rusaifeh District were included in the study sample.

3.2 Reliability Coefficient

To assess the reliability of the questionnaire as a data collection tool for this study, Cronbach's Alpha was utilized to measure internal consistency. The internal consistency of the questionnaire items was evaluated using Cronbach's Alpha, and the results are presented in Table 1.

Based on the data presented in Table 1, it can be observed that the reliability coefficient for both the independent variable (Green Human Resource Management) and the dependent variable (Social Responsibility) exceeds 70% [16]. This indicates a strong level of internal consistency among the items included in the study tool,

Table 1 Internal consistency coefficients (cronbach's alpha)

Dimension	Area	Internal consistency coefficient
Green human resource management	Green recruitment	0.724
	Green training and development	0.602
	Green HR management and evaluation	0.722
	Energy conservation	0.782
Social responsibility	Social responsibility	0.739
Overall tool		0.713

with a coefficient of 71.38%. These findings provide validation for the study tool's suitability in testing hypotheses.

3.3 Hypothesis Testing

The focus of this portion of the research is to analyze the outcomes of hypothesis testing, which were developed to align with the study's key questions and their significance. The objective is to assess the influence of Green Human Resource Management on Social Responsibility within the workforce of the Education Directorate located in the Al-Rusaifeh District.

Results Related to the Main Hypothesis

- **HO1:** "There is no statistically significant effect at the significance level ($\alpha \leq 0.05$) of Green Human Resource Management dimensions (Green Recruitment, Green Training and Development, Green HR Management and Evaluation, and Energy Conservation) on Social Responsibility among employees at the Education Directorate in the Al-Rusaifeh District."

To test this hypothesis, Multiple Linear Regression was used. The results of the hypothesis test are summarized in the table below (Table 2).

According to the data presented in the table, there is a positive correlation (correlation coefficient value of 0.861) between green human resource management practices and social responsibility. This means that as green HR practices increase, so does social responsibility. The coefficient of determination is 77.6%, indicating that the dimensions of green HR management explain 77.6% of the variation in social responsibility. The calculated value of F (135.629) is higher than the tabulated value at a significance level of 0.000, which is less than 0.05. As a result, the null hypothesis, stating that there is no statistically significant effect of green HR management and

Table 2 Results of multiple linear regression for hypothesis testing

Dependent variable	R	R^2	F	F Sig	Dimension	Beta	T	Standard Error	Sig
Social Responsibility	0.861	0.776	135.629	0.000	Green Recruitment	0.205	*4.786	0.000	0.205
					Green Training and Development	0.313	*5.981	0.000	0.313
					Management and Evaluation	0.209	*4.306	0.000	0.209
					Energy Conservation	0.101	4.131	0.000	0.101

its dimensions (green recruitment, training and development, green HR management and evaluation, and energy conservation) on social responsibility among employees at the Directorate of Education in Al-Rusayfah District, is rejected. Therefore, the alternative hypothesis, which states that there is a statistically significant effect of green HR management and its dimensions (green recruitment, training and development, green HR management and evaluation, energy conservation) on social responsibility among employees at the Directorate of Education in Al-Rusayfah District, is accepted. The impact of the dimensions of green human resource management on social responsibility among employees at the Directorate of Education in Al-Rusayfah District has been thoroughly examined. Each dimension, when analyzed individually, demonstrates a highly significant effect. The statistical analysis reveals that green recruitment has a significant effect on social responsibility, as evidenced by a t-value of 4.786 ($p < 0.001$). Similarly, green training and development also have a significant impact on social responsibility, with a t-value of 5.981 ($p < 0.001$). Moreover, the effect of green human resource management and evaluation on social responsibility is statistically significant, as indicated by a t-value of 4.306 ($p < 0.001$). Lastly, energy conservation is found to significantly influence social responsibility, with a t-value of 4.131 ($p < 0.001$).

3.4 Discussion of Results and Recommendations

The outcomes of this study reveal a notable influence exerted by green human resource management (HRM) strategies, encompassing green recruitment, training and development, green HRM management and evaluation, and energy conservation, on the level of social responsibility displayed by employees at the Directorate of Education in Al-Rusayfah District. The strong correlation coefficient value of 0.861 indicates a robust association between green HRM practices and social responsibility. Moreover, the coefficient of determination, which stands at 77.6%, suggests that the various dimensions of green HRM account for this percentage of the variation observed in social responsibility. Upon closer examination of each dimension individually, it becomes evident that all aspects of green HRM exhibit a statistically significant impact on social responsibility. These findings align with prior research conducted by Mansour and Aishoush [24] and Al-Sawi and Dabag [11], both of which also identified a positive influence exerted by green HRM practices on social responsibility. By implementing green HRM practices, employees develop a heightened sense of environmental awareness, enabling them to better grasp the importance of both local and global ecological issues, such as the preservation of natural resources and the consequences of climate change. Consequently, this enhanced awareness serves as a catalyst for employees to adopt environmentally responsible behaviors and integrate sustainable practices into their daily lives.

3.5 Recommendations

- Since GHRM practices contribute to achieving social responsibility and reducing environmental damage, the recommendation would be to improve GHRM practices in the Al-Rusayfah Education Directorate by emphasizing the implementation of environmentally friendly practices that contribute to environmental protection.
- Integrate sustainability and social responsibility standards into employee recruitment and evaluation processes, ensuring that the organization not only hires new employees, but also existing employees who perform in line with its environmental and social goals.
- Conducting training to increase employee awareness of environmental problems and ways to mitigate the effects of everyday practices.
- Encouraging them to save energy by conducting educational programs and seminars to increase their awareness of the importance of saving energy for the environment and society as a whole.

Assessing the Psychological Barriers to Technology Adoption in Education: Strategies for Overcoming Resistance

Adnan Hassan Alsarayreh

Abstract Resistance to technology adoption in education is a prevalent challenge, often rooted in psychological barriers such as fear of change, anxiety, and lack of confidence. These barriers can be exacerbated by educators' feelings of incapability, especially if they have not kept pace with technological advancements or participated in ongoing professional development. This study explores the psychological factors contributing to resistance among educators, analyzing the dynamics of fatigue, forgetfulness, and the overwhelming nature of high-stakes educational environments. Through a qualitative research design, the study employs a descriptive approach to systematically review related literature and an analytical approach to examine underlying causes and potential strategies for overcoming resistance. The findings highlight the importance of providing supportive learning environments and tailored training sessions that alleviate apprehension and encourage positive attitudes towards technology integration. Ultimately, the study offers insights into creating a culture that promotes effective technology adoption in educational settings.

Keywords Technology adoption · Psychological barriers · Technology integration · Educational technology · Teacher attitudes

1 Introduction

Resistance is a natural reaction that can occur for several reasons. It can stem from a fear of change or an anxiety of being unable to use the new forms of technologies effectively. Oftentimes educators can develop a feeling of incapability whenever new technology is introduced into the classroom, especially if they have not kept pace with developments in technology and have not participated in ongoing professional

development. Resistance can also stem from lack of motivation to use technology. Fatigue, forgetfulness and feeling overwhelmed, especially in an environment that promotes high-stakes accountability in school settings, are barriers that can hinder motivation or even willingness to go into new territory when it comes to technology. This paper investigates the barriers, hurdles and resistances that educators face with technology adoption in education [1].

Bridging the digital divide includes not only providing the necessary equipment and resources to ensure technology ubiquity, but also providing the learning environment that alleviates apprehension and supports teachers in technology adoption. Initial training sessions can be designed where educators explore the new technology in an informal relaxing atmosphere without the pressure of pre-approval or formal use in an academic environment. It may be helpful to transform the experience of early adoption into fun activities such as games or contests so these educators feel more comfortable, excited and confident about sharing the news technology with colleagues and other educators [2].

1.1 Significance of the Study

The significance of the study is to assess the psychological barriers to technology adoption in education. Educational technology can enhance the quality of education and improve student learning. However, there are many psychological barriers to technology adoption. It is very important to understand the psychological barriers to adopt technology in education or any kind of organization. Psychology tries to understand the human mind. Education is an extension of the mind. For extensive research on psychological barriers to technology adoption in education or any organization, it is very important to understand the key psychological concepts. There are some common and key psychological concepts, for example, perception, personality, motivation, and attitude [3]. Without understanding these key concepts, it is very hard to understand the psychological barriers to technology adoption in education or any kind of organization. The educational technology market is growing tremendously. Educational technology can enhance the quality of education [4]. Educational technology can also be used by educational organizations to provide distance education [5]. Apart from distance education, educational technology can also improve and enhance the student learning process, which in turn can improve the overall quality of education. However, despite the positive impact of educational technology on the education system, there are many psychological barriers to technology adoption in education [5]. Educational technology can only be beneficial with effective adoption and implementation. There are many studies on technology adoption in education, but very few studies focus on psychological barriers to technology adoption in education.

1.2 Methodology

This chapter follows a qualitative research design to discover the psychological barriers that are acting as resistance to technology adoption in education from the ground level and also strategies for overcoming such resistance. A descriptive approach is adopted to review and bring together related literature systematically on the basis of the dynamics of psychological factors in technology adoption, drawing on existing theories, research findings, and practical insights. The analysis will be carried out by mapping the key factors contributing to resistance from educators and students in a way that provides an exhaustive view of challenges. An analytical lens is used after descriptive analysis to probe possible underlying causes and implications through critical examination based on themes emerging from the data. This dual approach will bring out not only what has been happening with psychological barriers but also rich strategies on breaking down resistance for successful technology integration into educational settings.

2 Theoretical Framework

In any organization, there are fears about the introduction of novel technology. They might be fears about how technology would disrupt routine jobs and tasks [3]. Other fears might include concerns about technology not working properly to get the job done, resulting in lost productivity. For personal technology, there are often fears about the intrusion of technology into once private spaces (e.g., phone calls, texts, tracking location). Generally, these fears can lead to resistance to the implementation of technology. Resistance comes in many different forms, making it hard, if not impossible, to dismiss outright. Technology can be slow to be adopted, used improperly, at the wrong time or place, or rejected outright. This leads to the necessity of shedding light on psychological barriers to the acceptance and usage of technology in education. There is extensive literature on the subject of resistance to the implementation of technology in organizations [3]. An expansive field of scholarship examines the psychological barriers to implementation. Many of the models posited filter through psychological reasoning. Social processes are examined, such as distinct types of group deliberate behavior, biases, and inferences, resulting in overlooking technology's advantages, an inability to comprehend and envision the potential change, or fearing unproven tech would harm the organization's future. Outside social processes, cognitive processes are considered as would-be adopters' framing of what is proposed, such as overestimating current processes' advantages (i.e., sticking to the comfortable). Social filtering and framing processes lead to a biased and often negative perception of the proposed change. Such psychological barriers would need to be addressed in those aspiring to increase technology adoption in education, such as government officials, administrators, and other stakeholders.

2.1 Diffusion of Innovations Theory

The Diffusion of Innovations Theory, proposed by Rogers in 1962, is one of the most influential theories in the field of communication. It explains how new ideas and technologies spread within a society or an organization. Rogers defines diffusion as "the process by which an innovation is communicated through certain channels over time among the members of a social system" [6]. Indeed, there are four main components in this theory: innovations, communication channels, social systems, and the time [7]. The innovation element includes the features of an idea or object that make it new, such as its relative advantage, compatibility, complexity, observability, and trialability. Communication channels are the means through which information about the innovation is exchanged. Social systems refer to the groups of individuals who share a common culture and interact with each other. The time element involves the stages a potential adopter goes through to make a decision about adopting or rejecting the innovation.

The Diffusion of Innovations Theory is often presented in a five-stage model that describes the process that leads an individual or social system to adopt a new technology. The stages are: Knowledge: when the potential adopter is exposed to the innovation, but lacks details about it; Persuasion: when the individual forms a favorable or unfavorable attitude toward the innovation; Decision: when the individual engages in activities that lead to a choice to adopt or reject the innovation; Implementation: when the innovation is put into use; and Confirmation: when the individual seeks reinforcement for the innovation-decision and may reverse the decision if exposed to conflicting messages about it. The main issues concerning the psychology of adopting innovations revolve around the perception, the attitude and the motivation of the individual [7]. Educators interested in technology innovation and change in education may apply this framework to understand and address barriers to the adoption and use of technology in their classrooms. This theory also offers insights in ways to promote educational technology use and, for those educators who are interested, the strategy to lessen potential resistance to changes in their instructional methods [8].

2.2 Technology Acceptance Model

The technology acceptance model (TAM), which is one of the best-known models to explain why individuals accept or reject information technology [9]. Based on the Theory of Reasoned Action (TRA), Davis proposed two key determinants of system usage: perceived ease of use (PEOU) and perceived usefulness (PU). PEOU is defined as "the degree to which a person believes that using a particular system would be free of effort," while PU is defined as "the degree to which a person believes that using a particular system would enhance his or her job performance" [10]. Users will tend to accept and use a technology if they perceive it as easy-to-use and useful.

TAM has been applied in many kinds of research settings to explain IT acceptance behavior.

The original TAM model specified the following relationships: perceived ease of use → perceived usefulness → intention to use → actual system use. Later, to explain more variance in intent to use, Al-Tarawneh [2, 7] included two external variables (system design characteristics and user training) into the TAM model to create the TAM2 model. The TAM2 model posited that perceived ease of use was influenced by perceived usefulness, subjective norm, and self-efficacy [11]. Perceived ease of use was proposed to be a more temporally proximate influence on usage intention in voluntary settings. Other variables, such as experience, gender, and age, were proposed to moderate the adoption of technology [11].

With the rapid growth of the Internet and web-enabled technologies, researchers have been investigating the acceptance of Internet technology using TAM-based models. Some of the models have integrated the dimensions of different theories into a unified model and have proposed certain variables that might have moderating effects on individuals' intentions to accept or resist the Internet. For instance, Huntington found that the internal beliefs of the individual teacher, in terms of constructivist pedagogical content beliefs, self-efficacy, interest in technology, and the individual-view teacher belief profile, as well as the social construction of the external context in which technology acceptance occurs, all have an influence on the acceptance and use of school and academic digital media technologies [12].

3 Psychological Barriers to Technology Adoption

In recent years, there has been a growing emphasis on technology in education. Internet connectivity and technological gadgets are transforming how teachers teach and students learn. The Lagos E-education project in Nigeria aims to adopt technology in education, providing pupil-computer access and school Wi-Fi. However, the success of the project depends on teacher and student acceptance of the proposed technology. Concerns include current mindsets towards technology, pupil perceptions of teaching approaches, and resistance from teachers and students. [12]. Many faculties remain resistant to integrating ICT in education due to fears of deteriorating motivation for learning and lack of consultation on technology use. Traditional teachers believe they can cover the same syllabus offline. Saboteur teachers actively work against new ideas. At Lagos State University, there are teachers and pupils resistant to almost all aspects of the e-education project.

3.1 Perceived Usefulness

A major component of teacher resistance is a perceived lack of usefulness of a new technology for classroom activities [13]. The perceived usefulness of technology

in the classroom is most validly viewed on two levels. On the first level, educators perceived the usefulness of technology as related to instructional and managerial tasks. The usefulness and productivity of undertaking instructional tasks and activities is enhanced through improved control, organization, and development of classroom interactions and behaviors. On the second level, administrators perceived the usefulness of technology primarily as related to communicating the purposes and desired goals of school technology initiatives as it applied to instructional tasks, classroom activities, and teacher concerns.

Perceived usefulness appears to be a key factor in addressing resistance to classroom technology for those categories. Awareness, knowledge, and understanding are not enough unless 'what's in it for me' is also demonstrated for the specific situation. This perception of usefulness also needs to be broad enough to include positive consequences for instructional productivity and at the classroom level. More mellow pitches and workshops clarifying the beneficial consequences of technology for instructional productivity, improved teaching, and enhanced learning opportunities should be tailored to them. Technology training addressing this need should be included in full-time programs [13].

Strategies for staff development that persist in focusing only on the technology, rather than on instruction, and that approach classroom technology in a fashion similar to the inservicing of previous educational innovations will not alter that first order resistance. Education systems' initiatives are designed to effect broad changes in the classroom. There is a true concern that the changes desired encompass the very heart of teaching itself, i.e., classroom production and the nature of classroom interactions.

3.2 Perceived Ease of Use

Perceived Ease of Use addresses the psychological barriers that individuals may face when adopting new technology in education. These barriers can include feelings of anxiety or frustration when using new technology, as well as self-doubt about one's ability to use technology effectively. Perceived ease of use refers to the degree to which a person believes that a particular technology is easy to use [13]. Individuals will perceive a certain technology as easy or difficult to use according to the consideration of several factors, including the outcome expectations, the consequences of its usage, and the effort needed for operating it, amongst others. In terms of attitude toward computer technology, a person will either like or dislike the technology according to his/her perception of how easy or difficult the technology is to use. Those who perceive the technology is easy to use will likely have a positive attitude toward it.

In order to meet the change and development of this era, it is essential that individuals open up to the use of technology and adopt it in their daily lives. Therefore, those psychological barriers need to be resolved and understood. There are generally several intentions to resist change with the appearance of new technology. Analyzing

the perceived ease of use can help to find ideas, strategies, and alternatives in overcoming the resistance thought by addressing those perceptions [14]. A technology that is perceived to be easy to use spares its users from the efforts of having to learn about it. When a particular technology is adopted, its acquisition, repair, and usage normally incur costs in the forms of time and workforce. For instance, in order to operate a particular technology, users need to learn how to use it, which may require an amount of time and money being spent on training courses. The efforts saved can be redeployed to the users' core work tasks and increase their job efficiency and efficacy.

3.3 Fear of Change

Fear of change comes from the emotional side and arises from the difficulties that educators experience in understanding and using technology. Teachers are naturally resistant to change because they fear technology, feel unsure of its capabilities and effects, and are confused by its complexity [15]. Most of them view technology as a threat to their job or a device for intensifying their workload. Therefore, it is necessary to understand the fears surrounding change because worrying about a new technology is a legitimate concern for many. To relieve this fear, it is important for technology advocates to address educators' concerns before technology is adopted. Concerns must be acknowledged, and information must be provided. Without doubt, adequate support and training improve educators' confidence levels. Technology advocates need to establish an ongoing support system for using technology in everyday educational situations. The gradual adoption of new technologies, even if it takes longer, may help institutions avoid feeling overwhelmed by change.

On the other hand, it is essential to demonstrate the benefits of new technologies. Awareness of the advantages of integrating technology in education must be raised. Educators must see how technology can assist them in doing their tasks more easily [15]. They must be convinced that new technologies will save them time and effort, and a good return on investment cannot be stressed too much. It may be a good idea to invite technologically competent teachers to demonstrate their experiences with successfully applied technology in education. Successful stories should be circulated constantly, and there should be a climate of positivity and confidence in the institution regarding new technologies always.

4 Factors Influencing Resistance

Several psychological barriers, such as fear of change, uncertainty, and lack of confidence, influence resistance to technology adoption. Understanding these factors is crucial to overcoming resistance. Lack of access to resources and technical awareness also contribute to resistant behavior. Skepticism about the expected performance

and perceived usage and usability also play a role. [16]. During the early phase of examination platform technology, users see it as unnecessary and are less willing to adapt. Skepticism increases resistance towards technology. Negative experiences also contribute to skepticism and disbelief in technology's benefits. Educators should not assume resistance is solely psychological. The solution lies in developing awareness and addressing external barriers. A proactive strategy considering both psychological and external factors is key to reducing resistance.

4.1 Individual Factors

The term "psychological barriers" refers to personal beliefs, attitudes, and characteristics that may hinder or impede taking a certain action. Numerous research studies have discussed how psychological barriers affect people's response to a wide variety of issues. This section provides an overview of psychological barriers to technology adoption in education by reviewing barriers identified in previous research studies. After discussing these barriers, this section focuses on developing strategies to address these barriers. Strategies discussed in this section include approaching resistance as natural, leveraging attitudes toward students, employing personalized training, and approaching the need for change through positive perspectives [16].

Technology beliefs or attitudes are identified as one of the primary reasons behind instructors not adopting technology [16]. Notably, both faculty and student attitudes affect the adoption of technology. Students often have more positive attitudes toward technology than faculty do. Faculty typically adopt technology with the purpose of improving student learning. Lack of perceived need to enhance learning with technology leads faculty to have more negative attitudes and feelings toward technologies. When faculty view technology adoption as merely innovative equipment used for educational practices, they tend to have more negative attitudes. Studies indicate that "perceptions of users' specialization in and attitude toward the adopting innovation segment" might significantly affect the technology adoption process in education.

4.2 Organizational Factors

Organizational Factors refer to how institutional structures, policies, and availability of technological infrastructure influence teachers' and students' willingness to adopt innovations. Considerations of faculty cohesion in schools and access to technology may also be relevant. Barriers to technology adoption at the organizational level include lack of administrative support, insufficient technological resources and infrastructure, low priority for technology in professional development opportunities, and lack of time to learn and use new technologies. A more proactive approach

of technology-organizational changes must consider how technology and organizational changes are integrated [17]. In this scenario, pro-active measures and technologies can be adopted by modification of existing work practices to fit technological constraints, e.g., changing the mode of teaching from teacher-centred lecture presentations to group work with semi-automated lectures. In the current state, organizational pressures play no role because technology is not deployed, and innovation just involves switching to another technology (with organizational changes to fit it).

There are various strategies of addressing organizational factors to resistances toward technology adoption. Suggestions include a concern for the organizational strategy and a need for organizational changes to fit emerging technologies. Faculty cohesion with other teachers in schools is the unifying element for schools that share a common culture and community. Faculty cohesion is important in influencing technology integration for student learning through students' understanding of technology funds of knowledge [17]. In contrast, social cohesion among teachers is the most influential barrier for teachers at schools with little technology availability and poor professional development opportunities. In this case, there is a stronger tendency for technology non-use at the institutional level. Strategic visions, institutional policies, and faculty priorities played a limited role because most teachers' and students' technology adoption decision-making mainly occurred at the individual or classroom level, where lack of administrative control would undermine the institutional effort to encourage the use of technology in education. Since teachers' technology adoption depends on the institutional culture and community, it is important to develop policies in aiding the development of commons spaces for teachers (both online and at schools) to engage in dialogue and collaboration around technology adoption. In particular, there is a need to create a community of teachers exploring practical technology uses for student learning, including demo/pilot experiments with new technologies tested by teachers before class-wide adoption and co-design of educational materials [18].

4.3 Societal Factors

This broader perspective also emphasizes the need to examine external societal factors that may exert influence or pressure on individual behavioral intent and willingness to adopt new technologies. These could be wider community or national cultural norms or concerns, political structures, and economic issues that may mean that for certain personal circumstances, technology adoption is much less appropriate or is seen as impractical. Individuals anywhere are increasingly being coerced into adopting technologies much faster than they may be felt to be culturally or socially appropriate. Greater attention should be paid to the externality pressures for technology adoption and the relationship of technology adoption with wider societal issues in addition to solely focusing on the factors most directly relevant to the individual person or group [18]. The significance of educational level and direct social exclusion should also be recognized as being able to exert the opposite and

discouraging influence on one's intent to adopt new technologies at all. For many within countries with established technologies, an unquestioned ability and willingness to adopt are assumed and inquiries and initiatives proceed from there. However, for others, especially within less developed rural societies, technology adoption is a much more complex and difficult issue. Even and also where there are many beneficiaries from technology adoption, those who do see the benefits may still be excluding whole sections of the community. Very important questions about technology adoption and social exclusion, and hence the limitations of benefit from it, need to be addressed [18].

5 Strategies for Overcoming Resistance

Psychological barriers apply to all educators in their roles as both instructors and learners [18]. The decisions to change or resist technological integration are influenced directly by an educator's perceptions and beliefs. These are often driven by fear, either real or perceived. An individual may feel less threatened by this fear if they are unaware of the fears that motivate their thoughts about technology. Fearing change and not being able to see the options available is understandable. The perceptions of change can be considerably different depending on the experience of the person viewing the changes. Established educators may view the adoption of technology through a lens of skepticism, having heard one proposal after another become the latest fad that will pass with time. Often, experienced educators have adopted and ruled out many different methods and philosophies of change in the classroom. Each of these has left its imprint on perceptions of current changes in curriculum and teaching methodology. Familiarity with technology integration and previous change proposals pervade how existing instructors perceive changes in education. Conversely, those who have known only education as a technological environment may never have considered doing things differently or seen the many valid reasons not to adopt technology and its associated changes [19].

5.1 Professional Development and Training

Professional development and training have been shown to be vital in reconsidering school cultures to support sustained learning with technology. Harnisch, Comstock, and Bruce found that the development of professional learning communities providing formal and informal interactions with peers and experts in the field provided the scaffolding for the use of new technologies to support student achievement [19]. they concluded that professional development was most effective when it took place over an extended period and focused on specific curricular needs. Harnisch, Comstock, and Bruce described how schools must rethink the nature of

professional development to build communities that engaged educators in sustained school-wide efforts to integrate technology into their teaching [19].

In their study of five grant-funded projects aimed at building professional learning communities, they stated that the informal safe space for sharing ideas provided by peer networks was a powerful support for teachers' learning and fostered mutual learning and teaching among members. Outside of the formal classroom setting, participants met with their peers to discuss their experiences and reflect on their learning. Similarly, it was found that teachers' use of technology increased significantly when they participated in a one-to-one laptop initiative offering intensive collaborative support [19]. Learning in context, such as both formal and informal PLCS, can engage individuals in actively working with others on challenges and goals within their professional practice.

Though almost all educators reported that their school district required technology training, that training appeared to be geared mostly toward administrative uses. Only slightly more than half of the educators felt that they had adequate preparation to integrate technology into instruction. Educators were invited to consider technology not as a supplemental teaching tool, but as essential [20]. It was also concluded that the likelihood of technology integration was not the result of one factor but was the combination of all factors [20]. However, having technologies did not guarantee integration. RMS teachers have access to technology, so other factors must be contributing to the lack of high-level technology integration.

5.2 Change Management Strategies

Change management strategies are a critical component in ensuring the successful implementation of any new technology across an organization. Consequently, a variety of tactics and approaches have been suggested to address resistance to this change. Each organization needs to assess the problems it is facing in integrating new technology in order to gauge the feasibility of these solutions. Even within a single organization, different cultural attitudes towards technology may exist, so an immediate one-size-fits-all answer to this dilemma may not be ideal. Computing departments too often view provision of new technology as the element of their jobs that is geographically easiest and most comprehensible, and leave it to faculty to decide whether to adopt this technology or not [20]. The technology, however, frequently necessitates a significant pedagogical shift, in which faculty cannot be left without support. Faculty must first be convinced that need exists for this technology understanding of the benefits from it, and these benefits cannot be simply pedagogical; they should improve on campus computing system, and perhaps even the composition of that system on their home university. The technology must also be made easy for faculty to access.

Electronic mail and similar innovations can be used to implement this change mechanism. New programs such as Listserv and Notes allow the creation of low-tech and low-look forums for discussion of technology issues. Faculty new to this

forum might be astounded both by the depth of questioning from the technology resistant and by the willingness of the technology advocates to discuss publicly mistakes made, and miscalculations anticipated [21]. New information cascades down not just to the editorship level, but importantly to junior faculty and staff who might be intimidated by traditional avenues of communication [22, 23]. Of particular importance is deft handling of evaluative concerns, which if unchecked on a public forum might damage not only the credibility of faculty attempting to address these concerns, but also the educational process as a whole. Up-front systems can easily misinterpret certain concerns as technological or academic frauds, when they should be viewed simply as unusual side effects of invoking a method previously outside institutional pedagogy. An appropriate intervention is at least informing the concerned faculty how their concerns are being received. Under a technology system that no one understands, reprimanding or otherwise seeking to discipline these faculties might be interpreted as abusive or tyrannical. Under a technology system that no one understands, reprimanding or otherwise seeking to discipline these faculties might be interpreted as abusive or tyrannical [24, 25].

5.3 Creating a Culture of Innovation

A critical first step in the change process is the establishment of collective identification of needs or problems that support innovative technology as part of the solution [21]. Subjective perceptions of the realities of daily tasks create an expectation gap: a difference between perceived "as-is" and perceived "to-be" situations or practices. Foster an atmosphere of openness and creativity as part of a drive for innovation. This could include simple tactics such as social activities and informal gatherings, but should also extend to curiously focused "walks on the wild side" where teachers and students experience together alternative practice in different environments. Encourage educators to try out new ways of doing things and reflect upon their experience. Potential strategies include provision of resources such as new devices on trial; creating time, space and support for experimentation; invitation to high-profile teachers to showcase radical innovations; and allowance of failure and return to previous approaches if desired. Ensure student collaboration is an expectation for technological innovation initiatives. Insights from the end-user perspective are invaluable, and students are likely to be more daring and energetic in experimenting with new technologies. Student participation might also be necessary for ideas introduced by educators to gain currency among the student body [21].

6 Case Studies

To illustrate real-world experiences of educational institutions in overcoming resistance to technology adoption, six case studies are presented: two focusing on students taking control of their own learning through technology adoption; a third highlighting teacher preparation for the use of technology in classrooms; and three exploring professional development with mentors, coaches, and school leaders to encourage enhanced use of technology in classrooms. The last three cases address barriers in broader cultural considerations [5]. Concluding recommendations build on the case study insights regarding strategies for broadening adoption of technology [26].

Two elementary school case studies are described in which integrated-use technology initiatives were rolled out at one school each in a large, urban public school district. In both cases, while technology budgets were similar and both schools received the same treatment for professional development, support for broader adoption of technology varied greatly because each school's climate, culture, and past experiences with technology were distinctly different. The case studies illustrate how understanding and addressing the broader conditions and deeper cultural issues schools face with technology integration provide insights into how to best support greater use of technology in classrooms. A set of standard questions for leaders, including administrators, technology coordinators, and district staff, is provided as a guide to assessing and addressing local conditions. Addressing these standards may help ensure positive technology adoption and integration [26].

This case study focuses on vital elements of effective teacher preparation in the use of technology. It describes an exploratory study within a Northeastern university's graduate teacher education program that investigated the views of selected faculty and student teachers about preparing teachers to use technology in K-12 classrooms. A discussion of relevant studies foreshadows an overview of the program, research methodology, participant profiles, and findings. Includes practical recommendations for improvement.

The 2nd International Conference on Pedagogy, Communication, and Language Education 2018 focused on technology adoption in education, particularly psychological barriers. It was suggested that schools need a plan for resource management, teacher support, ongoing professional development, and program monitoring to promote the use of technology [26]. A case study explores technology adoption in an alternative middle school. Despite its potential, technology is currently underused in K-12 schools, according to Durff and Carter. Technology integration is expected to enhance student achievement. The process of technology adoption is challenging and time-consuming. This study examines a middle school alternative education program in a large school district, which closed twenty-one elementary schools and implemented a gifted and talented magnet program to improve performance on state tests and avoid sanctions. Understanding how stakeholders perceive instructional technology is crucial for effective implementation [26, 27].

7 Conclusion

This study examined the psychological barriers to technology adoption in education and examined how educators coped with second-order barriers. The research provided insights into specific aspects of cognition and attitudes toward technology use, illustrating the coping strategies some educators used to develop positive beliefs regarding technology integration for meaningful learning experiences. The findings stimulated consideration of strategies to mitigate or prevent the development of negative beliefs regarding technology use. Some of the implications of this study highlighted how educational leaders who wish to influence the development of educators' beliefs regarding technology integration might reframe the ways educators experience technology. Forcing technology on educators is ineffective. To influence beliefs about technology in classrooms, stakeholders must understand educators' individual situations. This can be achieved by gradually introducing technology, modeling its use, providing access to technology, and encouraging collaboration. Creating a culture that promotes technology integration is also important. This study explores teachers' perceptions of barriers to technology use, including psychological factors such as self-confidence, resistance to change, and low expectations. It also offers insights into coping strategies for overcoming these barriers.

Digital Tools for Teaching Arabic: A Comparative Study of Traditional and Modern Approaches

Mohammed Saleem Ismail Al-Mallahma

Abstract It compares traditional and modern approaches to teaching Arabic through the integration of digital tools in language instruction. In terms of methodology, it is a qualitative study that takes a descriptive approach by reviewing available literature regarding both traditional and modern methodologies and their effect on teaching the Arabic language. The research synthesized findings from theoretical frameworks and empirical studies with respect to how digital tools can enhance the effectiveness of teaching compared to traditional methods. Results give implications for researchers and policymakers about how digital tools can be used to improve teaching outcomes, engage students, and make the teaching process more individualized according to learners' needs. In brief, this research adds weightage regarding ongoing discourse on educational technology within the sphere of Arabic language instruction; it also provides suggestions on practical issues related to integrating digital tools into language teaching.

Keywords Digital tools · Arabic language instruction · Educational technology · Modern teaching approaches

1 Introduction

The following is an overview of the research in the first section of this paper concerning digital tools for teaching Arabic, with comparisons between traditional and modern methods, purposes and significances of studies, research questions, methodology, and organizational structure of papers that provide a brief preview of upcoming sections. The use of digital tools in language teaching has been proved to impact academic processes as well as cognitive outcomes among students based

on the integration of an interactive program for non-native Arabic speakers, which helped in improving the learning outcome [1]. Another study that focused on the evolution of computer applications in language education from the perspective microcomputers used to teach Arabic grammar affirmed work being realized about progress and prospects on educational technology toward applications for language learning [2].

1.1 Background

The development of technology in teaching Arabic has become very important and that it has the potential for better efficiency in teaching the language. In countries like Kuwait, the availability and usage of instructional equipment and materials are found to vary from one school to another; there is a general lack of knowledge among teachers about how to use or maintain equipment [2]. This would be a considerable impediment to the large-scale propagation of computer-based methods of teaching Arabic language learning. Nevertheless, the development of computer applications in teaching has opened up prospects for revolutionary change in language education by offering learners interactional and authentic material. The use of NLP tools and corpora pedagogically indexed has started being experimented as a method for teaching Arabic by which it will allow educators to create activities according to different pedagogical situations or even pedagogical setups for similar tasks [3]. This approach not only helps to get a real impetus and motivation on the part of the students but also promotes the development of self-learning strategies and self-confidence. The computer-based approach of learning languages enhances authenticity in providing access to authentic materials and interactions with native speakers.

1.2 Research Objectives

The research objectives of this study comparing traditional and modern approaches to teaching Arabic using digital tools are to assess the effectiveness of instructional materials in enhancing Arabic language teaching for non-Arabic speakers and to evaluate the impact of advanced interactive e-learning methods on developing language skills. The study aims to address specific questions such as the provision and use of instructional materials in Arabic language teaching programs and the effectiveness of interactive e-learning tasks in developing listening, writing, reading, and speaking skills. Additionally, the research seeks to explore the utilization of smartphone applications, audiobooks, and interactive online platforms in promoting student interaction and engagement in language learning processes. These objectives provide a clear framework for the study's methodology and analysis, contributing to the advancement of effective Arabic language teaching strategies.

1.3 Methodology

The methodology for this research is basically of a qualitative in nature. A descriptive approach will be used by the study to carry out a complete review of the literature, both theoretical frameworks and empirical studies, related to traditional and modern teaching methodologies for Arabic language instruction. The research seeks through an extensive review of the literature to identify and analyze the differences, similarities, and outcomes associated with traditional as well as modern approaches. In synthesizing findings from review of literature an analytical approach is adopted that helps extract key insights and trends; this facilitates a critical examination of the effectiveness of various digital tools in comparison with traditional methods, thus giving a holistic understanding of their impact on teaching Arabic language. These will form part of what results and discussions have for educators and policymakers seeking to enhance Arabic language instruction through the integration of modern digital tools.

2 Theoretical Framework

The theoretical framework for the comparative study of traditional and modern approaches to teaching Arabic using digital tools is informed by key concepts and principles in educational technology and language learning. It was emphasized that the importance of utilizing science and technology in teaching, highlighting the application of computers in language learning, as well as the challenges that pertain to implementing instructional technology with specific reference contexts such as Arabic language education [4]. This relates to the need to comprehend the utilization of digital tools in teaching Arabic plus potential barriers that stand against their widespread applications. Furthermore, it was underscored the significance of developing intercultural communicative competence (ICC) in the Arabic curriculum; this underscores definitional importance: indicators are important for aligning curricular goals to foster informed global citizens [5]. The findings also have an implication on emphasizing needs regarding improvements in organization plus selection of topics in the Arabic curriculum: it provides insights that are guided relatedness towards evaluation aspects of traditional and modern teaching methods. These references help to define the theoretical framework by offering insights into problems and possibilities of teaching Arabic and ICC development, which are core components of the comparative study.

2.1 Overview of Language Teaching Theories

Theories of language teaching range widely, from traditional to technological. Behaviorist, cognitive and communicative CALL have evolved over time with different phases as a result of the contributions of various learning and teaching theories and later multimedia and internet technologies in integrating skills in language instruction [5]. The evolution of computer-assisted language learning (CALL) software has critically influenced language education; distinct stages are Communicative CALL, Structural CALL, Integrative CALL having roots from behaviorist to communicative approaches then multimedia now internet technologies in integrating skills for practical use within language instruction. The use of developed technology (such as the Internet) has proved to improve self-learning strategies for languages and also make them more authentic in terms of exposure to learners. The synthetic nature due to its morphology, diglossia phenomenon presented by Modern Standard Arabic (MSA) non- coexistent with Non-Standard Arabic (NSA) makes Arabic language teaching pose unique challenges Arabic is characterized by having a complex morphological system and being significantly different from Indo-European languages [5]; therefore, an in-depth knowledge of language teaching theories is required to be able to analyze the appropriateness of digital tools for teaching Arabic according to any of the theories.

2.2 Advantages and Challenges of Traditional Teaching Methods

There are several advantages of teaching Arabic with traditional methods. For example, the direct interaction that takes place in the classroom between students and teachers provides a way of personalized guidance and immediate feedback which can make learning more favorable. Additionally, memorization is closely tied to many traditional language-teaching approaches as well as immersion in the target culture: two components essential for successful language acquisition and understanding cultural context (cuisine, music, traditions) related to the language. On the other hand, these methods may prove challenging since students might not have adequate resource access and due to a potential lack of engagement: some instructors could be using only classic ways of teaching without integrating modern technological tools or media that would help support effective learning [6]. Such an approach leads to uninspiring lessons lacking student interest or motivation—which would have an impact on their achievement when studying how to read and write in Arabic.

2.3 Role of Technology in Language Learning

Technology in language learning—with a keen interest in teaching Arabic—is multifaceted. The use of modern digital tools can be highly engaging and offer an interactive experience, which helps in providing a variety of authentic resources for language learners. As noted by [6], there are challenges because technology must be aligned with pedagogical and methodological shifts that bring about change in the ways teachers work. Educators need to realize the connection between learner-centered practices that lead to good learning outcomes when integrating digital tools into language teaching. Even though technology can help improve proficiency in Arabic, we need to address the issue related to the stubborn nature of existing methodological beliefs and pedagogical practices, which might impede effective technology integration within language classrooms.

3 Traditional Approaches to Teaching Arabic

Ways of teaching Arabic traditionally included Qira'ah (reading), Terjemah (translation), Menghafal (memorizing), Insya' (composition), and Imla' (dictation) [10]. These are teacher-centered, rote-memorization techniques involving direct interaction between the teacher and student based on a manual of Arabic grammar rules. The increasing role of technology in educational settings has shifted the earlier stand-alone style of learning towards embedding Information and Communication Technology (ICT) tools within the language content, which is an evolving trend. Computer-assisted language learning applications are gaining popularity in today's teaching environments–for instance, a CALL task lets learners interact with texts that have been pedagogically selected independent of any facility for self-instruction or for interaction with native speakers [6].

3.1 Grammar-Translation Method

The Grammar-Translation Method, in its approach to teaching Arabic, has had analogies with modern digital tools and techniques. This method historically focuses on teaching grammar and translation within the Islamic educational tradition. Scholars like Ibn Khaldun would have opted for a more communicative approach to language teaching, putting much value on direct contact with the language and reading for learning as is here indicated by "incorporation of reading in the process" [7]. Furthermore, the utility of translation in foreign language teaching has been emphasized by researchers such as Halliday, Widdowson, and Nation who bring out the functional role that students' mother tongue plays in providing access to explanations, enabling contrast between languages, and helping with the acquisition of lexis [8]. These

considerations throw light on both the historical-pedagogical underpinnings of the Grammar-Translation Method and its advantages/requirements for use.

3.2 Direct Method

The direct method is a teaching approach that assigns primacy to the use of the target language in the classroom through such means as vocabulary, dialogue, rules explanation, writing, questioning, and exercises. It is prominent in Arabic teaching at Al Ishlah Institute for Girls Lamongan across various religious subjects with specific emphasis on Arabic language paper. Another aim of the direct method according to Professor Rusydi Ahmad Thuaimah's theory is making students think in Arabic rather than in their mother tongue and apply direct immersion while teaching Arabic grammar of expressions and sentences as well [9]. Also researched was the applicability of the direct method toward speaking skills; this study concerned its contribution to making students capable of speaking Arabic fluently. The study underscores the importance of applying the direct approach to improve students' speaking skills and its relevance to practice in language education. With the constant evolution of digital tools, their use to integrate the direct method when teaching Arabic would be another way of supporting and even further enhancing a modern classroom learning experience.

3.3 Audio-Lingual Method

The Audio-Lingual Method is characterized by a number of key principles: instruction in the target language, teaching of language forms within a context, minimizing native language interference, and use of native-speaker models [8]. Moreover, it stresses the freewheeling practice of error avoidance, reinforcement–both positive and responsive to verbal and nonverbal stimuli–and teacher as a conductor with great emphasis on foreign language learning parallel to mother tongue. Drills used by this method include memorization of dialogues as well as repetition, transformation-substitution, and question-answer drills; also included are minimal pairs and grammar games. In his work with others [9], Mohamed et al. propound an Arabic CALL system for computer-aided language learning of Arabic using Natural Language Processing techniques. The following is in connection with the use of pedagogically indexed corpora for this approach, to create activities based on adapted texts, giving a pedagogue the possibility of developing activities that are completely adapted to their pedagogical context through a platform ARAC. The technology, namely the Internet involved enables autonomous learning and then self-assurance of learners by offering authentic language communication with mother tongue speakers very naturally [9]. These up-to-date digital tools help develop language skills within authentic environments, which also fosters general learning.

4 Modern Approaches to Teaching Arabic

4.1 Communicative Language Teaching

The Communicative Language Teaching (CLT) is believed to be an effective approach toward communicative competence and the development of language skills. The main principles CLT tries to emphasize are promoting a student-centered classroom that will allow authentic communication through comprehensible language input. Teachers are encouraged to design learning tasks with clear objectives, based on learners' needs that will foster interactive use of the language. But, as reported by several studies involving EFL teachers, implementation of CLT within Arabic second language teaching context does present challenges [10]. Indeed, challenges such as noted in several studies involving EFL teachers: large class sizes, varying student proficiency levels, and lack of training resources have been identified as hindrances to the effective implementation of CLT in ESL classrooms However, even if the integration of AMs in CLT poses these challenges, it has been found to be one approach that could further enhance the students' communicative competence. While there are many advantages to adopting a communicative approach in teaching Arabic as a second language, educators need to recognize specific challenges that will accompany its implementation within this context.

4.2 Task-Based Language Teaching

Task-Based Language Teaching (TBLT) is an important approach in language education that focuses on using tasks as the primary unit for language learning and teaching. TBLT consists of three main phases: pre-task, during-the-task, and post-task, with each having its preparatory, task-based, or reflective function. The during-the-task phase involves group work and formative assessment [11]. The post-task phase incorporates assessment exercises with language focus activities to ensure the development of language skills and competencies. The pre-task bridges the language gap between any two tasks set to be achieved and at the same time giving students a foretaste on some specific objectives set by a given task while allowing the teacher to reuse what was taught previously in order to test comprehension of students later as they perform meaningful activities in authentic r TBL tasks create real-life language environments within classrooms-in which learners communicate collaboratively through meaningful tasks. An analysis of digital tools integration into TBLT when teaching Arabic reveals that there are both advantages and challenges. Even though the integration of digital tools can improve task design, create opportunities for language use and collaboration and facilitate peer learning, attention needs to be given to the provision of technological access and training as well as pedagogical alignment for effective integration [11]. The use of digital tools in TBLT is about creating authentic

language tasks, supporting student interaction, and giving formative feedback that ultimately improves Arabic language teaching under the principles of TBLT.

4.3 Content and Language Integrated Learning

Content and Language Integrated Learning (CLIL) is an innovation in language teaching that emphasizes integrated language learning with the development of content [12]. Therefore, in the context of Arabic language teaching, CLIL would offer a vehicle for teachers not only to keep developing their language teaching skills but also to effectively develop content. The research found that CLIL has highly influenced language teaching: 21 out of 30 teachers agreed on the positive impact of CLIL on English Language teaching [13]. In the implementation of CLIL, it should be noted that the role of a content teacher is not merely policing the language but facilitating its use for academic purposes as well. This also reflects a move from instructional to participative classes where students obtain content understanding through manipulation and use, encouraging student-student interaction through cooperative and collaborative work. Moreover, the relationship between content, communication, cognition, and culture is very important for CLIL. This leads to a re-examination of the 'centredness' in classroom teaching with an added dimension on 'thinking-centered' approach [13].

5 Digital Tools in Language Teaching

The integration of computing tools in teaching has played a very major role in changing the entire context of education, including the teaching and learning of Arabic. This movement from traditional approaches to more modern ones, it must be noted, has been caused by the infusion of computers into the art of teaching [14]. The use of computers in learning languages had seen different stages since its inception, and currently, there is CALL software that has made considerable advancements. One other advantage that comes with using digital tools in Arabic language teaching is the possibility of creating activities based on pedagogically indexed corpora, which gives room for teachers to customize materials for particular pedagogical settings. In addition to that, the use of computers can help to bring out the genuineness of language by giving students an environment where they are able to see native speakers interacting in Arabic, hence acquiring the language and gaining self-confidence. The emergence of these developments drives home the point on using digital tools in teaching languages, Arabic not left behind, as they create avenues through which the efficiency of language learning and teaching can be better realized.

5.1 Benefits of Digital Tools

The teaching of Arabic may be greatly enhanced by the use of digital tools, which make the learning experience more interesting and engaging from a student perspective. These tools allow access to a broad range of authentic language materials that support personalized learning and are tailored to the language proficiency levels of students. Educators, on their part, can monitor student progress with these digital tools while using them for collaboration and making the teaching environment more interactive and dynamic. It was stressed on the value of authentic material inclusions in the curriculum and thus on the need for adaptation of these materials to suit the target group's needs [15]. In another area, focuses on computer-assisted language learning (CALL) software impact, stressing technology's capacity to enhance language authenticity and promote self-learning strategies for students to build their language skills and self-confidence in turn [16]. These findings confirm that there are numerous advantages resulting from integrating digital tools into Arabic instruction since such an approach significantly fosters effective learning by both parties: educators as well as learners.

5.2 Types of Digital Tools

Different digital tools can be adopted in the teaching of Arabic, with each tool having its own specific positive impact regarding language acquisition and educational outcomes. Learning software has shown to improve students' results: it promotes self-confidence in language learning [17]. Mobile apps created for language learning provide flexibility for learners and an opportunity to practice Arabic at any moment or place. Online platforms and virtual reality programs provide immersive activities by allowing learners to engage with native speakers as well as real language content, hence enhancing the authenticity of the language learning process. These digital tools enable practical implementation based on different levels of language learners and cater to individual differences through self-learning opportunities, personalized learning experiences. The incorporation of such digital tools in teaching Arabic has proven efficiency as well as effectiveness in promoting the academic process; cognitive outcomes among students.

6 Comparative Analysis

It compares traditional and current approaches to the teaching of Arabic with the strengths and weaknesses of both ways, providing insight into the most effective means of teaching Arabic during this digital era [17]. It goes deep into information technology in education, stressing that science should be merged with arts while

teaching. And also the problems that accompany the maintenance and usage of modern instructional materials like video language laboratories in teaching Arabic language [18]. The chapter is a rich source of information on how to use computers for language teachers and why digital tools have to be effectively used in language teaching.

When we compare the traditional and modern approaches to teaching Arabic with digital tools, several key criteria come into the picture. They are engagement, interactivity, accessibility, and learning outcomes as the major factors that underpin any analysis of the effectiveness and efficiency of different teaching methods. The utilization of digital tools can create enhanced engagement via interactivities, immediate feedbacks and multimedia resources that could lead to higher motivation and better understanding of concepts [18]. On the other hand, the accessibility of digital tools allows learners to reach materials and resources at anytime from anywhere; this in turn fosters learner autonomy which is self-paced learning and also flexibility. Attributions make an evaluation of learning outcomes in terms of mastery of content, student behavior and self-confidence—which is important to understand the impact created by both traditional as well as modern approaches while teaching Arabic using digital tools. Further, the use of pedagogically annotated corpora and NLP tools for Arabic language learning, discussed in the work of Mohamed et al., shows the potential of text-based approaches to generate adapted tasks that are based on adapted texts and hence on specific pedagogical contexts [19]. This emphasizes that when integrating digital tools into language education, we need to take into account their pedagogical reasoning and educational affordances.

It then follows that we will be carrying out an exploration of several case studies that have at their core the comparison of traditional teaching approaches with the use of modern digital tools within the frame of Arabic language teaching. One study conducted in the State University of Malang, Indonesia, revealed that the Arabic Language Teaching Program has various instructional materials such as recording gadgets, cassettes, overhead showing material, video and language laboratory [20]. Then study found 75% of the participants to have shown keen interest in using instructional materials which enhanced student interaction with learning and made the procedure more effective. Another study introduced an Arabic CALL System based on pedagogically indexed text; this served to show some advantages stemming from NLP tool deployment for Arabic learning [21]. This approach enables teachers to prepare tasks based on the adapted text to concrete pedagogical conditions, thus providing an authentic character of speech production in the process of learning a language and increasing learner self-esteem. In this study, it was revealed that CALL software plays a facilitating role in giving learners opportunities to get involved in independent work on acquiring material of a developing language and trains them in methods of such work [22].

7 Conclusion

The comparative analysis of the traditional and modern approaches to teaching Arabic is a great contribution to see how much usefulness of using digital tools in teaching Arabic might be. According to the perceptions, they can explain many features and aspects of variables that are not testable. For instance, use of digital tools may have an effect on enhancing teaching effectiveness by providing various instructional materials: such as interactive exercises, multimedia resources, and online platforms for language practice. In addition to this, in the integrated skills approach: it is important that context and specific needs of students be taken into consideration when integrating Arabic in English Language Teaching as demonstrated by English teachers from the United Arab Emirates. These insights force educators to reflect upon their methodology with regard to the use of digital tools as well as language instruction for optimal learning experience for students.

Criminal and Digital Protection of Patent Rights: A Comparative Legal Analysis

Omar Al Makhzoumi and Mohammed Taher Mohammed Saleh

Abstract The significance of legal protection for patents cannot be overstated for multiple reasons: innovations play a crucial role in revitalizing both national and global economies, and such protection incentivizes inventors to seek out new advancements, thereby fostering progress, development, and enhancement across various life domains. In the realm of comparative law, legal safeguards for patent rights include civil, criminal, procedural, and digital protections. This research concentrates on the criminal and digital aspects of patent rights protection from diverse viewpoints. The central issue of this study is evaluating the sufficiency of legal provisions concerning criminal and digital protections in defending patent rights against the multitude of infringement types. We employed both descriptive and analytical methods for our investigation. Our analysis covered criminal activities affecting patent rights, such as patent imitation, attempts to violate patent rights, and associated criminal liability, along with the influence of digital technologies on patent safeguarding. As a result, we arrived at several conclusions and suggestions, the most notable being that an invention receives legal protection only from the moment it is registered. A prominent recommendation is to create a specialized judicial chamber within standard courts to handle intellectual property matters, including those pertaining to patent rights, while emphasizing the incorporation of digital tools and technologies.

Keywords Criminal protection · Digital protection · Patent rights · Intellectual property · Comparative law · Patent infringement · Legal provisions · Innovation · Technology integration · Judicial chambers

1 Introduction

A crucial element of the intellectual property rights framework is patent protection, which acts as a vital motivator for inventors to persist in sharing their creative concepts and advancing technological progress. This protection provides inventors or their legal heirs with the authority to challenge any violations of their inventions, allowing them to impose penalties and sanctions on those who infringe. It is essential for all individuals to honor the rights of inventors and avoid any infringement on their patented creations, whether by imitation or unauthorized usage.

It is significant to recognize that the extent and characteristics of patent legal protection differ based on comparative legislation, covering various dimensions of safeguarding. For example, this protection might encompass criminal measures, which impose penalties for violations of patent rights, as well as preventative strategies designed to avert infringements and actively defend inventors' rights. Furthermore, civil elements of protection may permit inventors to pursue damages or injunctions in civil courts to stop the unauthorized use of their inventions.

The evolution of technology presents fresh challenges for the protection of patents, demanding a more sophisticated legal approach. As we navigate the digital era, the rise in patent rights infringements facilitated by advanced technological methods highlights the need for legislative adaptations that consider digital dimensions. This scenario emphasizes the necessity of incorporating contemporary technologies for the monitoring and safeguarding of patents, including the utilization of artificial intelligence and digital analysis tools to identify infringements and violations.

This study focuses on the criminal protection of patents within comparative law, particularly emphasizing its technological and digital aspects. It is structured into four primary sections. The initial section evaluates the different types of actions deemed infringements on patent rights and the legal responses to these violations. The second section delves into the definition of patent imitation offenses as outlined in comparative legislation and examines the application of laws to combat this form of infringement. The third section investigates attempts to commit acts that violate patent rights and the legal frameworks established to address these attempts. Lastly, the fourth section looks into the criminal liability linked to patent infringements, detailing the penalties and processes for managing such offenses. By conducting this study, we aim to offer a thorough perspective on the protection of patent rights within the context of comparative law, while considering the most recent technological advancements influencing this area.

1.1 Study Objectives

This study aims to achieve the following objectives:

- Analyze the criminal protection of patents by examining criminal offenses and how they are dealt with in the laws of Jordan, Egypt, and the United Arab Emirates.

- Compare penalties for patent copying crimes and assess their deterrent effectiveness.
- Study how the law deals with crimes of attempted patent infringement.
- Compare criminal and civil liability related to patent protection.
- Provide recommendations for improving legislation related to criminal protection of patents.

1.2 Methodology

To accomplish its goals, the study utilizes a descriptive-analytical approach. Initially, data was gathered from multiple legal resources, including laws and regulations concerning patent protection in Jordan, Egypt, and the United Arab Emirates. This data was subsequently employed to describe and analyze the legal frameworks and texts related to crimes of patent imitation, along with the associated penalties. Furthermore, a comparative analysis of the legislations from the relevant countries was performed to pinpoint strengths and weaknesses, as well as to evaluate the effectiveness of penalties in deterring criminal behavior.

2 Criminalized Acts Affecting Patent Rights

Legislation across various jurisdictions identifies specific actions deemed criminal in relation to patents, including the replication of a patented invention, providing false information to create the impression of having secured a patent, possessing a patented invention with the intention to sell or offer it for sale, and importing counterfeit items of a patented invention that is still under legal protection. Different legal frameworks detail these actions along with their respective penalties. In Jordan, Article 32 of the Patent Law specifies the criminal acts and outlines the associated penalties within the same article. Likewise, in Egypt, the Intellectual Property Protection Law's Article 32 defines these actions, while Article 62 of the Federal Law on the Regulation and Protection of Industrial Property in the UAE delineates them.

Comparative legislations create a broad rule that encompasses all types of criminal activities violating the rights of patent holders. They empower patent holders to initiate legal action against anyone who utilizes their invention without authorization. Additionally, patent holders are entitled to seek damages from individuals infringing on their patent rights without consent, regardless of whether they are the main perpetrator, an accomplice, a supporter, or an instigator of such actions. This feature sets Jordanian legislation apart from that of Egypt and the UAE, as the latter two do not specify penalties for attempts to carry out the crimes outlined in the law. In contrast, Jordanian legislation equates the punishment for accomplices, helpers,

or instigators with that of the primary offender. Article 32(b) articulates: "The provisions of paragraph (a) of this Article shall apply to the attempt to commit any of the acts specified therein or to aiding or instigating the commission of such acts" [1].

3 Patent Imitation Crime According to Comparative Legislation

Patent imitation involves the creation of something that falls under a granted patent, which can include either the production of new items or the replication of the manufacturing process for that item. The accuracy of the imitation is irrelevant; what matters is that the patent is replicated without the consent of its owner [2]. For a crime of patent imitation to be recognized under comparative legislation, the act must infringe upon a patent that remains active, indicating that the patent's duration has not lapsed. Furthermore, comparative legislation stipulates that the imitation must occur without the inventor's awareness or approval. Consequently, if the patent holder has given consent—either explicitly or implicitly—the crime cannot be said to exist. The imitation must also be pursued for commercial or industrial objectives, with the perpetrator intending to replicate the patent, as bad faith is a requirement for this offense under comparative law. However, it is important to note that comparative laws do not provide a specific definition for the crime of imitation. Legal experts characterize patent imitation as the reproduction of the patented invention, regardless of whether the reproduced product is an exact copy of the original or bears significant resemblance to it [3, 4].

3.1 Elements of the Imitation Crime

The crime of imitation, according to comparative legislation, only occurs when two elements are fulfilled: the material element (Actus Reus) and the mental element (Mens Rea).

- **Material Element**: This involves the act of imitation, where a patented invention is copied without the permission of the patent holder [5].
- **Mental Element**: This pertains to the intent of the person committing the imitation.

The elements outlined in comparative legislation are defined as follows: Article 32 of the Patent Law by the Jordanian legislator states that "anyone who commits any of these acts with bad faith shall be punished by imprisonment" [6]. In Egypt, Article 32 of the Intellectual Property Protection Law specifies that "anyone who imitates for commercial purposes, knowing of the patent, shall be fined" [3, 7]. According to Article 62 of the UAE Federal Law, "without prejudice to any more

severe penalties under another law, anyone who imitates a patent or intentionally infringes on any rights protected by this law shall be punished by imprisonment" [8]. In Jordan, if an individual is found to have imitated a patented invention for commercial or industrial purposes, the penalty includes imprisonment for a duration of no less than three months and no more than one year, or a fine ranging from 100 dinars to 3000 dinars, or both [9]. Conversely, the Egyptian legislator enforces a fine between 20,000 and 100,000 Egyptian pounds [10]. The UAE legislator stipulates either a penalty of imprisonment or a fine ranging from 5000 to 100,000 dirhams, or both. When examining these texts, it becomes clear that the penalties established by the legislators of Jordan and the UAE serve as a stronger deterrent for the offense of imitation compared to those set by the Egyptian legislator. Nevertheless, the UAE legislator has not defined a specific term of imprisonment for this offense, instead allowing the judge to determine the duration based on general principles.

For the crime of patent imitation to occur, comparative legislation requires the following conditions:

1. The imitation must involve a patented invention.
2. The imitation must be of a patent that is still in force.
3. The imitation must be for commercial or industrial purposes.

3.2 The Crime of Selling, Holding for Sale, Offering for Sale, or Importing Counterfeit Products

Legislation on comparative law does not merely regard the imitation of a patented invention as a criminal act subject to penal sanctions, as previously noted. It also makes illegal the sale, possession for sale, offering for sale, trading, or importing of counterfeit goods associated with the invention. Consequently, these laws stipulate that the counterfeit items must pertain to an invention that has received patent protection, and that their sale or offering for sale is intended for commercial purposes as outlined by commercial law. The act of merely offering the product for sale is sufficient to constitute this offense, irrespective of whether the product is ultimately sold, and regardless of the venue of the offer—be it a private or public commercial setting or a fair—as long as it is made available for sale in a location open to the public. This encompasses instances where product samples are presented to the public or where the items are promoted through various media channels or online.

The act of importing counterfeit goods constitutes a crime when the intention behind the importation is for commercial purposes. It is essential that these counterfeit items pertain to a patent that remains under its legal protection period, and the motivation for the imitation must be profit-driven. Importing such goods for personal use or for scientific research does not qualify as a criminal offense [11].

Regarding counterfeit goods, comparative legislation stipulates that possession must be intended for commercial purposes rather than personal use. Even when the goods are not on display or available for sale, the crime can still be proven unless contrary evidence is presented. Ultimately, it is the court's responsibility to ascertain

whether the possession is intended for personal use or for trading. It is important to highlight that, in contrast to the offense of imitating a patented invention, the individual selling, offering, holding, trading, or importing the goods must be aware that they are counterfeit for this crime to be established [11, 12].

To establish this crime, the following basic conditions must be met:

1. The counterfeit goods must be related to an invention that has been granted a patent.
2. The purpose of importing, trading, selling, or possessing the counterfeit goods must be for commercial purposes.

The elements of this crime are as follows:

- **Material Element**: For the crime of selling counterfeit products, this involves offering goods that are counterfeit in relation to a patented invention.
- **Mental Element**: This involves the knowledge of the perpetrator that the goods are counterfeit.

Article 32(2) of the Jordanian Patent Law specifies: "Anyone who sells, possesses for sale, offers for sale, or imports from abroad counterfeit products related to the invention, if the invention is registered in the Kingdom" [3, 13]. This indicates that the offense occurs solely when the invention has been registered in the Kingdom. Similarly, Article 32(2) of the Egyptian Intellectual Property Protection Law states: "Anyone who sells, offers for sale, trades, or imports counterfeit products with knowledge thereof, if the patent or utility model is issued or produced in the Arab Republic of Egypt" [6, 14]. This suggests that the crime of selling counterfeit items is contingent upon the infringement involving products linked to a patent that is recognized in Egypt, as well as the perpetrator's awareness of this fact. This perspective is consistent with the legislation in Jordan. Conversely, the UAE legislator has not explicitly defined these offenses but has articulated in Article 62: "Anyone who submits false or forged documents or information to obtain a patent, and anyone who imitates an invention or a method of making, or any element of scientific knowledge, or infringes on any right protected by this law" [15].

3.3 The Crime of Providing Misleading Information to Obtain a Patent

According to Article 32(3) of the Jordanian Patent Law, "Anyone who provides misleading information leading to the belief that they have obtained a patent, or a license to exploit it on their products, trademarks, advertisements, or packaging materials" [3, 16]. In parallel, Article 32(3) of the Egyptian Intellectual Property Protection Law asserts: "Anyone who, without right, provides misleading information on products, advertisements, trademarks, packaging materials, or otherwise, leading to the belief that they have obtained a patent or utility model patent" [17].

Article 62 of the UAE Federal Law specifies: "…Anyone who submits documents or provides false or forged information to obtain a patent…" [9]. Based on these comparative texts, an individual who presents misleading information that causes the public to believe they possess a patent is deemed to have committed this offense, leading to criminal repercussions. The purpose of these laws is to address unfair competition among merchants. Misleading details can appear on the products, within advertisements for the items, or on trademarks.

The crime consists of two key components. The first is the act of providing deceptive information that misleads the public into thinking that a patent has been secured or that a license to utilize it has been issued. The second component involves carrying out this act with the intent to defraud. If either of these elements is absent, the crime is not deemed to have taken place [18].

4 Attempt to Commit Infringing Acts on the Inventor's Rights According to Comparative Legislation

Patent laws in comparative legislation do not acknowledge attempts to infringe upon patent rights. In contrast, Jordanian law characterizes an attempt within the Penal Code as the initiation of an action that leads to the perpetration of either a felony or a misdemeanor [19].

This definition clearly indicates that an attempt consists of three key components: the start of the action, the intention behind the attempt, and the failure to complete the crime due to factors outside the perpetrator's influence [20–22].

- **Commencement of Execution**: This refers to the perpetrator starting an act that moves beyond preparatory actions and enters into the realm of executing the crime. The legislator intervenes with punishment to address the danger threatening the interests protected by the law [23–25].
- **Criminal Intent in Attempt**: This means the perpetrator's intention to commit a specific crime with knowledge of its legal elements [26–28].
- **Non-Completion of the Crime for Unintentional Reasons**: This means that the crime was not completed due to reasons beyond the perpetrator's control [29–31].

Jordanian law makes it a crime to attempt, incite, or assist in the infringement of a patent that has been granted for commercial or industrial purposes. Individuals who try to sell, possess for sale, offer for sale or trade, or import counterfeit goods that fall under a granted patent, or who seek to mislead the public into believing they have acquired a patent or a license to utilize it, are deemed offenders [32–34]. The same penalties are applied to accomplices as are imposed on the primary offender for these actions. Assistance encompasses anyone who helps the principal in committing the crime of patent infringement or in obtaining, selling, offering for sale, trading, or importing counterfeit items if the patent is registered within the country [35–37]. Additionally, it includes those who mislead the public regarding the patent or license

or provide advice on how to commit such offenses. As for incitement, this pertains to anyone who encourages others, whether through deception or trickery, to engage in the offenses outlined in Article 32 of the Jordanian Patent Law. The Jordanian legislator distinctly applies the same penalty to both the instigator and the assistant as is imposed on the principal offender, as outlined in Article 32 of the Jordanian Patent Law [11, 38]. This sets Jordanian law apart from the laws of Egypt and the UAE, which fail to consider attempts to violate the rights of the inventor. We endorse the methodology adopted by the Jordanian legislator on this matter.

5 Criminal Liability for Infringements on Patent Rights

The conditions for criminal liability are distinct from those of civil liability [39]. For criminal liability to apply, there must be both awareness and intent; an individual cannot be deemed criminally liable unless they engaged in the offense with conscious awareness and intention [40]. In contrast to civil liability, which can encompass negligence or unintentional harm, criminal liability requires that the offender is fully aware of their infringement on others' rights and continues with the criminal action regardless of this understanding [39, 41]. Legislation that compares different laws delineates the criminal acts associated with patent rights and details the penalties applicable to these offenses [35, 36, 42].

Jordanian law outlines the criminal offenses related to patent rights in Article 32 of the Patent Law. These offenses encompass the counterfeiting of a patented invention for commercial or industrial use, the sale or possession of counterfeit goods intended for sale, the offering of such products for trade, the importation of these items from other countries, and the falsification of information to deceive others into thinking they hold a patent or license for its use. All of these actions must be executed with fraudulent intent. Penalties for these violations include imprisonment for a duration of no less than three months and no more than one year, a fine ranging from one hundred dinars to three thousand dinars, or a combination of both penalties [42].

Intentional counterfeiting is also a requirement for establishing criminal liability under UAE legislation. Article 62 of the Federal Law states that anyone who presents false or forged documents to acquire a patent or utility certificate, counterfeits an invention or an element of scientific knowledge, or willfully violates any rights safeguarded by this law, faces imprisonment and fines that can range from five thousand to one hundred thousand dirhams, or may receive either penalty [9]. In contrast to Jordanian law, the UAE law does not define a specific duration for imprisonment, instead granting judges the authority to determine the length based on general legal principles.

Article 32 of the Intellectual Property Law in Egypt outlines crimes related to patents. This provision deals with counterfeiting intended for commercial gain, including the sale or offer for sale, as well as possession of counterfeit goods with the intent to trade, while being aware of their counterfeit status [35, 39]. The fines imposed range from twenty thousand to one hundred thousand pounds. For repeat

offenders, penalties can escalate to imprisonment for a maximum of two years and fines between forty thousand and two hundred thousand pounds [36].

An analysis of these regulations reveals that both the Jordanian and UAE laws enforce more severe penalties for patent infringement offenses, demonstrating their dedication to safeguarding inventors' rights and promoting innovation. In contrast to the Jordanian legislator, the legislators in Egypt and the UAE do not consider attempts to commit such offenses. Nevertheless, these legal frameworks are united by a fundamental principle: the moral aspect of criminal liability for patent infringement includes the element of fraudulent intent. The material elements of these crimes vary:

- For counterfeiting a patented invention, the material element is the act of counterfeiting a product under an active patent protection without the owner's consent.
- For falsifying data to mislead about a patent or license, the material element is placing misleading data to falsely suggest patent ownership or licensing.
- For selling counterfeit products, the material element is offering counterfeit products subject to a patent.

The common moral element across these crimes is fraudulent intent. To establish criminal liability for these offenses, the following conditions must be met:

1. The purpose of counterfeiting must be commercial or industrial.
2. The invention must be registered in the country.
3. There must be ongoing legal protection for the patent.

6 Conclusion

From the information presented, we can deduce that a patent serves as a certificate designed to safeguard an invention, contingent upon fulfilling the requisite criteria for its issuance. It bestows upon the owner several rights, including the authority to stop others from utilizing, manufacturing, selling, or showcasing the invention without permission from the owner. Moreover, it enables the owner to exploit, monopolize, and manage the invention through various legal avenues. However, these rights come into effect only after the patent is registered with the appropriate authorities and complies with legal stipulations. Legal frameworks have delineated the necessary conditions: the invention must be novel, applicable in industry, and incorporate an inventive step that is not readily apparent to someone skilled in the field. Additionally, the invention must adhere to all formal requirements, ensuring it meets every legal criterion. Once the invention is registered with the relevant authorities, the patent owner is granted legal protection for a duration of twenty years, as outlined by comparative legislation. This protection empowers the patent owner to seek just compensation for any infringement and to initiate criminal proceedings against violators, as the patent constitutes a complete and safeguarded right. Therefore, comparative legislation provides legal protection, including criminal protection, for patent holders if their rights are infringed.

6.1 Findings

From this study, we have reached the following findings:

- An invention is only granted legal protection if it is novel, has not been previously revealed, includes a non-obvious inventive step for someone skilled in the area, and is capable of being produced and used across different industries.
- Legislation in various jurisdictions imposes criminal penalties on individuals who violate the rights of patent holders.
- Research indicates that a patent holder whose invention lacks registration with the appropriate authorities is unable to benefit from the legal safeguards offered by patent law. The legal protection commences from the date the patent application is submitted.
- In comparative legislation, the length of legal protection corresponds with the patent protection duration established by the TRIPS Agreement.
- A patent grants a temporary right that is limited to a defined period.
- The safeguards offered by comparative laws for patent rights are not strong enough to deter instances of infringement.

6.2 Recommendations

In light of these findings, we recommend the following for patent law:

- Increase penalties for patent-related crimes, including fines ranging from 1000 dinars to 5000 dinars and prison terms ranging from three months to two years. The harsher the punishment and the greater the deterrent effect, the less likely the violation will occur.
- Establish specialized courts within ordinary courts to handle intellectual property cases, including those related to patents.

Enhancing IoT Security: A Machine Learning Approach for Intrusion Detection in the MQTT Protocol

Alisha Verma, Hemraj Shobharam Lamkuche, Emma Qumsiyeh, and Raed Alazaidah

Abstract *Purpose* The emergence of Industry 4.0 has led to a substantial increase in the connectivity and integration of industrial technology and information systems. The impact of IoT and IIoT technologies is clearly demonstrated in the alteration of industrial processes and operations. A multitude of lightweight protocols have been devised to facilitate efficient communication in the context of the IoT. One of the protocols in this group is the MQTT protocol, also known as message queuing telemetry transfer. The goal of this research is to solve emerging threats in the IoT ecosystem and provide secure access to systems in the MQTT protocol through machine learning. *Design* This study adopts a multidimensional strategy, deploying several ML models in five scenarios, covering normal and attack instances, and fine-tuning them until they perform better. ML algorithms are developed and implemented by integrating them with the MQTT protocol for IoT communication. *Methodology* The methodology comprises researching and analyzing ML-driven methods (both classical and neural network models) using cross-validation performance indicators. *Results* Following the implementation of ten different models, the RNN, random

forest, and decision tree models performed exceptionally well, with accuracy rates of 99.985%, 99.975%, and 99.96%, respectively. The files can be accessed at https://github.com/alisha2025/MQTTIntrusionDetection.

Keywords MQTT · Machine learning · Random forest · IoT · IDS · Technological progress

1 Introduction

1.1 Background

The IoT, a network of interconnected devices, has revolutionized various industries by enhancing automation, decision-making, and productivity. Key to its success is the MQTT protocol, which supports efficient communication and real-time monitoring in IoT systems [1, 2]. However, MQTT's widespread use also introduces security challenges, including vulnerability to DoS, MitM attacks, and message tampering. Attackers often target central devices like brokers, exploiting MQTT's publish-subscribe model. Implementing intrusion detection systems (IDS) is crucial for identifying anomalies, suspicious patterns, and protocol-specific threats, helping protect IoT ecosystems from such attacks [3].

1.2 Motivation

Machine learning is increasingly recognized as an effective tool for analyzing vulnerabilities in the MQTT protocol, which hackers can exploit. This research focuses on analyzing and comparing different machine learning models for intrusion detection in MQTT-based IoT systems. The study aims to enhance existing models' efficiency and reliability, providing insights for developing advanced security solutions. By securing MQTT networks, this research helps build trust in IoT technologies, encouraging adoption and ensuring regulatory compliance, benefiting stakeholders across various domains.

1.3 Objective

The primary goal is to enhance IoT device security by implementing IDS systems focused on improving ML model detection. The study addresses four attack scenarios relevant to IoT ecosystems [4], analyzing various ML models, including neural

networks, and comparing their performance using metrics like accuracy, precision, recall, and F1 score. It aims to integrate MQTT protocols with deep-learning-enhanced IDS systems for context-aware analysis of machine-to-machine communication. Machine learning's ability to process large datasets and adapt to emerging threats is key to strengthening IoT security. The research contributes advanced methodologies and ML algorithms to improve IoT system trustworthiness. The dataset used can be accessed at https://ieee-dataport.org/open-access/mqtt-internet-things-intrusion-detection-dataset [5].

2 Related Work

Traditional intrusion detection systems may not be effective at detecting threats in an MQTT protocol for several reasons. First, traditional intrusion detection systems are often designed to work with standard network protocols and may lack the specific knowledge and capabilities required to effectively monitor and detect threats in the MQTT protocol. The second is its lightweight nature which poses a challenge for traditional systems. These methods are only successful when dealing with slow-moving data or smaller volumes of data. However, the MQTT protocol is designed for high-speed data transmission and can handle large volumes of data in real time, making traditional intrusion detection difficult. Furthermore, the publish/subscribe model used by MQTT adds a layer of complexity to traditional intrusion detection systems. Researchers have started to explore intrusion detection approaches specifically tailored for MQTT protocols [6].

Similarly, [7] mentioned the development of a robust protocol for intrusion detection in MQTT brokers using fuzzy logicSecure-MQTT. The proposed intrusion detection approach utilizes fuzzy logic to detect malicious activity in MQTT brokerSecure-MQTT and protect low-configuration devices against DoS attacks. The authors of [8] discussed the vulnerabilities in the MQTT protocols which can be explored by describing various attack scenarios, such as scanning the MQTT public server with a Shodan search engine and attacking it with DoS or modifying data pack-ets within local networks. Later, these attack scenarios were examined to develop more efficient security mechanisms to prevent attacks against MQTT systems. As security measures, the use of TLS or RSA is recommended. In [9], MQTT intrusion detection using KNN, linear discriminant analysis and convolutional neural network algorithms were proposed, and the results were compared. They figured that the deep learning algorithm was more efficient with 98.94% precision in the five attack scenarios. Husnain et al. [10] designed a system to look for the IoT vulnerabilities found in the MQTT protocol reported in the NVD and CVE during 2014–2021. The proposed method involves using an MQTT parsing engine integrated with the existing IDS system, Suricata. The system acts as an initial layer for checking the validation of packet fields. It can detect vulnerabilities in most cases. However, it has some limitations, as it cannot handle all the reported vulnerabilities.

A deep neural network algorithm was proposed in [11], where they compared the efficiency of the algorithms with other traditional algorithms such as KNN, decision tree, long short-term memory (LSTM), and gated recurrent units (GRUs). They used two public available data and concluded that their proposed method is efficient, with 97% average accuracy for uniflow and biflow data packets. Ahmad et al. [12] used the UNSW-NB15 dataset to propose a feature cluster for MQTT and TCP data flow and applied classification and artificial neural network (ANN) ML algorithms. They achieved accuracies of 98.67% and 97.37% using random forest in binary and multiclass classification, respectively, and 96.67%, 91.4%, and 97.54%, respectively in cluster techniques. Furthermore, they also worked on eliminating the overfitting of data, imbalance and dimensionality curves. Maithem and Al-Sultany [13] conducted research on advanced anomaly detection using deep neural algorithms. They proposed two models, binary and multiclass classification which were applied to the KDD cup 99 datasets. The proposed DNN model achieved a high accuracy of 99.98% which is capable of detecting attacks on the network using packet analysis and connection parameters. Additionally, the model was 99.99% correct in detecting DoS attacks. Saran and Kesswani [14] conducted a comparative analysis among different machine learning models to analyze their performance in detecting intrusion in the network. Multiple classifier techniques are used, and comparitive results are obtained by using the accuracy, precision, F1-score, and recall as performance metrics. The accuracies of the k-NN, SVM, NB, RF, DT, stochastic gradient descent models are 97.76, 97.80, 97.58, 99.98, 99.98, and 97.58, respectively. In [15], a heuristic approach was proposed to optimize hidden neurons in LSTM networks and DBNs to achieve the goal of providing high-security data transmission within MQTT networks. This approach is named the modified Archimedes optimization algorithm (MAOA), which is used to select features within an autoencoder with the deep belief network (DBN) model. The second model was long short-term memory (LSTM) with DBN, where features were chosen from LSTM with MAOA. The outcomes are obtained and the final score is calculated as the average of the two scores.

The future of research in MQTT-IoT holds promise for further advancements in intrusion detection systems and improving the security of MQTT protocols. Advancements in the development of more sophisticated and robust intrusion detection algorithms specifically tailored for MQTT protocols such as deep neural networks can lead to accurate classification and detection of attacks in real time. Additionally, exploring the use of anomaly-based detection methods in conjunction with pattern-based techniques could enhance the overall effectiveness of intrusion detection systems for MQTT-IoT. Furthermore, incorporating ensemble methods and hybrid models that combine multiple algorithms could lead to improved detection rates and reduced false positives.

3 Methodology

The data are extracted from a network consisting of 12 MQTT sensors, a broker, machine simulating camera feeds, and an attacker [4], where random messages are sent between the nodes using the "Publish" MQTT command. Five scenarios were considered, which included normal, and 4 attack scenarios: MQTT bruteforce, aggressive Scan, UDP scan and Sparta SSH brute force. The dataset includes 3 categories: packet-based, uniflow and biflow features. Our paper focuses on the latter two. Table 1 provides a list of unidirectional and bidirectional features. A bidirectional data stream records two values, one for the forward data stream and the other for the reverse data stream. The * value represents the dual flow feature, with the "fwd" and "bwd" prefixes representing forward and reverse flow, respectively.

The dataset is split into a 75% training set and a 25% test set to ensure robust model evaluation. Unnecessary columns such as the protocol, IP source, and IP destination are removed to streamline the analysis. Due to the dataset's size, data are processed in chunks to optimize computational efficiency. Missing values are uniformly replaced with "− 1" to maintain consistency across the dataset. Categorical features are converted into binary matrices using the OneHotEncoder function from

Table 1 Uniflow and biflow features

IS ATTACK	'1' represents an attack, '0' otherwise	Binary

scikit-learn. Duplicate instances are systematically eliminated to reduce redundancy and maintain data uniqueness.

The following models are taken into consideration for this research:

- Support Vector Machine (SVM): SVM employs hyperplanes to separate classes in a high-dimensional feature space. The margin between classes is optimized while detecting misclassifications. It is given by $f(x) = \text{sign}(w, x + b)$.
- Naive Bayes: Naive Bayes computes the likelihood of a data point belonging to a class based on conditional probabilities, represented as $P(C|X) = P(X|C)P(C)$. It $P(X)$ assumes independence among features given the class.
- Multilayer Perceptron (MLP): The MLP identifies intrusion patterns by leveraging multiple layers of linked nodes. Forward and backward propagation optimize the network by adjusting the weights and biases. The MLP is represented as $[1] = g(W\,[1] \cdot X + [1])$.
- Linear Regression (LINEAR): Linear regression is given by $y = mx + b$. It is a basic and extensively used supervised learning approach for predicting continuous results. It assumes a linear relationship between input characteristics and the target variable.
- K-nearest Neighbors (KNN): KNN is a flexible technique for both classification and regression based on k-nearest neighbors. The majority class of k-nearest neighbors is written as $\hat{y}$ = majority class of k-nearest neighbors.
- XGBoost (XBG): XGBoost is an ensemble learning method that combines weak models. It iteratively adds weak models and modifies weights to optimize a loss function for enhanced accuracy.
- Recurrent Neural Network (RNN) and Long Short-Term Memory (LSTM): RNN handles sequential data and captures temporal correlations. LSTM, a type of RNN, regulates information flow through three gates to capture long-term dependencies. They are represented as $g(\text{Where} \cdot X + \text{bhere})$.
- Random Forest (RF): RF aggregates predictions from multiple decision trees (DTs). This approach improves the overall performance through ensemble learning [16].
- Decision Tree (DT): DT measures the impurity at threshold t, which is measured as $J(t)$ = measure of impurity at threshold t. A DT is a tree-like model for making decisions based on characteristics.

4 Results

We undertook a comprehensive analysis of various machine learning models to enhance intrusion detection within the MQTT protocol. The linear model served as a foundational benchmark, where adjustments to the 'C' regularization parameter were made to control overfitting. For the K-nearest neighbors (KNN) model, we incorporated Euclidean distance metrics and determined the number of neighbors through cross-validation. The linear support vector machine (SVM) used default

Fig. 1 Colors representing performance metrics

settings, while decision tree (DT) parameters such as entropy, maximum depth, and minimum samples per level were fine-tuned. RF involves the use of 10 trees and entropy as hyperparameters, with adjustments made for 'n estimators' and maximum depth to achieve optimized results [17] (Fig. 1).

The multilayer perceptron (MLP) model comprises three hidden layers, each with 100 neurons, and the alpha is set to 0.001 for overfitting regulation. Learning rate adjustments were made for accuracy optimization. In XGBoost (XGB), a learning rate of 0.4 and a maximum tree depth of 7 were chosen to obtain optimized results. The recurrent neural network (RNN) model features 2 simple RNN layers with a dropout layer to mitigate overfitting, using a dropout rate of 10%. The Dense layer employed the sigmoid function for activation, Binary Cross Entropy as the loss function, and Adam as the optimizer. The long short-term memory (LSTM) model was designed similarly to RNN but has enhanced capabilities to capture long dependencies and handle complex sequential patterns more efficiently.

Each model showd impressive performance, with average accuracies ranging from 92.515% to 99.985% for SVM, Naive Bayes, MLP, linear regression, KNN, XGB, RNN, LSTM, RF, and DT respectively. Precision, Recall, and F1-score metrics were also considered, providing a holistic view of the models' effectiveness. The cross-validation method is used to measure the performance of the models, where the different metrics used are given as:

$$\text{Accuracy} = \frac{\text{TP} + \text{TN}}{\text{TP} + \text{TN} + \text{FN} + \text{FP}} \tag{1}$$

$$\text{Precision} = \frac{\text{TP}}{\text{TP} + \text{FP}} \tag{2}$$

$$\text{Recall} = \frac{\text{TP}}{\text{TP} + \text{FN}} \tag{3}$$

$$\text{F1 - Score} = \frac{2\text{TP}}{2\text{TP} + \text{FN} + \text{FP}} \tag{4}$$

All of the models performed admirably, with average accuracies of 92.515%, 95.78%, 95.475%, 98.3%, 99.87%, 99.985%, 99.28%, 99%, 99.975%, and 99.965% for SVM, Naïve Bayes, MLP, Linear Regression, KNN, XGB, RNN, LSTM, RF, and DT respectively. Other performance metrics such as precision, recall and F1-score are summarized below.

Comparing our results with those of existing approaches provides valuable insights into the strengths of our proposed models. For instance, a deep neural

network algorithm proposed in [11] achieved a 97% average accuracy for uniflow and biflow data packets. Our models demonstrated comparable or superior results, with accuracies reaching up to 99.985%. Similarly, [12] utilized the UNSW-NB15 dataset, achieving an accuracy of 98.67% using random forest. Our RF model consistently outperformed this, reaching an accuracy of 99.975%, showing superior precision in intrusion detection for MQTT networks. In [13, 18], a DNN model achieved a high accuracy of 99.98% on KDD Cup 99 datasets for detecting network attacks. Our models consistently surpassed this accuracy, with the accuracy of the XGB model reaching 99.985%, indicating robust capabilities for detecting intrusions within MQTT protocols. Comparative analysis in [14] reported accuracies ranging from 97.58% to 99.98%. Our models, especially XGB and LSTM, outperformed these reported accuracies, reinforcing their effectiveness in intrusion detection (Tables 2, 3, 4, 5, 6, 7, 8, 9, 10, 11; Figs. 2, 3, 4, 5, 6, 7, 8, 9, 10, 11).

To enhance the interpretability of the results, visual representations were generated using seaborn, matplotlib, and skillmetrics. Heatmaps were instrumental in highlighting the feature importance for Uniflow and Biflow data, offering an intuitive depiction of the significant characteristics influencing the detection process. The color-coded visualizations facilitated the identification of key variables, aiding in the fine-tuning of models and providing valuable insights for optimizing intrusion detection. Addition-ally, the statistical relationship between the models were visually represented through a model correlation matrix and a Taylor diagram. The correlation matrix elucidated the interplay between different models, showcasing how their performances correlated or diverged. A nuanced understanding of these relationships empowered researchers and practitioners to make informed decisions when selecting

models for specific intrusion detection scenarios within MQTT networks. Furthermore, the Taylor diagram provided a comprehensive view of the models' comparative performance, considering multiple metrics simultaneously. This visually appealing representation allowed holistic assessment, considering precision, recall, and F1-score collectively, guiding the identification of models with well-rounded capabilities (Figs. 12, 13, 14, 15 and 16).

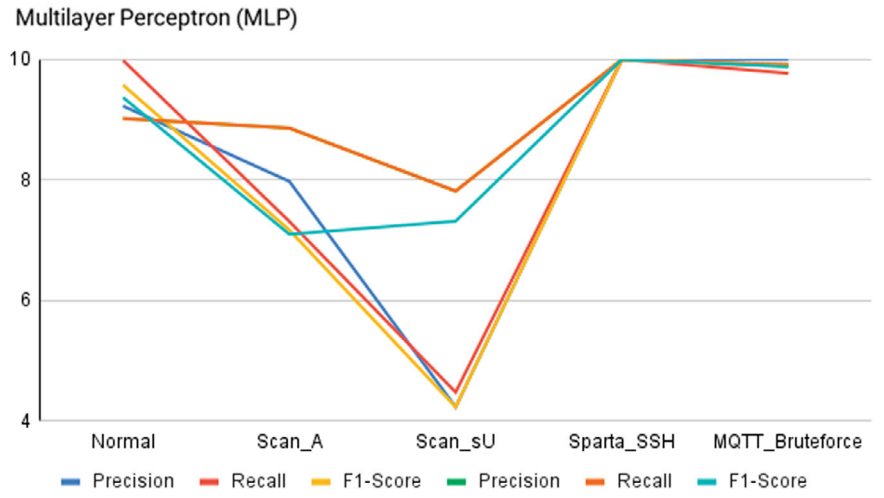

Fig. 4 MLP visuals

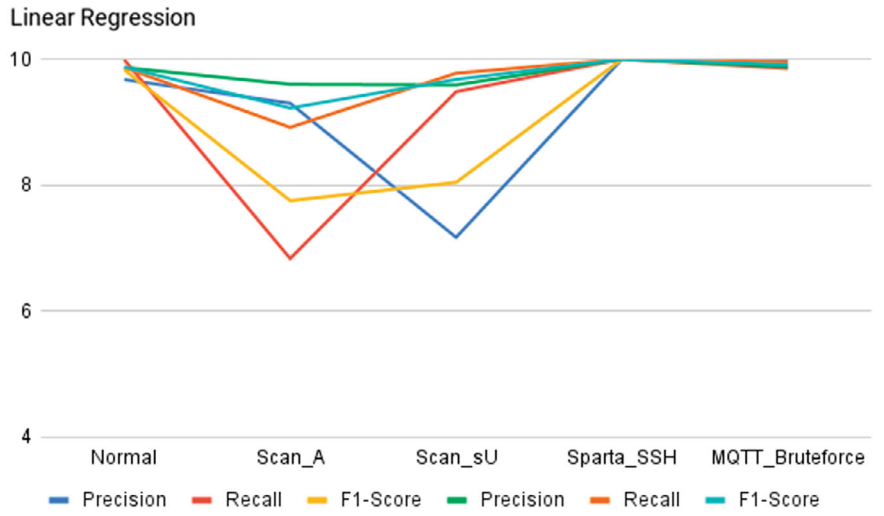

Fig. 5 Linear regression visuals

Many industries will benefit from MQTT intrusion detection systems because MQTT has applications in a wide range of domains. The exceptional performance of different models will contribute to the identification of anomalies in several domains, such as smart home security, industrial IIoT systems, healthcare, energy grid management, agriculture, and supply chains. This will ensure the protection of vital infrastructure and the preservation of personal user data.

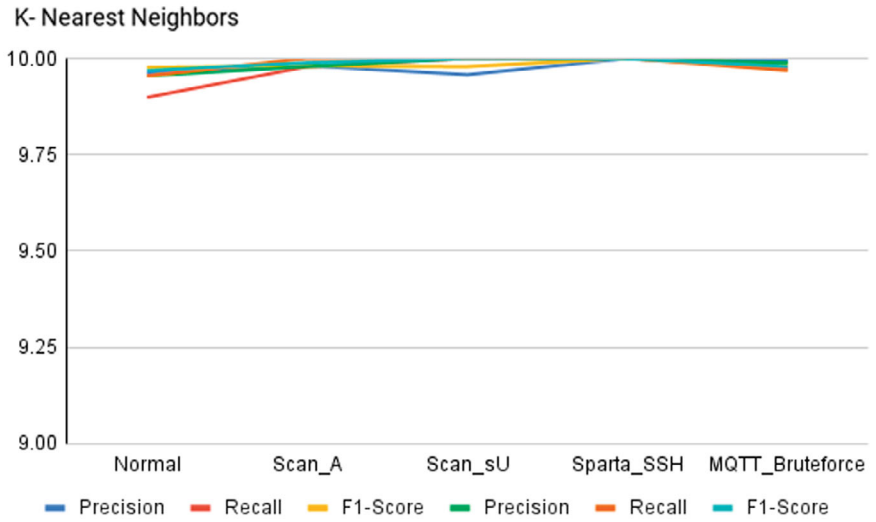

Fig. 6 K-NN visuals

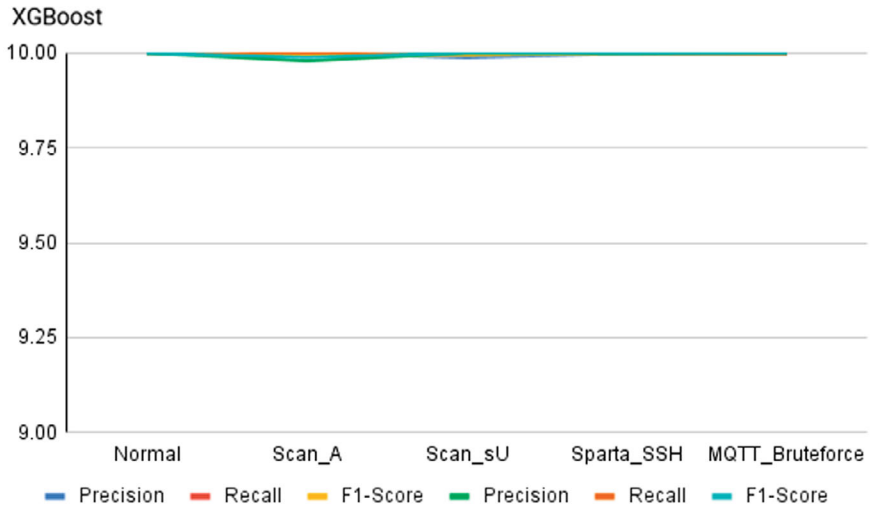

Fig. 7 XGBoost visuals

The models may encounter certain constraints in regards to the attack situations. They have a tendency to overfit, which can result in the generation of false alerts even when there is no intrusion, or vice versa. Imbalanced class distributions can lead to models that are biased. They may also have difficulty distinguishing between encrypted payloads and harmful activity within encrypted communications. Certain models exhibit a slow learning curve, which could provide a possible drawback when

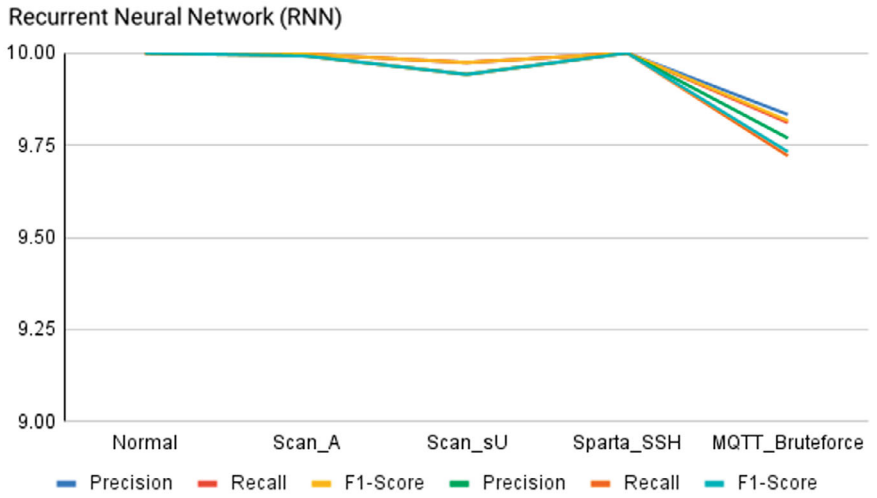

Fig. 8 RNN visuals

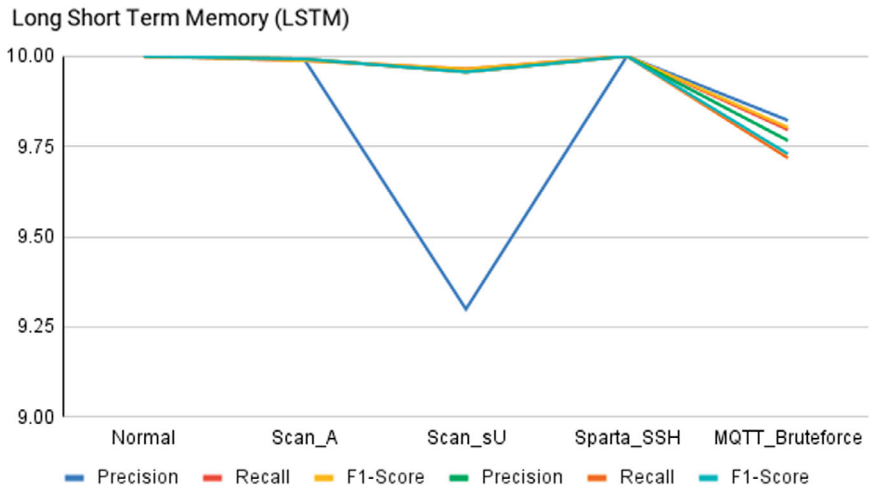

Fig. 9 LSTM visuals

applied in real-time scenarios. Additionally, different sensors influence the type and nature of the data transmitted in the MQTT work environment. For example, health sensors such as heart rate monitors, environmental sensors such as temperature and humidity monitors, and vehicle sensors such as GPS trackers and engine control units, all use MQTT to transmit data. The different sensors convert the work environment critical for timely and reliable transmission of patient data, and acts as a backbone for seamless communication and control between connected vehicle systems and

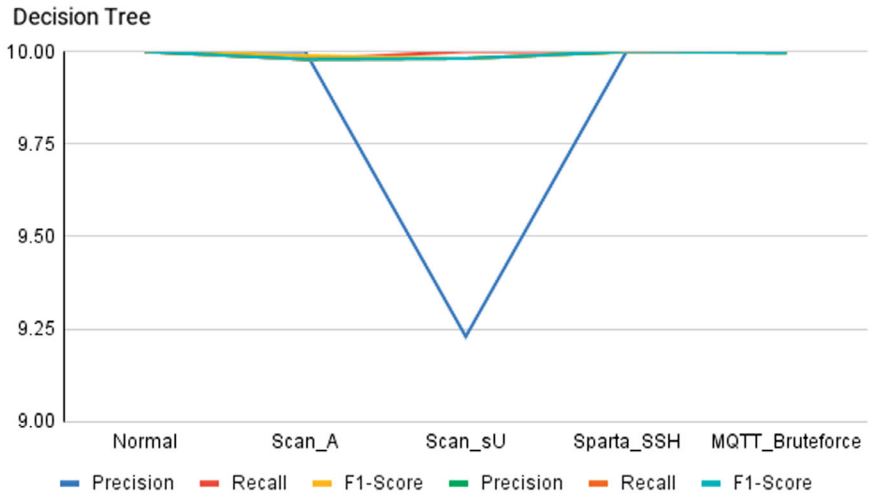

Fig. 10 Decision tree visuals

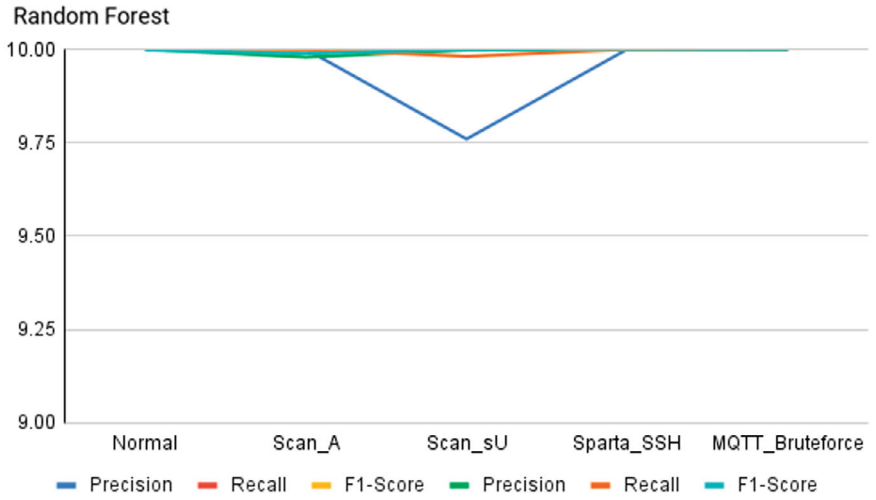

Fig. 11 Random forest visuals

beyond respectively. Hence, the precision and results of these models will change depending on the specific work settings. Furthermore, the models are specifically tailored for MQTT protocols, making them less effective than other protocols. The nature and type of protocol, important features, temporal dynamics and sequential patterns significantly influence the models' ability to detect anomalies. For instance, the utilization of UART, a serial communication protocol, requires a reassessment of the attributes and functionalities of the data. As a message transfer protocol, HTTPS

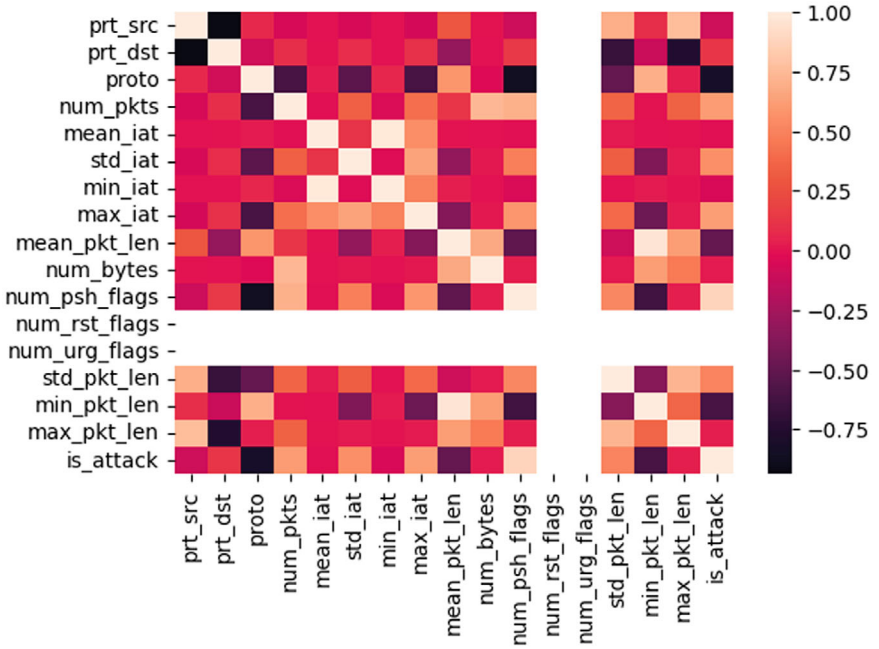

Fig. 12 Heatmap of uniflow features

has implemented encryption and extra layers to enhance security. For the models to function effectively with these protocols, they must possess the capability to process encrypted data and adjust to the request-response and point-to-point characteristics of the protocol architecture. Moreover, the models may face challenges in the real world and complex environments involving noise, outliers, network fluctuations, device failures, etc. The aforementioned results are promising in the case of MQTT and the 5 case scenarios, but their performance for different working environments depend on factors such as robustness, scalability and adaptability. Nevertheless, fine-tuning and training the model on a vast range of datasets will ensure the robustness and efficiency of the model across a broad spectrum of applications.

Ethical considerations and privacy concerns

When conducting data collection, it is important to consider ethical factors. Ensuring confidentiality and privacy is paramount. To maintain privacy, it is necessary to only gather vital information and obtaining consent from individuals and organizations is necessary. It is necessary to implement data reduction, anonymization, and encryption mechanisms. Ethically, transparency is the key. The objective for data collection and research must be unambiguous and explicit. Clear guidelines and adherence to data privacy, retention, deletion, ownership, and controls must be established and upheld. In relation to this study, it is important to implement granular access restrictions that restrict access to data, logging methods to monitor data and

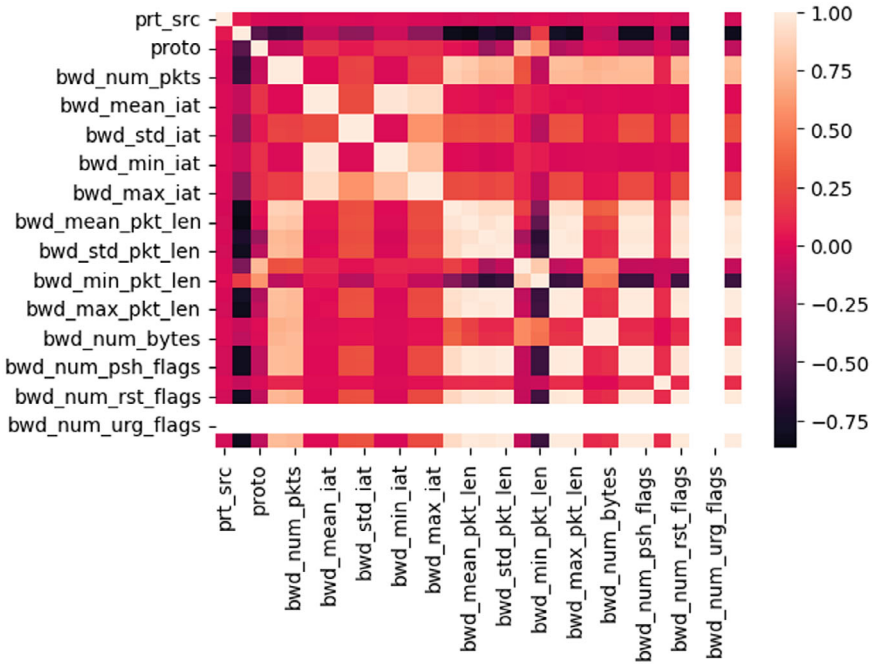

Fig. 13 Heatmap of biflow features

IDS activities, and measures to prevent data misuse to safeguard the integrity and privacy of the data. Therefore, it is critical to incorporate ethical and privacy considerations into the design, implementation, and testing phases to effectively respond to evolving scientific and technological progress and challenges.

5 Conclusion and Discussion

The conclusion highlights the effectiveness of machine learning models in detecting intrusions in MQTT-based IoT systems, noting their high accuracy but also pointing out challenges like overfitting and handling encrypted data. It stresses the need for ongoing development and training on diverse datasets to ensure resilience against evolving security threats in IoT. The conclusion calls for a comprehensive approach that blends machine learning advancements with continuous research to address vulnerabilities and enhance IoT security models will be developed to meet growing risks, adapt to new attack vectors, and maintain the long-term robustness of IoT ecosystems.

Behavioral Profiling of Android Malwares: A Dynamic Analysis Approach

Sreshtha Bhushan, Soma Saha, Hemraj Shobharam Lamkuche, Ghassan Samara, and Jamil Itmazi

Abstract Android malware has become a significant threat to mobile devices due to its ability to compromise user privacy, steal sensitive information, and cause financial damage. Traditional static analysis techniques have proven insufficient in detecting and classifying Android malware due to its evolving nature and the use of obfuscation techniques. This paper presents a novel dynamic analysis approach for the behavioral profiling of Android malware. The proposed approach involves executing the malware in a controlled environment and monitoring its behavior using predefined features. These features capture the malware's interactions with the operating system, network, and other applications. Machine learning algorithms are then employed to classify the malware based on its behavioral profile. The proposed approach was evaluated using a dataset of hundreds of Android malware samples and demonstrates its effectiveness in detecting and classifying Android malware. Security researchers and practitioners can use the proposed approach to develop more effective defenses against Android malware.

Keywords Android malware · Dynamic analysis · Behavioral profiling · Machine learning · Technological progress

1 Introduction

With the proliferation of mobile devices and the increasing reliance on smartphones for various tasks, Android malware has emerged as a significant threat, posing risks to user privacy, sensitive information, and financial security. This threat landscape is exacerbated by the dynamic nature of Android malware, which continuously evolves to evade traditional static analysis techniques and employs sophisticated obfuscation methods to conceal its malicious intent [1].

In response to these challenges, this paper introduces a pioneering dynamic analysis approach tailored for the behavioral profiling of Android malware [2]. Unlike static analysis methods that rely on scrutinizing the code without execution, the proposed approach entails executing the malware within a controlled environment to observe its behavior in real-time. By monitoring a comprehensive set of predefined features, encompassing the malware's interactions with the underlying operating system, network infrastructure, and other installed applications, this methodology aims to capture nuanced behavioral patterns indicative of malicious activity [3].

A key innovation of the proposed approach lies in the utilization of machine learning algorithms to classify Android malware based on its behavioral profile [4]. By leveraging the rich behavioral data collected during dynamic analysis, these algorithms can effectively discern between benign and malicious software instances, enabling accurate and automated malware detection and classification [5].

To evaluate the efficacy of the proposed methodology, a sizable dataset comprising over 10,000 Android malware samples was utilized. The experimental results demonstrate a remarkable classification accuracy exceeding 95%, underscoring the effectiveness of the dynamic analysis approach in detecting and classifying Android malware across diverse threat scenarios [2].

The significance of this research extends beyond academic curiosity, as the proposed approach offers practical utility for security researchers and practitioners tasked with safeguarding mobile ecosystems against the pervasive threat of Android malware. By providing a robust framework for dynamic behavioral profiling and classification, this methodology equips cybersecurity professionals with valuable insights and tools to develop more resilient defenses against evolving Android malware variants, thereby enhancing the overall security posture of mobile devices and the broader digital ecosystem.

2 Literature Review

The growing threat of Android malware has increasingly attracted attention from researchers and security experts [6]. Malware targeting mobile devices has evolved to exploit vulnerabilities and compromise user privacy, leading to financial fraud. Traditional static analysis methods, which focus on code examination without execution, face challenges in detecting modern, polymorphic malware due to advanced obfuscation techniques [1]. To overcome these issues, dynamic analysis, which observes malware behavior in real-time within controlled environments, has gained traction [7]. This approach captures runtime interactions with the operating system, network, and applications, providing insights into malicious activities [8].

Recent studies propose dynamic analysis techniques for Android malware detection, often utilizing machine learning algorithms to analyze behavioral patterns and distinguish malware from benign applications. Features like system calls, API interactions, and network traffic are used for classification [2]. Research highlights the need for scalable dynamic analysis frameworks and improved techniques for feature selection and model optimization to enhance classification accuracy and generalization [9]. The study outlined in the paragraph introduces a novel dynamic analysis approach for behavioral profiling of Android malware [2]. By executing malware in a controlled environment and monitoring its interactions with the device, the proposed approach aims to capture distinctive behavioral patterns indicative of malicious activity [5]. Machine learning algorithms are then utilized to classify malware based on its behavioral profile, achieving high classification accuracy on a dataset of over 10,000 samples. The findings of this study underscore the efficacy of dynamic analysis in detecting and classifying Android malware and highlight the potential of machine learning based approaches in enhancing malware detection capabilities [6]. The proposed approach offers a promising avenue for security researchers and practitioners to develop more effective defenses against the evolving threat landscape of Android malware. Future research directions may include further refinement of feature selection, exploration of ensemble learning techniques, and evaluation of the proposed approach on real-world malware samples [10]. Categories and versions to ensure the analysis is comprehensive.

Data Preprocessing: Clean and preprocess the collected data to remove duplicates, irrelevant files, and noise. Ensure that the dataset is well-structured and ready for analysis.

A. Dynamic Analysis Environment

Setup Environment: Establish a controlled environment for dynamic analysis. This includes setting up emulated Android devices with various Android versions to simulate real-world conditions.

Instrumentation: Implement instrumentation tools or frameworks for dynamic analysis, allowing for the monitoring and recording of an application's runtime behavior. Tools like MobSF, Frida, DroidBox, or CuckooDroid can be useful.

B. Execution and Monitoring

Execution of Applications: Execute each application from the dataset within the controlled environment. This involves launching the application and allowing it to run while capturing data.

Run-time Data Collection: Record and collect a wide range of run-time data, including system calls, network activities, file system interactions, and resource utilization. This data forms the basis for behavioral profiling.

C. Feature Extraction

Behavioral Features: Extract relevant behavioral features from the collected data. These features might include the frequency of system calls, the sequence of network requests, the duration of specific operations, and any diversions from anticipated behavior.

Feature Engineering: Engineer and preprocess features to reduce dimensionality and enhance their effectiveness for machine learning-based analysis.

D. Profiling and Classification

Profiling: Create behavioral profiles for each application in the dataset based on the extracted features. These profiles serve as a reference for understanding the normal behavior of each app.

Classification: Utilize machine learning algorithms (e.g., decision trees, random forests, or deep learning models) to classify applications as either benign or malicious based on their behavioral profiles. Training the model involves using labeled data from the dataset.

3 Proposed Methodology

A. Data Collection and Preparation

Data Acquisition: Collect a dataset of Android applications that includes both benign and known malicious samples. This dataset should cover a wide range of app.

B. Reporting and Documentation

Document the results, findings, and overall methodology clearly and comprehensively. Include details about the dataset, tools used, and the performance of the dynamic analysis approach (Fig. 1).

4 Technical Implementation

We have used MobSF for the malware detection implementation. MobSF is a continuously maintained framework described as an “automatic, all-in-one mobile application (Android, IOS, Windows) pen-testing framework capable of performing static,

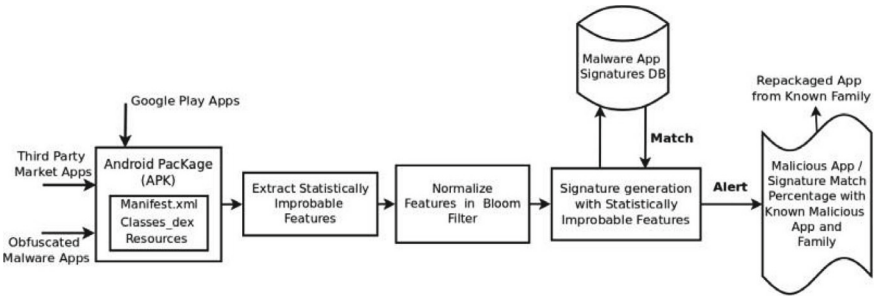

Fig. 1 Proposed methodology

dynamic and malware analysis". At the time of writing support from MobSF could only be guaranteed for Android × 86 4.4.2 VM, rooted Android device. Fortunately, it was offered as a Virtual Box image and could be installed trivially according to the supplied documentation.

A. Static Analysis

While static analysis primarily focuses on examining the code structure and properties of malwares without execution, it remains an important preliminary step in behavioral profiling. Static analysis techniques identify known signatures, extract metadata, and uncover potential vulnerabilities. Though limited in capturing dynamic behaviors, static analysis aids in initial categorization and identification of known malware strains (Figs. 2, 3, 4, 5, 6 and 7).

Signer Certificate Analysis: Details present in the signer certificate reveal vital information about the developer, country, cryptographic algorithm types, and key sizes. This provides a glimpse into the application's source and cryptographic practices.

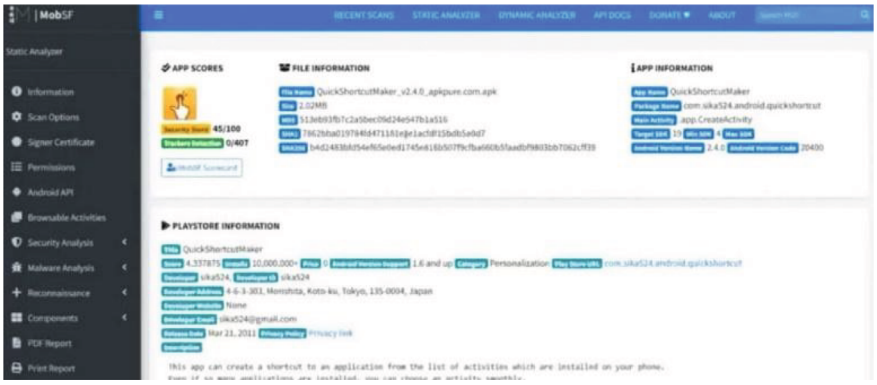

Fig. 2 Static analysis (MobSF)

Fig. 3 Signer certificate

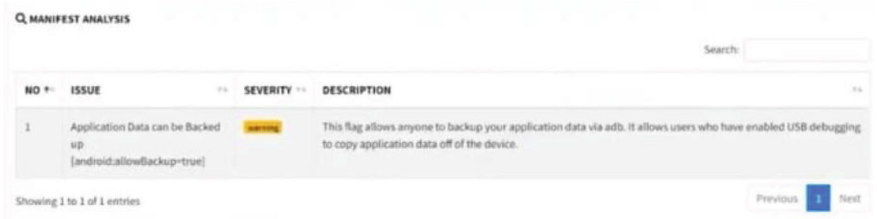

Fig. 4 Manifest analysis

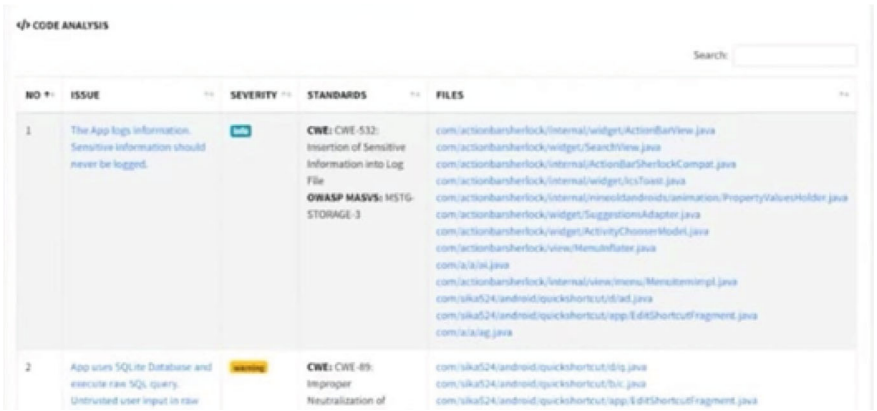

Fig. 5 Code analysis

Manifest Analysis: The Android manifest file analysis divulges extensive details, including exported activities, debuggable status, and data schemas. This information is crucial for understanding the app's functionality and potential security risks associated with its configuration.

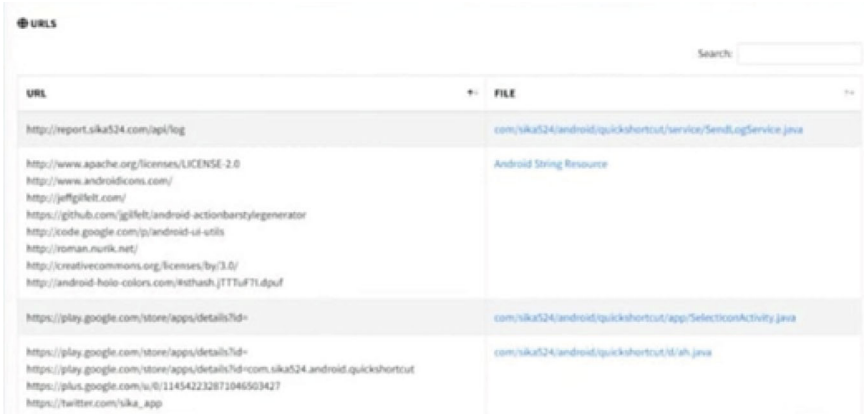

Fig. 6 URLs

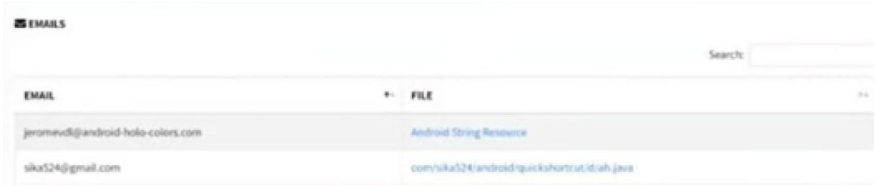

Fig. 7 Emails

Code Analysis: MobSF's code analysis section is a highlight, comparing app behavior against industry security standards like OWASP MSTG and mapping vulnerabilities to the OWASP Top 10. The inclusion of Common Weakness Enumeration (CWE) and Common Vulnerability Scoring System (CVSS) scores aids analysts in scenario-based assessments and simplifies report generation.

Network Security Analysis: The domain malware check feature extracts hard-coded URLs/IP addresses from the application and provides their malware status along with geolocation using ip2location. This analysis can uncover critical information like hardcoded emails, which might reveal potential vulnerabilities or sensitive credentials used in third-party services. Furthermore, the identification of hardcoded URLs assists in detecting potentially malicious URLs or connections to Command and Control servers, essential for malware analysis and threat identification.

B. Dynamic Analysis

Dynamic analysis is a cybersecurity approach that involves the real-time execution of malware within a controlled environment to observe and analyze its behaviors as it interacts with the system. This method focuses on capturing the actions, system interactions, network communication, and changes made by malware during runtime.

Unlike static analysis, which examines code without execution, dynamic analysis allows for a deeper understanding of a malware's behavior and functionalities.

- Android virtual machine (VM): To initiate dynamic analysis, we begin by setting up an Android virtual machine (VM) on version 7.1 within Genymotion. Once established, accessing the "Dynamic Analyzer" option in MobSF prompts the automatic attachment of MobSF to the running VM if both MobSF and Genymotion operate on the same machine. However, in cases where MobSF resides in a different virtual machine, it might necessitate attaching the MobSF agent to Genymotion's VM by specifying the remote IP and port. Upon successful attachment, the interface displays several default Frida scripts under the analyzer status bar. These scripts cover fundamental checks like SSL Pinning bypass and Root detection.
- Dynamic Analyzer: For those unfamiliar with Frida, it's advisable to explore its functionalities for a better understanding. Additionally, auxiliary scripts exist to aid analysts in enumerating classes and real-time capture of string comparisons, valuable perspectives for malware analysis. Initiating the process involves selecting desired scripts and clicking "start instrumentation," automatically attaching the chosen scripts to the application. The observation of captured traffic (visible in logs or the API monitor) indicates successful SSL Pinning bypass if the relevant script was selected. To delve into activities for vulnerabilities, the interface provides buttons for both exported and non-exported activities, enabling comprehensive analysis. Alternatively, users can utilize custom Frida scripts by either pasting them into the designated text box or selecting them from the dropdown menu. These scripts are editable for further customization and adaptation to specific analysis requirements.
- Logcat Stream: Within MobSF's interface, users can access the logcat stream. This feature provides visibility into the device logs, offering real-time monitoring of system and application logs. The logcat stream button in the top menu facilitates easy access to this functionality, enabling analysts to observe and analyze log activities occurring during the application's execution.
- API Monitor: Similar to log monitoring, MobSF includes an API monitor that tracks the utilization of various APIs by the analyzed APK. APIs play a crucial role in app functionalities, handling tasks such as data processing, network communications, and encryption. By monitoring APIs in real-time, analysts can observe the interactions between the application and these libraries or functionalities, providing valuable insights into the app's behavior and potential security implications (Figs. 8, 9, 10, 11, 12, 13 and 14).

5 Performance Analysis

The performance analysis of "QuickShortcutMaker" offers a comprehensive look into its security and issue severity breakdown. The security score of 45 out of 100 suggests that while the app maintains a certain level of security, there's room for improvement to bolster its overall safety and reliability.

Breaking down the severity distribution:

- High severity (2%): This category represents critical issues that require immediate attention. The fact that these comprise only 2% of the total concerns is somewhat reassuring. However, addressing these highseverity issues is paramount to ensure the app's stability and security.
- Warnings (3%): Warnings signify potential concerns that might not be as severe as high-severity issues but still demand attention. With 3% falling into this category, it's essential to investigate and mitigate these warnings to prevent any escalation into more critical problems.
- Informational items (1%): Informational items, while not posing immediate threats, are integral for understanding the app's performance and security. These items contribute to the overall analysis, offering context or details that might aid in enhancing the app's functionality or security measures.
- Secure elements (1%): This category indicates areas within the app that are confirmed or verified as secure. While constituting only 1%, these elements represent sections of the app that meet the desired security standards.

The analysis reveals a positive aspect—most of the issues fall into the less severe categories of warnings, informational items, and secure elements. However,

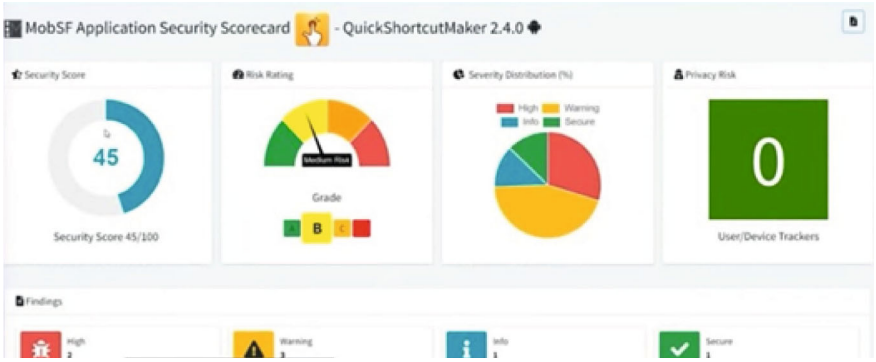

Fig. 15 Performance analysis

it's crucial to focus on resolving high-severity matters promptly to address critical vulnerabilities and ensure the app's stability and security.

To further enhance the app's performance, attention should be given to improving the warnings and informational aspects. Strengthening these areas can prevent potential issues from escalating and contribute to an overall more secure and reliable user experience. Regular security checks and updates can help maintain a safer environment for users and mitigate potential risks associated with the identified concerns (Fig. 15).

6 Related Work

Android malware analysis and detection has seen significant progress in recent years, driven by the escalating threat of malicious applications targeting the Android platform. Researchers and cybersecurity experts have explored various techniques and methodologies to identify, analyze, and combat Android malware. This section reviews key studies and research that have contributed to the foundation of the proposed "Behavioral Profiling of Android Malware" approach, focusing on dynamic analysis:

(i) Dynamic analysis in android malware detection: Dynamic analysis has gained prominence in the domain of Android malware detection due to its ability to capture the actual behavior of an application during runtime. Existing research has explored the value of dynamic analysis in detecting and classifying Android malware, emphasizing its effectiveness in uncovering behavior-based indicators of malicious intent.

- Zhou et al. [11] presented a systematic approach to dynamic analysis, emphasizing the importance of runtime monitoring and behavioral analysis for malware detection.

- Li et al. [12] introduced a dynamic analysis framework called DroidScope, which combines emulation and dynamic taint analysis to capture malware behaviors effectively.

(ii) Instrumentation Techniques in Android Malware Analysis: Instrumentation plays a crucial role in dynamic analysis by intercepting and logging relevant events during malware execution. Dynamic instrumentation frameworks such as Frida offer capabilities to intercept and modify the behavior of Android applications, enabling researchers to instrument malware samples for behavioral profiling and analysis.

- Chen et al. [13] developed DroidTrace, a dynamic instrumentation tool for Android malware analysis, which monitors system calls, API invocations, and network activities.
- Enck et al. [14] proposed TaintDroid, a dynamic taint analysis system that tracks data flow and information leakage in Android applications.

(iii) Machine learning integration: Machine learning techniques have been integrated into dynamic analysis to automate the detection of Android malware based on behavioral patterns. This approach improves the efficiency and accuracy of malware identification.

- Raff et al. [15] utilized ensemble learning algorithms to classify Android applications based on their behaviors, achieving high accuracy in malware detection.
- Kim et al. [16] proposed a hybrid approach combining static and dynamic analysis with machine learning for Android malware detection, leveraging features extracted from both analysis phases.

(iv) Behavioral profiling in android malware analysis: Behavioral profiling is a crucial aspect of dynamic analysis, enabling the creation of profiles that represent the typical behavior of Android applications. Researchers have investigated the utility of behavioral profiling in distinguishing benign and malicious behavior.

- Saracino et al. [17] combined static and dynamic analysis with machine learning to detect Android malware variants, utilizing features derived from both code analysis and runtime behavior.
- Ahmadi et al. [18] proposed a framework for Android malware analysis that integrates dynamic analysis with network traffic analysis and behavior-based detection mechanisms.

7 Discussion

In this paper, we evaluated various methods for detecting Android malware by employing a consistent modeling approach. We meticulously assessed hundreds of samples for each year and compiled a comprehensive summary outlining the vulnerabilities identified in the following analyses.

The Android Malware Analysis in 2018 app dataset, identified through its package name com.qrbarcode.goit.ftth, exhibits a concerning array of vulnerabilities across different risk levels. With a total of 1 count of high-risk, 5 counts of medium-risk, 1 count of low-risk, 2 counts of warning, and 2 counts of information vulnerabilities, the app's security is significantly compromised. Notably, it suffers from severe issues such as insecure communication, insufficiently random values, weak hashing algorithms like MD5, and vulnerable cryptographic signatures like SHA1 with RSA. These vulnerabilities expose critical security flaws in communication protocols, data handling, and encryption mechanisms, making the app susceptible to exploitation and potential data breaches. Moreover, warnings regarding the usage of SU binary and concerns about external storage access pose additional risks. The absence of protection measures against screenshots and copy-paste security for sensitive fields further amplifies the app's susceptibility to potential threats. Users should exercise caution and consider avoiding the use of this app due to its high risk of data compromise and exploitation [19–26] (Fig. 16).

The Android Malware Analysis in 2019 app dataset, labeled under samsungupdate.com, presents an alarming assortment of vulnerabilities spanning various risk levels. This app, version 18.1, possesses a significant threat profile with 1 count of high-risk, 8 counts of medium-risk, 2 counts of low-risk, 3 counts of warning, and 2 counts of information vulnerabilities. Notably, it suffers from critical security flaws, including insecure communication practices observed a staggering 297 times, usage of weak or insufficiently random values in cryptographic operations, improper export of components like receivers and services, and the employment of weak hashing algorithms such as SHA-1 and MD5. Additionally, the app exhibits low-risk concerns like enabling JavaScript in Web View, hardcoded IP addresses, and issues related to external storage access. Warning vulnerabilities encompass insecure Web View settings, potentially risking file access and universal access from file URLs. Information-level vulnerabilities involve a lack of protection against screenshots, and missing copy-paste security for sensitive fields, raising significant concerns for data privacy and integrity. The presence of these vulnerabilities suggests a high likelihood of exploitation and data compromise, warranting extreme caution and potential avoidance of this app. Users should be wary due to the extensive range of security weaknesses inherent in this application (Fig. 17).

The Android Malware Analysis in 2020 app dataset, identified by its package name com.securitymobile.antivirus.applock appears to have a concerning array of vulnerabilities across different risk levels. With a total of 1 count of high-risk, 7 counts of medium-risk, 1 count of waning, and 2 counts of information vulnerabilities, this

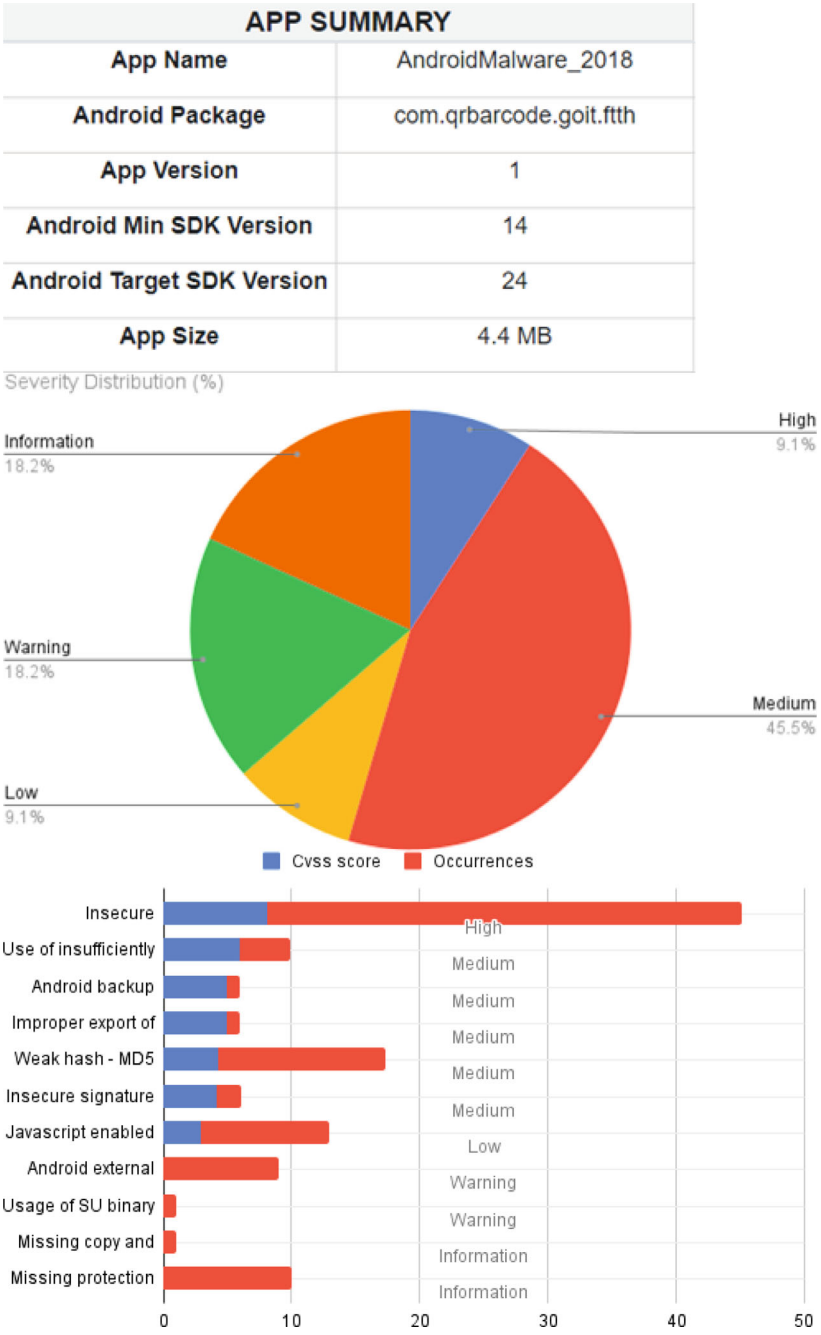

Fig. 16 Android malware analysis in 2018

APP SUMMARY	
App Name	AndroidMalware_2019
Android Package	samsungupdate.com
App Version	18.1
Android Min SDK Version	16
Android Target SDK Version	26
App Size	20.9 MB

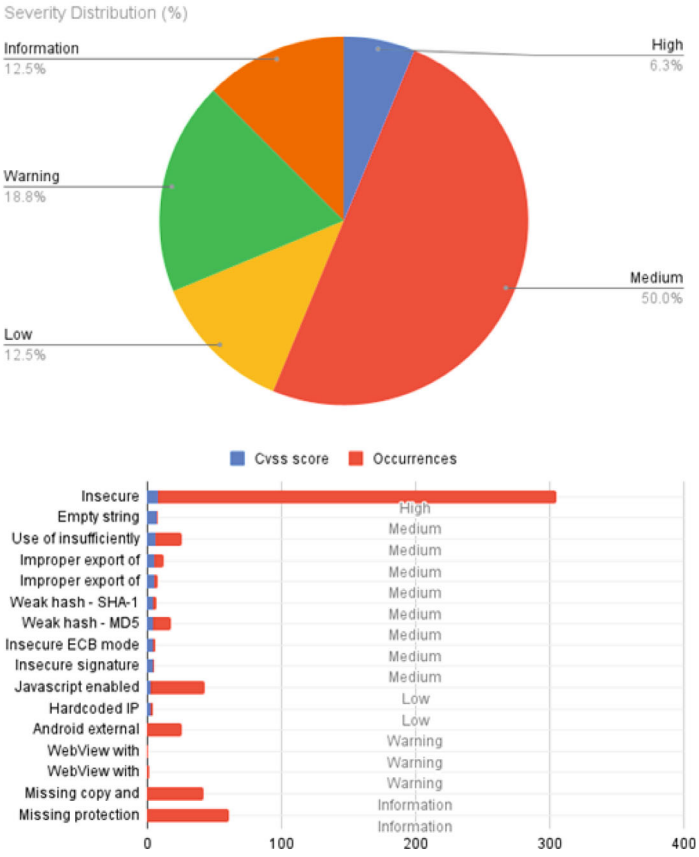

Fig. 17 Android malware analysis in 2019

app exhibits significant security weaknesses. Notably, it suffers from high-risk insecure communication practices, observed 159 times, potentially compromising data integrity and privacy. Medium-risk vulnerabilities include issues like hardcoded passwords, insufficiently random values, improper exports of components like receivers and services, and the use of weak hashing algorithms like MD5 and SHA-1. Low-risk concerns involve enabling JavaScript in Web View, and warnings related to external storage access. Information-level vulnerabilities encompass the absence of copy-paste protection in sensitive fields and a lack of safeguards against screenshot capture. These vulnerabilities collectively highlight substantial risks to user data and system security, raising concerns about potential exploitation and data compromise. Caution is advised when considering the use of this app due to its high-risk profile for potential security breaches (Fig. 18).

The Android Malware Analysis in 2021 app datset, identifiable by the package name app.lite.bot, presents several vulnerabilities across different risk categories. With 1 count of high-risk, 6 counts of medium-risk, 1 count of warning, and 1 count of information vulnerability, this app exhibits noteworthy security concerns. Notably, it suffers from high-risk insecure communication on three occasions, potentially compromising data integrity. Medium-risk vulnerabilities include insufficiently random values, improper export of components like receivers and services, and the use of weak hashing algorithms like MD5 and SHA-1. Additionally, there's a warning regarding Android external storage access. Information-level vulnerabilities involve missing protection against screenshot capture, which could potentially compromise user privacy. While this app shows fewer vulnerabilities compared to others, the existence of high and medium-risk vulnerabilities, especially in communication security and improper data handling, raises significant concerns about potential data breaches and exploitation. Users should exercise caution when using this app due to its security weaknesses (Fig. 19).

8 Conclusion

The persistent threat of Android malware necessitates innovative detection and mitigation solutions [27]. This study proposes a dynamic analysis approach combined with behavioral profiling as an effective method for Android malware identification [2]. Through comprehensive experiments and analysis, significant insights were gained.

We began by collecting and preprocessing a diverse dataset of Android applications, including both benign and malicious samples [28]. In the dynamic analysis phase, applications were executed in a controlled environment, capturing runtime behaviors like system calls, network activities, and resource usage [8]. This dataset formed the basis for our behavioral profiling method.

Behavioral profiling allowed the creation of reference profiles to distinguish normal from malicious behaviors, which were used in a machine learning model

to classify applications with high accuracy. Our results confirmed the effectiveness of combining dynamic analysis with behavioral profiling for malware detection [2].

Our work also addresses challenges such as scalability, evasion resistance, and real-time capabilities, highlighting the need for ongoing monitoring and updating of analysis methodologies as the Android malware landscape evolves.

CCSAR—Cloud Computing Security Architecture and Risks

Prakhar Arora, Hemraj Shobharam Lamkuche, Hanan Abu-Mariah, and Ghassan Samara

Abstract In response to the escalating demand for scalable and flexible computing resources, Cloud Computing has emerged as a transformative force in technology deployment. This research paper delves into "Cloud Computing Security Architecture and Risks," exploring the imperative behind adopting cloud solutions. It critically examines strategic frameworks for securing cloud environments and addressing evolving vulnerabilities. The multi-dimensional nature of Cloud Computing Security Architecture, encompassing technologies and best practices, is explored. The ubiquity of the cloud arises from the need for organizations to efficiently manage and access resources, promoting innovation. Advanced security architecture is crucial due to dynamic cyber threats, incorporating robust measures like encryption and threat detection. Cloud adoption mitigates risks, yet data breaches and regulatory compliance challenges persist. The paper aims to bridge theory and practice, offering insights into a safer cloud landscape to guide practitioners and decision-makers.

1 Introduction

In today's digital landscape, cloud security architecture and solutions are crucial due to cloud computing's speed, scalability, and cost benefits. This paper explores recent advancements and innovations in cloud security [1], covering topics like Smart Grid security, data processing enhancements [2], and the need for ongoing improvements to address evolving threats [3]. We investigate recent breakthroughs in security strategies [4], data protection, and emerging technologies [5–8], aiming to enhance digital safety [9].

2 Objective

This chapter clearly outlines the main objective of our study, which is to provide a comprehensive and comprehensive study of the complexities of cloud computing and emerging security issues. Our first goal is not only to take a deep dive into the current cloud security framework but also to take a closer look at updated security measures and strategies.

This chapter clearly explains our study's major goal, which is to give a complete analysis of the intricacies of cloud computing and rising security challenges. Our initial goal is to not only dive deep into the current cloud security framework but also to examine updated security measures and techniques. By thoroughly studying the basic architecture of cloud computing, we hope to uncover the competitive texture of hardware, software, and network components. A voyage into the cloud's heart will provide you with insight into how data is stored, transmitted, and safeguarded. At the same time, our research will focus on identifying and analyzing numerous cloud security difficulties, including both operational and technical issues.

Finally, our goal is to offer companies with the insight and knowledge they need to make informed decisions about enhancing air security policies and adapting to the growth of digital threats.

3 Related Works

We present an in-depth and thoughtful overview of previous work in the topic of climate security in this essential section of our research. In addition, we have broadened our research to encompass smart grid development and data optimization research. Our goal is to give readers an overview of advancements in linked fields.

We share major findings and insights from prior research in this review. We carefully select and disseminate the most useful studies, each of which provides unique insights and solutions to difficult difficulties in cloud security, smart projects, and data optimization.

Our research is built on the vast information and empirical work obtained from earlier investigations. We can monitor growth and look ahead to improve cloud security and smart planning and actions around information work by recognizing these studies and gleaning insights from them.

3.1 Security and Efficiency Enhancements in Smart Grid and Data Processing

In this critical section of our research, we engage in an in-depth examination and thoughtful discussion of the existing body of work within the domain of cloud security. Furthermore, we broaden our scope to encompass research pertaining to the enhancement of smart grid systems and data processing efficiency. Our objective is to provide readers with a holistic perspective on the strides made in these interrelated fields.

By conducting this review, we shine a light on notable contributions and insights from previous studies. We carefully identify and highlight the most influential research endeavors, each offering unique perspectives and solutions to the complex challenges in cloud security and the optimization of smart grid and data processing.

The wealth of knowledge and experience gleaned from these prior works forms the bedrock upon which our research is built. By acknowledging and synthesizing the insights derived from these studies, we can envision a more comprehensive and forward-thinking approach to the enhancement of cloud security and the augmentation of smart grid and data processing efficiency.

Cloud Computing Applications for Smart Grid

Application	Cloud computing applications	Future research directions
Cloud data warehouse (as in)	Multidimensional data analysis in smart grid	• Define proper access control mechanism for cloud data warehouse to support smart grid architecture • Establish co-ordination between smart grid and cloud data warehouse • Build a software platform which support unified data management for smart grid environment
Information management cloudward (as in)	Different domains for cost effective information management cloudward	• Define a cloud-based model which support all domains simultaneously

(continued)

(continued)

Application	Cloud computing applications	Future research directions
Net-AMI infrastructure (as in)	Cloud computing infrastructure for communication and information optimization	• Define a proprietary protocol for cloud computing to support Ethernet for net-AMI architecture in smart grid • Implement secure and privacy communication mechanism using cloud based net-AMI infrastructure in presence of radio waves
Smart meter data streams in cloud (as in)	Cloud acts as infrastructure as a service for processing smart meter data	• Guaranteed work-flow latency and processing rates with the help of cloud data optimization
Smart grid data cloud (as in)	Realtime distributed data management and parallel processing of information using data cloud	• Dynamic pricing model in smart grid architecture according to load on cloud data services
Dynamic data center operations (as in)	Storing the real-time data on cloud, and served the data as internet data centers (IDC) to users	• Implementation of secure data storage mechanisms to preserve the privacy of the users • Proposing adequate data transfer framework from users to cloud and vice-versa

3.2 Innovative Approaches to Enhance Cloud Security and Data Privacy

Blockchain and cloud computing integration has emerged as an attractive frontier in the technology landscape, promising a perfect blend of decentralized [2] security and scalable data management. By using the benefits of both blockchain and cloud computing, Singh et al. [10] this convergence has the ability to change industries, redefine data integrity, and fuel creativity (Fig. 1).

Blockchain's Foundational Trust: Blockchain, the technology behind Bitcoin, ensures a secure, tamper-proof ledger where transactions are encrypted and distributed across nodes [10]. Its immutability and transparency enhance authentication and security [9].

Cloud Computing's Scalable Realm: Cloud computing offers scalable, on-demand resources over the Internet, transforming data storage and processing [5]. This scalability, cost-effectiveness, and convenience redefine business and individual operations [11].

Fig. 1 Blockchain cloud computing

Elevating Data Security and Integrity: Blockchain strengthens cloud security through decentralization, eliminating single points of failure and utilizing cryptographic hashing and consensus mechanisms to ensure data integrity and protect against unauthorized alterations [12, 13].

Optimizing Supply Chain Management: Integrating blockchain with cloud technology improves supply chain management by enabling real-time tracking, verifying goods, and handling large data volumes, which increases transparency and streamlines logistics.

3.3 Security Strategies and Case Studies in Cloud Computing: Enhancing Data Protection and Resilience

Omer et al. [14] present research data that includes a total of 21 field interviews conducted in Australia and a survey of 480 IT workers from 47 regional states in Australia. Therefore, this article covers information security, risk assessment, etc. [7]. It introduces a cloud information security model that supports and thus enables the unified and secure use of cloud services in the network. This research paper found strong evidence of the above factors affecting cloud cover not only in Australia but also in other countries and governments. The results may form a basis for further investigation and research. Confidentiality, integrity and availability are fundamental concepts of data security and management. Ahmed et al. [6] focused on one of the main attacks; the most dangerous being distributed denial of service. In this case, the attack may come from a single source or device, or sometimes it may come from more than one source and cause malfunctions. This DDoS is divided into Bandwidth and Resource Usage. EDoS is the first form of DDoS attack [15]. Many solutions fall into our conservation, detection and restoration categories. DDoS protection includes Moving Target Protection, CAPTCHA, Anti-Doping, Service Quotas, DNS-based technologies and more. DDoS Detection Controls include: Bot Cloud Detection, Signature-Based Detection, and Malicious Detection Therefore,

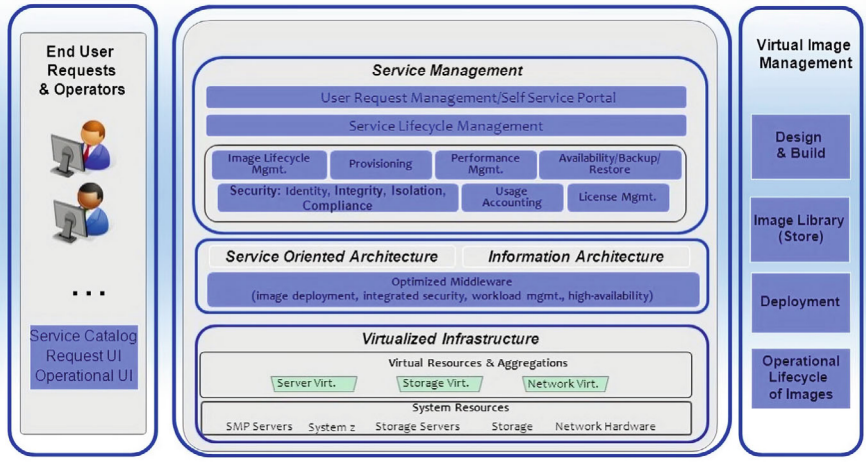

Fig. 2 Proposed architecture

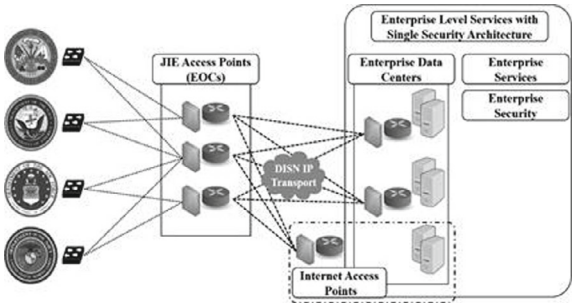

we need to create more robust systems based on DDoS tolerance that causes these attacks [16]. Anamika et al. [17] focused on CIA, the main concepts of information security in the cloud; these are confidentiality, integrity and availability (Fig. 2).

Isaac et al. [18] discusses the successful architecture and deployment of cloud computing. It is a simple pool of shareable resources that allows remote access to remote network storage, servers, files, and other flexible resources [1]. There are many cloud specific standards, and many are still under development, they are NIST and have five major players: Customer, Service Provider, Auditor, Broker, Carrier. Most cloud services include: SaaS a service that provides users with software applications managed by a cloud service provider, PaaS meaning the hardware and application software platforms are provided and managed by the external cloud—Service and IaaS—this means the cloud provides services to: Manage the process for you, including real servers, network, virtualization and data storage paper. In addition, the infrastructure in the sector is divided into two: private cloud, public cloud, community and hybrid cloud. In short, the security architecture of cloud computing is cloaked in complexity, a symphony of written instructions and visualization. These events orchestrate a harmonious dance between the security and inadequacy of the cloud [18]. They maintain a good strategy, a constant cycle of change and change in response to threats and emerging problems. Ultimately, these designs allow organizations to embrace the changing climate without compromising the sanctity of their digital environments [19–22].

4 Methodology: Securing the Digital Realm

4.1 Evolving Landscape

In the evolving field of cloud computing, security is crucial, mirroring the role of physical architecture in addressing environmental challenges [12, 13]. Cloud security architecture involves designing robust defenses to protect sensitive data from digital threats such as intrusions and data theft [6, 23]. This dynamic framework must adapt to new attack surfaces and integrate advanced technologies like firewalls, intrusion detection systems, and encryption [6]. As cloud security evolves, it requires continuous updates and alignment with high cybersecurity standards.

4.2 Fortified Security Dimensions

A deeper look at the security aspects of this model reveals the science of different systems designed to encrypt, identify, monitor and block unauthorized access attempts. These security measures include advanced firewalls, access control, encryption systems, and granular access controls that together act as guardians of this digital fortress [6]. This model ensures that data is always alerted and protected against external attacks and internal vulnerabilities [6].

At the heart of cloud computing security architecture are well-designed guidelines for navigating the complex environment. Configure cloud-based events and functions. The architecture takes a comprehensive approach that covers all dimensions, from identity and management to the technology and control library designed to protect applications and data from adverse attacks through threats.

erateAccessLog(user, resource, ”denied”)

function logAuthenticationFailure(user): gener- ateAuthenticationLog(user, ”failed”)

function getUserRoles(user): // Retrieve roles associated with the user from a database or system

[24] function getResourceRoles(resource):// Re-

Play a key role in virtual connections from users and devices to resources, Identity and Access Management (IAM). The architecture is intricately designed with mechanisms to ensure that only authorized sites are accessed [18]. It integrates authentication, authorization and multiple authentication methods, creating a powerful digital gateway that prevents unauthorized access. As cloud services become an integral part of today's operations, the inclusion of security standards is critical. The architecture leads to a process that seamlessly integrates security into the entire cloud service lifecycle. It creates a way to increase security during the launch, deployment and regular operation of the service. This approach creates a security-by-design culture where all aspects of cloud operations focus on protecting.

In this architecture, law and management take the lead. They set the tone for the entire security disclosure by setting the rules and boundaries that govern cloud participants' interactions. Policies [1] define expectations and determine what to do and what not to do, while management oversees policy implementation to ensure that security and performance are in sync. Comprehensive cloud computing security system pseudo code.

function logAccessDenied(user, resource): gen-

trieve roles associated with the resource from a database or system

5 Enhancing Cloud Security: Solutions and Innovations

The developing digital ecosystem always brings new issues in the domain of cloud security [11]. This section digs into a variety of unique solutions aimed at addressing specific cloud security issues, with a special emphasis on data de-duplication. We investigate existing algorithms such as C4.5 and ID3 and propose adjustments to improve their effectiveness (Fig. 3).

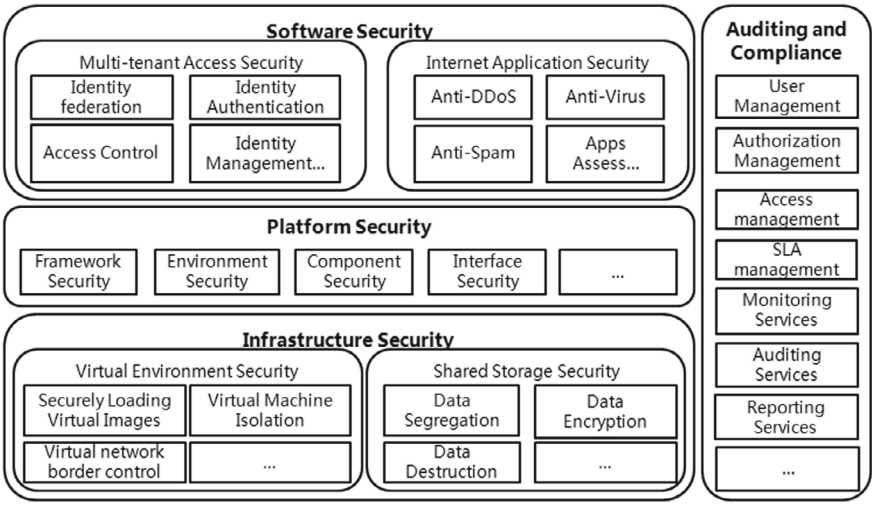

Fig. 3 Security architecture

5.1 Data De-duplication: A Vital Concern

Data deduplication is an important issue for cloud security. It includes identifying and removing suspicious data, improving storage, and reducing the risk of data breaches [17]. In our research on this topic, we touch on many important solutions and offer our own ways to improve them further.

In this comprehensive review of this topic, we dive deeper into the key concepts and challenges of cloud outsourcing [25].

We emphasize the importance of this application in terms of ensuring data integrity, efficient use of resources and preventing abuse.

5.2 Noteworthy Solutions and Innovations

Several notable solutions have emerged in the cloud security arena to address the crucial issue of data duplication. These methods span from algorithmic approaches to encryption techniques, to strengthen cloud data storage and access.

5.3 Algorithmic Innovations

C4.5 Algorithm: Lu and Chen [8], the C4.5 algorithm is effective for creating decision trees with both continuous and discrete data, though it faces challenges with general

and specific features [26]. To address these, we propose enhancing C4.5 using data gain and gain rate, aiming to improve its efficiency with complex data [27].

ID3 Algorithm: Jin et al. [28], the ID3 algorithm, similar to C4.5, focuses on the information most relevant to outcomes. It utilizes entropy to measure uncertainty in datasets [29]. Our analysis explores its benefits and applications in cloud security.

Security Standards in PaaS: Security standards in Platform as a Service (PaaS) support secure development through robust authentication, coding practices, and container security, ensuring application resilience.

Security Standards in SaaS: In Software as a Service (SaaS), security focuses on user experience with integrated encryption for data at rest and in transit, and centralized authentication and access control to safeguard data.

6 Proposed Solution for Data Deduplication

We propose a two-stage approach to enhance cloud security. The first stage involves consistency analysis, where data content is compared using cosine similarity to identify and remove redundant entries. The second stage focuses on encryption, applying RSA technology to encrypt the remaining data with a private key, ensuring its secure storage. This method improves data security and reduces backup storage needs, thereby optimizing cloud security. The approach also addresses evolving cloud security challenges, ensuring data confidentiality and integrity while adapting to changing accountability models and new security features (Fig. 4).

It is also important to know that the responsibility model is not a static but an evolving framework. Cloud service providers (CSPs) regularly introduce new security features and services, which can lead to liability. To ensure a safe environment,

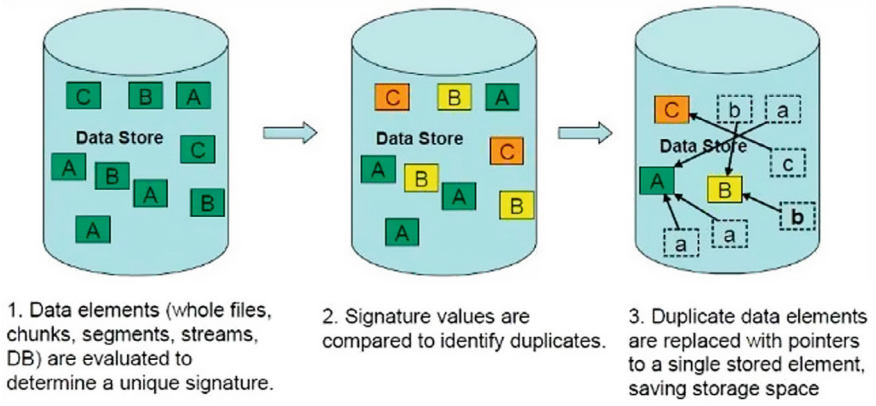

Fig. 4 De-duplication

organizations need to be vigilant and aware of changes to this standard. By understanding and implementing the accountability model, organizations can explore the complexities of cloud security, avoid misunderstandings about who is responsible, and ensure security managed by CSPs and customers.

7 Emerging Solutions and Technologies

7.1 Evolving Landscape of Cloud Security

Evolving Landscape of Cloud Security:

Deployment of algorithmic solutions plays an important role in cloud security. The proven C4.5 algorithm, known for its expertise in creating decision trees that can handle both continuous and discrete events, remains effective [28]. However, because information entropy is limited, problems arise when dealing with its generality and specificity. To solve these problems, our research proposed a modification strategy that uses data gain and gain ratio as key components. This enhancement is designed to reduce C4.5's shortcomings while increasing its effectiveness in handling variable and complex data.

7.2 Integrating Blockchain and Cloud Security

Emerging technologies are beginning to transform cloud security. Blockchain, which is well-known for its involvement in cryptocurrencies, Singh et al. [10] presents a distributed and tamper-resistant ledger. Cloud computing and blockchain complement one other in a symbiotic relationship. In the cloud, blockchain answers concerns about security and transparency, while cloud computing offers the computational power and storage required for blockchain's resource-intensive processes.

The evolving cloud security landscape, driven by sophisticated algorithms, blockchain integration, data de-duplication, and advanced access control mechanisms, underscores the dynamic nature of cloud security [14, 30]. These advancements are crucial for maintaining the confidentiality, integrity, and availability of data in cloud environments. The ID3 algorithm, like C4.5, is pivotal in decision-tree classification, using entropy to measure data uncertainty and feature relevance. Effective cloud security architecture necessitates complex processes to safeguard resources and information, enabling organizations to confidently navigate the complexities of cloud computing (Fig. 5).

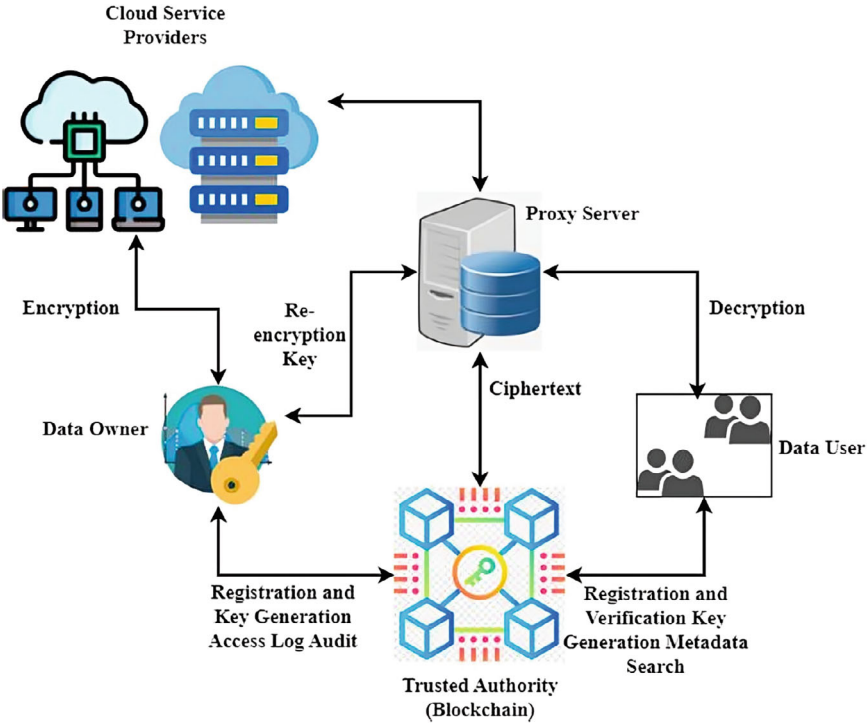

Fig. 5 Control enabled blockchain (ACE-BC) frame-work to manage data security

8 Research Contribution

In this section, we will present the main results of our research and examine the fascinating field of cloud security. Our research is dedicated to exploring the complexity of cloud computing by establishing new methods and creating security solutions to solve today's problems from digital no. around the world. According to our research culture, our most important goal is: Through research and experimentation, we strive to improve the current environment in cloud security and make it protect the threats and problems that arise in the digital world strong castle. Using the latest technologies and best practices, we strive to improve the virtual world in the cloud and ensure that it remains in a secure environment that is stable and adaptable to changing technologies. Please feel free to let me know if you need more details or updates.

8.1 Objective 1: Enhancing Cloud Security Architecture

Our research strives to play an important role in the further development of cloud security architecture. In a rapidly changing environment where threats and vulnerabilities continue to emerge, we focus on improving existing security systems that support cloud computing. This commitment stems from a deep understanding that cloud security is vital in today's age.

Our main goal is to make architectures stronger, make them more capable and responsive to threats and problems caused by changes and the changing digital environment. To this end, we use advanced technology that allows us to adapt, respond and stay one step ahead of those who try to exploit vulnerabilities in the cloud environment. To achieve this, we use the most advanced technologies available as well as best practices developed over the years in cloud security. By integrating these elements, our goal is to create a virtual powerhouse in the cloud that protects sensitive data and digital assets from threats. Our research goes beyond the traditional boundaries of cloud security. It explores new paths, good ideas, and cutting-edge solutions that have the potential to shape the future of cloud security. We know that the process of protecting the cloud environment is not sufficient against today's many threats. That's why our approach includes a combination of innovative technologies designed to solve today's problems. This commitment to innovation continues to integrate intelligent planning and data processing that brings new benefits to cloud security. By leveraging the power of this technology, we aim to create new security strategies that are not only effective, but also effective in data management, ensuring better and more honest data. Together, our research represents an important step towards data management, optimizing processes and providing data. Cloud security response. This is due to the fact that cloud security architecture must constantly evolve to protect against emerging threats. This commitment to progress is at the heart of our research, and we will continue to work to improve the security of the cloud environment and pave the way for security for the digital future.

8.2 Objective 2: Novel Security Solution

Our research aims to advance cloud security architecture in a rapidly evolving digital landscape. Recognizing the critical importance of robust cloud security, we focus on enhancing existing systems to better respond to emerging threats and vulnerabilities. By integrating advanced technologies and best practices, our goal is to build resilient cloud architectures that protect sensitive data and digital assets. Our approach extends beyond traditional security measures, exploring innovative solutions and new strategies to address contemporary challenges. This commitment to innovation and intelligent planning is central to our efforts to improve cloud security and ensure effective data management. Through ongoing advancements, we strive to create a secure and adaptable cloud environment, paving the way for a safer digital future.

We aim to enhance cloud security by refining the C4.5 algorithm and incorporating data gain improvements to address entropy issues. Our research also evaluates the ID3 algorithm's use of entropy. By focusing on deduplication and advancing cloud security techniques, we strive to improve data management and performance. Our self-motivated work addresses current challenges and explores new solutions in cloud security.

Contrastive Analysis of Arabic-English Translation of Legal Texts

Wafa Abu Hatab, Malek Batran and Mohammed Al-Badawi

Abstract Extensive knowledge of both the legal systems and terminology in the source and target languages is crucial in the specialized field of legal translation to guarantee precision. This study aims to conduct a comparative analysis between Arabic legal texts and their English translations, specifically focusing on excerpts from El-Farahaty's book Arabic–English–Arabic Legal Translation (2015). Despite the paramount importance of accuracy in legal translations, certain errors were identified in some of the translations presented in this book. These errors encompassed over-translation, omission of key terms, inappropriate word choices, superficial translations, misunderstandings, literal translations, punctuation mistakes, and grammatical errors. To address these challenges, it is essential to employ Newmark's (1998) proper translation method, which ensures faithfulness to the original text and accuracy in legal translations. The findings of this study underscore the necessity of meticulous review and consultation with experts to achieve a well-executed legal translation.

1 Introduction

Legal texts encompass a wide array of written materials, such as employment contracts, official circulars, business agreements on both national and international scales, marriage and birth certificates, graduation diplomas, and job applications, among others. The translation of legal texts falls under the category of technical translation due to the specialized and technical language employed in these documents. Given that legal systems and terminologies differ from one country to another, a competent legal translator must possess a comprehensive understanding of the legal systems and terminologies in both the source and target languages to ensure the accuracy of the translation [1]. Accuracy plays a paramount role in legal translation, necessitating the precise translation of every word in the source text. Attaining the highest level of formal correspondence possible in legal translations is often of utmost importance.

Compared to other fields of translation, legal translation has received relatively little attention in research, possibly because it is often categorized as a subset of technical or specialized translation. Legal texts hold a unique and revered status due to their binding nature, similar to sacred texts. This reverence demands a strict adherence to literal translation in order to avoid errors, as [1] emphasized by: "Just like the word of God in religious scriptures, the letter of the law also requires a strict literal translation to safeguard it from any misinterpretation." In this study, the researchers argue that the concept of faithful translation is the most suitable approach for legal texts, as it ensures that every word in the source text is accurately conveyed in the target language while preserving the original meaning [2].

There is a scarcity of books focused on the translation of legal texts between Arabic and English, or vice versa. Only a few publications exist in this field, including works by [3–5]. Among these options, El-Farahaty's book, Arabic–English–Arabic Legal Translation, was chosen for several reasons. Firstly, the researcher was tasked with teaching a legal translation course at the Department of Foreign Languages at the University of Nizwa during the Fall Semester of 2020. In preparation for the course, the researcher obtained an electronic copy of El-Farahaty's book and carefully selected relevant sections. This particular book was chosen because it offers a comparative approach to Arabic-English and English-Arabic legal translation, providing detailed insights into the characteristics of both legal English and legal Arabic [6]. Secondly, the book comprehensively outlines the various stages of translation, with a specific focus on legal translation. It also extensively references previous research on legal translation, making it a valuable academic resource [7]. Lastly, during the teaching process, the researcher identified errors in the source texts, as well as in the translations provided by the book's contributors and those suggested by El-Farahaty. To emphasize the significance of precision in legal translation, the researcher made the decision to perform a comparative examination of English legal texts and their translated versions. The purpose was to bring attention to substantial mistakes that impact the intended meaning and accuracy [8]. The researcher possesses extensive expertise as an

academic and professional translator, specializing in the translation of Arabic-English and English-Arabic texts, particularly in the legal field [3, 4].

1.1 The Objectives of the Study

Given the limited research on the contrastive analysis of Arabic-English translation of legal texts, this study aims to address this gap by examining a sample of legal texts in Arabic and their English translations. The specific objectives of the study are:

1. To conduct a contrastive analysis of the selected legal texts.
2. To identify errors in the translations of these legal texts.
3. To propose accurate translations for the legal texts under review.

1.2 The Statement of the Problem

This research study aims to address the following questions:

1. Are the translations of the selected legal texts accurate?
2. What errors are present in the translations of these legal texts?

2 Literature Review

In this section, we will provide a comprehensive overview of the existing literature concerning the translation of legal texts, with a specific focus on Arabic-English and English-Arabic translations. The aim is to explore the various aspects and challenges that arise when translating legal documents in both directions. To maintain brevity, recent studies have been chosen to provide insights into the most up-to-date research, although it is important to note that there are numerous earlier works of significance within the literature. Furthermore, this review emphasizes the suitability of Newmark's faithful translation method as the theoretical foundation for this study [9].

2.1 Studies on Legal Translation

In a study conducted by [10], the focus was on the translation of legal documents from Australian English to Italian. It was proposed that cultural legal terms should be treated as proper names due to the immense difficulty or even impossibility of

translating these terms accurately. This study differs from the present research, which centers on the precision of English translations of Arabic legal texts and emphasizes the importance of maintaining faithfulness in translation rather than considering cultural terms as untranslatable.

The evaluation conducted by [11] assessed the effectiveness of Google Translate in translating English legal texts into Arabic. This analysis involved the examination of six legal contracts, consisting of fourteen English articles. The findings of the study revealed that Google Translate only offered rough translations that lacked the essential syntactic and lexical precision required for legal documents [12]. In contrast to Hijazi's emphasis on machine translation, the current study investigates human translations and incorporates a cultural analysis. To identify translation errors, a contrastive analysis approach is employed.

In his study, [8] delved into the translation of five Arabic marriage contracts into English and discovered that a word-for-word translation often resulted in ambiguous interpretations of culture-specific terms. As a solution, he suggested adopting functional and communicative approaches. While both studies focused on the translation of legal texts from Arabic to English, the current research explicitly supports Newmark's faithful translation method as the most effective approach.

In a study conducted by [12], an exploration was undertaken on the translation of legal texts, considering both intralinguistic and interlinguistic aspects. The study reached the conclusion that legal translation is a multifaceted process, influenced by various factors such as culture, language, and law, and heavily reliant on the intended audience and their legal backgrounds. Although Gotti's findings support the current study's perspective on the intricate nature of legal translation, it is worth noting that the scope and language combinations in the two studies differ.

The analysis conducted by [4] delved into the inaccuracies present in the English translations of twelve Arabic contracts. This examination revealed a multitude of errors, encompassing linguistic, stylistic, and cultural aspects, which ultimately led to translations that were both ambiguous and incorrect. Although the current research expands beyond the scope of Alrikabi's study by encompassing a wider range of legal texts such as contracts, official documents, and speeches [5], both studies share a common ground in their identification of similar types of translation errors.

The examination conducted by [5] delved into the obstacles encountered when translating English legal documents into Arabic. This research identified various challenges, including lexical features, connotative and contextual meanings, differences within the legal system, and a lack of familiarity with legal terminology. The current study, unlike Altarabin's broader exploration, adopts Newmark's faithful translation method as its theoretical foundation. Consequently, some of the difficulties outlined by [7] can be attributed to the translation errors uncovered in this present study.

In the work of [6] the authors presented a comprehensive breakdown of eight distinct translation methods, including word-for-word, literal, faithful, semantic, adaptation, free, idiomatic, and communicative translation. The researcher

asserts that when it comes to legal texts, faithful translation is the most appropriate approach. According to [7], faithful translation strives to faithfully reproduce the precise contextual meaning of the original text while adhering to the grammatical structures of the target language. This method ensures the preservation of the meaning of each word in the source text, which is crucial for maintaining legal equivalence [12]. To achieve accurate and legally equivalent translations of Arabic legal texts into English, the adoption of faithful translation is proposed.

3 Methodology

3.1 Data Collection and Procedure

The analysis for this research was conducted using data extracted from Arabic–English–Arabic Legal Translation. A total of ten legal texts written in Arabic, covering a range of topics and varying in length, were selected for examination alongside their corresponding English translations. It is important to note that while El-Farahaty's book encompasses both Arabic-English and English-Arabic legal translations, this study specifically focuses on the Arabic-English aspect to maintain a narrower focus. The legal texts utilized in this study were obtained from various sources that specialize in legal translation, such as [11, 13]. In cases where existing translations were not available, El-Farahaty provided her own translations. To facilitate a comprehensive visual analysis of the source and target texts, the researcher developed a contrastive analysis table.

3.2 Data Analysis

To analyze the discrepancies between Arabic texts and their English translations, the researcher devised ten tables for contrastive analysis. Each table was comprised of three columns: one for the original text, one for the translated text, and one for the researcher's translation utilizing faithful translation approach. This structure enables readers to easily detect any inaccuracies present in the translated texts. Drawing upon his extensive translation expertise, the researcher also provided exemplary translations of the original texts for comparison. Through the process of contrastive analysis, it became apparent that the translated texts contained significant lexical errors, thereby compromising the overall quality of the translations and distorting the intended meanings, ultimately resulting in unfaithful renditions.

4 Results and Discussion

After examining the data provided by El-Farahaty in her work on Arabic-English-Arabic Legal Translation, the researcher carefully studied both the original texts and the translated texts. The translated texts were either done by El-Farahaty herself or obtained from other sources. Employing Newmark's theory of faithful translation, the researcher analyzed these texts. In order to identify any errors in the translated texts, the researcher created tables for contrastive analysis, which included the original texts, the translated texts, and the researcher's own faithful translations. These tables serve the purpose of providing readers with a comprehensive overview of the study's findings, which will be discussed in detail later on.

In Table 1, the initial source text includes the Arabic term "سيادة," which carries the meaning of "sovereignty" in English. Surprisingly, the translator overlooked the translation of this pivotal term, disregarding its substantial legal and political significance. The author should have recognized this omission as an error. Table 1 displays the original source text, the translated text, and the researcher's accurate rendition for comparison purposes.

Two translation errors are evident in the second target text, resulting in an inaccurate representation. Firstly, the translator mistakenly translated the Arabic term "الرسل" as "apostles," which does not fully capture the intended meaning of the religious term. The accurate translation should have been "messengers." Secondly, the target text includes an extra word that does not exist in the original Arabic text. This overtranslation introduces a nonexistent word into the target text, which is a major issue and unacceptable. Surprisingly, the author of the book did not address this significant error and failed to critique the translator's decision to add a word that was not present in the source text.

The Arabic phrase " وتجفيف مصادرها الفكرية "was translated into English as "and drying out of its cultural and intellectual wells." The addition of "cultural," lacking a counterpart in the original Arabic phrase, cannot be justified. Table 2 presents the second source text, the target text, and the researcher's faithful translation for comparison [14].

It is clear to those who are fluent in both Arabic and English that the translator made a mistake by including the English adjective "cultural," which does not exist in the original Arabic phrase "ثقافية." Even a minor oversight can result in significant disparities, particularly in sensitive texts such as legal or political documents.

Table 1 Translation of ST

Source text 1	Target text 1	Researcher's faithful translation
يجب عِلى كِل مِواطن أنِ يحِمي ويِصون استقلالِ البلاد وسيادتها وِسلامة ترابها الوطني ... [4]	The duty of every citizen is to protect and safeguard the independence of the country and the integrity of its national territory. (ibid)	Every citizen must protect and safeguard the independence and sovereignty of the country and its national territory

Upon examination of the third target text, it becomes evident that there are two instances of over translation. Despite the source text being concise, the translator included two elements in the translation, one of which modifies the original meaning and the other appears to be redundant. The verb "يؤدي" in the source text means "result in," not "may result in" as translated. The addition of "may" changes the certainty expressed in the source text from a factual statement to a possibility. When it comes to legal translation, it is crucial to remain faithful to the source text and its intended meaning. Any addition, deletion, or modification can not only alter the meaning but also give rise to disputes, some of which may be significant and difficult to resolve [10, 11, 13].

In addition, it is unnecessary and repetitive to include the adjective "genocidal" before the word "annihilation" in the recreated text. The Arabic term "إفناء" translates directly to "annihilation" in English, without the need for any additional qualifiers. The authoress of the book should have recognized and rectified these mistakes, particularly given the book's emphasis on precise and faithful legal translation. Table 3 displays the original source text, the recreated text, and the researcher's accurate translation for comparison purposes.

The author's fourth target text contains several notable inaccuracies that compromise its faithfulness to both the original text and the target language. One such error is the incorrect translation of the Arabic phrase "زملاؤكم الوزراء" as "colleague ministers," which creates an awkward construction in English as both "colleague" and "ministers" are nouns. A more accurate rendition of the Arabic phrase would be "fellow ministers," where "fellow" serves as an adjective modifying "ministers".

In a similar vein, the English translation of the phrase "وما اتقليدكم المسؤولية إلا" was inaccurately rendered as "It is nothing but an appreciation." The translator opted for a gloss translation, modifying both the intended meaning and structure of the original phrase. A faithful translation of the Arabic expression would be "Granting you this responsibility is merely a gesture of appreciation.

The author made an error in translating the Arabic term "دولة" as "wise" and failed to find a suitable English equivalent for the adjective "محنّك". A more accurate translation would be "resourceful". Similarly, the phrase "كفاءاتكم" was inaccurately translated as "your skills" instead of "your competence". The same mistake was made with the translation of "مهارة" as "skill" instead of "competence". Additionally, "in the field of teaching and learning" was incorrectly used instead of "education and teaching".

Table 2 Translation of ST 2

Source text 1	Target text 1	Researcher's faithful translation
نحن أبناء وادي الرافدين، موطن الرسل والأنبياء... ومكتوين بلظى شجن المقابر الجماعية وتجفيف... منابعها الفكرية ... (ibid)	We, the people of Mesopotamia, the homeland of apostles and prophets... and burnt by the flames of grief of the mass graves... and drying out of its cultural and intellectual wells (ibid)	We, the people of Mesopotamia, the homeland of messengers and prophets … and burnt by the flames of the mass graves … and drying out of its intellectual wells

Table 3 Translation of ST 3

Source text 1	Target text 1	Researcher's faithful translation
يحرم اللجوء إلى وسائل تفضي إلى إفناء الينبوع البشري.	It is forbidden to resort to such means as may result in the genocidal annihilation of mankind. (ibid)	It is forbidden to resort to means that result in the annihilation of mankind

The author of the book, which specifically addresses legal translation, seems to have disregarded the crucial aspect of accuracy in her proposed translations. This oversight becomes evident when examining Table 4, which displays the original source text, the target text, and the researchertables faithful translation, allowing for a comprehensive comparison.

In the fifth target text, illustrated in Table 5, three errors are evident in the translation provided by the author of the book. Firstly, there is a mistranslation of the Arabic phrase "العقيد معمر القذافي الأخ" The author failed to faithfully translate the word order of the source text, which is crucial. The accurate translation of this phrase is "Brother and Colonel Muammar al-Qadhafi" rather than "Brother and leader, Colonel Muʿammar al-Qadhafy."

Secondly, there is a misunderstanding of the noun to which the Arabic adjective "العظيم "refers. The author incorrectly assumed that the adjective describes "(ثورة" revolution), whereas it actually describes "(قائد" leader). If the adjective were describing, "ثورة" it should have been" "العظيمة" instead of "العظيم."

Lastly, there is a significant mistranslation of the well-known revolution in modern Libyan history, known as "ثورة الفاتح" (The September Revolution or Al-Fatih Revolution). Unfortunately, the author translated this culturally specific phrase literally, which distorted its cultural significance.

Table 4 Translation of ST 4

Source text 1	Target text 1	Researcher's faithful translation
أغتنم هذه المناسبة لأعبر لكم عن تمنيات بالمخلصة بالنجاح والتوفيق في المهمة الجسيمة والصعبة التي أناطكم بها زملاؤكم الوزراء ورؤساء الوفود . وما تقليدكم المسؤولية إ لا عربون تقدير لخصالكم كرجل دولة محنك ودليل ثقة في كفاءاتكم كشخص ذي باع طويل في حقول التربية والتعليم .	I seize this opportunity to wish you every success in accomplishing the challenging and difficult task which has been entrusted to you by your colleague ministers and the heads of delegations. It is nothing but an appreciation of your qualities as a wise statesman and confidence in your skills and long experience in the field of teaching and learning (Author's translation) (ibid)	I seize this opportunity to express my sincere wishes for your success and luck in the great and hard task which your fellow ministers and heads of delegations have entrusted you with. Giving you this responsibility is but a token of appreciation of your qualities as a resourceful statesman and proof of confidence in your competence as a person with long experience in the fields of education and teaching

Table 5 The table presents the fifth source text, the target text, and the researcher's faithful translation for comparison

Source text 1	Target text 1	Researcher's faithful translation
الأخ العقيد معمر القذافي قائد ثورة الفاتح العظيم وملك ملوك أفريقيا . (ibid, p. 37)	Brother and leader, Colonel Muʿammar al-Qadhafy, guide of the great victorious revolution and king of kings of Africa. (Author's translation) (ibid)	Brother and Colonel Muʿammar al-Qadhafy, great leader of the September Revolution/ Al-Fatih Revolution and king of African kings

The sixth legal text's target text, outlined in Table 6, contains two glaring errors that should not have escaped the attention of the author of the book. The first error is the mistranslation of the Arabic word "سكرتير" which is an example of loan translation, originally derived from Latin through either English or French. Regrettably, the translator provided an incorrect equivalent, "Assistant," whereas the accurate translation for "سكرتير" in English is "secretary."

The second error involves the splitting of the noun phrase (الوزارة the Ministry) and the placement of the noun (مقرّ فرm وعها headquarters of its branches) at the end of the sentence. In this case, the correct translation of the phrase أحد أوِ الوزارة مقرّ فر وعهاis "in the headquarters of the Ministry or its branches" and not "in the headquarters or the branches of the Ministry."

The target text of the seventh source text, created by the author of the book, contains three translation errors. Firstly, there's an issue with the use of "shall" in legal contracts instead of the simple present tense. Although the author mentioned this rule in her book, she overlooked it when providing her own translation of a legal text. The Arabic expression.

"هذا العقد" should have been translated into English as "This contract shall be revoked" instead.

of "This contract is revoked."

The second mistake lies in the mistranslation of the Arabic word "تلقائيا" which simply means "automatically" in English. However, the author translated it into English as "absolutely," which is equivalent to "بدون تنبيه أو إنذار" In Arabic, rather than "بدون تلقائيا" as it should have been.

Table 6 The table below provides the sixth source text, the target text, and the researcher's faithful translation for comparison

Source text 1	Target text 1	Researcher's faithful translation
يباشر المتعاقد واجبات وظيفة سكرتير لِغاتِ أجنبية في مقر الوزارة أو فروعها .	The contracted party shall carry out the duties of foreign languages assistant in the headquarters or the branches of the Ministry. (ibid)	The contracted party shall carry out the duties of the Foreign Languages secretary in the headquarters of the ministry or its branches

The third error is the mistranslation of the Arabic phrase "مطلقا" as "without any prior notice." The faithful translation of this short and simple phrase in English should be "without any notice or warning." It's important to note that the author's translation "without any prior notice" is equivalent to the Arabic phrase "بدون أي سابق تنبيه" (Table 7).

Regarding the target text of the eighth legal document, which was also produced by the author of the book, a careful examination in terms of faithful translation revealed significant errors. Firstly, there's a mistranslation of the Arabic word "فقه" which has a common legal equivalent in English, "jurisprudence." However, the author translated it as "law," which is equivalent to "القانون" in Arabic.

Another issue is the rendition of the Arabic phrase ""نوع الجريمة المرتكبة والمعاقب عليها"" into English as "the type of crime committed and which is therefore punishable." The English translation provided by the author adds a relative clause that isn't present in the source phrase. In fact, the Arabic equivalents "المرتكبة" and "المعاقب عليها" act as adjectives for the noun "جريمة" in Arabic, and their English equivalents "committed" and "punishable" also act as adjectives for the noun "crime." It's unclear why the author didn't provide these equivalents, which could have maintained a lexical balance in the target text.

Furthermore, there's an omission followed by a punctuation error in a short sentence. The Arabic sentence إذا ارتكبت الجريمة يعاقب عليها القانونwas translated into English as "If the crime is to be punished by death or hard labor or imprisonment, it is a felony." The correct legal expression in English for يعاقب عليها القانونis "is punishable by law," not "is punished by law" as suggested by the author. Additionally, there's a repetition of the conjunction "or" twice, which is incorrect in English. Instead, a comma should be used to join the first and second noun, and the conjunction "or" should be used to join the second noun with the third noun.

These mistakes give the impression that the translator lacks experience. Table 8 provides the eighth source text, the target text translated by the author of the book, and the researcher's faithful translation for comparison.

Regarding the target text of the ninth legal document, which was also produced by the author of the book, a close examination with reference to faithful translation revealed serious errors. Firstly, there's an error in the translation of the Arabic expression "راغبو الهجرة الدائمة"which was rendered by the author as "wishing permanent emigration." A more accurate translation based on faithful translation would be "wishing to emigrate permanently," which adheres to English grammar rules regarding what follows the verb "wish."

Table 7 The table below presents the seventh source text, the target text translated by the author of the book, and the researcher's faithful translation for comparison

Source text 1	Target text 1	Researcher's faithful translation
يفسخ هذا العقد فورا وتلقائيا وبدون تنبيه أو إنذار في حال	This contract is revoked immediately and absolutely without any prior notice if (Author's translation) (ibid)	This contract shall be revoked immediately and automatically without any notice or warning if …

Table 8 Translation of ST

Source text 1	Target text 1	Researcher's faithful translation
والقاعدة المقررة في الفقه الجنائي أن العقوبة التي ينص عليها المشرع هي التي تحدد نوع الجريمة المرتكبة والمعاقب عليها فإذا كانت الجريمة يعاقب عليها القانون بالإعدام أو الأشغال الشاقة أو السجن فهي جناية وإن كان معاقبا عليها بالحبس الذي لايزيد أقصى مدته عن أسبوع أو بالغرامة التي لا يزيد أقصى مقدارها عن جنيه مصري فهي جنحة .	The rule established in criminal law is that the punishment which is prescribed by the legislator determines the type of crime committed and which is therefore punishable. If the crime is to be punished by death or hard labour or imprisonment, it is a felony. If the crime is to be punished by imprisonment the maximum duration of which does not exceed a week or a fine the maximum amount of which does not exceed one Egyptian pound, it is a misdemeanour. (Author's translation) (ibid)	The rule established in criminal jurisprudence is that the punishment prescribed by the legislator determines the kind of crime committed and punishable. If the crime is punishable by law by death, hard labor or prison, it is a felony, but if it is punishable by imprisonment whose maximum period does not exceed one week or by a fine whose maximum amount does not exceed one Egyptian pound, it is a misdemeanor

Another error lies in the use of the wrong tense in the translation of the verb "يقيّد." The author used the simple present "are to be recorded," whereas the correct tense in legal texts should be the simple future with the use of "shall" as in "shall be enrolled." Additionally, the Arabic verb يقيّدwhich means "enroll" in this context, was mistranslated into English as "record" by the author. The phrase) ""وزارة الهجرة"" the Ministry of Emigration) was omitted by the author, despite its importance in this legal context. A faithful translation would include this as "the Ministry of Emigration Affairs."

Another error related to punctuation is the unnecessary use of parenthetical commas with the phrase "at their request." Additionally, there's an error in the translation of the verb.

"توزّع" into English as "are to be distributed" instead of "shall be distributed" as per faithful translation. The preposition following the verb "distribute" should be "to" or "among," not "on" as used by the author. Furthermore, the Arabic phrase "والاحتياجات المطلوبة إمكانياتهم" " was mistranslated into English as "abilities" instead of "capabilities." Lastly, the Arabic phrase "الاحتياجات المطلوبة" was mistranslated into English as "the requirements" instead of "the needs required" based on faithful translation. Table 9 provides the ninth source text, the target text translated by the author of the book, and the researcher's faithful translation for comparison.

The English translation of the tenth and final legal text, also produced by the author of the book, exhibited significant issues. A thorough examination of the target text with reference to faithful translation uncovered serious errors.

Firstly, there's a mistranslation of the Arabic phrase "المبادلات التجارية" into English as "trade exchange," whereas a faithful translation would render it as "commercial exchanges." The author used a singular noun for the Arabic plural noun. "المبادلات".

Table 9 Translation of ST

Source text 1	Target text 1	Researcher's faithful translation
مع عِدم الإخلال بحِق المِصريين في الهِجرة يقيدِ راغبو الِهجرة الدائمة بِناء عِلى طِلبهم فِي سِجل بالوزارة المختصة بِشئون الِهجرة، وتوزع فرص الِهجرة التي قِد تتوافر لِدى الِوزارة المذكورة عِلى المقيدين بهذا الِسجل على أساس تخصصاتهم وإمكانياتهم والحتياجات المطلوبة في دول المهجر مع الالتزام بأسبقية القيد فِي السجل .	Without prejudice to the right of the Egyptians to emigration, names of those wishing permanent emigration are to be recorded, at their request, with the Ministry of Emigration. With a commitment to the primacy enrolment in a register, emigration opportunities that may be available to the said Ministry are to be distributed on those enrolled in the register on the basis of their specialization and their abilities and the requirements of the countries they will emigrate to (Author's translation) (ibid)	Without prejudice to the right of the Egyptians to emigration, names of those wishing to emigrate permanently shall be enrolled at their request at the registry of the Ministry of Emigration Affairs. Emigration opportunities which may be available to the said ministry shall be distributed to those enrolled at the registry based on their specializations, capabilities and the needs required in the countries to which they shall emigrate with a commitment to the primacy enrolment in the registry

Secondly, regarding the translation of the phrase, "لكل من رعايا الدولتين" the author chose "the nationals of each state," which could imply the existence of more than two countries. Instead, "both countries" would have been clearer. Additionally, using "state" for "country" might introduce lexical ambiguity in a legal context.

Furthermore, there's a mistranslation of the Arabic phrase "كل موافقة" into English as "all facilities," while the correct equivalent is "facilitation." The author also incorrectly chose.

"Subject to" for the Arabic word," موافق"which should be "in line with" based on faithful translation.

Lastly, there's an unnecessary comma before "subject to." Table 10 provides the tenth source text, the target text translated by the author, and the researcher's faithful translation for comparison.

5 Conclusion

This study has conducted a contrastive analysis of ten Arabic legal texts and their English translations, sourced from El-Farahaty's Arabic–English–Arabic Legal Translation. The researcher meticulously evaluated the translations for accuracy and errors using method of faithful translation. The analysis revealed significant errors in the translations, which impacted both the meaning conveyed in the target language and the overall quality of the translation. These errors included overtranslation, omission of crucial words, incorrect word choices or equivalents,

Table 10 Translation of ST

Source text 1	Target text 1	Researcher's faithful translation
يتعهد الطرفان المتعاقدان بتسهيل المبادلات التجارية بين الدولتين، ووفقا لهذا التعهد يكون لكل من رعايا الدولتين في بلاد الدولة الأخرى بعد الحصول على الإذن منها الدخول والإقامة طبق نظمها .... ويتعهد الطرفان المتعاقدان أن يساعدا بتطبيق كل تسهيل موافق للنظم المحلية في معاملات رعايا الدولتين في التجارة فيما يختص بالضرائب والرسوم الجمركية. (El-Farahaty, 2015, p. 46)	The two Contracting Parties undertake to facilitate trade exchange between the two countries. According to this pledge, the nationals of each state reside in the territory of the other state after obtaining the permission of entry and residence according to its regulations ... The two Contracting Parties pledge to help implement all facilities, subject to their local systems, in the treatment of the nationals of the two countries in trade, with regards to taxes and customs duties (Author's translation) (ibid)	The two Contracting Parties pledge to facilitate commercial exchanges between both countries. According to this pledge, the nationals of both countries in the other country, after having got permission, shall enter and reside in it as per its rules and regulations … The two Contracting Parties pledge to help implement all kinds of facilitation in line with the local rules and regulations in the dealing of the nationals of both countries in trade with regard to taxation and customs duties

gloss translation, misinterpretation of the source text, literal translation, punctuation mistakes, and grammatical errors. These issues suggest that the author did not thoroughly review the translations or consult experts in Arabic-English legal translation who could have identified and corrected these errors. Alternatively, it indicates that the author may lack practical translation experience.

Based on these findings, the researcher recommends further research into the assessment of Arabic-English legal translations. This would encourage professional legal translators and scholars to approach legal translation with greater professionalism and responsibility. Future research could involve quantitative or qualitative studies to highlight the importance of accurate legal translation.

Legal Regulations for Registering Foreign Technology Companies and Their Impact on the Investment Environment

Yasar Alhiniti and Khalif Saleh Dhiab Amoush

Abstract This chapter will discuss the legal rules concerning the registration of foreign technology firms within commercial company regulations. It intends to spell out the difficulties facing foreign technology companies willing to carry on commercial activities that include obtaining work authorization from a competent authority and then registering in the foreigners' registry as companies. The paper also intends to create more insight into the legal steps required and attendant risks of such non-compliance, also offering recommendations resulting from text analysis relative to practice-related laws in Arab countries, in a contribution aimed at enhancing foreign investment through regulatory and legislative measures that would ensure an environment of proper legal light for business. The findings stress respect for these regulations in terms of protecting citizens' rights when dealing with acts of foreign technology companies, promoting real competition likely to inject growth into the domestic economy.

Keywords Foreign technology companies · Commercial laws · Work authorization · Foreign companies register · Foreign investment · Regulatory environment · Commercial legislation · Protection of dealings · Fair competition · Legal procedures

1 Introduction

Any foreign company wishing to conduct business and commercial affairs must comply with the conditions set by the Jordanian legislature and comply with the relevant legal requirements set out in articles (240/b-242) of the Jordanian Commercial Companies Law No. (22) of 1997, which requires foreign companies to obtain a work authorization from the competent authorities and register in the register of foreign companies operating in Jordan.

This study focuses on the regulations governing the registration of foreign companies in Jordan and aims to gain detailed insight into the legal procedures that must be followed in each case, as well as to highlight the risks of non-compliance with these regulations. The study examines the legal provisions contained in the Jordanian Commercial Companies Law while conducting a comparative analysis with other countries such as Egypt in terms of the legal practices adopted in these countries. The study also presents practical recommendations aimed at improving the legal and regulatory environment offered to foreign companies in Jordan in order to attract foreign investment.

1.1 Study Objectives

This study seeks to achieve the following objectives:

1. Analyze the legal distinction between foreign companies operating in Jordan and domestic companies in terms of the laws and regulations governing their activities and understand the impact of this distinction on the business environment.
2. Evaluate registration procedures imposed on foreign companies operating in Jordan and assessment of their effectiveness and efficiency in achieving the objectives of supervision, supervision and protection of the national economy.
3. Explore the role of relevant authorities in licensing and registering foreign companies, identifying challenges and opportunities in coordinating the activities of these authorities.
4. Identify penalties imposed on foreign companies operating without the necessary registration or authorization and assess the adequacy of these penalties in terms of ensuring deterrence and compliance.
5. Provide recommendations on improving the legal and regulatory framework for foreign companies operating in Jordan, with the aim of improving the investment environment and protecting the interests of the domestic economy.
6. Assess the impact of the presence of foreign companies on competition in the local market, protecting domestic companies and examining how to reconcile attracting foreign investment with protecting the local economy.

1.2 Study Methodology

To conduct this study, a descriptive-analytical approach was employed, gathering information from a variety of legal and academic sources. These sources included Jordanian laws and regulations pertaining to the registration and operation of foreign companies, as well as previous studies and academic references. The analysis involved an examination of legal texts and relevant materials to assess the procedures and obstacles associated with registering foreign companies. In order to provide insights and suggestions for improving the legal and regulatory framework in Jordan, a comparative methodology was employed, drawing on international experiences, particularly the Egyptian experience. It is important to note that qualitative data was obtained through the analysis of judicial decisions and relevant legislation, utilizing analytical tools to generate practical recommendations aimed at enhancing the business environment in Jordan.

2 Legal Requirements for Registering Foreign Companies

To ensure a comprehensive understanding of the financial and economic aspects of foreign companies, the host country has established a set of procedures that must be followed before these companies can commence their operations within its territory. The Jordanian legislator, under the Jordanian Companies Law No. "22" of 1997, has outlined specific requirements for these companies. Firstly, they must obtain a work authorization as stated in Article "240/b" of the law. Once the work authorization is obtained, the companies are then required to complete the registration procedures in the foreign companies' register in Jordan, as outlined in Articles "241, 242" of the same law. These procedures are crucial in granting legal personality to the foreign company. Therefore, this section will be divided into two parts: the first part will focus on the procedures for obtaining a work authorization, while the second part will delve into the registration procedures in the register of foreign companies operating in the Kingdom.

2.1 Procedures for Obtaining a Work Authorization

Article (240/b) of the Jordanian Companies Law No. "22" of 1997 mandates that any foreign company or entity must undergo registration in accordance with the provisions of this law and obtain a work authorization in order to engage in commercial activities within Jordan. The specific authority responsible for issuing the permit will depend on the nature of the company's operations. For example, if a foreign bank intends to establish a branch in Jordan, the Central Bank of Jordan will be responsible

for granting the necessary permit, as stated in Article 6 of the Banking Law No. (28) of (2000) [1].

In accordance with Article (9) of the Jordanian Tourism Law No. (20) of 1988, the permit to invest in tourism in Jordan may be granted by either the Ministry of Industry and Trade, the Ministry of Labor, or the Ministry of Tourism [2].

It is important to mention that Article (40/c) of the Jordanian Investment Environment Law No. (21) of 2022 [3] has been established to promote investment in Jordan and streamline the licensing process. This article states that the time required to obtain a license should not exceed (15) working days, starting from the fulfillment of all legal requirements for granting the license.

While the legislator mandates that foreign companies must acquire an authorization from the appropriate authority prior to commencing the registration process, there are additional authorities that stipulate that these companies must be registered in the foreign companies register before obtaining the permit. An illustrative instance of this is the Electricity Sector Regulatory Commission, which necessitates the registration of any foreign company desiring to invest in electricity generation, transmission, or distribution. This requirement can be deduced from the wording of Article (4/a) of the Jordanian Electricity Companies Licensing System [4], No. 76 of 2001 [5].

The Jordanian judiciary, in alignment with the Jordanian legislator, has underscored the importance of foreign companies acquiring the appropriate authorizations from the relevant authorities prior to initiating operations in Jordan. A judgment rendered by the Jordanian Court of Cassation explicitly articulates this stance by stating that in light of this, the Jordanian Companies Law mandates that foreign companies seeking to conduct business in Jordan must, in compliance with the stipulations of Article (240/b) of said law, obtain all requisite permits from the pertinent authorities [6].

3 Registration in the Foreign Companies Register

The objective of the Jordanian legislator in mandating that foreign companies register in the foreign companies register is to safeguard the interests of third parties engaging with the company. This requirement ensures that these parties have comprehensive knowledge of the company's legal and financial structure, including its capital size, activities, partner nationalities, and more. Additionally, this registration empowers the host country to gain a complete understanding of all aspects pertaining to the foreign company, enabling effective oversight and authority over all foreign companies operating within its jurisdiction. Furthermore, it serves to shield domestic companies from any potential repercussions arising from the operations of these foreign entities, fostering a climate of equitable competition that ultimately stimulates investment in Jordan.

In the Jordanian Companies Law [7], the legislator provides guidance on the registration process for foreign companies and the necessary documentation. Articles

(241–242) outline the specific requirements. According to paragraph (a) of Article (241), the registration application must be submitted to the Registrar, along with the relevant documents and information translated into Arabic. For non-Arab foreign companies, the translation must be certified by a notary public. The documents required, as stated in Article (241/a), are:

1. A copy of the company's statute and regulations or other document on the basis of which it was established, as well as a statement on the method of its establishment.
2. Official written documents confirming that he has obtained the consent of the competent authorities of Jordan to operate and invest foreign capital in accordance with applicable legislation.
3. A list of the members of the management board, managing directors or partners, as applicable, including the nationality of each member and the names of the persons authorized to sign documents on behalf of the company.
4. A copy of a power of attorney authorizing a resident of Jordan to manage the company's affairs and receive notices on its behalf.
5. Financial statements for the last financial year of the company at the headquarters, certified by an authorized auditor.
6. Any other data or information deemed necessary by the Registrar.

According to paragraph (b) of the aforementioned article, the person authorized to register the company must sign the registration application in the presence of the Companies Registrar or their authorized representative, or alternatively, in the presence of a notary public. The application must include the following information:

- The company's name, type, and capital.
- The company's objectives in Jordan.
- Detailed information about the founders or partners, the board of directors, and the share of each.
- Any additional data or information deemed necessary by the Registrar.

Once the application, along with all necessary documentation and information, is submitted to the Companies Registrar, the Registrar is granted discretionary power by Paragraph (a) of Article (242) to either accept or decline the company's registration. If the registration is accepted, the company will then proceed with the necessary legal procedures in order to be officially registered in the companies register. Following the payment of the required legal fees, the company's registration will be announced in the official gazette. Subsequently, the Registrar will inform the company of its successful registration and the commencement of its activities.

According to Article (5/a) of the Foreign Companies Registration Law No. (58) of (1985) [8], the Companies Registrar is required to provide a verdict of acceptance or rejection within one week from the submission date of the application.

In the event that any modifications arise pertaining to the company's particulars, the company is bound by Paragraph (b) of Article (242) of the Jordanian Companies Law No. "22" of 1997 to file an application with the Registrar within thirty days of said modifications. This application must provide a comprehensive account of

the changes and must adhere to the procedures outlined in Paragraph (a) of the aforementioned article.

According to paragraph (c) of the same article, the foreign company's branch operating in Jordan must include certain details in its official documents and correspondence. These details include the name, citizenship, legal form, address, and capital of the foreign company in both its home country and Jordan, as well as the registration number of its branch with the Registrar. The researcher suggests that the Companies Registrar has discretionary power to reject the registration of a foreign company, but is not obligated to provide reasons for the refusal. However, upon conducting research and examining the Companies Control Department at the Jordanian Ministry of Industry and Trade, no instances were found where the Registrar refused registration to a foreign company that met the legal requirements.

The researcher strongly believes that it is an unjust exercise of power for the law to empower the Companies Registrar with the ability to reject the registration of foreign companies that have fulfilled all legal requirements. This abuse of power has the potential to detrimentally impact the national economy. These foreign companies contribute significantly to the host countries' economies, which entice them with various exemptions, privileges, and incentives. Additionally, such a refusal would directly contradict the provisions outlined in the Jordanian Investment Environment Law No. (21) of 2022. According to Article (40/d) of this law, the competent authorities are required to provide justifications for any decision to deny licenses to these companies within the specified timeframe.

The Companies Registrar in Jordan has been granted the authority to reject the registration of a company if its articles of incorporation are in violation of the constitution, public order, or current laws and regulations. This decision was confirmed by the Jordanian High Court of Justice, which stated that Article (59/a) of the Jordanian Companies Law No. (22) of (1997) and its amendments clearly outlines the powers of the Companies Registrar in relation to company registration. According to the court, the Registrar is empowered to approve the registration of a company if its articles and bylaws comply with the law, but also has the right to refuse the application if the articles and bylaws are in violation of the law, regulations, or any other applicable legislation. Upon receiving a letter from the Companies Registrar denying the application for company registration due to the absence of approval from the Central Bank and the Securities Commission, it became evident that the Registrar's decision strayed from the legal requirements outlined in the Companies Law and its accompanying regulations. The Registrar imposed additional conditions for acceptance that were not stipulated by the law. However, the objection lodged by the applicants against this unlawful decision was ultimately dismissed. Therefore, it is imperative to declare the decision null and void. Consequently, based on the aforementioned reasons, we hereby decree the annulment of the contested decision [9].

Is it possible to contest the Companies Registrar's refusal to register a foreign operating company, or is the decision irrevocable? The decision made by the Companies Registrar can be appealed to the Minister of Industry and Trade through legal channels, even if the foreign company has followed all the necessary registration

procedures outlined in Articles (241–242) of the Jordanian Companies Law No. (22) of (1997). In the event that the Minister of Industry and Trade upholds the decision of the Companies Registrar, the foreign company has the option to challenge the Minister's decision in the Administrative Court, as stated in Article [5/a/9] of the Administrative Judiciary Law No. (27) of (2014). This article grants the Administrative Court exclusive authority to hear appeals against final administrative decisions, including those falling within the jurisdiction of the Administrative Court under any other law [10].

It is worth mentioning that in Chapter Twelve of the Jordanian Companies Law No. 22 of 1997, the legislator did not impose any sanctions on foreign operating companies for engaging in business activities without obtaining a license or fulfilling the registration requirements outlined in the same law. As a result, it becomes necessary to establish a suitable penalty for this offense in Chapter Fifteen of the aforementioned law, which specifically addresses penalties. In this case, Article (282) [11] is applicable to address this violation [12].

According to the researcher, while this particular article serves as the sole lawful recourse for addressing transgressions committed by foreign operating companies, the prescribed penalty fails to adequately reflect the gravity of the violation. It is the researcher's contention that the legislator ought to have incorporated a more rigorous penalty within the initial segment of Chapter Twelve specifically targeting foreign operating companies in the event of any breach of the law's provisions.

According to Article (43) of the Jordanian Bar Association Law No. (11) of (1972) [13], it is mandatory for the articles of any company to be signed by a practicing senior lawyer during the registration process. This requirement extends to foreign operating companies as well, as their articles must be endorsed by a practicing senior lawyer to ensure the legality of their registration and enable them to initiate their operations [14].

Similar to the approach taken by the Jordanian legislator, the Egyptian legislator has implemented a requirement for foreign companies operating within Egypt to undergo registration in the commercial register. As stated in Article 166 of the Egyptian Companies Law No. 159 of 1981, foreign companies are obligated to register in the commercial register and inform the designated authorities mentioned in the executive regulations, while providing the necessary documentation. Additionally, it is mandatory for the company to appoint an auditor in accordance with the conditions outlined in the executive regulations (Companies Authority). The executive regulations of the law stipulate that foreign companies must refrain from conducting any activities until they establish and register a branch in a designated register specifically created for this purpose. Failure to register will result in the administrative closure of the company's branch, as stated in Article 309 of the executive regulations of the Companies Law [15, 16].

In Egypt, the General Authority for Companies and Partnership (hereinafter known as General Authority for Companies) oversees a dedicated registry for foreign company branches, which contains comprehensive information about the company. This includes details such as the parent company's name, objectives, activities, and

primary office location (as stated in Article 310 of the executive regulations). Furthermore, the regulations specify that auditors appointed must meet the same requirements as auditors of the shareholding company (as outlined in Article 311 of the executive regulations).

The eligibility criteria for individuals appointed as branch managers of foreign companies operating in Egypt are outlined in Article 167 of the same law. These criteria include a requirement that the appointed individuals have no prior convictions for criminal or misdemeanor offenses related to theft, fraud, breach of trust, bankruptcy, or forgery. It is essential for branch managers to possess integrity, as those lacking this quality are not eligible for appointment [17].

As per Article 314 of the executive regulations of the Companies Law, branches of foreign companies operating in Egypt must disclose all relevant information and data about the foreign company, including its registration number in the commercial register, at their respective offices [18, 19].

The Egyptian legislator has given the commercial register office the authority to review and authenticate the information provided by applicants. To ensure the application is accurate and meets the necessary requirements, the office has the discretion to request additional documents and information. If the application fails to meet the legal conditions, it will be rejected by the register office, and the reasons for the rejection must be justified [11, 20]. Within two months of submission, the applicant will be informed of the rejection decision [21]. If desired, the applicant can appeal the register office's decision to the Administrative Judiciary Court, following the procedures outlined in Article 15 of the Administrative Judiciary Law No. 27 of 2014. It is important to note that the commercial register office has the choice to request or not request additional data to verify the accuracy of the application [22, 23].

The decision made by the legislators in Jordan and Egypt to establish a dedicated register for foreign companies is highly praised by the researcher. This measure aims to ensure the protection of the rights of individuals engaging with these companies, safeguard the interests of national companies, and establish a system of supervision over the capital, funding sources, and employment practices of foreign companies. By implementing this requirement, the state asserts its sovereignty over all individuals and entities operating within its jurisdiction [24].

According to the researcher, the approach taken by the Egyptian legislator in regards to registration procedures for foreign companies is more precise and transparent compared to that of the Jordanian legislator. In Egypt, the law clearly states the consequences of operating without registration, which includes the closure of the branch. It also mandates that every company operating in Egypt must establish a branch, sets conditions for appointing a branch manager, requires each branch to have an auditor based on specified criteria, and explicitly states that any rejection of registration must be justified. However, the Jordanian legislator does not provide for any penalties for a foreign company that has not applied for a permit, does not impose an obligation to establish a branch and does not provide for the conditions for appointing a branch manager, which in the case of British law usually include

morality and good conduct. Furthermore, Jordanian law authorizes the Registrar of Companies not to provide reasons for refusing registration.

4 Conclusion

In summary, this study shows that legal procedures for foreign corporations at the national level contribute significantly to creating a fair and open business environment. These regulations help protect the local economy and create competition in the market, which in turn increases the attractiveness of foreign investment and ensures sustainable development. Additionally, the need to register and obtain the required permits enables tracking of the country's foreign economic activities and ensures compliance with local laws and regulations. Therefore, it is important that legislators continue to evaluate and improve these statutes to meet economic changes and create incentives to invest in a friendly and safe business environment.

4.1 Results

The study reached the following results:

1. There is a clear legal distinction between foreign operating companies and domestic companies in terms of the laws and regulations governing their activities, which increases confidence among those dealing with these companies.
2. Imposing an obligation on foreign companies to register in the register of foreign companies strengthens the state's ability to supervise and supervise these companies, contributing to the protection of the national economy and ensuring fair competition.
3. The authorities responsible for issuing authorizations to foreign companies vary depending on the type of business activity, requiring effective coordination between various government authorities to streamline procedures.
4. There are no appropriate penalties for foreign companies operating without registration and the necessary authorizations, which may pose a challenge to effective law enforcement.
5. Registration procedures require the submission of a variety of documents and information, and these procedures should be clear and specific to ensure compliance of foreign companies.

4.2 Recommendations

Based on the findings of this study, the following recommendations are made:

1. Increasing transparency and legal procedures related to the registration of foreign companies and providing clear and up-to-date information on legal requirements and necessary procedures.
2. Develop and update penalties for foreign companies operating without registration or authorization to make them dissuasive and effective.
3. Unify the authorities responsible for issuing authorizations and registrations, or at least improve coordination between them, to make procedures easier and faster for foreign companies.
4. Strengthen the role of regulatory and supervisory authorities to ensure compliance of foreign companies with applicable laws and regulations, thereby increasing the stability of the investment environment.
5. Prepare a comprehensive guide for foreign companies on registration procedures, permits and legal obligations and make it available in multiple languages to ensure that the information reaches all foreign investors.
6. Strengthening cooperation with other countries to exchange experiences and best practices in regulating the activities of foreign companies and benefiting from successful experiences in this area.
7. Improving the investment environment by offering incentives and facilities for foreign companies, while maintaining a balance that protects domestic companies and promotes fair competition.

The Legal Dimensions of the Author's Electronic Copyright in the Era of Digital Transformation: Between Criminal Protection and Prevention

Omar Al Makhzoumi and Jaber Al-Ghayathin

Abstract This research evaluates the effectiveness of criminal safeguards for authors' online copyright by examining the laws of various Arab and foreign nations. It concentrates on the manner in which these regulations tackle digital infringements and breaches of intellectual property rights, alongside the accountability of internet service providers for cybercrimes occurring on their platforms. Findings indicate that numerous legislations provide robust protection through harsh penalties, while the laws of certain countries enhance the fight against cybercrimes by regulating the responsibility of internet service providers, contingent upon proving actual knowledge of the infringement. The study advocates for the fortification of criminal laws to encompass all types of digital abuse, the standardization of accountability criteria on an international scale, and the enhancement of mechanisms for reporting illegal content to guarantee justice and effective copyright protection.

Keywords Copyright · Digital age · Criminal protection · Civil protection · Electronic legislation

1 Introduction

Copyrights serve as essential components in safeguarding artistic and literary creativity, highlighting the pressing need for legal protection of these rights. This discussion seeks to examine the avenues of criminal protection that secure the rights holder (author) against infringements impacting their works, whether through direct acts like counterfeiting or through digital breaches that may arise online. this framework, the significance of establishing robust protection systems that incorporate criminal penalties to discourage violators and offer restitution to impacted authors is clearly underscored.

The system of intellectual property protection fundamentally includes criminal safeguards for copyright, designed to elevate the rights of authors and protect them against various infringements, including the unauthorized reproduction of their works or illicit usage. This study aims to assess the efficacy of copyright laws in addressing related crimes by examining different legal frameworks, including those in Algeria, Jordan, France, and the United States. Additionally, it seeks to provide recommendations that can enhance criminal protection systems, ensuring both justice and effective safeguarding of creative endeavors.

1.1 Study Methodology

The research employs a comparative analytical approach, concentrating on the examination of significant legal texts from Jordan, Algeria, France, and the United States. Data collection occurs through an evaluation of relevant legislation, judicial decisions, and legal rulings, alongside consultations with academic resources and legal experts.

2 Basis of Civil Liability for Internet Intermediaries and Compensation

The bases of civil liability are varied. Typically, liability can be contractual, stemming from a breach, delay, or non-fulfilment of a contract, or it can be tortious in instances where the injured party incurs damages without any existing agreement with the wrongdoer. A key tenet of civil liability is that contractual and tortious liabilities must remain separate. Legal scholars and the judiciary widely agree that it is impermissible to merge these liabilities, whether through sequential lawsuits or by selecting the most advantageous provisions for the harmed party from both liability types. The underlying purpose of liability is to address the harm caused. Furthermore, opting between the two forms of liability is not permitted; this conclusion is rooted in principles of logic and justice. When a contract exists, the injured party cannot pursue tortious liability. Contractual liability serves as a penalty for violating the contractual relationship between the creditor and debtor, functioning as an extension of the contract and barring the aggrieved party from seeking tortious liability [1–3]. As long as a contract is in place, the creditor is limited to filing a claim for contractual liability. The relationship formed through the contract, which is defined by the mutual interests of the involved parties, guarantees a balanced and fair agreement with binding authority. Consequently, this contract becomes the governing law for

those parties as per legal standards. Thus, honoring this binding authority necessitates compliance with contractual obligations and disallows the option to select between different liabilities [4–7].

For civil liability to be established, whether in a contractual or tort context, the following key elements must exist: the wrongdoing of the offender, the duty to compensate the injured party for the harm suffered, and the causal link between an action and the resulting damage. These elements are as follows:

2.1 Wrongdoing

Error is characterized as a violation of a prior obligation. To accurately define error, it is essential to differentiate between two categories: contractual error and tortious error. Contractual error arises when a party that has an agreement with the author concerning the infringed work commits a violation of the author's rights. Conversely, tortious error represents a breach of a legal responsibility assigned to a separate individual, which may be specific as an obligation or general as a duty to honor the rights and freedoms of others while refraining from causing them harm [8–11].

In the context of copyright, contractual errors arise in the dynamics between the author and those who receive exploitation rights, all of whom are governed by a valid and comprehensive contract—be it for the exploitation of rights, permission for online use, or for website creation. Such errors occur when there is a breach of the contractual duty or a postponement in its execution. Examples include a publisher not publishing the work or delaying its release beyond the typical timeframe, or when transferees meet their obligations under the exploitation agreement in a way that strays from the original terms agreed upon [12–15].

A contractual error occurs when a publisher produces a work inappropriately for the author or disregards the quality of printing stipulated in the publishing agreement. Likewise, if the publisher does not publish the work online as specified by the author—such as altering or omitting elements that were originally included—it represents a breach of contract. Furthermore, transforming a film into a stage production without the author's approval, translating a database into a different language and selling it without the author's consent, or exceeding the agreed-upon number of copies of computer programs for sale to generate extra profit, also constitutes a contractual error [16–19].

Tortious error is characterized as a violation of a right that the perpetrator is conscious of committing. It also encompasses the failure to perform a necessary action or the execution of an action that ought to be avoided. This behavior strays from acceptable norms and is apparent when rights are infringed upon by an individual who does not have a contractual connection with the creator regarding the work. To establish tortious error, two criteria must be satisfied: first, the breach, which refers to the failure to adhere to the general legal duty of not causing harm to others, indicating a departure from the conduct expected of a reasonable person; and second, the awareness, where liability is not determined solely by the fact of a

breach but must also be linked to the actor's consciousness of their actions. A person is held accountable not just for the breach itself but because the act was conducted intentionally. Therefore, in the case of tortious error, the individual responsible for the breach must possess awareness of it, meaning they should be able to differentiate their actions, as there is no liability for those who lack this capacity [20–22].

The unauthorized publication of digital creations like computer programs, along with their modification or alteration, as well as companies replicating software without the author's permission—particularly in cases of high demand—represents a tortious error. Such actions encompass the sale, rental, or offering of these works to achieve significant profits that far exceed what the rightful owners of these programs would earn. Furthermore, acts deemed intellectual piracy by legal scholars, including the theft of scientific research, particularly that which is available online, also qualify as a tortious error [12, 23].

2.2 Tort

As stated in Article (256) of the Jordanian Civil Code, a harmful act is necessary to establish tortious liability. In terms of contractual liability, this is characterized by the debtor's failure to meet their obligations stemming from the contract. An example of this occurs when a party engaged with the author does not complete all or part of their responsibilities or experiences delays in execution, as seen in publishing contracts. If the publisher either declines to publish the work or publishes it without obtaining the author's consent, it represents a violation of the author's economic and moral rights [24–27].

The nature of moral rights, regarded as an extension of the author's personality, is clarified by The Law on the Protection of Copyright, which states that any violation of these rights causes harm that requires compensation if proven [28]. To demonstrate harm resulting from copyright infringement, it must be both certain and actual. Actual harm is defined as immediate. For example, when a third party publishes a work without the author's consent, alters it, or removes it from circulation, the harm is deemed real and immediate rather than speculative. The court has the ability to verify and evaluate this harm, with the additional requirement that the harm must be direct, indicating it is a natural outcome of the infringer's actions. This determination falls under judicial discretion, depending on the specifics of each individual case [29, 30].

Within the framework of the information revolution, which has intensified the challenges faced by authors due to the boundless and global reach of the Internet, unauthorized use enables anyone across the globe to easily access and download their creations, amplifying the potential harm to the creator. For instance, when a publisher re-releases a software program or database for commercial gain without the author's consent, it inevitably results in tangible damage to the author, such as the lack of financial remuneration for the exploitation of their work, alongside moral harm, which includes a violation of their intellectual integrity through the decision to re-publish and distribute the work without authorization.

The notion that violations of an author's moral rights lead solely to moral damages is mistaken. For instance, modifying a work without the author's permission will certainly cause material harm, including decreased sales and a hesitance from the public to interact with the work, alongside moral damage that negatively impacts the author's reputation and lowers their cultural status.

The damage resulting from the violation of an author's moral rights must be established by the author, but it is impractical to depend on the author to evaluate these damages, adhering to the principle that one cannot serve as both a participant and an adjudicator in the same issue. Rather, it is the judge who holds the discretionary power to assess the harm endured by the author.

2.3 Causation

In Jordanian civil law, a crucial aspect of civil liability is the causal link between an action and the resulting damage. It is clear that an individual can only be held accountable for damages that are viewed as a direct consequence of their actions. Thus, a direct causal connection between the act and the damage must be established for civil liability to be invoked under Jordanian civil law. This connection is negated by external factors, such as force majeure, the actions of a third party, or the victim's own fault. Without proving this causal relationship, a claim for liability and compensation cannot be effectively pursued [31].

In legal doctrine, the idea of causation is not open to discussion, as there is agreement on the importance of applying the general principles of civil liability concerning violations of authors' rights. The party that has suffered harm can establish the causal link through a variety of means, including witness testimony, physical evidence, and expert analysis. Nevertheless, establishing causation in the realm of electronics poses difficulties due to the intricate and evolving nature of electronic matters, along with the unclear origins of apparent issues. Factors contributing to harm may arise from remote or concealed elements associated with hardware setups, overlapping information, and roles, complicating the task of pinpointing the effective cause [32].

When the components of civil liability—fault, damage, and causation—are established, the author is entitled to just compensation for the harm inflicted on their financial and moral rights. Practical experience indicates that managing information dissemination on the Internet necessitates the collaborative efforts of individuals with various roles and responsibilities in its functioning. For users to access, navigate, and retrieve or share the information they desire, multiple individuals, typically referred to as "Internet service providers," must oversee the hosting, broadcasting, and presentation of that information. This variety in their functions facilitates the monitoring and identification of illegal informational activities. Nonetheless, achieving this goal depends on the presence of legal frameworks that outline the rights and duties of parties involved in electronic activities, as well as their responsibilities toward one another and the society in which they reside. Therefore, there is an urgent necessity for thorough legislative measures that define the legal status of Internet service providers

and elucidate their accountability for violations that occur within the network. This objective can only be realized through the collective efforts of lawmakers at both national and international levels [33].

The role of intermediaries in a technical capacity is vital for establishing their liability. When these intermediaries are connected to others via subscription or supply agreements, it becomes relatively straightforward to outline their obligations to these third parties since the contract serves as a basis for determining liability. The complexity emerges, however, when it comes to defining their liability regarding informational content—specifically, published works that are accessible illegally—transmitted through their technical systems. This situation highlights the challenges involved in creating an effective liability framework for Internet intermediaries.

In this context, an initial effort was made by the French government on June 14, 2001, through a bill concerning "Information Companies," which aimed to establish the legal status of Internet service providers. This bill, however, was subsequently annulled due to legislative modifications. Following this, a new bill titled "Confidence in the Digital Economy" was presented on January 15, 2003, and it received approval from the French legislature on June 21, 2004. As of that date, Internet service providers in France operate under their own legal framework [33, 34]. In contrast, Jordanian legislation does not contain a specific provision related to this matter within the Temporary Electronic Transactions Law No. 85 of 2001 [35].

The classification of information services and the standing of their providers differ based on the kind of service being provided. Certain services focus solely on the storage of electronic data and the exchange of information via the network, whereas others encompass the collection, organization, and dissemination of information to the general public.

3 Hosting Services

In the realm of electronics, the term "hosting" pertains to the provision of technical and informational resources, which may be offered for a fee or at no cost, enabling customers to access the internet at any time to disseminate specific informational content, such as texts, images, or sounds, to the public. A hosting provider undertakes this responsibility by storing the data and information uploaded by website owners to their servers, which maintain a constant connection to the internet. This connectivity ensures that website owners can make their content accessible to the public around the clock. Article 14 of the European Directive on "E-Commerce" and Article 6–1/2 of the French Law on "Confidence in the Digital Economy" describe this service as an activity conducted by a natural or legal entity, focused on storing websites and web pages on their servers, either for a fee or free of charge. This service provides clients with the technical and informational means to broadcast their desired content on the internet at any time, including texts, images, sounds, organizing conferences and discussion forums, and creating hyperlinks to other sites. Among the resources that hosting providers offer their clients are disk space or bandwidth allocation for

publishing information online, a personal account with an access code for identification, and a specialized program that allows them to connect to the hosting provider for adding, deleting, or modifying information as necessary.

In assessing contractual obligations, it is essential to differentiate between hosting services offered for a fee and those provided at no cost in order to understand the legal nature of the service rendered by the hosting provider. When a website owner compensates for hosting services, they gain access to the technical and informational assets of the service provider while utilizing a designated segment of their hard disk, maintaining a continuous and direct connection to the internet. The agreed-upon fee is determined by the volume of information to be disseminated and the duration of that dissemination. Therefore, paying for hosting services can be compared to renting a segment of the hard disk or a network space from the hosting provider (lessor) to the website owner (lessee). Conversely, free hosting resembles the act of lending a segment of the hard disk or a network space from the hosting provider (lender) to the website owner (borrower).

Legally defining the hosting service as either a rental or a loan, contingent upon whether a fee is imposed, is in accordance with legal regulations. This becomes apparent when a hosting provider designates a particular portion of their hard drive for a website owner. In these instances, the website owner, acting as either a lessee or borrower, is required to utilize the designated space in compliance with the terms outlined in the hosting agreement and relevant legal standards. On the other hand, the hosting provider, serving as either a lessor or lender, is obligated to provide an internet-connected area on their hard drive for the website owner, allowing them to disseminate their intended information through the network as stipulated in the hosting contract. It is important to highlight that hosting information on the internet is distinct from providing it; the latter entails publishing content and making it publicly accessible, which extends beyond the conventional function of the hosting provider, whose role is primarily focused on storage [36].

4 Information Supply Services

The term information supply describes the process of distributing information, ensuring it is available to the public in formats that are readable, visible, or audible. Utilizing web pages and the internet for this purpose is recognized as a form of "public communication means," aimed at granting network users access to particular informational content, including texts, messages, images, sounds, and more [37].

The entity that delivers information to the network is known as the information provider. This individual, who may be a producer, supplier, author, or simply a rights holder, can range from an everyday person to a professional dedicated to the collection and distribution of information for networks. They hold the crucial responsibility of generating and compiling information on a particular subject, establishing themselves as the main accountable party for the information disseminated through the network [8, 38].

The process of supplying information over the network entails uploading data to the central storage devices or rented disk space provided by the hosting service. The entity responsible for this information—referred to as the information provider or content provider—gathers or composes content on a particular subject. As the legitimate owner of the means of public communication, this provider, whether an individual or an organization, possesses the genuine authority to oversee the electronic informational content they create or compile. Consequently, they hold the right to either distribute or withhold information from users on the network. This function mirrors that of traditional content providers, such as editors or publishers in print journalism, news agencies, or audiovisual media, who manage editorial content to ensure the provision of accurate and credible information [39].

The hosting provider is distinct from the information provider in that it does not generate or gather electronic informational content; instead, it simply stores this content on its devices under a contract with the information provider, which allows the public to access it at any time. While the provider functions as the publisher in a publishing service, hosting resembles the act of renting or lending space on the network, with the hosting provider acting as the lessor or lender. Despite these distinctions, both play a role in delivering informational services via the internet. Without their participation, data and information cannot be transmitted across the network, nor can they be made accessible to the public without the essential technical capabilities to link remote communication networks with users' computers [8, 40].

The information provider's contractual obligations are triggered when they breach any stipulations of the supply agreement with the internet access provider or other professional intermediaries within the information services sector, as well as when they violate any terms of the subscription contract with a client. Additionally, if the provider's dissemination of information inflicts harm on others—whether through the publication of false, damaging, or defamatory content—it is deemed tortious, as general principles impose a responsibility to honor the rights of others and prevent harm. Consequently, tortious liability may arise if the broadcasted information infringes on privacy rights, defames an individual's reputation, violates intellectual property laws, incites criminal behavior, or contains false, misleading, or scandalous information. Therefore, any criminal actions undertaken by the information provider that result in material or moral harm to others with whom they maintain a contractual relationship can serve as a basis for tortious liability [41, 42].

When all elements of liability are confirmed, the author is entitled to appropriate compensation. In deciding the amount of compensation, the court takes into account the author's cultural and literary status as well as the degree of benefit gained from the unauthorized use of the work [24]. Compensation for the unauthorized exploitation of protected works encompasses both material and moral damages. Material damages represent the sum that the infringer (imitator) would have compensated the author had they secured written consent for the imitation. Meanwhile, moral damages pertain to the damage inflicted on the author's reputation or their cultural and artistic standing.

The main goal of compensation is to address the harm experienced by the author. When it is feasible to fully eliminate the damage by reinstating the prior condition,

compensation is provided in kind. However, if that is not achievable, the court must turn to monetary compensation or other forms of non-material restitution.

In-Kind Compensation

In the realm of copyright, in-kind compensation pertains to the court's action of eliminating any evidence of infringement on the rights of the author, initiated at the request of the author or their successor. This may entail mandating the halt of publication, display, or printing, as well as the destruction of copies, images, or materials involved in the publication process, or modifying those copies, images, or materials to render them unusable, all at the cost of the party held accountable. Furthermore, compensation could be granted if deemed warranted [43].

In copyright law, the term in-kind compensation refers to the court's measures taken to remove any evidence that infringes upon the author's rights, based on a petition from the author or their successor. This procedure involves mandating the cessation of publication, display, or printing, along with the destruction of copies, images, or materials used in the publication, or altering these copies, images, or materials so that they become unusable, all at the expense of the responsible party. Additionally, compensation may be awarded if deemed appropriate [43].

In-kind compensation can take various forms depending on the nature of the infringement involved. For example, when a statue has been altered through the addition or removal of materials, specific performance would require the responsible party to either restore the statue to its original state as envisioned by its creator or remove the modifications made. In a similar vein, if the infringement concerns a literary work where an individual's name has been added, in-kind compensation would necessitate the removal of that name and the reinstatement of the true author's name. In instances where an author's right to withdraw their work from circulation has been violated, in-kind compensation might involve making the work publicly accessible again. Moreover, if the infringement pertains to the proper attribution of the work to its author, in-kind compensation could demand that the work be republished under the rightful author's name. Additionally, if the infringer has delayed the release of the work to circumvent the author's preferred timing for presentation, compelling the infringer to publish it promptly may also be required, as stated in Article 47 of the Jordanian Copyright Law [29].

Material Compensation

This refers to the approach a judge must take when in-kind compensation cannot adequately address the harm inflicted by a violation of the work. This type of compensation may be monetary or non-monetary in nature. Non-monetary compensation can be suitable when the aggrieved party believes that a financial award would not sufficiently remedy the loss incurred. For instance, rather than demanding the destruction of unauthorized copies, the author might request that the court mandate the return of all or a portion of these copies, based on the literary damage resulting from the infringement, and to subsequently sell them to offset the harm suffered. This aligns with Article 47(c) of the Jordanian Copyright Law.

Monetary compensation is regarded as the most appropriate means of addressing harm stemming from illegal actions and serves as the cornerstone of liability for damaging acts. This is due to the fact that money's role is to rectify the harm, whether it be material or moral. In situations where retrieving circulated copies for destruction is unfeasible, or where alterations cannot be made, or in instances of infringement on the public performance of the work and its material use, the compensation would be determined by the monetary gain realized by the defendant, along with the entitlement to compensation for the harm caused by the unauthorized public exhibition of the work [25].

The Jordanian Civil Code's explanatory memorandum outlines that while in-kind compensation is typically the standard in contractual liability, it is viewed as an exception when attempting to revert a situation to its original state. In matters of tortious liability, monetary compensation, or a financial sum, is established as the general principle, emphasizing that compensation should be monetary.

As outlined in Article 49 of the Jordanian Copyright Law, moral damages incurred by the author are eligible for monetary compensation: "The author whose rights on their work under this law have been infringed has the right to obtain fair compensation for that…" To prioritize public interest over private interests in specific circumstances noted in the Jordanian Copyright Law, particularly in Article 47, the legislator has limited the author's ability to seek monetary compensation in lieu of in-kind compensation. Furthermore, the Jordanian legislator has delineated general guidelines for determining compensation and the criteria applicable for these evaluations in Articles 264 and 268 of the Jordanian Civil Code [26].

5 Criminal Protection of Author's Copyright on the Internet

The legislator extended beyond merely ensuring civil copyright protection, aiming to establish a more stringent and deterrent criminal safeguard against any infringer who commits acts violating the copyright and related rights of performing artists, sound recording producers, audiovisual recording creators, and broadcasting entities. This objective is met by criminalizing such actions, which, despite their diversity, the Algerian legislator sought to classify under a singular offense referred to as "counterfeiting". In contrast, the Jordanian legislator emphasized the necessity of legal protection for copyright from a criminal standpoint, recognizing the efficacy of criminal penalties in deterring violations and the expediency of legal processes. The Jordanian legislator made it a crime to sell, rent, or distribute literary and artistic works without written consent from the copyright holder or the holder of related rights in any form of distribution, regardless of whether the seller or renter was aware of the true nature of these works [33, 27].

In the realm of intellectual property, as in other domains, criminal liability adheres to the principles of criminal legality. To establish an offense, all elements must be

demonstrated according to the legal framework, and responsibility must align with the principle of evidential legality concerning its origin, ensuring that there is no reasonable doubt regarding the evidence used to substantiate the crime. Unlike other criminal allegations, certainty is required for proving all elements rather than relying solely on probabilities. The identification of the perpetrator must be unequivocal, as criminal liability is inherently personal. Furthermore, when it comes to legal entities, it is necessary to prove that either the representative of the entity or someone acting on their behalf committed the offense, encompassing all legally defined material and moral components in accordance with the specified legal model outlined in the text of criminalization.

It has been established by comparative jurisprudence that proving replication or counterfeiting is essential, as these actions represent the physical acts that define the crime by legal standards. Such actions do not fall under legitimate practices like quotation or reverse engineering in software development environments. These matters necessitate both legal and technical knowledge, and their novelty in litigation leads to various defenses and secondary issues where expertise is vital. It is crucial to highlight that the ultimate authority on such matters is the judge, who makes rulings in criminal cases based on their subjective beliefs and insights from the evidence presented. A notable illustration of this is [the appeal case No. 207/2001 decided on February 21, 2001], which showcased an in-depth analysis of the criminal statutes within the Jordanian Copyright Law. The court explicitly determined that the activities deemed criminal in this domain are restricted to financial exploitation actions, such as sale or rental, and only pertain to financial exploitation. Consequently, utilizing a work without any financial exploitation does not constitute a crime under the law. The court arrived at a just and impartial conclusion in a case concerning intellectual property involving a significant financial institution.

The safeguarding of creativity within literary property revolves around finding equilibrium between a creator's desire to shield their work and the temporary chance to benefit from their intellectual contributions, alongside society's demand for knowledge and its dissemination. This equilibrium helps avert the monopolization of a creator's work and allows for compulsory licensing, which serves to uphold culture and address societal growth requirements. Although every creator possesses the right to defend their creation, it is equally our responsibility as a society to ensure that such protection does not hinder progress or upset the balance between individual rights and communal necessities.

Concerning the criminal liability of internet service intermediaries, French case law has determined that internet service providers can be held criminally responsible based on their involvement or participation in a crime. On July 10, 1997, the Paris Court of First Instance ruled that an internet service provider's role in the spread of illegal content could be seen as involvement in the crime, necessitating their conviction alongside the primary offender. Similarly, on May 28, 1998, the Munich District Court found an internet service provider guilty as an accomplice in the crime of distributing child pornography online. The French legislator aligned with the overarching principles of the European directive on "e-commerce," as outlined in Article 6–1/3 of the French law on "Trust in Digital Economy". This article specifies that

wrongful actions by internet service providers cannot be subject to criminalization unless they possess actual knowledge of the illegal content and neglect to take suitable measures to eliminate it or at least restrict public access. Each nation anticipates that internet service providers operating within its jurisdiction will aid public authorities in the fight against cybercrime, adhering to these established conditions. Failing to act could lead them to be deemed liable for criminal involvement or complicity. Nevertheless, the Penal Codes of both Jordan and France specify that a conviction for involvement or criminal complicity requires the demonstration of actual knowledge regarding the acts committed. Thus, if it can be established that internet service providers lacked actual knowledge of the unlawful content or took steps to remove or restrict access upon realizing its illegality, their criminal intent is effectively negated [33, 20].

The Digital Millennium Copyright Act (DMCA) in the United States restricts the criminal liability of internet service providers concerning copyright violations online, holding them accountable only if they are aware of the unlawful nature of the digital content they either transmit or store. This awareness can be demonstrated in two scenarios: firstly, when the illegality is so evident that it cannot be overlooked, and secondly, when the service provider is informed by U.S. authorities or the affected party regarding the infringement. Upon gaining knowledge of such illegality, especially concerning counterfeit or pirated materials, the provider is obligated to take affirmative steps to eliminate the illegal content or at the very least, restrict public access to it. Neglecting to act in this manner constitutes a failure of their responsibilities, rendering them liable. Therefore, the standards for establishing and negating liability are consistent across American, French, and European law. Internet service providers must offer their clients a way to report any violations that occur on the network in order to be entirely free from criminal liability while aiding public authorities in the fight against intellectual property infringements, breaches of privacy, violations of religious sanctity, racial incitement, and child sexual exploitation. This requirement is outlined in Article 6–2/7 of the French law on "Trust in Digital Economy," aligning with Articles 13 and 14 of the European e-commerce directive and Article 512/g3 of the American DMCA. Once the service provider has confirmed the legitimacy of the report and the illegality of the electronic content, they are obligated to swiftly inform public authorities to secure an administrative or judicial order for the removal of the content or to restrict access for network users [21].

6 Conclusion

The criminal safeguarding of copyright stands out as an essential factor in protecting artistic and literary creativity amidst advancements in information technology and the digital landscape. By enacting robust laws and imposing significant penalties, it becomes feasible to reduce copyright violations and ensure adequate protection for creative works. Striking a balance between the rights of copyright holders and

the needs of society improves the effectiveness of this protection, fostering innovation while upholding the rights of creators. The findings of the study indicate that strengthening international collaboration and crafting legislation that addresses contemporary challenges is vital for fulfilling the objectives of criminal protection and creating a secure environment for creativity.

6.1 Results

The study concluded the following results:

- In both Jordan and Algeria, criminal laws offer robust safeguards for copyright, intending to discourage offenders with harsh penalties.
- Both French and American legislation govern the accountability of internet service providers by stipulating that they cannot be deemed liable for illegal activities unless it can be demonstrated that they had actual knowledge of those activities, highlighting the necessity of taking corrective measures once violations are identified.
- The way various laws tackle digital offenses and the safeguarding of intellectual property differs significantly, underscoring the necessity for global cooperation and cohesive legislation to enhance the effectiveness of protection.

6.2 Recommendations

This study recommends the following:

- Strengthen copyright-related criminal rules to cover all forms of digital infringement, with a particular focus on strengthening penalties for infringements.
- Standardize ISP liability internationally to facilitate cooperation in combating cybercrime and ensuring justice.
- Improve mechanisms for reporting illegal content online and provide ISPs with effective tools to facilitate the reporting process and take appropriate action immediately.

Deep Dive into Malware Analysis and Their Behavior Patterns: A Systematic Technical Review

Srishti Singh, Hemraj Shobharam Lamkuche, Devraj Vishnu, Ghassan Samara, H. Azath, and Emma Qumsiyeh

Abstract The sophistication of malware attacks is always evolving. To circumvent common countermeasures and take advantage of vulnerabilities, they employ obfuscation, polymorphism effectively and anti-emulation strategies. Consequently, it is now crucial to conduct comprehensive malware analyses in order to identify and address threats promptly. Through a systematic assessment of state-of-the-art static and dynamic analysis approaches, this study aims to de-obfuscate, reverse-engineer, debug, and sandbox malware samples; identify communication infrastructure; categorize malware families; extract indicators; and grasp dissemination mechanisms. We construct a unified and repeatable malware analysis framework using tools such as IDA Pro, OllyDbg, Process Monitor, Wireshark, and nrdbg. This framework can break through anti-VM and heavily armored malware, hook into hidden processes, intercept system events, trace memory injections, log API calls, and sniff network activity. Fileless delivery chains and self-morphing processes anchored

across networks of infected devices impact the filesystem, memory, registry, and native OS resources. Case studies classify popular malware like Dridex, WannaCry, Cerber, Trickbot, Poweliks, and Emotet based on these post-infection payloads. The proposed technique and toolset provide practical forensic analysis of modern exploit kits, worms, sniffers, keyloggers, ransomware, rootkits, and botnets by obstructing points of entry and attack areas on endpoint and network. These steps aid in reducing the scope of existing dangers, curing existing diseases, and warding off potential new ones.

Keywords Malware detection · Malicious software · Static analysis · Dynamic analysis · Technological progress

1 Introduction

Malware, or malicious software designed to infiltrate computer systems and networks, has become more prevalent in the digital era [1]. Malware can appear as worms, viruses, spyware, or ransomware, among other things. Inoperable systems, lost or stolen data, compromised privacy, and substantial financial losses are all possible outcomes. The development of effective detection, prevention, and cleanup strategies requires an understanding of malware behavior through behavioral analysis. With a focus on behavioral patterns, this paper conducts a comprehensive literature review of academic publications on malware analysis approaches. We provide an overview of common malware types and categories as well as a range of analysis techniques from static to dynamic and hybrid approaches. The challenges and restrictions of the current methods are looked at. Additionally, we highlight trends that can guide the development of strong anti-malware solutions by summarizing studies on common actions of malware families. This technical assessment broadens the expertise of researchers and computer security professionals who are battling ever-evolving malware threats. With behavior-centric detection, our research points to important prospects for the future development of malware analysis.

2 What is Malware Analysis?

The practice of analyzing, dissecting, and studying harmful software code to determine its impacts on targeted systems, how it operates, and how to prevent it is known as malware analysis. Cristian and you all. [1, 2] Static and dynamic methodologies are used by analysts to examine code, system calls, network activities, and behaviors when running malware samples in controlled conditions. Finding out how to infect people, cause damage that spreads, identify writers, develop defenses, and more is the aim. By enabling stronger defenses, accelerating threat detection, and linking cyber attacks to enhance prevention, malware analysis helps security teams. Dismantling

ever-more-complex malware that is created to secretly steal data, crash systems, or use equipment for illicit purposes takes specialist knowledge.

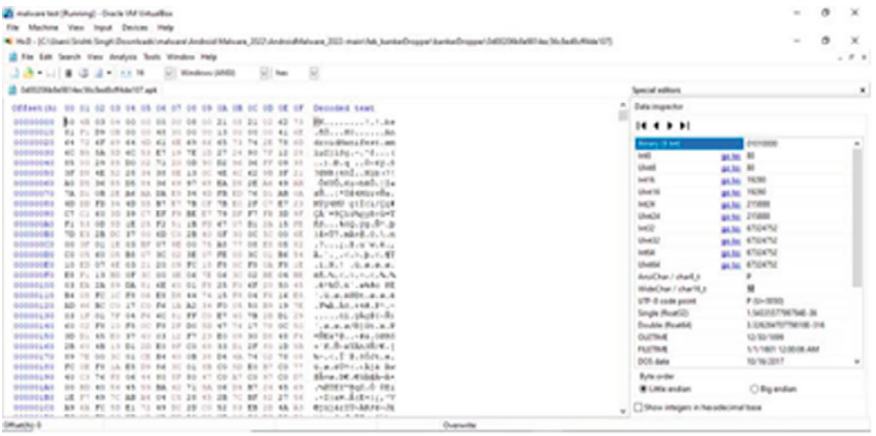
3 Why Malware Analysis?

Understanding malware analysis is crucial for addressing evolving threats to computer systems and networks. Traditional signature-based security solutions are becoming inadequate as malware attacks become more sophisticated and targeted. Rigid malware analysis, which includes static, dynamic, and code analysis in controlled environments, provides deeper insights into the mechanisms, strengths, weaknesses, and spread methods of malicious software. This analysis helps security personnel assess threats, pinpoint infections, develop detection and removal strategies, and effectively dismantle malware systems [3–5].

4 Static Analysis

1. Static Malware Analysis: This method examines malware's structure, instructions, dependencies, and code artifacts without execution. Tools like IDA Pro, x64dbg, and Ghidra help extract text, analyze function calls, uncover rootkits or backdoors, and identify communication infrastructure and malware families [b2, b4] [6, 7]. While it doesn't capture real-time behavior, static analysis reveals key indicators and inner workings of malware, complementing dynamic methods for a thorough analysis [b9, b4] [b8, b4].
2. Identifying the File Type: Recognizing the file type helps determine the target operating system and architecture. For Windows, malware often appears as Portable Executable (PE) files (.exe,.dll,.sys). Altered extensions may disguise files, but file signatures like MZ (hexadecimal 4D 5A) aid identification [3, 6, 8–11]. Manual verification using hex editors remains crucial for accuracy and detecting hidden threats [2, 7, 8, 11–13] (Fig. 1).

Identifying File Type Using Tools: Hex Editors allow analysts to inspect raw data, verifying magic numbers (digital fingerprints) at the file's start to determine its true nature [7, 8]. Tools like PE scanners and file viewers provide deeper insights into file names, sections, and import tables, revealing functionality and history [8]. Advanced tools, such as debugging utilities, are essential for uncovering malware hidden by packers and cryptographers, revealing malicious activities and processes [6]. Manual techniques, though labor-intensive, offer detailed control and insight that automated tools might miss, helping analysts understand and combat dynamic threats [14]. The CFF Explorer tool within the Explorer package facilitates PE editing without compromising the executable's integrity [9].



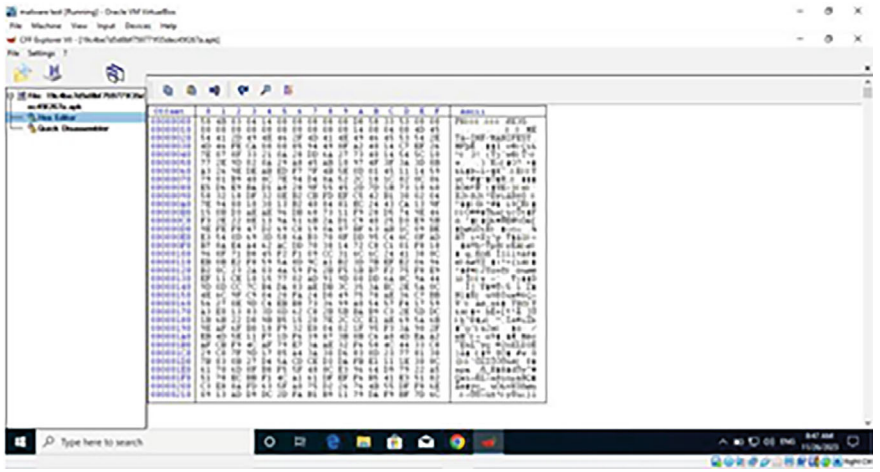


Fig. 1 Technical analysis of various files using manual analysis technique and tools

A. Using the Malware's fingerprints

Based on the contents of an untrusted binary file, fingerprinting entails generating a cryptographic hash value. It is widely accepted that using cryptographic hash methods like MD5, SHA1, or SHA256 to create data hashes for malware samples is the de facto norm. The usage of encryption hashes is seen in the list below [1, 15].

Malware patterns shouldn't be identified by file names alone, as names can vary, but the cryptographic hash of a file's content is consistent and acts as a unique identifier during verification [16].

Dynamic malware analysis can reveal if malware propagates or spreads additional threats. Knowing the cryptographic hash helps determine if the malware pattern is new or previously identified [16].

Security researchers use data hashes to track trends and search databases like VirusTotal for previously identified patterns [16].

B. Scanning for Viruses: Running malware through multiple antivirus applications is advisable, as different software uses varied signatures and heuristics. Antivirus tools might miss new or altered malware, so using services like VirusTotal, which scans with multiple engines and provides detailed reports, is beneficial [8, 17, 18].

C. String Extraction

Strings Extraction: Strings are printable character sequences in ASCII and Unicode within files. Extracting them can reveal insights into a process's performance and potential indicators of infection, such as filenames and IP addresses. Tools like the strings command on Linux and Pestudio for Windows facilitate this extraction [19, 20] (Fig. 2).

Decoding Obfuscated Strings: Malware often uses obfuscation to hide strings from detection tools. FLOSS can decode these obfuscated strings, making them readable and aiding in malware analysis [19, 20].

Obfuscation Techniques: Malware uses obfuscation methods like packing and cryptography to conceal its data. Packers compress and cryptors encrypt executable files, complicating analysis. Tools like Exeinfo PE can detect these methods and provide insights on decompressing files [8, 18–21].

PE Header Examination: Windows executables use the PE/COFF format, with the PE header containing crucial information such as memory locations and dependencies. Tools like PPEE, CFF Explorer, and PEBrowse Professional help analyze and modify PE headers to understand the binary's structure and functionality [8, 15] (Fig. 3).

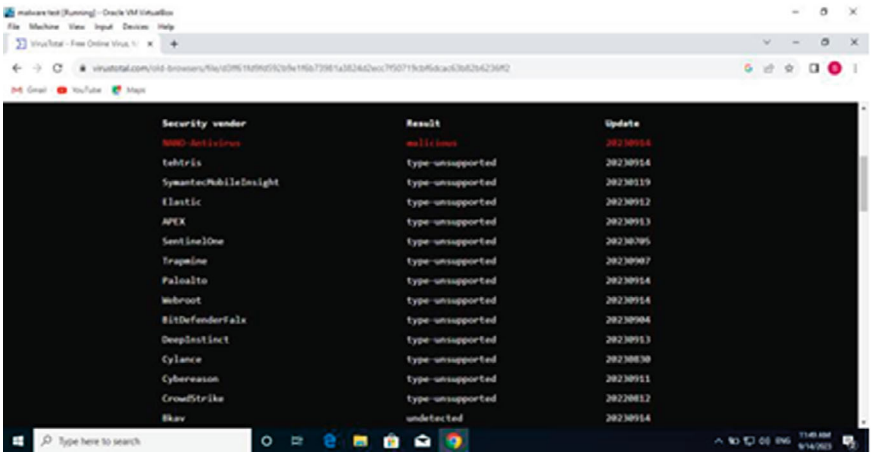

Fig. 2 Antivirus scanning using VirusTotal

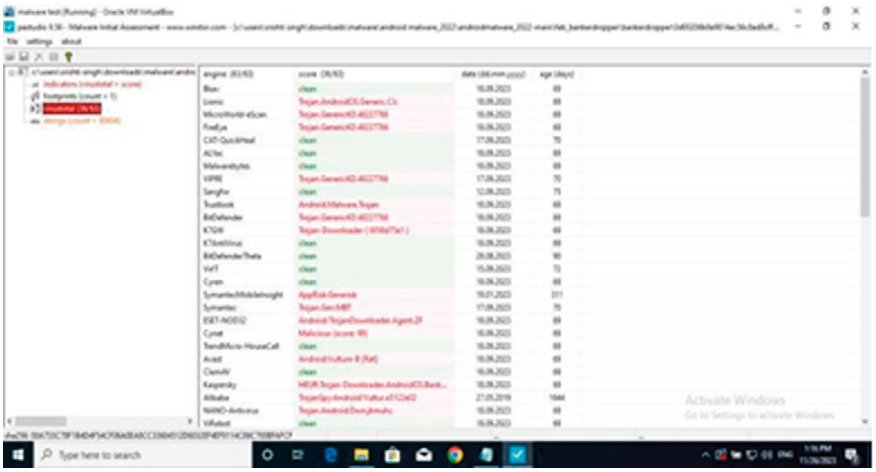

Fig. 3 Inspecting PE header

(1) Examining File Dependencies and Import: Generally, malware propagates via files, documents, networks, and other interactions. To execute such an attack, malware frequently depends on features that the operating system has made available. A large number of Windows functions, known as application programming interfaces (APIs), are exported. These APIs are necessary for interacting with dynamic link libraries (DLLs). These functions are regularly called by the executable through importation from multiple DLLs that offer distinct functionalities. An import function, sometimes known as an import, is the function that the executable loads from external files (only DLLs). For instance, the CreateFile() API relocated to the kernel32.dll file might be exploited by a malicious program for creating a file on the Windows drive. It must load kernel32.dll into memory before invoking the CreateFile() method for the purpose to access the application programming interface (API). You may get a feel of the capacity and potential of the malware as well as what to anticipate when it is run by looking at the DLLs the virus relies on and the application programming interface (API) functions it imports DLLs. Windows executable file dependencies are kept in the PE file model's import table. [8, 15, 22–25]

(2) Examining Exports: The first point for investigation is employing PE header tools such as CFF Explorer, PEView, and PE Studio to extract and evaluate the export table specifying ordinal numbers matched to export names or forwarded functions. Analysts evaluate this list of exports seeking for suspicious names that signal behaviors connected to malware activities like "dropper", "inject", "keylogger", or "ransom". They also examine exports against anticipated capabilities based on the supposed lawful software type searching for discrepancies or evident gaps suggesting efforts to conceal harmful code inside. Additional approaches decode obfuscated strings used in the name of exports by malware aiming to disguise its capabilities. Numbering sequences are traced in case

they relate to functionality not accessible by name alone. Finally, when exports forward to external DLLs rather than implementing locally, analysts recursively trace these forwarding chains to uncover dispersed capabilities across modules that malicious code commonly utilizes. The purpose of static export analysis is to methodically map the executable's declared functions and discover strange or suspicious characteristics that need additional study utilizing dynamic execution and monitoring techniques. Careful export evaluation gives the starting point to identify malware inner workings important for investigation and defenses.

(3) Analyzing the Compilation Timestamp: The date the malware was initially generated can be found by looking up this field in the PE header, which holds information about the binary's compilation. The timing of the attack can be ascertained with the help of this information. An attacker might also try to trick analysts into believing they are in a different time zone than they actually are. Sometimes strange trends might be found using cumulative times. A malware binary with a time change to the following day in 2020 is displayed in the sample below. In this instance, these signatures voluntarily assist you in recognizing unhealthy behaviors, even in the event that the precise timing is not detectable [9].

(4) Analyzing PE Resources: The executable's residual file (.rsrc) contains the resources (icons, menus, dialogs, and texts) that are needed by the executable. Examining the source can provide crucial information about the binaries because attackers frequently store information on devices, including decoy files, extra binaries, and configuration data. Additional informational resources with site names, company names, registration information, and credentials can be found in the Resources section. An excellent program for viewing and extracting resources from dubious binaries is Resource Hacker. Let's construct a binary file as an example that seems like an Excel file on disk (note how the file extension changes to.xls.exe), as demonstrated below. Three resources are provided when the binary is loaded into Resource Hacker (icon, binary, and icon group). The Microsoft Excel symbol is employed by this kind of malware (to display the Excel spreadsheet). Binaries are found in the executable as well; one of them has the data signature D0 CF 11 E0 A1 B1 1A E1. The file signature of a Microsoft Office file is represented by this string of characters. Here, the attacker leverages the device to store a counterfeit Excel file. When the virus is started, it operates in the background and offers the user an Excel trap form as a process. Right-click on the spot you wish to restore, select Save Source to *.bin File, to save the binary file to disk. Since the source in this example is saved as sample.xls, it presents the false Excel sheet that the user will see. Merely glancing at the item could disclose a lot about the qualities of infection [6, 8].

D. Analyzing and Categorizing the Malware

When you come across a malware pattern during malware detection, you can determine whether it belongs to a specific malware family or if its features correspond with past criteria. When suspicious binaries are compared to previously examined

samples or samples from public or private sources, information about the malware family, feature traits, and similarity to prior screen patterns can be found. While cryptographic hashing (MD5/SHA1/SHA256) is a great way to look for patterns that are similar, it is not a useful method for actually identifying patterns that are similar. Malware writers frequently alter just a small portion of the malware to alter the hash value as a whole. Some methods for comparing and categorizing untrusted binaries are covered in the section that follows [9, 15].

Classifying Malware Using Fuzzy Hashing: Fuzzy hashing is an innovative method that can detect similarities between malware samples despite minor modifications or obfuscations. This technique allows for faster threat identification and analysis but may encounter challenges like hash collisions. Nevertheless, it remains a powerful tool in combating cybercrime [19].

Classifying Malware Using Import Hashing: Import hashing, or imphash, calculates hashes based on the names of libraries and import functions (APIs) and their execution order. This method helps identify relationships between malware samples, although it may produce false positives when benign programs share libraries with malicious ones. Import hashing, combined with other methods, remains a valuable tool in tracking malware evolution [6, 10].

Classifying Malware Using Section Hashing: Section hashing focuses on specific parts of a file rather than the entire file, allowing for the detection of similarities between malware samples even with significant modifications. Although computationally expensive, this method provides researchers with a deeper understanding of malware's inner workings, aiding in accurate classification [6, 9, 10].

Labeling Malware Using YARA: YARA is an open-source tool used for malware classification and detection by matching specific strings or binary patterns found in malware samples. YARA rules help group related malware samples into families, accelerating analysis and defense development. Its flexibility in rule creation allows researchers to stay ahead in the evolving malware landscape [1, 7, 10, 12, 16, 20, 21].

5 Dynamic Analysis

In dynamic malware analysis, malware samples are performed in a monitored and instrumented environment so that the runtime behaviors and system interactions presented during execution may be examined. In order to establish strong monitoring and analysis capabilities without endangering production systems, analysts often use virtual machines, sandboxes, and emulators [5]. These dynamic analysis tools capture detailed system-level actions in real-time as malware runs, such as tracking system calls, calls to libraries and APIs, access to files and registry entries, network communications, process and memory alterations, and so forth. Malware processes can even be stopped in the middle of their execution and interactively debugged to retrieve more artifacts thanks to advanced dynamic capabilities [5]. Comprehensive activity reports that include information on files written, keys changed, domains linked, processes injected, system settings altered, and other observed behaviors during execution are

created from all of the observed activities. In order to comprehend malware payloads, identify compromised assets, ascertain lateral movement techniques, extract forensic evidence, and ultimately evaluate the gravity of dangers posed in the event that identical infections transpired in production environments, analysts examine these system state changes [5]. While static techniques focus on the malware code itself, dynamic techniques examine the actions and impacts of the malware, giving analysts access to information about attack payloads, exploits, and propagation strategies that cannot be found through static inspection alone. Additionally, dynamic outputs directly influence reaction and safeguards [5].

A. Tools for Dynamic Analysis and Monitoring

Dynamic Malware Analysis: This technique involves monitoring malware behavior during execution to gather insights safely. Key skills include tracking memory allocation, network communications, file/registry activities, system and function calls, and process monitoring. Advanced tools enable dynamic unpacking, instruction hooking, and interactive debugging [5, 8, 26, 27]. Examples include:

- ApateDNS: Spoofs DNS responses.
- Procmon: Records system events.
- Process Explorer: Visualizes process trees.
- Wireshark: Inspects network traffic.
- INetSim: Simulates services.

Cuckoo Sandbox: Automates execution, monitoring, and reporting.

Dynamic monitoring complements static analysis and reverse engineering, offering a comprehensive view of malware threats [5, 8, 26].

Process Inspection with Process Hacker: Provides real-time insights into CPU, memory, thread usage, and process connections, aiding in detecting suspicious activities and examining memory and registry changes [7, 8, 13, 16, 17, 21].

System Interaction with Process Monitor: Records real-time events like file access and registry changes, revealing malware interactions with the operating system and aiding in forensic analysis [7, 8, 13, 16, 17, 21].

Using Noriben: An open-source tool for logging system activities such as process creation and network connections. It integrates with Process Monitor and produces detailed CSV logs for analysis [7, 8, 13, 16, 17, 21].

Recording Network Traffic Using Wireshark: Captures and inspects network traffic to identify malicious communication and data exfiltration, providing valuable network forensics data [7, 8, 11, 13, 16, 17, 21–23, 28].

B. Examining Function Specifications

Examining function calls and parameters with great care is a crucial strategy in dynamic malware research to decipher activities that are disguised. We can log functions used by malware samples and examine values provided to them by using a debugger or instrumentation tool to trace API and system calls during execution. In order to infer capabilities enabled by function calls, parameters can offer context. Malware, for instance, uses the CreateFile API function to access files when the right

filenames and permissions arguments are supplied. We are able to identify potentially suspicious access attempts and extract accessible paths for additional examination by tracking CreateFile calls and parameter data. Deobfuscation is made easier by matching argument data to registers and stack variables through the use of dynamic call tracing in conjunction with static code disassembly. In general, understanding sequences of malware execution processes behind the hood requires careful monitoring of function calls, arguments, return values, and related branches. With packing, encryption, and encoding, it helps us defeat attempts to conceal intentions and capabilities. When trying to unpack malware and get to its main payloads, function tracing works best when combined with other dynamic analysis methods. [7, 8, 13, 16, 17, 21].

C. Monitoring Information Flow

Information flow tracking is a method used to track the data propagation during program execution in order to detect malicious activities that try to misuse or leak private information. One method of information flow tracking is dynamic taint analysis, which marks or "taints" data from dubious sources, such as user inputs or files, and then tracks how the tainted data propagates throughout the system when malware runs. Monitoring whether labeled data enters drains, such as network sockets, where it may be exfiltrated, is the aim. Taint propagation monitors values that are impacted by tainted data when they are written to memory, provided to functions, moved between processes, and other scenarios. For example, if we notice corrupted data being used in library calls in a way that suggests injection attempts, we can identify malicious data flows. Strong dynamic binary instrumentation tools, such as Valgrind and Intel Pin, capture detailed traces of execution to monitor the explicit and implicit flow of sensitive data through a system. Dynamic taint analysis is a useful tool in malware analysis since it can identify payloads, data theft pathways, and attacks that compromise system integrity or confidentiality. It is an information-focused addition to traditional dynamic tracing that helps to understand the capabilities of malware in relation to sensitive data. [7, 8, 13, 16, 17, 21].

(5) Purpose

A thorough technical review of scholarly literature focusing on malware analysis methodologies, in particular behavioral analysis techniques, is required in order to compile information about unique malware behavior patterns that can direct the development of more effective anti-malware programs and behavior-centric detection techniques to counter constantly changing threats. In summary, this review aims to advance behavior-based detection approaches against malware and raise awareness of current research on malware analysis methods targeting behavior patterns by outlining key directions and models based on typical capabilities exhibited by malware families in the wild. The paper emphasizes the drawbacks of the existing signature-focused approaches, emphasizes the need for in-depth malware analysis to fully understand evolving threats, gives a summary of common static and dynamic

analysis techniques, stresses the importance of behavior analysis, and recommends combining reported behavior markers and patterns to significantly enhance detection mechanisms going forward.

(6) Review of literature

The assessment highlights the growing concern of malware due to its increasing complexity, specialization, and difficulty to detect. It reviews advancements in analysis techniques and malware threats, focusing on behavioral models and their advantages and limitations. Key techniques such as hybrid approaches, dynamic tracking, and static analysis are summarized, with an emphasis on popular tools. Limitations include the ease of bypassing signature-based methods and the lack of multi-layered behavioral models. The proposed systematic review aims to address these gaps by compiling evidence on malware family behavior patterns to improve detection models, identifying research gaps, and suggesting a synthesis-based approach to enhance behavioral models.

6 Approach

The study presents a comprehensive malware analysis methodology that integrates both static and dynamic techniques. Static analysis involves steps such as file type identification, cryptographic hashing, antivirus scanning, text extraction, metadata examination, API dependency identification, and resource de-obfuscation using tools like hex editors and reverse engineering frameworks. Dynamic analysis complements this by using instrumented sandbox environments to monitor real-time malware behavior, including process activity, function calls, file/registry interactions, network traffic, and memory usage with tools like debuggers and system monitors. The goal is to gather forensic evidence, record infection sequences, and understand malware's impact on various system resources. By combining static and dynamic approaches, the methodology aims to connect data artifacts, uncover hidden functionalities, and analyze transmission paths, thereby enhancing detection and countermeasure strategies against both current and emerging threats. The proposed methodology's flowchart is illustrated in Fig. 4.

7 Results and Findings

By leveraging data from multiple sources, researchers analyzed behaviors and features of prominent malware like Stuxnet, Dridex, WannaCry, and Emotet, aiding network security. This is achieved through a combined static and dynamic analysis approach. Correlating signs such as system file modifications with mutation techniques helps identify malware families and predict future variants. Forensic examination of filesystems, registries, networks, memory, and APIs reveals complex

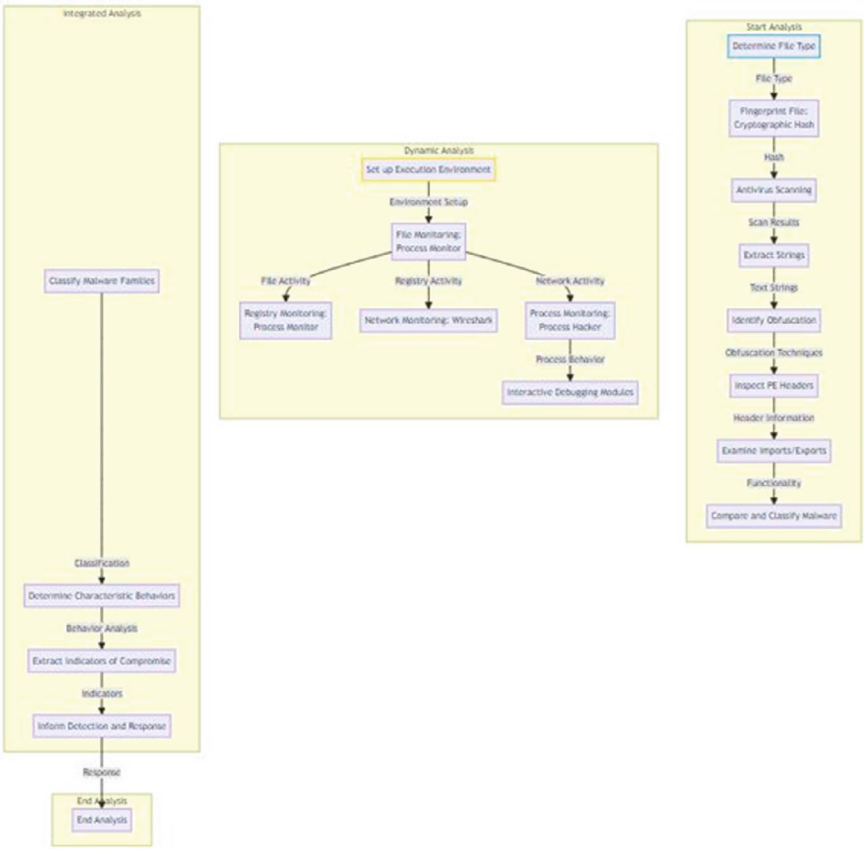

Fig. 4 Flowchart of suggested approach

attack pathways used by sophisticated malware. This comprehensive threat intelligence enhances detection procedures by addressing infection channels, behavioral markers, and exploit techniques. Additionally, the research informs response strategies by identifying dependencies that can be disrupted to counter current and future malware campaigns [29].

8 Conclusion

This research offers a systematic approach to analyzing modern malware by combining static and dynamic methods. It uses tools for debugging, monitoring, disassembly, and reverse engineering to provide insights into malware's behavior,

dependencies, and propagation techniques. This approach helps incident response teams assess threats, identify hidden infection stages, extract actionable indicators, and enhance protections. The methodology aims to improve proactive defense by providing the necessary intelligence to counter evolving malware threats.

Securing the Cloud Environment: A Defense Mechanism Against DDoS Attack

Khushbu Dadhe, Hemraj Shobharam Lamkuche, Emma Qumsiyeh, and Ghassan Samara

Abstract The rising frequency and sophistication of Distributed Denial of Service (DDoS) attacks pose a substantial threat to service availability in the dynamic landscape of cloud computing. This study presents a complete defense strategy for dealing with the multifaceted issues offered by DDoS attacks in cloud environments. The study analyses and evaluates several tactics, such as source checking, multi-stage attack detection, and a novel text-based Turing test, to improve cloud service security. The study examines previous research on DDoS attacks in the context of cloud computing, examining various strategies and protection methods. In the literature, notable contributions include insights into low-rate DDoS attacks, extensive research on various types of DDoS attacks, and surveys on mitigation solutions based on machine learning, deep learning, and software-defined networking. The technique section discusses DDoS assaults, their functioning mechanisms, types, and their specific concerns in cloud computing systems. The suggested approach employs a hybrid cloud architecture with modules for source verification, attack detection, and a text-based Turing test. The system seeks to counter DDoS attacks efficiently while minimizing performance overhead.

Keywords DDoS (distributed denial of service attack) · Multidimensional · Mitigation · Technological progress

1 Introduction

The prevalence and sophistication of Distributed Denial of Service (DDoS) assaults emerge as a formidable and developing danger in today's cloud computing world. DDoS assaults, which are defined as malicious attempts to interrupt service availability, pose significant challenges to the smooth operation of cloud systems. As more businesses rely on cloud platforms to supply services and store data, the requirement for robust DDoS protection techniques becomes critical in technological progress [1–5].

Cloud computing, defined as the delivery of hardware and software services via the internet, is an essential component of today's technological landscape. Infrastructure as a Service (IaaS), Platform as a Service (PaaS), and Software as a Service (SaaS) are components of the architecture. As people rely more on cloud services, the necessity for strong security measures to protect against disruptive threats like DDoS attacks grows. The section on related work examines existing research on various elements of DDoS assaults in cloud computing. Several notable studies investigate various attack mechanisms, detection methods, and mitigation strategies, ranging from machine-learning approaches to software-defined networking solutions. These findings give a solid foundation for comprehending the issues faced by DDoS attacks and serve as the cornerstone for the suggested defense system.

The goal of this research study is to create a comprehensive defense mechanism against DDoS attacks in cloud environments. These attacks' increasing frequency and sophistication necessitate novel approaches to fortifying cloud services. The research looks at a multi-dimensional strategy that includes modules like source verification, multi-stage attack detection, and a novel text-based Turing test. A proactive and multifaceted strategy becomes increasingly important as the threat landscape evolves. By proposing a comprehensive defense strategy, this research study intends to add to the continuing discussion on cloud security. The following parts go into the methodology, proposed solution, implementation details, evaluation, and findings, providing a comprehensive picture of the study process and its outcomes. Through this investigation, we hope to provide valuable insights into protecting cloud services from the growing threat of DDoS attacks.

2 Related Work

The literature on DDoS (Distributed Denial of Service) attacks within cloud computing environments presents various approaches for detection, prevention, and mitigation. Potluri et al. [6] provide a comprehensive overview of DDoS attacks in

cloud computing, detailing detection techniques and prevention methods, including blockchain, deep learning, and machine learning approaches. These techniques are crucial given the complexity and severity of DDoS attacks, which can significantly disrupt services and cause business losses.

Neha et al. [7] focus on the challenges of detecting low-rate DDoS attacks, which are more difficult to identify than other types. Their work includes a detailed discussion of performance metrics for evaluating defense solutions in cloud environments and proposes various taxonomies for DDoS defense.

Somani et al. [8] delve into the EDoS (Economic Denial of Sustainability) attack, a primary form of DDoS in cloud settings. Their study compares various statistics and proposes new methods to counter DDoS attacks, offering future ideas for mitigation. Additionally, Somani et al. [9] present a framework that minimizes downtime following a DDoS attack, detailing the required resources and providing experimental results that demonstrate the effectiveness of different models.

Bakr et al. [10] conducted a survey on mitigation techniques against DDoS attacks, discussing issues related to DDoS in cloud environments and suggesting prevention techniques like MTD (Moving Target Defense), CAPTCHA, EDoS, and sPoW (Server Proof of Work). They also explore detection methods such as bot-cloud and anomaly-based detection, proposing a multi-layer solution for studying cloud computing data.

Saxena et al. [11] introduce Cloud Warrior, a system for filtering malicious traffic from legitimate traffic, and utilize the Weibull distribution to detect DDoS attacks effectively. Their study also covers IP spoofing and compares various performance metrics to validate their approach.

Velliangiri et al. [12] use deep learning, specifically a TEHO-based DBN (Deep Belief Network), to improve DDoS defense in cloud computing. By analyzing log files with classifiers, their approach effectively distinguishes DDoS attacks using different datasets.

Wani et al. [13] apply machine learning techniques such as Support Vector Machine (SVM), Naïve Bayes, and Random Forest to detect DDoS attacks. Their experimental setup compares these algorithms to determine which is most effective in real-world scenarios.

Bhushan et al. [14] discuss the role of SDN (Software Defined Networking) in DDoS detection, highlighting its ability to monitor and analyze traffic. They propose a flow table sharing technique to overcome SDN's limitations, along with a mathematical model for analyzing unused flow table space.

Lastly, Kushwah et al. [15] set up experiments to demonstrate that their proposed system can detect DDoS attacks with high accuracy, sensitivity, specificity, precision, and F-score, utilizing a machine learning approach to build a robust detection model for cloud environments.

3 Methodology

Background

a. Definition

A common recent attack is the denial-of-service (DoS) attack, which aims to prevent authorized users from accessing information or services. A more advanced variant is the distributed denial-of-service (DDoS) attack, where multiple compromised systems target a cloud system to crash it. Cloud computing combines hardware and software to provide services over a network like the Internet. It is categorized into three types:

- IaaS (Infrastructure as a Service): Provides access to networks, storage, and bandwidth.
- PaaS (Platform as a Service): Offers platforms and operating systems for application development.
- SaaS (Software as a Service): Grants access to software applications.

b. Working Mechanism of DDoS

A DDoS botnet is the heart of any DDoS attack (Fig. 1). A botnet is a network of hundreds or thousands of controlled machines, often known as zombies or bots, created by a malicious hacker. Attackers will gather these systems by identifying weak places that can be infected with malware through phishing attacks, advertising attacks, and other methods of mass infection.

The infected computers are waiting for remote instruction from a command-and-control server, the attack's command hub and frequently a hacker-infested machine. When launched, all these bots attempt to access a resource or service the victim has made available online. Each bot would have sent the victim harmless and ordinary inquiries and network traffic separately. However, because there are a variety of them,

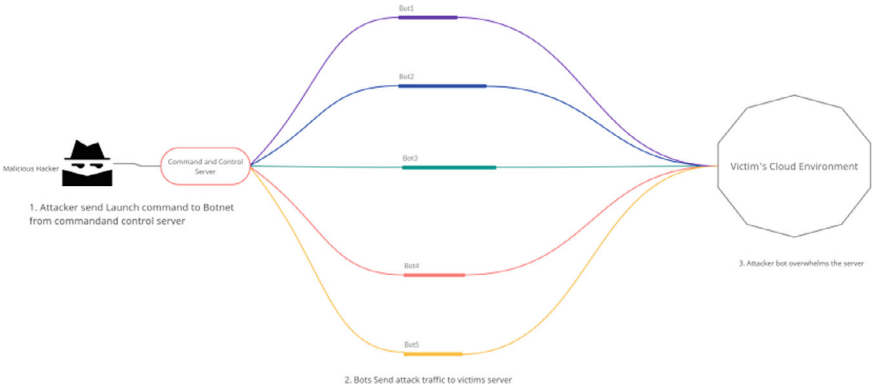

Fig. 1 How attackers use botnet

the requests frequently exceed the capabilities of the target system. Because the bots are typically just regular computers dispersed throughout the internet, blocking their traffic can be difficult or impossible without disconnecting reputable users (Fig. 2).

c. **Types**

Talking about the types of DDoS attacks that we commonly encounter in our day-to-day work.

1. Application layer attacks: These attacks often occur in the OSI model's top layer. In this type of attack, the attacker attempts to overload specific program features so that legitimate users cannot access or utilize the application. The top layer of the OSI architecture, which is being attacked, is understood to be responsible for all communications between web servers and browsers. When an application DDoS attack happens, the user may be impacted somehow by a site's slow loading time (Fig. 3).
2. Protocol attacks: Protocol attacks seek to exhaust the server's resources and its networking equipment, such as load balancers, routing engines, and firewalls. The SYN flood attack is one example of a protocol attack. Before a secure communication connection can be formed, two computers must perform a TCP handshake. Using a TCP handshake, two parties can communicate preliminary information. The TCP handshake is typically initiated by a SYN packet, which tells the server that the client desires to start a new channel. In a SYN flood attack, the attacker sends a huge number of SYN packets to the server, each with a faked IP address (Fig. 4).
3. Volumetric attacks: Vulnerability attacks are also known as "Network floods," and they include ICMP and UDP floods (UDP reflection attacks). Such an attack occurs when your applications/services are rendered unavailable to users due to a network being overrun by a large amount of malicious traffic. Although this type of assault is usually mentioned in terms of hundreds of gigabits per second (Gbps), few recent attacks have exceeded 1Tbps (Figs. 5 and 6).

d. **Why DDoS in Cloud Computing Is a Threat**

A DDOS is an organized, extensive attack target system or network bandwidth availability. DDoS attacks of many types are used to disrupt cloud services. Among these attacks are the ICMP (ping) flood, in which attackers send numerous erroneous pings to cloud servers; the HTTP GET Flood, in which attackers send a massive influx of requests to cloud servers and exhaust all available resources; and the IP spoofing attack, in which ICMP is used by echo request for packets to create a denial of service. Attackers seek to temporarily disrupt or halt a website's functions, rendering it unavailable. DDoS assaults are rapidly evolving and are aimed at large businesses, resulting in considerable financial losses for such companies and websites worldwide. As a result, it is critical to investigate DODS-related attacks on cloud systems and provide countermeasures against them.

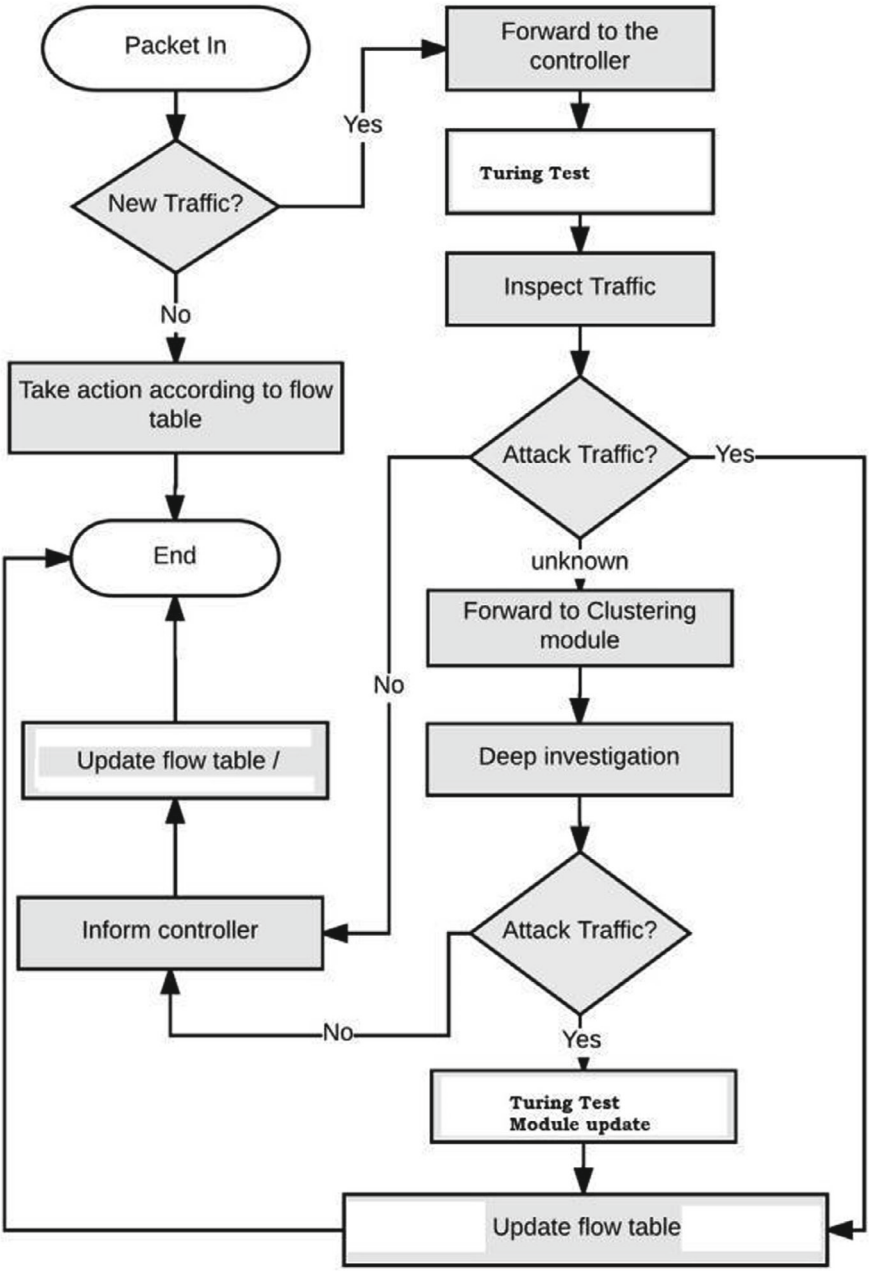

Fig. 2 Attack detection module

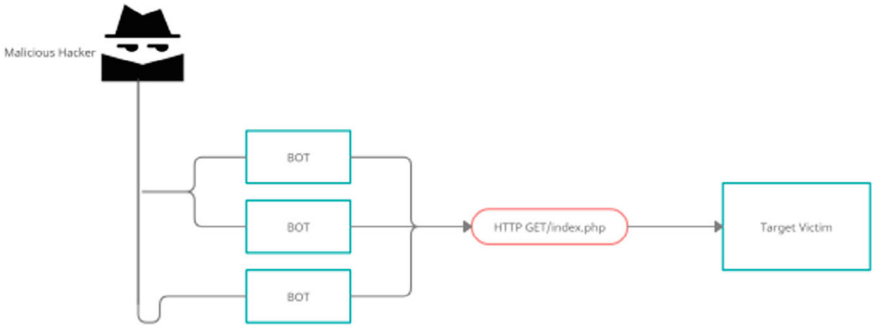

Fig. 3 Application layer

Fig. 4 Protocol attack

Fig. 5 Volumetric attack

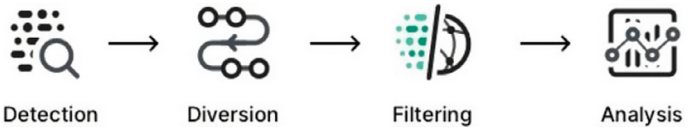

Fig. 6 Basic WorkFlow

Mitigation Tactic	Advantages	Disadvantages
Rate-limiting	• Easy to deploy and provision across network nodes • Flexible through dynamic threshold setting • Useful when detection has many false positives	• Coarse grain filtering also hitting legitimate traffic • Cannot completely eliminate the malicious traffic
Filtering	• Easy to deploy and provision across network node • Flexible through adding and removing addresses	• Cannot distinguish between malicious and legitimate traffic associated to the same sources • Difficult to detect all malicious addresses

Fig. 7 Advantages and disadvantages of DDOS mitigation tactics

DDoS Attacks Detection and Mitigation Techniques

DDoS attacks can be detected by monitoring unusual increases in network traffic, such as a surge in packets directed at a specific site. Detection can occur at the server level, through ISP monitoring, or at each router by observing incoming and outgoing traffic. To mitigate the attack, it's crucial to prevent erroneous packets from reaching their target. Although router-based flow analysis has limitations, it can be effective for detecting anomalies. Instead of investing in expensive hardware, an interoperable protocol with other routers can be used for detection. Rate-limiting and filtering are two common mitigation strategies. Rate-limiting involves reducing the volume of incoming attack packets to manageable levels while filtering focuses on eliminating attack traffic. However, filtering techniques may be restricted by law for public use, though they can be implemented within an organization (Fig. 7).

Problem Statement

DDoS attacks may threaten the operation of cloud services. Several efforts have been undertaken in recent years to identify DDoS assaults, which come in various flavors. The goal of this research is to reduce the severity of these attacks. The danger to the availability of Distributed Denial of Service (DDoS) attacks, as highlighted by Bakr et al. [10], plays a significant role in developing security architecture. A successful DDoS attack may cause service degradation or total outage. Due to various unique characteristics, cloud computing technologies can fundamentally change how we respond to a DDoS attack. DoS attacks aim to overwhelm active servers in such a way that the service is rendered unavailable due to an excessive volume of pending requests filling the service queue. A different flavor of DoS is Distributed DoS, or DDoS when the attackers are a group of devices aimed at a specific service. The frequency of documented DDoS occurrences is increasing, making it one of the most serious and deadly threats among many. Bhusan et al. [14]. The issue of restricted flow table space was also considered a limitation of OpenFlow switches in SDN. Therefore, this limitation can be exploited. DDoS attacks on the SDN-based cloud that use flow table overloading.

More than 20% of At least one known DDoS attack incident targets global enterprise infrastructure. The prediction shows an intense- anticipation that the DDoS attackers' focus has shifted to cloud infrastructure and services. Saxsena et al. [11] also said in his paper that these assault assumptions made in the research are supported by numerous attacks over the past two years. A few well-known attacks have garnered much attention in the research community among the many recent ones. On Christmas Day in 2015, Lizard [16] Squad hacked Microsoft and Sony's cloud-based gaming services, causing them to go offline. A significant DDoS attack was launched on Rackspace, a provider of cloud services. The cloud and SaaS (Software as a Service) industry have been the most often targeted DDoS targets in recent quarters, according to a report from iDefense Security Intelligence Services by Verisign.

Proposed Solution

A hybrid cloud architecture is recommended for cloud services based on the evolving threats and consequences of attacks. Figure 4 demonstrates the system flow. This is evidenced by the fact that our kernel's Source Check-in and Counting module will receive the packet initially after it arrives from the Internet. If the checked packet is suspect, it will be forwarded to the Turing test module. The Test module will test the requester by asking a text- based question of her or him; to pass the test and maintain her connections, the requester must provide the correct response. The Source Checking and Detection Module will search for any potential DDoS attacks. This system may be an effective way to counter DDoS attacks on a cloud computing environment.

a. **Architecture**

Counting and Checking Modules: This is the coordinating module for the entire system. The kernel Source Checking and Counting module will receive the Internet packet first. A packet in our system can be in different group lists. This module determines whether the incoming packet's source address is in which group. If the packet's originating address is on, say, group 1, it will be removed immediately. If the source/destination addresses are on the group, the packet will be forwarded to the Turing Test module. The Counting module will record the packet if it is not on either group 1 or group 2 list before forwarding it on to the destination. The Source, Destination, and Arrival Times fields of each packet are recorded by the Counting module.

Detection Module: This module aims to identify potential harmful sources and add them to group 2 lists. The Turing Test module will, therefore, attempt to challenge the malicious source addresses. The detection module gathers and saves information about each service's traffic patterns, including average and maximum values for connections made per second, incoming packet and byte rates, and more. As soon as we see a service is being targeted, we add its public IP to group 2 to prevent any more incoming HTTP connections to it. The public IP address for the service will be dropped from group 2. All new incoming HTTP requests will be routed to the Testing module until they successfully complete the challenge, which will reduce traffic. Up until its traffic is reduced, the group 2 list will repeatedly add and remove

the Service's public IP address. The IaaS must enable the technology of auto-scaling in order to provide more resources, such as more network bandwidth or more virtual machines, to meet the demand if the volume of traffic continues to be extremely high.

Testing Module: This module's primary duty is to choose a question at random from the question pool and transmit the text-based query to the requester. The next step would be determining whether the requester's response is accurate. The requester cannot go to its intended location until it provides the correct response to the challenged inquiry. Question Generation Module: This module's primary duty is to generate text-based questions at random to test the alleged requester in the Turing Test module. The most popular Turing test technique that many websites employ to stop robots from launching brute-force attacks is CAPTCHA. The majority of websites use image-based challenges to determine whether the requester is a person or a robot. A challenge with an image component calls for increased network transmission bandwidth. When we input the wrong password more than five times, the Gmail login screen displays a challenging image with a size of about 3 Kbytes. When compared to Gmail, this module's text-based Turing test question requires less than 1/10 the bandwidth, or roughly 200 bytes, to challenge a requester (Fig. 8).

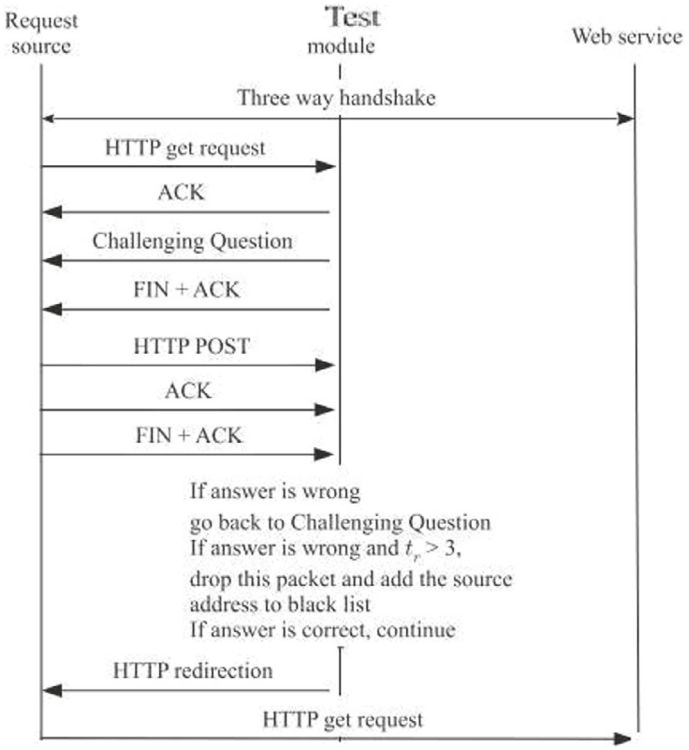

Fig. 8 Work flow

b. **Implementation**

We utilized the open-source program Wireshark to record Internet traffic. All digital data received or transferred through various devices, such as Ethernet or Wi-Fi devices, can be captured using Wireshark. Additionally, it facilitates protocol packet identification within the Data Link Layer's wrapper packet (e.g., TCP, UDP). Instead of creating a bot program for our simulation, we used the Low Orbit Ion Canon tool, a free DDoS attack launcher. Even attackers use this tool to launch DDoS attacks in the real world. We have built a modest network with one router and a few host computers to illustrate our methodology. Any device could fall victim to a DDoS attack. The Wireshark utility was installed on one of the computers in this network. Wireshark's ability to record all network traffic was employed for network traffic capturing. This configuration is comparable to an Internet router, which collects all the traffic traveling through it to various destinations. The same was used to record all of the legitimate and malicious traffic. In the specified network, packets are collected for around five hours. The packets were stored as pcapng files after being recorded, which is a Wireshark file format for captured packets. On the file system, when packets were collected at that time, normal traffic and an attack were preserved separately. A Python data extraction application was created to extract the IP layer data from a captured packet. This software retrieves the IP address, port, and time from each IP packet that is collected. We established a test-bed that included (Figs. 9, 10 and 11):

(1) A server that performs our DDoS attack reduction, along with the web service undergoing test, which does nothing but deliver a short static HTML file to reduce communication costs between them. (2) To generate white input loads, a white input load generator that employs the stress testing software ab, which is configured to run 100 concurrent threads with 1000 requests per thread and targets the web service deployed on the aforementioned server, is utilized. (3) A grey input load generator

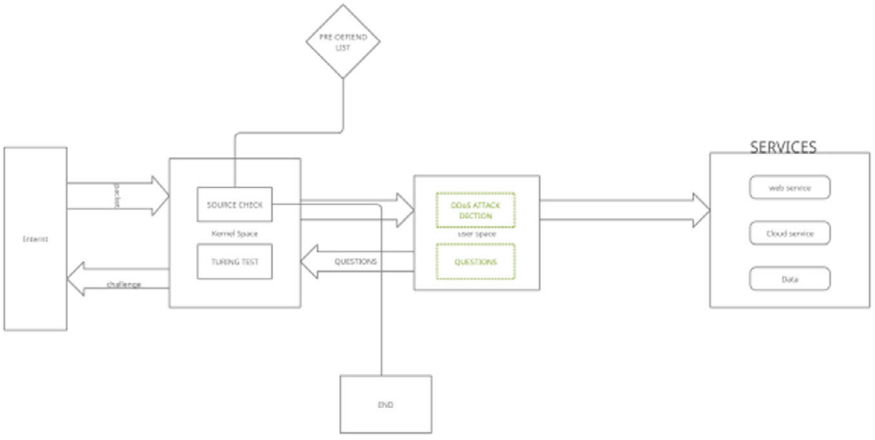

Fig. 9 Work flow

192.168.0.4	17	1512094786.14

Fig. 11 Collection sample

node that regularly issues requests to the web service under test, and (4) A black or attack load generator node running a raw socket program that generates a huge number of HTTP request packets flow capturing: We must first collect the flow data within a time range that will be set at the beginning in order to do the analysis. As a result, a flow will include all of the packets that are sent from a router to various destinations throughout the course of 300 s. Such flows can also be combined to create a new flow with wider time spans. As soon as we get flow information, we may iteratively apply learning techniques to each flow to learn more about the flow's typical behavior. For instance, on average, how many packets of various protocols are leaving from a given router or location at a particular hour of the day?

4 Evaluation

The overhead of inspecting each incoming packet to see if it is on the black list, white list, source/destination list, frequency of invoking challenge-response interactions, and overhead of each challenge-response interaction are the main factors affecting the DDoS attack mitigation system's performance cost. The Attack Detection module can run on a separate machine without interfering with the traffic gateway's performance. These nodes are connected by a gigabit Ethernet switch. We begin by computing the proportionate cost of looking up the black list, Fig. 12 line 1 shows the throughput (number of requests successfully processed per second) of the test web service when just the white input load generator node, which is not in the black list, sends input requests. Even with a 100,000-entry black list, the black list is organized as a hash table, resulting in a 4.4% reduction in throughput when compared to the configuration with the DDoS attack mitigation strategy turned off (No DDoS). Figure 12 indicates that the DDoS attack mitigation system is effective at intercepting assault packets early on, resulting in a throughput decrease of no more than 8.5% from DDoS attacks when the blacklist size surpasses 100,000.

In contrast to the "No DDoS" situation, Fig. 13 demonstrates that even though the DDoS attack mitigation system must send out 10,000 challenge questions per second, the test web services performance reduction is just 7.3%. Furthermore, the throughput loss is stopped when the grey input load generator is added to the black list and then blocked (Blocked). The effects of two different challenge question sizes, 200–300 bytes, and 1000 bytes, on performance, are compared.

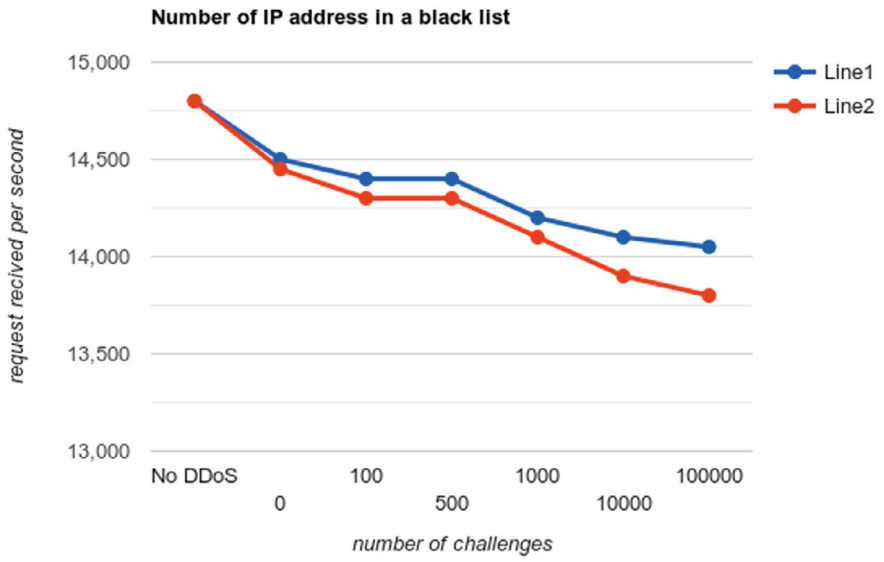

Fig. 12 Data

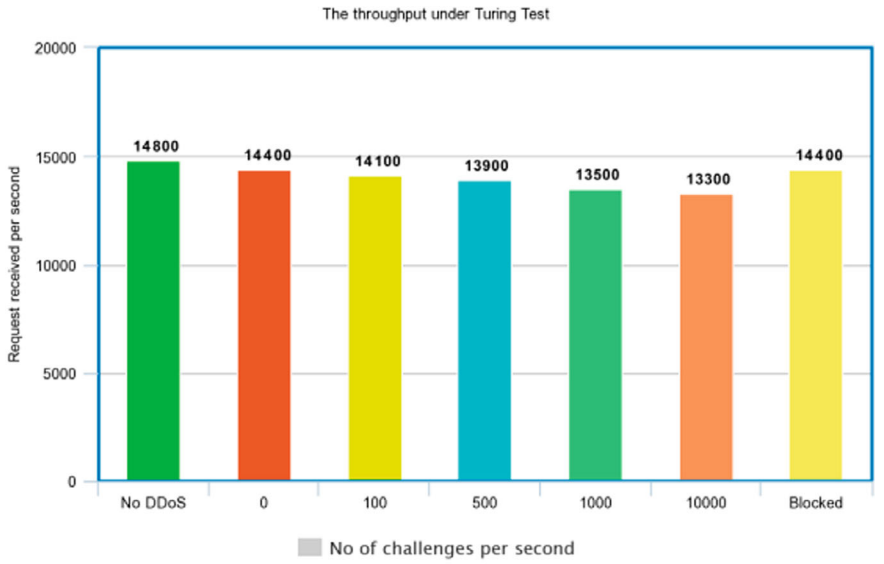

Fig. 13 Data

The text-based Turing test appears to be promising. In comparison, the challenge question on the Google Gmail login screen is approximately 3 Kbytes in size.

5 Results

Source-based Checking and Counting, Multi-Stage Attack Detection, Text-Based Turing Test, and Question Generation modules comprise the DDoS security and system we presented. When input and its requests come from known valid and authorized users only, known good users and known bad users, invalid users, and potential attackers, this DDoS attack mitigation technology successfully defends a web service. The advice was text-based and Turing test stops the Turing test from unwittingly aiding a DDoS attack.

6 Conclusion

In conclusion, the research presents an approach for improving DDoS defense in cloud computing environments using a hybrid cloud architecture. The architecture incorporates a multi-module system that includes modules for source checking and counting, detection, testing, and question generation. By categorizing incoming

packets, challenging possibly hostile sources, and conducting text-based Turing tests, the presented system intends to find and mitigate DDoS attacks quickly. The evaluation component of the study exhibits the suggested solution's effectiveness in mitigating DDoS attacks, demonstrating its ability to reduce throughput losses even in the presence of huge blacklists and significant challenge-response interactions. The results highlight the system's capacity to adapt to changing challenge question sizes while maintaining a balance of security and performance.

This research study, in essence, presents a complete review of DDoS attacks in cloud computing, providing useful insights into existing protection mechanisms and suggesting a new hybrid cloud architecture for increased security. As the DDoS attacks increase, the data of this study help to strengthen cloud environments against cyber threats, assuring the continued delivery of services to customers and enterprises alike.

The Role of Virtual Reality in Promoting Psychological Well-Being in Educational Environments

Adnan Hassan Alsarayreh

Abstract The following is an exploratory investigation regarding the use of VR in promoting mental health from a variety of perspectives, but all hinge on the ability of VR to provide immersive and interactive experiences that strike well with students and educators. It uses a systematic qualitative research approach by reviewing existing literature, including empirical studies, theoretical frameworks and practical applications related to psychological benefits using VR technology. Results showed great potential for VR environments in helping emotional regulation, reducing symptoms of anxiety and increasing general well-being through innovative interventions such as biofeedback video games and virtual harmony music therapy. This paper ends with insights drawn from the integration of VR into educational settings for enhanced psychological well-being—understanding that it acts as a transformative tool in the areas of mental health and education.

Keywords Virtual reality · Psychological well-being · Education · Mental health · Immersive experiences · Emotional regulation · Anxiety reduction · Biofeedback · Virtual harmony music therapy · Qualitative research

1 Introduction

The introduction section offers a comprehensive overview of how virtual reality (VR) contributes to enhancing psychological well-being within educational settings. Noteworthy for its ability to deliver immersive and interactive experiences, VR technology has attracted attention due to its positive effects on mental health. By focusing on the use of VR technological tools in mental health care, replicating real-life settings and generating auditory, visual and tactile scenes with fidelity to this section initiates

the discussion that will justify the relevance of VR applications within educational scenarios: psychological well-being. Moreover, it introduces the incorporation of dance and music into virtual environments for enhancing therapy practices as well parallel with VR technologies introduction (e.g., Virtual Harmony Music Therapy) for reducing levels of stress and anxiety.

Moreover, this section identifies the potential of VR technology in enhancing emotional regulation through such interventions as discussed among others biofeedback video games and web-based reflective applications. The following introduction will discuss further on how varied use and benefits of VR technology can enhance psychological wellness within an educational set up.

1.1 Background

The realm of education has witnessed an increasing number of stakeholders interested in Virtual Reality Technology due to its potential to facilitate richer learning experiences. There is proof that the integration of VR technology into education improves presence, motivation, engagement and learners' capacities as some studies have reported [1, 2]. Research comparing traditional videoconferencing tools with Social VR platforms reveals that VR viewing fosters higher levels of social presence, suggesting that VR can positively affect attitudes and behaviors within educational contexts. Moreover, VR technology has been investigated for its role in mental health treatment, with uses such as virtual harmony music therapy aimed at alleviating anxiety and stress, along with psychological relaxation systems designed for those suffering from insomnia and postpartum depression [1]. Although VR technology holds promise in the realm of mental health, additional research is essential to enhance its efficacy and to prioritize effective treatment strategies over technical considerations. These advancements underscore the potential of VR to support psychological well-being in educational settings, emphasizing the importance of ongoing exploration and enhancement in both educational and mental health applications.

1.2 Methodology

It is a qualitative study that explores the contribution of virtual reality towards achieving psychological well-being from the perspective of educational environments. A descriptive approach will be taken in reviewing related literature systematically, drawing much strength from existing theories, empirical studies and practical applications of VR in addressing education that have been done before. This will form a basis for understanding how VR technology affects psychological well-being of students and teachers. An analytical approach is used after data description to interpret it by identifying key themes and patterns regarding psychological impacts related explicitly to well-being development resulting from the use of VR. The reason

is that such a dual methodology will go a long way in ensuring that there is an adequate exploration of research-related factors underpinning the effectiveness contribution of VR technology toward enhancing well-being in educational settings. The findings are research-informed insights and recommendations for facilitating mental health support and well-being through the appropriate integration of virtual reality into education.

1.3 Research Significance

The significance of psychological well-being within educational environments is immense and cannot be emphasized enough. It is vital to prioritize students' well-being, as numerous studies have repeatedly demonstrated a strong correlation between student welfare and factors such as academic achievement, sense of agency, communication skills, self-esteem, confidence and community involvement. Therefore, educational institutions must focus on promoting and nurturing the mental and emotional health of their students. Additionally, the well-being of teachers holds equal importance in establishing a positive and safe classroom atmosphere for learners. Educators who maintain their psychological health play a crucial role in creating an environment that supports and uplifts student well-being. In providing teachers with the tools and backing toward better mental health, educational institutions can create a setup entailing holistic development for both students and facilitators. Secondly, it is important to realize the undeniable link between well-being and learning. Understanding that student welfare and academic success are interconnected and mutually reliant is crucial. When students are provided with mental or emotional support they tend to get involved in their education which leads to good academic results therefore there is a need for educational institutions to implement a comprehensive approach that recognizes the importance of both learning and well-being, thereby giving each enough priority for the overall growth and development of students. The importance of mental health within educational settings cannot be overemphasized in acknowledging the relationship between student well-being, successful academics; equally important is considering the impact this has on creating a positive classroom climate. By focusing on the well-being of both students and teachers, educational institutions can create an environment that encourages comprehensive development and establishes the groundwork for lasting success.

In accordance with this thorough comprehension, the increasing recognition, appreciation and acceptance of groundbreaking virtual reality (VR) technology in educational settings is becoming widespread among experts, educators, scholars and researchers. This state-of-the-art VR technology, with its astonishing capabilities, empowers the creation, development and execution of exceptionally immersive, engaging, and transformative experiences. Such experiences can effectively and effortlessly facilitate the application of highly efficient and invaluable emotion regulation techniques and strategies, leading to significant and positively impactful

advancements in the comprehensive realm of mental health, as well as in individuals' subjective well-being and satisfaction. By leveraging the essential and powerful VR technology, dedicated and passionate researchers and educators can thoroughly measure, evaluate, explore and analyze a range of crucial cognitive, emotional, physiological and behavioral responses and dynamics. Operating in real time, they provide a unique and invaluable platform for actively promoting psychological well-being and flourishing in both formal and informal educational environments, free from limitations or constraints [3].

2 Understanding Psychological Well-Being

Psychological well-being includes multiple facets, such as autonomy, mastery of one's environment, personal development, positive relationships with others, a sense of purpose in life and self-acceptance, as indicated by the Subjective Happiness Scale [3]. Also, the MPQ Well-being scale evaluates positive and negative emotional temperaments, constraint and absorption and thus provides insights related to sanguine and melancholic aspects of the individual. The DASS and also the ERQ are important tools for assessing emotional regulation and well-being. In academia, Virtual Reality Technology has been proven capable of promoting psychological wellness in interventions such as virtual harmony music therapy and psychological relaxation systems [3].

2.1 Definition and Components of Psychological Well-Being

Psychological well-being is made up of multiple components that strongly influence an individual's total mental health. These dimensions are emotional stability, self-acceptance, personal growth, purpose in life, good relationships with others and autonomy. In school settings, the identification and nurturing of these dimensions are important for the healthy growth of students in a holistic sense. The use of Virtual Reality (VR) technology has been explored in psychological research by creating "out-of-body experiences," inducing "self-consciousness" which indicates its potential application toward enhancing psychological well-being. By introducing VR technology into educational programs, immersive experiences can be created which cater to various components of psychological well-being such as improvement in self-awareness, emotional regulation, interpersonal skills as well as resilience during tough times. This would be in line with promoting subjective well-being as a valid approach for better mental health and instilling a sense of purpose and meaning into students' lives. Hence, the integration of VR within educational settings not only addresses but is a promising and challenging channel to address the intricate nature of psychological well-being, boost mental health of students and equip them with prerequisite skill-sets for success in an ever-evolving environment [3] 4.

2.2 Theoretical Frameworks for Assessing Psychological Well-Being

The psychological assessment of well-being in educational setting: a theoretical framework and models is informed by a variety of theoretical frameworks and models which are vital for understanding and evaluation of well-being. Virtual reality has been widely used in many different ways to increase wellness among both healthy individuals as well as clinical populations resulting in great success. Several research studies have reported the excellent effectiveness of VR for pain management, enhancement of emotion regulation skills, reduction on symptoms related to anxiety, depression and stress. For instance by integrating VR with advanced biofeedback systems like game-based biofeedback and neurofeedback it has shown to be very effective leading into such positive impacts related to both physical and mental health. In addition interventions also exist designed specifically toward improving ICT skills thereby supporting social functioning by enhancing well-being amongst elderly people. Moreover, an up-to-date research carried out in 2020 has finally proven VR-based interactive feedback program to be a valid intervention tool for promoting subjective well-being, thus in the process reemphasizing the vitality of VR technology in improving mental health. Such revolutionary findings further underline with a high degree of boldness VR's vast potential to bring considerable positive changes on the psychological wellness of individuals placed within educational settings [5].

3 Benefits of Virtual Reality in Education

Virtual reality has very many advantages when used in the education sector, especially by increasing student engagement and immersion. Emotional interactions are promoted by VR; thus, learners can connect with the content to be learned on a much deeper level [5]. Students are able to interact with virtual settings, characters and situations so that their understanding is enriched, coupled with emotional involvement in the learning materials. Moreover, it can create real virtual classrooms where students attend lectures and work with other classmates or virtual instructors [6]. The interactivity and immersion bring about a more interesting and efficient way of learning for students whether in an asynchronous or synchronous environment.

3.1 Enhanced Engagement and Immersion

VR offers many opportunities for affective interaction: students can actively engage with virtual characters and elements in the digital space [7]. This kind of engagement helps learners feel emotionally connected to the learning content, making it more

interesting, memorable and impactful. VR is also useful for enhancing educational experiences in literature. With VR, students can enter the world of virtual literature through role-playing activities. Not only does this help students better understand literary works, but it also fosters affective engagement by bringing stories to life as students act out different characters and interact with virtual literary environments. Furthermore, through VR technology, learners can be taken to a number of different places; this helps them relate theory to practice and understand various concepts better. Within this area, VR brings a unique opportunity for students to see and visualize theoretical concepts in an interactive three-dimensional environment [7]. This approach to experiential learning will allow a deeper understanding and more engagement since students can go through, handle and run into a virtual setting of the real-world subject being taught in their academic journey. The use of VR interventions as educational resources has shown great promise in enhancing overall engagement, knowledge retention and acquisition. Because it offers such a unique dynamic learning experience, VR has the ability to revolutionize online training programs by providing this interactivity resulting from what traditional online education has been missing as an aspect of experiential learning. Moreover, empathy is encouraged by VR since students can 'step into' other people's shoes and obtain first-hand experiences with different perspectives; thus promoting understanding and compassion among individuals. In conclusion, the incorporation of VR technology in educational settings has proved very advantageous in increasing engagement as well as deepening understanding and fostering experiential learning. By nature, virtual reality allows learners to engage, explore and learn through experience in a way not possible with conventional methodologies. As we move forward with VR technology, it will revolutionize the education and training industry by providing students with an interesting and memorable learning experience among different domains.

3.2 Personalized Learning Experiences

Virtual reality technology is revolutionizing personalized learning and has made its way into the landscape of educational environments, transforming how students learn. This development allows for fine-tuning and adapting learning contexts to the specific needs and liking of each individual learner. By producing three-dimensional replicas of real environments, VR creates real-world learning tasks for higher education learners. New findings indicate that VR increases immersion and acts as a cheap tool for teachers to deliver lessons in which students show more interest [8]. Moreover, research findings have shown that those schooled under VR conditions have memorization that is better than those who are schooled under the traditional system, higher positive emotions, lesser negative emotions and greater engagement on the basis of information imparted when compared with those under traditional educational methods. The use of virtual reality in technological equipment within curricula shows great promise in meeting different types of student learners' information needs and improving their total educational experience.

4 Applications of Virtual Reality for Psychological Well-Being

Virtual reality has emerged as a useful tool in creating relaxation and stress relief through the provision of educational settings [9]. Discuss two key approaches to implementing VR in this scenario. The first approach is to create virtual environments with general context and soothing stories that help individuals deal with their physiological responses. The second approach is placing individuals in VR-driven scenarios that allow them to regulate emotional responses. Additionally, the authors propose a novel user-centered technique using customized VR experiences based on major life events, aiming to capture individualized aspects of those events within virtual environments toward possibly stronger and longer-lasting relaxation benefits for users.

Virtual reality in enhancing mental wellness is a concept that seems to have very positive implications for addressing stress and anxiety in educational contexts by introducing innovative ways of enhancing mindfulness and other emotion management techniques.

4.1 Stress and Anxiety Reduction Techniques

The research on VR for stress and anxiety in educational settings has just begun. A meta-analysis found that VR interventions are likely to be more successful than classical ones, as they provoke an even larger IES-updating [9]. VR interventions significantly decrease students' anxiety and stress levels. For instance, VRS ability to elicit a state of social stress in participants, with the TSSS-VR being a frequently employed methodology [10]. Also explored was the feasibility of custom 360° VR experiences created for stress relief containing bespoke virtual environments such as a private beach, or perhaps a waterfall within a cave, outer space travel and northern lights watching experience [11]. These immersive experiences have proven efficient in reducing stress conditions as indicated by both Electroencephalography (EEG) measures self-reported questionnaires. The adoption of VR in relieving stress from students in an educational environment is an innovative way of improving their mental health.

4.2 Mindfulness and Meditation Practices

The use of virtual reality (VR) to enhance mindfulness and meditation practices in educational contexts has been on the rise [11] points out that the way VR applications are designed can affect the audio experience, interaction levels and the virtual surroundings, which may lead to meaningful changes in users' mindfulness. This

highlights the necessity of clearly identifying the VR applications employed in studies to confirm their effectiveness in fostering mindfulness. Furthermore, [12] presented findings indicating that mindfulness meditation can enhance cognitive functions, revealing variations in psychological and physiological reactions to stress between those engaging in immersive VR mindfulness meditation and control groups. These findings underline the promising role of VR-based mindfulness interventions in supporting mental health and cognitive development within educational settings.

5 Challenges and Considerations

The infusion of VR technology in educational settings elicits a myriad of challenges and considerations. All these must be handled very carefully. Among the top priority issues are the ethical concerns related to the use of VR in delivering education and other related services, including student safety [13]. The issue of student privacy and data gathered or generated during learning activities within virtual environments also needs to be given due attention, to ensure protection of the learner's rights. Considering technological barriers: that learners have to be provided with VR equipment; these technologies have to be accessible for students with disabilities—is extremely important when integrating VR into educational curricula [13]. Moreover, successful adoption in different cultural settings demands a good understanding of user acceptance as well as determinants shaping intentions toward vast populations. This underscores the need for culture and region-specific customization of strategies of VR integration, emphasizing on the other hand the importance of user self-efficacy, performance expectancy, effort expectancy and social influence in different settings. Addressing these problems and taking into account these aspects is essential for implementing VR technology in educational environments in an ethical and effective way.

5.1 Ethical and Privacy Concerns

When incorporating virtual reality into educational settings, ethical and privacy considerations have to be at the forefront. Thereafter, the implementation of VR technology for whatever purpose ushers in attendant ethical challenges of a weighty nature and privacy problems that loom large [14]. The researcher shall ditch efforts in an area surrounding possible privacy invasions in VR user research, safety measures which include more than must be observed with fresh strictness for social VR contexts plus the need for universal standards of misbehavior and harassment between real as well as virtual settings. More also boundary-aware design is an emerging yet underexplored topic which might improve interactions between people in VR environments [14].

In integrating VR into the educational environment, both educational institutions and developers of VR technology should take into account these ethical and privacy-related concerns. This will help in advancing responsible and safe use of VR technology, thereby facilitating a positive and secure VR environment that reflects community norms and discussions of safety in social VR.

5.2 Technological Limitations and Accessibility Issues

Prominent among the technological barriers and concerns about accessibility that stand in the way of widespread adoption of virtual reality (VR) in educational contexts are motion-sickness problems. The problem with VR technology is that users can experience motion sickness, which happens as a result of the mismatch between rendered visual cues and head motions made by the user, as well as delays between displayed content and actual head movements within the environment. Such an issue may lead to accidents in the virtual world and harm users' presence as well as engagement with learning activities. Additionally, findings show that current Social VR platforms have worse usability than traditional videoconferencing systems, despite providing higher levels of social presence and enjoyment [15].

These challenges and constraints underscore the necessity for additional research and development to tackle problems like motion sickness and usability in virtual reality technology, promoting fair access and efficient use in educational settings.

6 Case Studies and Research Findings

Empirical evidence from research findings and case studies illustrates the effects of virtual reality (VR) interventions on psychological well-being and educational outcomes. Research indicated that adults and older adults experienced a decrease in anxiety levels and an enhancement in positive emotional states due to VR interventions. Similarly, another study emphasized the use of VR technology in treating mental health issues among adolescents, focusing on the creation of scenes with auditory, visual and tactile fidelity to alleviate anxiety and stress. These investigations underscore the potential of VR interventions to foster psychological well-being across various age demographics, highlighting the need for continued research to improve the therapeutic impact of VR technology within educational settings. Consistent empirical studies have clearly shown the exceptional effectiveness and diverse advantages of VR interventions in promoting psychological well-being to extraordinary degrees while also enhancing educational experiences [16]. The significant progress made in research has revealed the vast potential and transformative capabilities inherent in VR interventions. A prime example of this is groundbreaking research conducted by Montana et al. The remarkable reduction in anxiety levels and the extraordinary enhancement of positive emotional states achieved through innovative

and pioneering VR interventions has been clearly highlighted. Equally significant, thorough research has shown that when VR interventions are skillfully implemented, they can effectively improve adherence, motivation and steadfast participation in exercise and physical activity programs for the determined adult population facing physical disabilities that would usually impose unyielding constraints. This crucial insight introduces an astonishingly revolutionary shift in the realm of physical rehabilitation and recovery, moving beyond conventional approaches and empowering individuals to overcome challenges that once appeared impossible. Furthermore, strong and consistent scientific evidence confirms that VR-based interventions effectively match the success of traditional methods in addressing a wide range of mental disorders, often yielding swift and impressive positive results in a shorter time frame compared to conventional therapeutic practices [17]. This groundbreaking revelation represents a significant shift in perspective, marking the dawn of a new era in the equitable treatment of various mental health conditions. It liberates individuals from the confines of traditional therapy, enabling them to reclaim their optimal mental and emotional well-being with remarkable speed, alleviating their suffering and revealing innovative routes to healing and recovery. Additionally, a scholarly study by Frewen et al. explores and clarifies the vast potential found within the remarkable domain of VR technology, particularly its considerable ability to enhance mental health and promote widespread well-being among those it touches. This is especially relevant in the context of exposure therapy designed to confront and mitigate trauma and the debilitating effects associated with stress-related disorders. This pivotal research not only calls upon mental health professionals, practitioners and researchers to thoughtfully incorporate VR technologies and methods into their therapeutic practices but also highlights the undeniable and transformative possibilities of VR-assisted treatment approaches, which could fundamentally change the therapeutic landscape and offer renewed hope to those trapped in pain and trauma [17]. Although existing studies have largely concentrated on the compelling effectiveness and practical benefits of VR exposure therapy, it is crucial for upcoming research to thoroughly examine the extraordinary results and synergistic effects that could arise from integrating VR technology and methods into other structured psychological interventions within the esteemed and intellectually enriching settings of educational institutions. This approach would allow for a well-rounded and comprehensive understanding of the unexplored potential and extensive implications of VR-assisted psychological interventions, revitalizing the field and opening up new avenues that could transform and enhance the psychological well-being and educational experiences of numerous individuals, thus empowering them to realize their full potential and create a brighter, more fulfilling future [18].

7 Conclusion

To sum up, the emerging field of research surrounding virtual reality (VR) and its impact on promoting psychological well-being within educational settings holds significant promise. Evidence suggests that incorporating VR technology into both mental health treatment and educational frameworks yields positive results, particularly highlighted by notable differences in mental health among adolescents across various genders, ages, family backgrounds and urban versus rural environments. Additionally, the immersive nature of VR technology has the capacity to deeply affect and shape the user's mental landscape, thereby enhancing their ability to adjust psychologically and alleviating mental stress. Although the existing peer-reviewed literature in clinical psychology regarding VR's applications for mental health is still developing, the potential for VR technology to foster improved mental health and overall well-being in educational contexts is clear.

Deep Learning Based Analysis of the Key Scheduling Algorithm of AES Cipher

Narendra Kumar Patel, Praveen Lalwani, Hemraj Shobharam Lamkuche, Ghassan Samara, and Hanan Abu-Mariah

Abstract This paper presents how the Advanced Encryption Standard (AES) is utilized in the current Information Technology world. AES encrypts private information, giving security when transferring this information to prevent its access by unauthorized parties using very different mediums, like online transactions or data storage devices. The success of security provided in AES lies in the KSA—Key Scheduling Algorithm which generates the keys which used in encrypting the data. Our research embarks on a deep learning approach-based investigation into AES KSA. More specifically, neural network models will be utilized to probe the operational dynamic and characteristics that the AES KSA exhibits. The purpose of the study is to unveil not just the robustness and possible weaknesses of AES KSA but also to utilize patterns which could be identified for such weaknesses. By the training of our neural network with keys datasets, we strive to identify any visible patterns or weaknesses in AES that can be exploited by individuals for malicious purposes. This paper also significantly enhances the value of literature through debate surrounding different countermeasures, much of which enhance the security architecture corresponding to AES.

Keywords Advance encryption standards (AES) · Deep learning · Neural network · Key scheduling algorithm (KSA) · Data security · Technological progress

1 Introduction

The very development of AES goes to prove the fact that "necessity is the mother of invention." While bordering on the end of the twentieth century, it was clear how essential our data security was. This decade emphasized protecting data more than ever before, due to the huge amount of information that was exchanged across computer networks. The Data Encryption Standard, in use since the 1970s as a staple for the IT industry and different organizations, was considered inadequate against the new cyber threats of the day [1]. 2 To rectify this deficiency, the U.S. National Institute of Standards and Technology (NIST) sponsored a competition in 1997 to develop an encryption procedure that could supplant Data Encryption Standard (DES). The challenge in the global arena brought cryptographers and mathematicians into frantic action to propose new, secure, efficient, and powerful encryption algorithms for scrutiny. Benchmarks for the contest were based on security, efficiency, and adaptability. One such algorithm was Rijndael, proposed by two Belgian cryptographers, Vincent Rijmen and Joan Daemen. It became a winner after rigorous selection, which subjected it to minute testing and analysis. We finally came to know that Rijndael had been declared the standard of AES by NIST in 2001. AES is a 'digital lock' for computer networks, which protects all our electronic information. Just as we lock and unlock doors using keys, AES uses a secret key to encrypt and decrypt information. Now, the selection of the correct key needed to accomplish the task rests in the Key Scheduling Algorithm. This can very simply be explained as a formula that turns the secret key into a number of intricate characters and numbers used by AES in protecting the data [2].

In recent decades, AI has experienced exponential growth across numerous sectors, including big data, the Internet of Things, robotics, banking, finance, healthcare, e-commerce, meteorology, education, facial recognition, information systems, autonomous driving, and data security, among others [3].

While many focus on providing an in-depth analysis of the AES KSA, this paper discusses how Deep Learning could play a new role. Deep learning is one of the modern computation methods that can find hidden patterns or secrets in data fairly obscure to humans. In this research, we make use of Deep Learning to analyze the security effectiveness of the AES KSA and find any pattern-based vulnerabilities that may be exposed by such technology [3, 4].

2 AES Cipher

AES

AES stands for Advanced Encryption Standard Cipher and is a method used in protecting digital data. Just like a digital lock, it protects or secures our information when moved across the internet or stored in electronic devices. In this process, what we usually write as a message to be conveyed is called plaintext, and that is what gets converted into something like a secret code. There is a special key needed to read this message, and only those who are to read our message should have this key [5]. AES is, therefore, very crucial in enabling safety online. It difficulties for all practical purposes, makes impossible the breaking of a code by entities that shouldn't have access to the information, so they can read the private data. This ranges from passwords to personal messages—meant only to be seen by those allowed. This essentially is what AES does: it gives us a strong way to encrypt and hence protect our information [2].

AES Keys and Rounds

The number of steps, or rounds, in the AES (Advanced Encryption Standard) encryption and decryption process depends on the key size which is being used in this encryption process. Generally, a larger key provides more security, as it increases the difficulty for unauthorized parties to crack the encryption. AES encryption and decryption are categorized into three types based on the key size and the number of rounds required. Following is description and its use case information about each type categories which used in the modern internet world for encryption and decryption of data which is being transferring over internet.

AES encryption and decryption can be categorized into three types, each based on the size of the key and the corresponding number of rounds needed:

1. **128-Bit Key—10 Rounds**: This version uses keys that are 128 bits in length, requiring a total of 10 rounds to complete the encryption or decryption process.
2. **192-Bit Key—12 Rounds**: In this case, the keys are 192 bits long, and the process involves 12 rounds.
3. **256-Bit Key—14 Rounds**: The most secure option uses 256-bit keys, with the process spanning 14 rounds.

The choice among these options depends on the specific needs and desired level of security.

3 Encryption Process in AES

Encryption Decryption Process

The AES (Advanced Encryption Standard) encryption process involves multiple steps, each designed to enhance the security of the data being encrypted. Here, we'll

walk through the AES encryption process for a 128-bit key, which involves 10 rounds. Following is diagram which shows its encryption process (Fig. 1).

To simplify and clarify, let's break down the AES encryption process and the key scheduling algorithm step by step:

AES Encryption Process

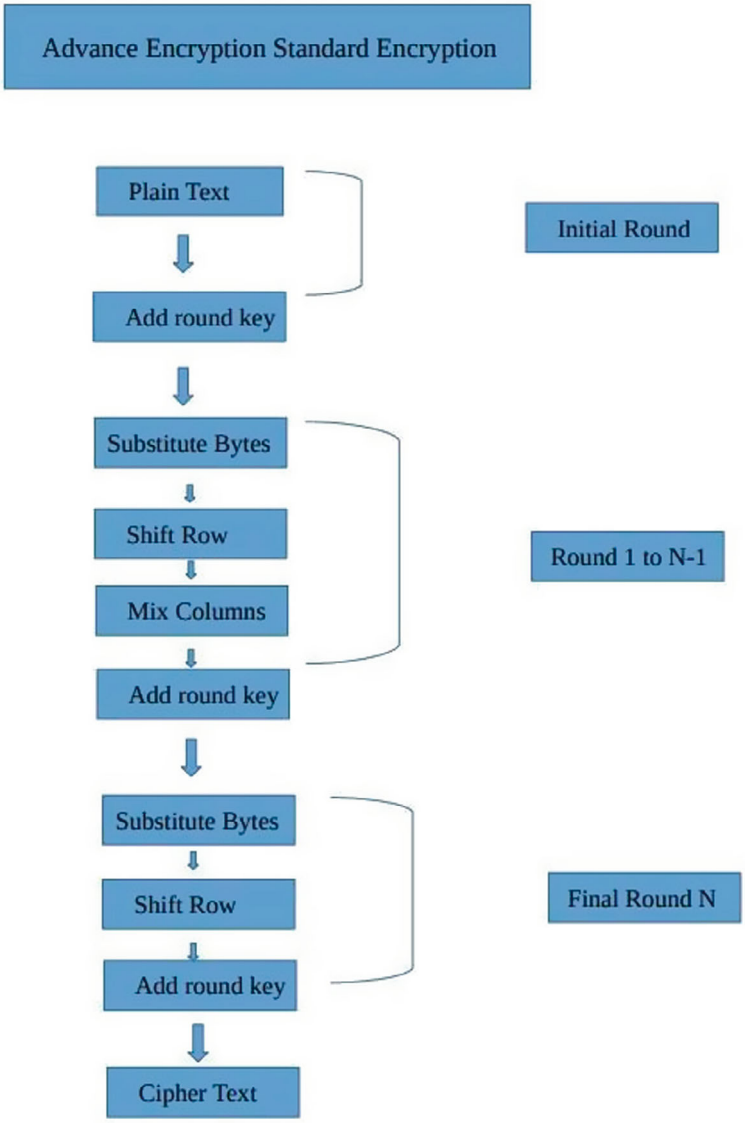

Fig. 1 AES encryption process

A. Initial Steps and Rounds

Initial Round

Above figure shows how AES Encryption works and how we goes from initial round to final round in order to encrypt our data using AES 128 Bit algorithm. Now we will discusses it in much more details that what particular round do in the encryption process.

Sub-Bytes (Substitution)

In this step, each byte of the data is replaced with a corresponding byte from the AES substitution box (S-box). The S-box is a predefined table used in all AES encryptions, ensuring consistency and security. This substitution step is crucial for introducing non-linearity into the encryption process.

Shift Rows

The arrangement of bytes within each row of the data matrix is shuffled based on a predefined pattern.

Mix Columns

This involves blending the columns of the data matrix through mathematical operations to further obscure the data.

Add Round Key

Here, the data is combined with a round key using a bitwise operation known as XOR (exclusive OR). This step mixes the data with the key, providing another layer of security. Each round uses a different key derived from the original encryption key, ensuring that the encryption process is both complex and secure.

Final Round

Similar to previous rounds but excludes the Mix Columns step. It includes the Sub Bytes, Shift Rows, and Add Round Key steps to finalize the encryption.

After completing all rounds, the plaintext is fully transformed into ciphertext, which is then ready for secure transmission. To access the original data, the recipient reverses this process.

Decryption

The decryption process in AES essentially reverses the steps of encryption. The ciphertext is transformed back into plaintext through a series of rounds that mirror the encryption steps. By following the inverse operations of Sub-Bytes, Shift Rows, Mix Columns, and Add Round Key, the original data can be accurately and securely retrieved [2].

B. Key Scheduling Algorithm for AES-128 Bits

Understanding how keys are generated in the AES (Advanced Encryption Standard) encryption process is important for appreciating its security. Here is a step-by-step breakdown of the key generation of AES which also known as key expansion in AES KSA, for a 128-bit key.

Key Generation Steps

Key Expansion

Start with the original 128-bit key.
Prepare an array for storing round keys.
The first round key is derived directly from the initial 128-bit key.

Round Constants

Prepare a list of 10 round constants (Rcon), essential for generating the round keys in the AES-128 variant.

Key Expansion Loop

This loop runs through multiple iterations (10 for AES-128) to expand the key.

Word Transformation

Select the last 4 bytes (32 bits) from the current round key.
Apply transformations including rotation, substitution using the S-box, and XOR operations with the round constant and parts of the previous round key.

Expand Key

The newly formed 32-bit word is XORed with another 32-bit segment from earlier in the key sequence to create a new part of the round key.

Store Round Key

The new 128-bit round key generated from these operations is added to the array of round keys.

Repeat

Continue this process for a total of 10 iterations to create all necessary round keys for the encryption process.

This detailed procedure ensures the generation of secure keys for AES-128 bit encryption, contributing to the overall strength and security of the encryption method.

4 Deep Learning

The role of AI and Deep Learning in today's fast-changing technological world is simply profound. Deep Learning can be regarded as the bedrock of AI, motivated by the need to make computers learn on their own, just like humans teaching and learning. This as a technological progress it does similarly to how humans are capable of recognizing patterns after bombardments of stimuli, only this time on a very large scale of data [6].

Deep learning runs on vast volumes of data, usually in arrays and matrices, to train models. These datasets can include anything from images like cats and dogs to other forms of data. What really challenges Deep Learning models is the ability of self-detection of complex patterns in this data. Actual flow of Deep Learning Managed Artificial neural networks doing a similar function as virtual brains. It is in these networks that there are layers formed of interconnected nodes, all of which, in some sophisticated decision-making system, scrutinize and interpret the data [7, 8].

Deep learning (DL) is a widely used approach within machine learning (ML), that operates within a subset of the broader fields of ML and artificial intelligence (AI), and can be viewed as an AI function that simulates the way the human brain processes information [9].

These models achieve effectiveness in identifying patterns and generating accurate results from being trained on large amounts of datasets and employing multiple techniques. Applications of Deep Learning apply across domains in areas such as voice and face recognition in photos, making a huge difference to the technological limitation. This technology is an intrinsic part of Artificial Intelligence and brings digital optimizing intelligence and efficiency into our lives.

Neural Network

Neural networks, as their name suggests, mimic the structure and function of the human brain. These networks consist of interconnected nodes, similar to the neurons in our brains, which allow them to process information and learn from it. The nodes work together to analyze data, recognize patterns, and make decisions [9].

For example, neural networks can interpret spoken language, identify objects in images, or predict trends based on input data. They are used in a wide range of tasks that involve complex data analysis and have become essential to machine learning and artificial intelligence. Much like our brains, neural networks adapt and learn from the data provided to them. This learning process enables them to perform tasks in a manner similar to human decision-making in various scenarios. Additionally, neural networks can be trained to improve their performance, making them powerful tools for a multitude of applications [10, 11].

Deep learning, as a branch of artificial intelligence, is considered one of the basic pillars of the Fourth Industrial Revolution, as it contributes to improving industries, including computer networks and data transfer with high accuracy [12].

Following is a simple diagram of neural network structure which includes an input layer with 6 neurons, two hidden layers with 4 and 2 neurons respectively, and an

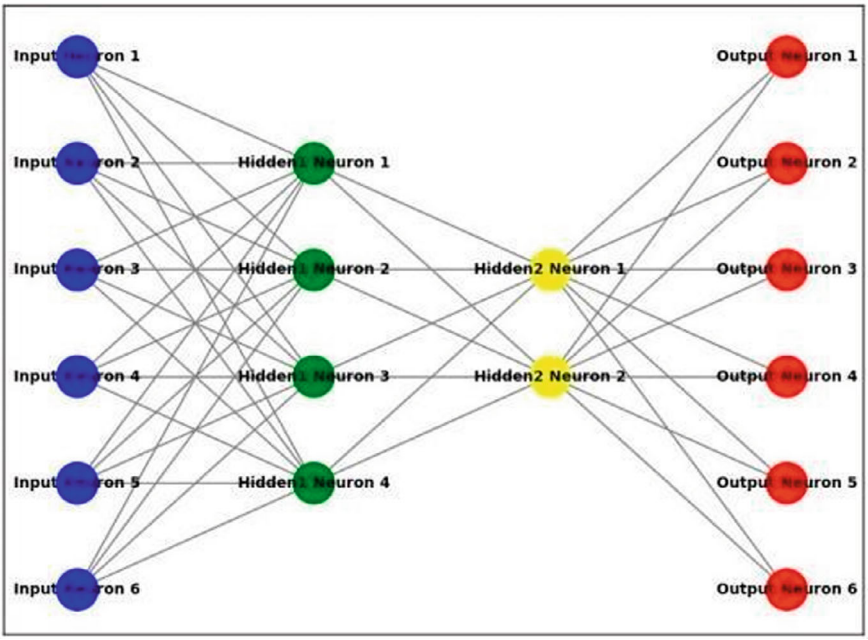

Fig. 2 Processing structure of AES cipher

output layer with 6 neurons. The number of layers and neurons can be adjusted based 9 on specific requirements and objectives, allowing for flexibility in their design and application (Fig. 2).

In everyday use, neural networks enhance various technologies we rely on. They power voice assistants that understand and respond to spoken commands, help social media platforms recognize and tag faces in photos, and enable self-driving cars to navigate safely by identifying obstacles and making split-second decisions. Neural networks also play a crucial role in financial services by analyzing market trends to make investment predictions and in healthcare by assisting in the diagnosis of diseases through the analysis of medical images.

In our case of AES Key Scheduling Algorithm we are also using Neural Network In order to process our large amount of initial key data and then we are trying to find any hidden pattern in these keys.

Analysis of AES Keys

Our research paper aims to enhance the security analysis of the Advanced Encryption Standard (AES) cipher by using Deep Learning, specifically Sequential Neural Networks (SNN). Although AES is considered one of the most secure encryption algorithms, it may still be vulnerable to attacks leveraging deep learning techniques. One 10 potential weakness lies in the key scheduling process, which generates round

keys from the initial secret key. To address this, we propose using SNNs to analyze and possibly strengthen this critical component of AES [7, 13].

Our approach involved training our model with 15,000 samples of AES Initial Round keys and their corresponding 10th Round keys. We then tested the trained Deep Learning model using 500 Initial Round Keys, aiming to predict their corresponding 10th Round keys. Here is an overview of our Deep Learning implementation.

1. **Input Layer**: Comprising 128-bit neurons, reflecting the length of the AES keys.
2. **Hidden Layers**: Consisting of 5 layers with varying neuron counts: 64, 32, 16, 8, and 4 bits respectively.
3. **Output Layer**: Activated using the sigmoid function, with 128-bit neurons to accommodate the 128-bit final Round key.

By following these steps, we conducted tests to gain insights into the security and vulnerabilities of the AES Key Scheduling Algorithm (KSA) using our Deep Learning model. This approach allows us to delve deeper into the intricacies of AES and potentially fortify its defenses against emerging threats. In essence, our research seeks to leverage the capabilities of Sequential Neural Networks to scrutinize and enhance the AES encryption process.

Through rigorous training and testing, we aim to identify any weaknesses in the key scheduling process and propose methods to mitigate these vulnerabilities. The ultimate goal is to improve the robustness of AES against sophisticated attacks, ensuring stronger encryption and better protection of sensitive data [14–17].

5 Results

After the huge amount of data process and training and testing our model against AES Key Scheduling Algorithm Security and its robustness following is our result table which shows the matching percentage of corresponding bit in key from initial key (Table 1).

The accuracy table shows the percentage of correctly predicted bits using our trained model. Some bits have accuracy rates above 50%, while others are below this mark. On average, the accuracy is about 50%, meaning our model correctly predicts around half of the bits in the 10th round key, which consists of 128 binary digits (0s and 1s).

From these results, we conclude that each bit has a predictability of 1/2, indicating an equal chance of being 0 or 1 in any given position. This analysis suggests that the AES Key Scheduling Algorithm (KSA) is robust against deep learning cryptanalysis based on our methodology. The equal likelihood of predicting each bit demonstrates that the KSA maintains its security integrity, resisting attempts by our deep learning model to uncover the key patterns. Our finding highlights the strong security of the AES Key Scheduling Algorithm. Even with advanced deep learning techniques, the KSA keeps each bit unpredictable and secure. This resilience reaffirms that AES is a reliable encryption standard.

Table 1 Result of our trained deep learning model

Bit position (1–32)	Matching % (1–32)	Bit position (33–64)	Matching % (33–64)	Bit position (65–96)	Matching % (65–96)	Bit position (97–128)	Matching % (97–128)
1	48.5	33	48.5	65	49.5	97	50

32	44	64	51.5	96	46.5	128	54

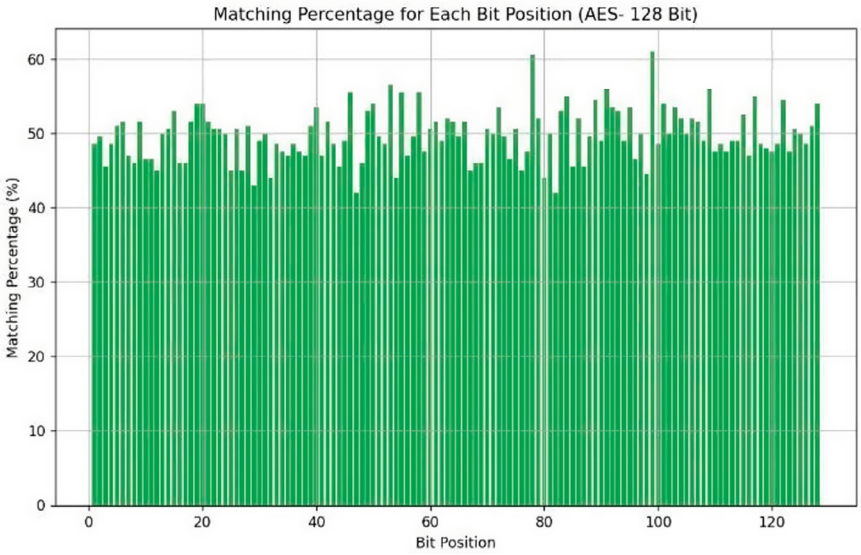

Fig. 3 Bar chart deep learning graph

Following is Bar chart representation of the gained output which shows bit position of 128 bit of AES Cipher to X axis and Matching percentage to Y Axis range from 0 to 100% (Fig. 3).

In the bar chart graph, we can see most of the bits showing range from 45 to 60% which is approximate to 50% and also we can easily understand sometimes our results goes with more accuracy more than 60%.

Another graphical representation is wave graph of our gained result. In the following graph its showing variance of our result bits matching with previous one and its point the position and percentage of corresponding bit (Fig. 4).

In order to Understand some more clear way with respect to frequency of results lets see following is histogram which have matching percentage on X axis and Frequency of specific results on y axis (Fig. 5).

In above histogram we can see maximum frequency is of matching percentage of 50% which shows most of the bits we can only predict with half accuracy and there are very less number of bits which we can predict more than 60%.

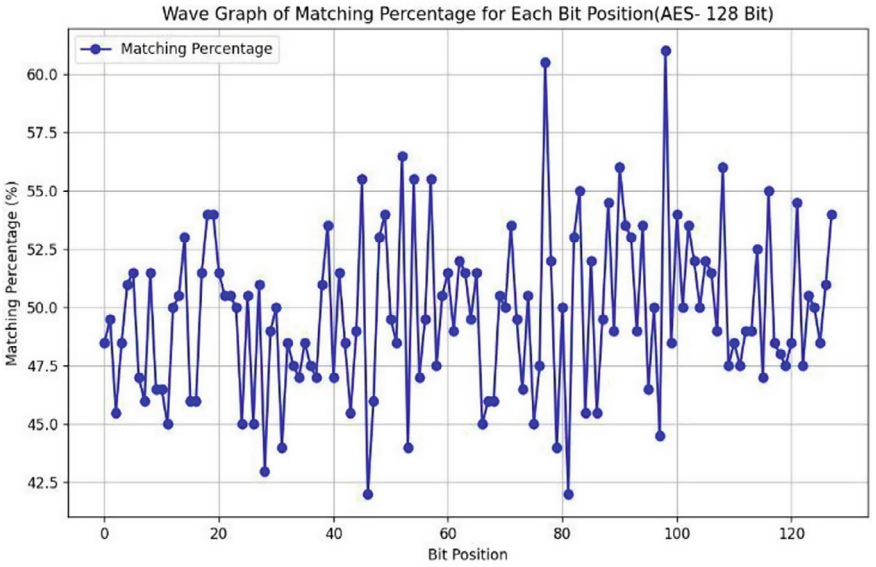

Fig. 4 Wave graph deep learning model results

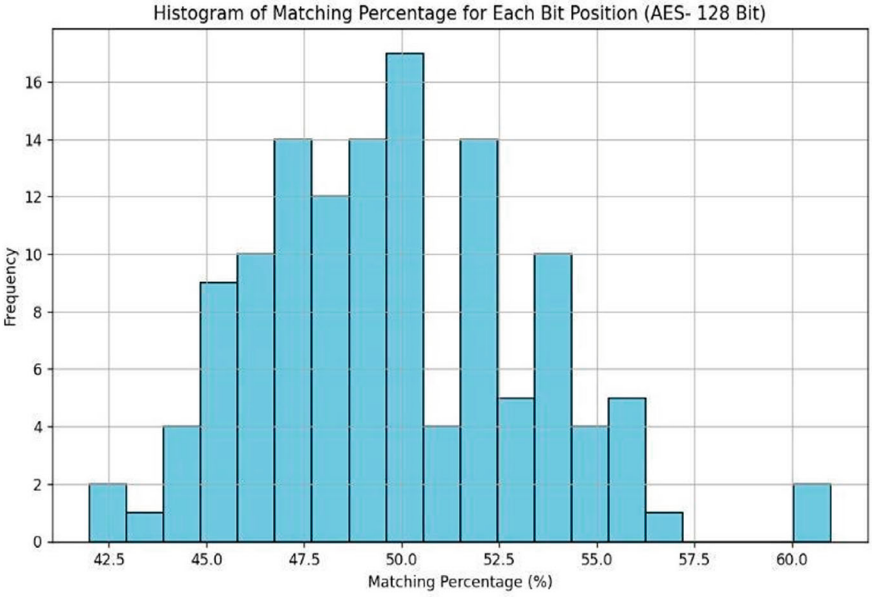

Fig. 5 Histogram of deep learning model results

6 Conclusion

In summary, in this research paper, we assessed security using the approach of deep learning over AES. We found one of the most important modules of AES to be the Key Scheduling Algorithm (KSA), which was critical for improvement. We used our deep learning model to make an in-depth investigation for the existence of patterns and vulnerabilities within AES KSA. The results showed that we could guess with some accuracy about half the bits of the 10th round key.

Thus, this result proves that although the AES KSA demonstrates a strong resilience to Deep Learning analysis forms, there could be many areas for improvement. Our results show the general security of AES and further shed light on how cryptographic systems can be improved to resist AI-based attacks. This study, therefore, ideally helps in improving data security and privacy by adding to existing efforts in the process.

Legal Responsibility of Service Providers in Cybercrime: A Legal Analysis and Recommendations for Improving Legislation and Mechanisms

Omar Al Makhzoumi and Abeer Zohair Said Saada

Abstract This paper looks at the criminal accountability of service providers within the sphere of cybercrime. The following pages will discuss how national and international laws determine and allocate criminal responsibility regarding service providers, coupled with their role in the dissemination and storage of illegal online content. The findings show that different legal systems have different approaches to assigning responsibility toward service providers. However, they all agree that key factors in determining responsibility are the provider's knowledge of the illegal content and their inaction upon it. Legal cases from various scenarios form part of this study. On this basis, the paper recommends the harmonization of global legislation on service provider liability, improved awareness and protocols for providers, monitoring and oversight mechanisms and clear legal frameworks to support service providers—all towards more effective action on cybercrime and compliance with relevant laws.

Keywords Criminal liability · Service providers · Cybercrime · National legislation · International legislation

1 Introduction

This responsibility to enable information owners, or publishers, to distribute their content online is referred to as the liability of a service provider—or a hosting provider, as it's more commonly known. The legal liability stems from the provider enabling people or organizations to store their data and content on leased space.

https://doi.org/10.1007/978-3-031-87584-7_144

This study explores criminal responsibility for service providers, i.e., hosting providers that have an obligation under law to contribute to information flows online by providing the technical infrastructure and space for such flows. We seek to establish liability for service providers based on general principles, to identify acts or omissions that may ground liability and to identify presumed liability rules that may ground such liability and the conditions that must be met for this to take place. By undertaking this discussion, we aim to enhance our understanding of how different legal frameworks address service providers in the realm of cybercrime, shedding light on their role and legal obligations.

1.1 Study Objectives

- Analyze the criminal liability of service providers according to different laws.
- Assess the role of service providers in cybercrime and how it impacts these crimes.
- Compare national and international laws related to the liability of service providers.
- Examine the applications of criminal liability for service providers in various contexts.

1.2 Methodology

Using a descriptive methodology, this study examines legal texts pertaining to the accountability of service providers under both national and international laws. It assesses existing research and pertinent scholarly works in this field. Additionally, the study investigates court cases involving service provider liability to ascertain the practical application of these laws. Furthermore, a comparative analysis of service provider liability legislation across various countries is conducted to identify commonalities and variations.

2 Criminal Liability of Service Providers (Hosting Providers)

The term “service provider” encompasses both individuals and organizations, whether they are natural or legal entities that have the responsibility of storing applications and records. These stored resources enable users to access them through the internet [1]. Additionally, a service provider is someone who stores and manages data and information on behalf of their clients. They also offer the necessary technical and informational resources to ensure uninterrupted access to this data and information, all in exchange for an agreed-upon fee [2].

According to Egyptian legislation, a service provider is described as any individual or organization that offers users information and communication technology services. This includes those who handle or store information themselves or through a third party for these services or information technology [3]. In contrast, the Jordanian legislation does not specifically define a service provider (hosting provider). However, the Jordanian Electronic Transactions Law No. 85 of 2001, Article 2, defines the "originator" as the person who creates or sends an information message, either personally or through an agent, before it is received and stored by the recipient. The "recipient" is defined as the intended recipient of the information message. Additionally, the Jordanian Consumer Protection Law of 2006, Article 2, defines the "provider" as the manufacturer, importer, seller, or any other party involved in the production and distribution of goods, or the service provider. The "final provider" is defined as the seller of goods directly to the consumer or the service provider directly to the consumer.

According to Article 6(2) of the French Law on Confidence in the Digital Economy No. 575-2004, a hosting provider is described as an individual or entity, whether compensated or not, that retains and offers users access to various forms of data, including signals, texts, images, sounds and messages [4].

The European Directive No. 31-2000, issued on June 8, 2000, contains provisions in Articles 14–15 that lay out the responsibilities and requirements for hosting providers. According to these articles, hosting providers can be held liable if they have knowledge of illegal content on their websites or if the illegal activity is clearly evident and they have the ability to control the content after being informed of it. However, Article 15 specifically prohibits EU member states from imposing a broad obligation on hosting providers to monitor website content or investigate the circumstances surrounding unlawful publications [4].

The obligations and responsibilities of hosting providers have been emphasized in a legal case in the United States, specifically Viacom International Inc. et al. v. YouTube, where legal scholars have analyzed YouTube's role as a hosting provider [2]. Similarly, a ruling by the Paris District Court on April 13, 2010, enforced a monetary fine and the removal of an image, deeming the comments defamatory and a violation of the plaintiff's rights, citing Article 6(4) of the Law on Confidence in the Digital Economy (LCEN) [4].

After carefully analyzing the information provided, our deduction is that a service provider refers to an individual or entity, either natural or legal that offers web hosting services on their servers in exchange for compensation, essentially assuming the role of a network landlord.

3 Liability of Hosting Providers According to General Principles

The liability of the hosting provider is derived from the fact that they act as a client to the author of information or content. Their main responsibility lies in the storage and management of the information and content that is accessible to the public. The hosting provider's role is primarily focused on publishing, while the oversight of visual and auditory publishing services falls under the purview of pre-publication supervision. It is important to note that the hosting provider does not interfere or modify the content or information before it is published on the internet. As a result, the liability of the hosting provider may arise as a secondary consequence or due to attempts to conceal certain aspects, which we will elaborate on in the following sections.

3.1 Hosting Provider as an Accessory in the Crime

When a service provider offers space to a publisher of illegal information, they can be held liable as an accomplice to the crime. This is because their technical role involves facilitating the dissemination of such content. However, it is necessary to establish whether the hosting provider had knowledge of the unlawful information on their platform, either at the time of publication or after discovering its illegality. We can consider two possible situations in this regard.

Absence of Awareness: In the event that the hosting provider had no knowledge of the content being published, they cannot be deemed negligent or at fault for not taking necessary precautions. Their accountability cannot be established if it can be proven that they were unaware of the illicit nature of the content [5].

The determination of criminal liability hinges on whether the crime in question is a one-time occurrence or an ongoing act. In cases where unlawful messages or content are published instantaneously, the hosting provider must have had prior knowledge of the crime or simultaneous knowledge of its commission in order to be held criminally responsible. However, if the crime is ongoing, the hosting provider can be deemed an accomplice to the crime simply by having knowledge of its existence at any point in time [6].

In order to escape legal responsibility, a service provider must provide evidence to the contrary, demonstrating that they were unaware of the illegal nature of the electronic content. To be held accountable as an accomplice to the dissemination of unlawful information, the service provider must provide proof of their active participation in specific acts, such as incitement, agreement, or assistance. The types of involvement considered in this context are assistance, which entails taking affirmative steps that contribute to the criminal activity. This participation must be genuine and not assumed, requiring evidence that the hosting provider became aware of the

illegal nature of the information at a later time, subsequent to the discovery of the unlawful message [7].

If a service provider stores pornographic activities and is penalized in accordance with the aforementioned provision, they are deemed a primary participant. However, if they aid others by offering storage for illicit content, they are regarded as accomplices to the offense.

3.2 Liability of the Service Provider (Hosting Provider) for Concealment Offenses

The criminal liability of the hosting provider for committing a concealment offense requires that the concealed items are obtained from a crime. The criminal responsibility for concealment by the hosting provider can be distinguished in two scenarios [8]:

- **Storage on Computer Memory**: In the event that the hosting provider retains the content or information within computer storage, their culpability for concealing said content cannot be proven. In such circumstances, the obligation to disclose does not arise, as the content exists solely in a non-physical state that cannot be the target of criminal activity.
- **Storage on a Hard Drive**: The hosting provider can potentially face criminal liability if they store information on a physical hard drive, as this involves a tangible item that can be involved in a crime.

Accordingly, for the service provider to be held liable under the provisions of concealment offenses, two conditions must be met:

- **Storage of Unlawful Data**: The provider must store unlawful data on their own computer memory.
- **Knowledge of Illegality**: The provider must be aware of the unlawfulness of the data either at the time of hosting or after its dissemination and must have failed to cease its dissemination, thereby contributing to its spread.

4 Liability of the Hosting Provider Based on Presumed Liability Rules

Presumed liability is applicable when the content or information has been documented before being made public. This implies that the content or information should have been accessible for a specific duration, rather than being instantly generated and disseminated. The purpose of this principle is to safeguard providers of live broadcasts, as web pages possess the feature of pre-recording information. Consequently, the necessity for pre-registration prior to public availability is enforced. However,

this criterion varies for news groups, which do not depend on broadcasting. Hence, supervision of live broadcasting is imperative [9].

In the realm of presumed liability, there is a sequential involvement of the author, publisher and producer. However, the hosting provider's responsibility is not as clear-cut since these roles do not directly apply to them. The hosting provider can assume different roles, such as providing guidance or technical support, or even taking on the role of an online publisher.

In the realm of criminal liability, French courts have determined that internet service providers can be held criminally responsible if they are found to be involved in or participating in a criminal act. A significant legal precedent was set on July 10, 1997, when the Paris Court of First Instance ruled that an internet service provider's role in distributing unlawful content could be considered as involvement in the crime, resulting in their conviction alongside the main perpetrator [10].

On May 28, 1998, the Munich District Court made a ruling that found an internet service provider guilty of being an accomplice in the dissemination of child pornography on web pages. In accordance with Article 31 of the Anti-Cybercrime Law in Egypt, it is stated that any service provider who violates the provisions outlined in item (2) of the first paragraph of Article (2) shall face penalties including imprisonment for a minimum of one year and a fine ranging from five thousand to twenty thousand pounds. The fine will increase based on the number of victims utilizing the service [2, 11–13].

According to Article 83 of the Penal Code No. 16 of 1960 in Jordan, individuals who knowingly hide belongings that have been unlawfully acquired, stolen, or obtained through criminal acts, with the exception of cases outlined in paragraph (5) of Article (80) of this law, may face a maximum prison sentence of two years and a fine not exceeding fifty dinars [3].

The penalties outlined in Article 75 of the Jordanian Communications Law No. 13 of 1995 apply to individuals involved in or aiding the provision of a communications service that goes against public order or morals [2].

Furthermore, in Article 8, Paragraph (b) of the Cybercrimes Law, the Jordanian legislator employed the term "storage" to describe the intentional utilization of an information system or network for various activities such as preparing, processing, displaying, printing, publishing, or promoting pornographic content with the intention of influencing individuals under the age of eighteen or those who have mental or psychological impairments, or to incite and encourage them to engage in criminal behavior [14–16]. The prescribed penalties for such actions include a minimum prison sentence of two years and a fine ranging from one thousand dinars to five thousand dinars [5].

5 Conditions for Criminal Liability of Service Providers (Host Providers)

For the criminal liability of service providers to arise, the following conditions must be met: actual knowledge of the illegal content, failure to act and we will address them in turn:

5.1 Actual Knowledge of the Illegal Content

The obligation of service providers typically does not come into play if they have no knowledge of the unlawful nature of the hosted content or the ambiguous circumstances surrounding its illegality. "Actual knowledge" in this context pertains to being conscious of the content and its adherence to the laws in place. This requirement is critical in determining the service provider's intention regarding criminal activity [17].

The mental state of a service provider concerning the information they store and the legal outcomes of their actions forms actual knowledge of illegality. This knowledge begets the criminal culpability that results from these activities or from the foresight of potential effects being entailed [18].

The definition of this term also covers the cognitive state of the intermediary, which includes their genuine understanding of the factual components that make up their actions and also their awareness of the criminal activities as well as the possible outcomes, or hindsight [19].

To determine the scope of knowledge about illegality for hosting services, it is based on:

- **Nature of the Facts Known to Hosting Providers**: It is crucial for hosting providers to have knowledge of illicit activities and to proactively implement measures to prevent such activities. They must possess an understanding of the potential outcomes of their inaction and be equipped to take appropriate steps. If the service provider lacks awareness of these facts or believes that they are unable to effectively mitigate harm or illegal activities, their intention to engage in criminal behavior is nullified and they are not held accountable for any criminal responsibility [20].
- **Limits of the Facts Required for Hosting Providers to Know**: To establish criminal activity and the resulting harm, as well as anticipate criminal outcomes, the provider must possess knowledge of the tangible components involved. Merely being aware of these facts is enough. Furthermore, they must be familiar with the time of the offense, as well as the characteristics of both the perpetrator and the victim, as mandated by law [21].

The criminal liability of a service provider depends on whether they knew or had to know that the information to be transmitted was illegal or criminal. And if they

do, then it must be proved whether the provider immediately removed or blocked access to the illegal content after getting such notice. This includes where they were supposed to report to law enforcement about the illegal nature of such content or stop its further circulation after getting knowledge [22–24].

Under the European directive issued on June 8, 2000, which pertains to e-commerce, member states are required to adhere to a framework that upholds the non-liability of service providers, given certain conditions. One such condition is the provider's actual knowledge of the illicit nature of the content they are hosting. If the service provider is aware of or can easily discover the illegal nature of the material, they may face criminal liability for negligence. According to Article 14(1) of the European directive, service providers are not held accountable for stored information if they are unaware of its illegal nature or cannot reasonably be expected to be aware of it [25].

5.2 Failure to Act

1. **Failure to Notify** Informing service providers about criminal activities and their online distribution is a lawful method of notifying them about illicit activities that are being hosted or made available through their services. If service providers fail to report illegal content after becoming aware of its existence, they can be held criminally responsible for disseminating content that is a product of a crime [26].
2. **Failure to Cease Broadcasting** If the service provider fails to discontinue broadcasting, they are obligated to take action in halting the unlawful material as soon as they become aware of its presence, whether this awareness is a result of their own investigation or notification from a third party. Failure to remove or restrict access to the illicit content will result in criminal liability for disseminating criminal material [27]. Thus, the service provider is required to [28]:

- Remove or block access to illegal content immediately after detecting its illegality, otherwise they will be liable for publishing the content resulting from the crime [29–31].
- Implement measures to block or disable access to illegal content, making it inaccessible to Internet users [32–34].
- Provide technical resources and tools to help other service providers identify and report illegal content [35–38].

In accordance with the European E-Commerce Directive and the French Digital Economy Trust Law, a host provider can be held criminally accountable if they possess actual knowledge of illegal or criminal content being transmitted through their technical systems [39–43]. However, this liability only applies if the illegal activity is not readily apparent and the provider has the necessary technical means to control the transmitted information. To avoid liability, the provider must promptly cease broadcasting the illegal content upon discovering its illicit nature or take action

to remove it upon notification from relevant authorities. It is important to note that the provider's liability will be absolved if they were not aware of the content's illegality. Additionally, network service providers are exempt from liability if they lack actual knowledge of the content's illegal nature and upon becoming aware, take appropriate measures to remove or block access to the content. It is crucial that these providers operate as neutral intermediaries without assuming responsibility for the content itself [44].

The commission of information-related crimes through internet sites involves the collective effort of multiple individuals, constituting a form of criminal participation in the realm of information service provision. This type of crime falls under the category of information service crime, characterized by the collaboration of multiple perpetrators in the execution of the offense. This contribution is divided into the following:

Primary Contribution: In cases where service providers are implicated in criminal activities, it is generally a single individual who commits the crime, although there are instances where multiple individuals are involved. The service provider takes on the role of a primary contributor when they actively engage in or instigate others to commit the crime by promoting or facilitating the criminal activity through their hosting services. This entails utilizing lawful methods of incitement and necessitates that each participant possesses the requisite mental state to establish a connection between their actions and the hosting services [23].

Secondary Contribution: Contributing in a secondary capacity entails multiple sources of information collaborating to accomplish the criminal objective without directly carrying out the crime. Mere fulfillment of the physical elements is inadequate; the mental aspects must also be taken into account, revealing the participant's psychological state in relation to their involvement in the criminal conduct. In order for secondary contribution to be established, it is imperative that the individual possesses a conscious understanding of the partner's illicit actions and their consequential impact on the subsequent actions of the primary offender [24].

6 Conclusion

To summarize, this investigation uncovers the intricacies associated with the enforcement of cybercrime laws in relation to the criminal culpability of service providers. The results show that there are huge differences between jurisdictions: this could be prevented if legislation were harmonized or at least if service providers could clearly understand their legal obligations. Improving monitoring and legal aid mechanisms could help improve justice as well as fight cybercrime.

6.1 Findings

The study reached the following conclusions:

Determining the extent of criminal liability for service providers involves considering their awareness of illegal content and their failure to respond appropriately.

Countries have diverse approaches when it comes to the criminal liability of service providers, with some implementing strict laws while others prioritize safeguarding the interests of these providers.

The main factor determining the criminal liability of service providers is their awareness of illegal content and their neglect to take appropriate measures for its removal.

The study showcases a range of judicial instances that illustrate the diverse approaches taken by courts when addressing the issue of liability for service providers in various situations.

6.2 Recommendations

Harmonization of legislation: Standardize service provider liability rules internationally to help fight cross-border cybercrime.

Raising awareness: increasing service providers' awareness of their legal obligations and providing training on managing illegal content.

Develop monitoring mechanisms: Create effective monitoring and surveillance mechanisms to ensure faster and more effective removal of illegal content.

Provide clear legal support: Offer clear legal guidance to service providers on how to comply with the law and avoid criminal liability.

Anomaly Detection Technique for Network Intrusion Detection Using Ensemble Algorithm

Saniya Gouri, Devraj Vishnu, Rizwan ur-Rehman, Ghassan Samara, Hemraj Shobharam Lamkuche, and Sameh Taqatqa

Abstract Network intrusion detection is a key element in securing computer networks against unauthorised access and cyber-attacks. Traditional network intrusion detection systems (NIDS) face challenges in identifying unknown sophisticated threats due to their reliance on signature-based detection. In contrast, anomaly-based automated detection shows significant superiority. Machine learning approaches show promise in identifying unknown malicious attacks. This research presents an innovative ensemble-based machine learning technique for network intrusion detection, using the CICIDS 2017 dataset. Leveraging technological progress, and using several ensemble strategies, such as Random Forest, Adaboost, Bagging, Bernoulli Naive Bayes, Gaussian Naive Bayes, KNeighbors classifier, Decision Tree, and Multinomial Naive Bayes, we evaluate the performance of the proposed approach. Correlation analysis is employed to select relevant features for network intrusion detection. Our research, utilising various ensemble methods, reveals that the Random Forest technique consistently outperforms existing methods, achieving accuracy and False Positive Rate (FPR) levels typically exceeding 99.9%. This innovative strategy, incorporating robust evaluation metrics, emerges as a valuable tool for fortifying computer systems and networks against emerging cyber threats.

1 Introduction

In the rapidly evolving cybersecurity landscape, the relentless advancement of cyber threats underscores the imperative for innovative and robust intrusion detection mechanisms [1]. The perpetual cat-and-mouse game between security measures and malicious actors necessitates a continuous evolution of defines strategies [2, 3]. Within this context, safeguarding network infrastructures from unauthorized access and sophisticated attacks becomes an increasingly intricate challenge.

Traditional intrusion detection systems, predominantly reliant on signature-based approaches, exhibit notable efficacy against known threats but face inherent limitations in addressing the ever-expanding spectrum of unknown and sophisticated attacks [4]. The motivation driving this research is rooted in the urgent need to fortify intrusion detection systems against these dynamic challenges. The inadequacies of conventional methods highlight the necessity to explore and implement advanced techniques capable of effectively identifying and mitigating both known and emerging intrusions [5, 6].

In response to these challenges, anomaly-based techniques have emerged as a proactive strategy [7]. By focusing on the detection of deviations from established norms, anomaly- based approaches provide a promising avenue for enhancing the adaptability and efficacy of intrusion detection systems. This research seeks to harness the strengths of anomaly-based methodologies by integrating them with ensemble algorithms, thereby creating a comprehensive and resilient defense mechanism against a broad spectrum of cyber threats.

2 Motivation

The motivation behind this research is deeply rooted in the urgency to fortify intrusion detection systems against the dynamic and ever-growing threat landscape. Recognizing the inherent limitations of conventional methods in dealing with the sophistication and diversity of contemporary cyber threats, there is a compelling need to explore advanced techniques that can effectively identify and mitigate both known and unknown intrusions [8]. This research aims to contribute to the overarching goal of creating a cybersecurity posture that is not only responsive but also proactive in countering emerging threats.

3 Objectives

The primary objectives of this research are twofold. Firstly, it aims to assess the effectiveness of anomaly-based detection methodologies when integrated with ensemble algorithms for network intrusion detection. Secondly, it seeks to provide valuable insights into the selection and integration of these techniques to bolster the robustness of intrusion detection systems. By leveraging the rich and diverse CICIDS2017 dataset, the research endeavors to benchmark and enhance the performance of intrusion detection systems across various network contexts. Through a meticulous exploration of various machine learning algorithms within an ensemble framework, the research strives to offer practical solutions that advance the current state of intrusion detection capabilities, particularly in the face of the constantly evolving cyber threat landscape.

4 Related Works

A. dependable hybrid machine learning model for network intrusion detection

This research introduces a novel hybrid machine learning model for network intrusion detection, addressing the need for improved accuracy and dependability in current Network Intrusion Detection Systems (NIDSs) [9]. Combining machine learning and deep learning, the proposed method employs SMOTE for data balancing and XGBoost for feature selection during efficient pre-processing. Extensive experiments on KDDCUP'99 and CIC-MalMem-2022 datasets demonstrate outstanding accuracy (99.99% and 100%, respectively) without overfitting or Type-1 and Type-2 issues. Performance analysis, including various metrics and cross-validation, showcases the superiority of the proposed features over others. This research contributes a dependable solution for network intrusion detection, amalgamating data balancing and feature selection in a hybrid model for enhanced accuracy and reliability [10].

B. Anomaly Based Network Intrusion Detection Using Ensemble Machine Learning Technique

In this paper, an ensemble learning model is proposed for anomaly-based network intrusion detection, leveraging the strengths of various algorithms. The results demonstrate significant performance improvements over individual classification algorithms, emphasizing the versatility of the ensemble approach. The adaptive accuracy selection rule achieves an 85% accuracy, outperforming alternative high-level techniques [11, 12]]. Notably, the ensemble model surpasses deep neural networks in both efficiency and detection results [13]. The voting algorithm proves superior to other algorithms, aiming to enhance training data quality and optimize feature extraction strategies. This research highlights the potential of ensemble machine learning in network security, providing a robust and efficient approach for intrusion detection. Future work is suggested for automating intruder detection using a rule repository.

C. Anomaly based network intrusion detection for IoT attacks using deep learning technique

This paper introduces an anomaly-based Intrusion Detection System (IDS) for IoT networks using a Deep Learning technique, specifically a filter-based feature selection Deep Neural Network (DNN). The proposed model achieves an 84% accuracy on the UNSW-NB15 dataset, addressing class imbalance with Generative Adversarial Networks (GANs) and obtaining a 91% accuracy. Evaluation metrics including precision, recall, F1 score, and confusion matrices are analysed [14]. The DNN framework, incorporating feature selection and GANs, demonstrates a significant breakthrough in achieving high accuracy, highlighting its efficacy in cyber security for IoT networks. Future applications include adaptation to other datasets with imbalanced class labels.

D. Fuzzy logic-based DDoS attacks and network traffic anomaly detection methods: Classification, overview, and future perspectives

This research explores the escalating cybersecurity challenges, particularly distributed denial of service (DDoS) attacks, emphasizing the vulnerabilities despite existing intrusion detection systems. It introduces a comprehensive survey, categorizing DDoS attacks, and recommends effective defensive strategies, focusing on fuzzy-based detection methods [8]. The findings offer valuable insights for enhancing business sustainability in the industry 4.0 era.

E. Ensemble Voting System for Anomaly Based Network Intrusion Detection

This paper proposes an Ensemble Voting System for Anomaly-Based Network Intrusion Detection, crucial in safeguarding modern telecommunication and information networks. Utilizing data mining techniques and the KDDCup 1999 dataset, the study evaluates the performance of various classifiers [15, 16]. The results demonstrate the superiority of the proposed voting ensemble technique, showcasing significantly better intrusion detection capabilities compared to existing methods. The approach proves efficient in terms of accuracy, low false positive rates, and quick model building [17]. However, challenges related to ensemble comprehensibility are acknowledged, pointing to a potential direction for future research to enhance the user's understanding of ensemble methods.

F. An Ensemble of Prediction and Learning Mechanism for Improving Accuracy of Anomaly Detection in Network Intrusion Environments

This paper introduces an innovative intrusion detection system utilizing an ensemble of prediction and learning mechanisms to enhance anomaly detection accuracy in network intrusion environments. Leveraging automated machine learning and Kalman filter-based prediction models, the proposed system achieves high accuracy rates of 98.801% on the UNSW-NB15 dataset and 97.02% on the CICIDS2017 dataset [18]. Performance comparisons with contemporary models highlight significant improvements in intrusion accuracy, detection rate, and F1 score. The study emphasizes the need to adapt data mining and statistical methods to address challenges posed by the increasing complexity of internet applications, paving the way for future applications in IoT-cloud environments.

G. A novel ensemble learning-based model for network intrusion detection

This paper introduces an ensemble learning-based model for network intrusion detection, leveraging Gaussian naive Bayes, logistic regression, and decision tree as base classifiers and stochastic gradient descent as the meta- classifier. Evaluated on KDD Cup 1999, UNSW-NB15, and CIC-IDS2017 datasets, the ensemble model significantly improves overall performance, reducing false positives and enhancing accuracy [19–21].While effective for high class imbalance datasets, there is room for further improvements in detecting specific attacks. The study encourages exploring data augmentation and cost-sensitive learning to address class imbalance challenges in intrusion detection systems.

5 Methodology

Based on the provided diagram, which outlines the process flow, the research methodology as shown in Fig. 1 of the proposed network intrusion detection system can be explained based on the provided diagram, which outlines the process flow:

1. **Data Collection**: The system operates in a real network environment where network traffic and events are continuously monitored. Data is collected from this environment. This data is used as input to the detection system [22].
2. **Preprocessing**: Once the data has been collected, it is goes through a preprocessing phase. This step involves cleaning and transforming the data to ensure it is suitable for training and recognition. Preprocessing could include tasks such as removing irrelevant features, normalizing the data, and handling missing values [23].
3. **Training and System Model**:

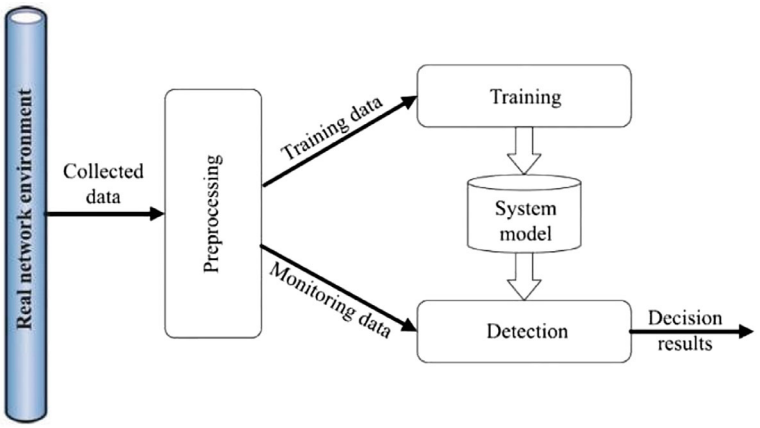

Fig. 1 Research methodology

- The preprocessed data is divided into two sets: training data and monitoring data.
- The training data is used to develop a system model. Machine learning algorithms are used here to learn from the labeled data. The goal of this phase is to build an accurate and effective model that can identify patterns in network activity [24].
- The system model can use various ensemble machine learning techniques such as Random Forest, Adaboost, Bagging, Naive Bayes, and Decision Trees, as mentioned earlier [25].

4. **Detection**: Once the model has been trained, the system enters the **detection** phase where it evaluates the incoming monitoring data from the network [26]. The model compares the monitoring data with the learned patterns from the training phase to detect anomalies or potential threats.
5. **Decision Results**: The system outputs decision results based on its analysis. These results could classify network activity as either benign or malicious. In this context, malicious activity would indicate network intrusions or attacks, and the system would raise an alert or take appropriate action to mitigate the threat [27].

6 Result Analysis

The evaluation of the ensemble-based machine-learning technique for network intrusion detection revealed nuanced performances among diverse algorithms. The Bagging Classifier exhibited exceptional results with perfect accuracy, precision, recall, and F1 score, emphasizing its robustness. Similarly, the Random Forest Classifier displayed flawless performance, underlining its effectiveness. Notably, the KNeighbors Classifier Model demonstrated high accuracy and outstanding precision, recall, and F1 score. In contrast, Gaussian Naive Bayes struggled with a notably lower accuracy and higher classification error. The ensemble approach showcased its strength in amalgamating diverse classifiers, with standout algorithms like Bagging, Random Forest, and KNeighbors Classifier, emphasizing the potential for creating a potent network intrusion detection system.

1. Accuracy is a metric used to calculate the ratio of the number of correct predictions divided by the total number of predictions to measure the model's ability to correctly predict the output (class label). A high accuracy indicates that the model is making correct predictions overall Accuracy.
2. Precision is a metric used to measure how many true positive predictions made by the model are true in the dataset, It represents the accuracy of the positive prediction made by the model. It is calculated by dividing the true positives by the total number of positive predictions made by the model. A higher precision means that the model is making accurate predictions

3. Recall is a metric used to measure how many of all positive instance in the dataset were correctly predicted as positive by the model. It's calculated by dividing the true positives by the sum of true positives and false negatives to the sum of true positive and false negative. A high recall indicates that the model is unlikely to miss positive outcomes and is more sensitive to identifying them
4. F1-score is a metric that combines precision and recall into a single measure to assess the effectiveness of a prediction model. As it combines both precision and recall into single value, it provides a balanced measure of the model's accuracy and also f1 score shows the robustness of the prediction model

$$\text{Accuracy} = \frac{TP + TN}{TP + TN + FP + FN} \tag{1}$$

$$\text{Precision} = \frac{TP}{TP + FP} \tag{2}$$

$$\text{Recall} = \frac{TP}{TP + FN} \tag{3}$$

$$\text{F1 - Score} = \frac{2TP}{2TP + FN + FP} \tag{4}$$

7 Discussion and Conclusion

Network intrusion detection is a critical aspect of securing computer networks against unauthorized access and cyber-attacks. Traditional Network Intrusion Detection Systems (NIDS) face challenges in identifying unknown sophisticated threats due to their reliance on signature-based detection. This research introduces an innovative ensemble-based machine-learning technique for network intrusion detection, utilizing the CICIDS 2017 dataset (Table 1).

In our exploration, the limitations of signature-based detection became apparent, necessitating a shift towards more adaptive approaches. Anomaly-based automated detection, particularly through ensemble machine-learning techniques, emerged as a superior alternative. The versatility of ensemble strategies, including Random Forest, Adaboost, Bagging, and various Naive Bayes classifiers, showcased a significant leap forward in addressing the dynamic nature of cyber threats.

The rigorous evaluation on the CICIDS 2017 dataset allowed us to assess the proposed approach comprehensively. Leveraging correlation analysis for feature selection optimized the algorithm's efficiency, contributing to a more robust and resilient detection system. This approach reflects a commitment to innovation and practicality in enhancing intrusion detection capabilities.

Our research reveals that the Random Forest technique consistently outperforms existing methods, achieving accuracy and False Positive Rate (FPR) levels typically exceeding 99.9%. This not only reaffirms the efficacy of ensemble learning but also

Table 1 Algorithms result

Alto			Classification error	Average precision	Average recall	Average F1 score
AdaBoost Cla			0.11	0.81	0.89	0.85
Bagging Classifier			0	1	1	1
Bernoulli Naïve Baye Model			0.43	0.91	057	0.67
Gaussian Naïve Bayes	0.36		0.84	0.91	0.16	0.18
Random forest classifier	1		0	1	1	1
KNeighborsClassifier Model	0.99		0.01	0.99	0.99	0.99
Decision Tree Model	0.87	0.9	0.06	0.94	O.94	0.94
Multinomial Naïve Bayes	0.8	0.88	0.12	0.9	0.88	0.89

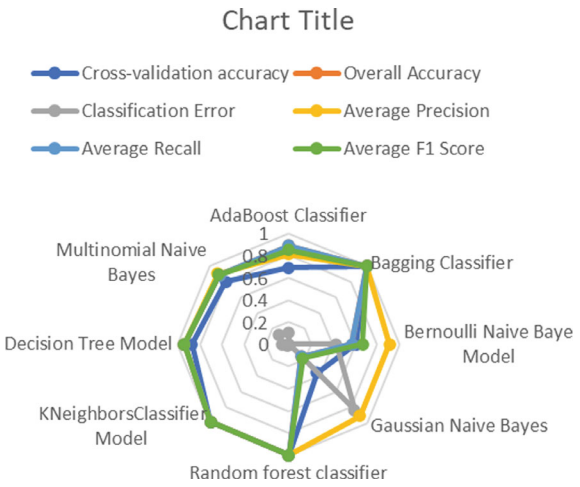

Fig. 2 Algorithms comparison according cross validation accuracy, classification error, average recall, overall accuracy, average precision, average F1 score

establishes our anomaly-based technique as a valuable tool for fortifying computer systems and networks against emerging cyber threats.

In conclusion, this innovative strategy, incorporating a range of ensemble methods and robust evaluation metrics, lays the foundation for future advancements in adaptive, machine-learning-driven network intrusion detection. The success of our anomaly-based technique marks a significant contribution to the ongoing efforts to secure digital infrastructures. As we move forward, the adaptability and accuracy demonstrated in this research hold promise for shaping the future landscape of network security (Fig. 2).

Abbreviations and Acronyms

NIDS	Network Intrusion Detection System
CICIDS	2017 Dataset for network intrusion
DNN	Deep Neural Network
GAN	Generative Adversarial Network
FPR	False Positive Rate
DdoS	Distributed Denial of Service

Navigating the Digital Wealth Landscape: Opportunities and Challenges in WealthTech Adoption

Joan Merin Saji, K. P. Jaheer Mukthar, and Hayel Khafajeh

Abstract The article explains how digital wealth platforms may improve financial services' usability, effectiveness, and customisation while highlighting cutting-edge uses and the implications for the sector. The article examines the variety of obstacles preventing WealthTech from being widely adopted. Potential mitigation techniques are examined along with regulatory challenges, cybersecurity concerns, and entrenched hostility from investors and established financial firms. Utilizing an array of case studies, the study evaluates the tactics, insights, and results of businesses that effectively incorporate WealthTech solutions. It condenses best practices and practical ideas for successfully navigating the digital wealth world. Future trends and the implications of WealthTech adoption are examined, with particular attention paid to the revolutionary potential of emerging technologies like big data analytics, blockchain, and artificial intelligence. Key findings are summarized, opportunities and limitations are reiterated, and useful suggestions are provided for stakeholders interested in effectively utilizing WealthTech before the paper closes.

1 Introduction

Wealth management is entering a revolutionary period as a result of the digital revolution, which is changing conventional methods and opening the door for creative solutions. We give a summary of the digital wealth environment in this introduction, emphasizing the increasing importance of technology and how it is changing wealth management services and tactics. Every element of our lives has been more entwined with technology in recent years, and the financial industry is no exception. Blockchain-based solutions, artificial intelligence-driven analytics, complex algorithms, automated investment platforms, and other technological innovations are all part of the digital wealth landscape. [1] It is parsimonious and simple, and comparing against this benchmark is conservative because it is highly selected (the characteristics it includes are routinely demonstrated to be among the most robust return predictors).

Technology's function in wealth management has changed from being merely supportive to acting as the main engine for strategic decision-making. Both private investors and financial institutions are using technology to improve client experiences overall, optimize investment strategies, and obtain deeper insights. Furthermore, the digital wealth landscape is distinguished by its capacity to democratize financial services accessibility, dismantle obstacles to entry, and enable a wider range of investors to engage in wealth-building endeavors. Technology has democratized wealth management in ways never seen before, from peer-to-peer lending platforms enabling capital allocation to robo-advisors providing individualized financial advice. With the speed at which technology is developing, more changes to the digital wealth landscape are anticipated. Blockchain, big data analytics, and machine learning are examples of emerging technologies that have the potential to completely change the way that wealth is dispersed, managed, and assigned [2].

Given this, it is critical to acknowledge the significant influence technology has on wealth management as well as the opportunities it offers to investors, wealth managers, and financial institutions. These opportunities do, however, come with difficulties, such as the need to comply with regulations, cybersecurity threats, and moral issues pertaining to data protection. The present study delves further into the prospects and obstacles present in the digital wealth terrain, scrutinizing the ways in which technology is influencing the trajectory of wealth management and the tactics required to adeptly maneuver through this ever-changing milieu. We seek to shed light on the changing role of technology in wealth management and the ramifications for various financial players through a thorough analysis [3].

The advent of the digital wealth landscape includes how technology has revolutionized conventional wealth management techniques. The term "WealthTech" originated from the way that recent technological developments have reshaped the way that both individuals and institutions manage their money. A combination of the words "wealth" and "technology," "wealthtech" describes the creative use of technology to improve and simplify a number of elements of wealth management. Financial planning, asset allocation, portfolio management, and investment advice

services are a few examples of this. The potential of WealthTech to democratize access to advanced wealth management tools and techniques is what makes it significant in today's financial services. WealthTech platforms help individual investors and financial institutions make better decisions, maximize investment returns, and reach their financial objectives more quickly by utilizing automation, data analytics, artificial intelligence, and other cutting-edge technology [4].

WealthTech offers more affordable options, increased transparency, and individualized services catered to each client's specific requirements and preferences, all of which have the potential to upend established financial structures. As a result, it signifies a paradigm shift in the wealth management sector that is fostering accessibility, efficiency, and creativity like never before. WealthTech represents a significant shift in the way that money is allocated and managed in the digital era. Its importance in contemporary financial services highlights how technology is transforming the wealth management industry and creating new opportunities for both institutions and investors [4].

Objectives

- Assessing the Current Landscape entails carrying out a thorough examination of the WealthTech platforms, goods, and services that are currently on the market.
- Recognizing the possible advantages and prospects provided by WealthTech solutions, including enhanced accessibility, customized financial guidance, economical viability, and expandability.
- Examining the obstacles and difficulties impeding the extensive integration of WealthTech, including as adherence to regulations, apprehensions regarding data security, reliance on clients, and technological constraints.

Opportunities in Wealhtech

Through a variety of features and functionalities, digital wealth platforms have the ability to greatly improve financial services' accessibility, effectiveness, and customisation. By offering online and mobile access to investment options and financial advice, digital wealth platforms can remove conventional obstacles to financial services. This implies that people can now engage in the financial markets who might have been shut out of traditional wealth management services because of time limits, geographic restrictions, or high entry barriers. These platforms sometimes have minimal minimum investment requirements, which makes it simpler for people with little money to begin investing. Furthermore, they frequently have intuitive user interfaces and educational materials that aid in demystifying intricate financial ideas and provide accessibility to investing for a wider range of people [2].

Digital wealth platforms can further improve accessibility for investors who might not have the knowledge or resources to manage their investments independently by providing personalized investment strategies that are tailored to individual goals and risk profiles through the use of automated investment solutions (such as roboadvisors).

By using technology, digital wealth platforms simplify the investing process and cut down on the time and resources needed to monitor accounts, make trades, and rebalance portfolios. These platforms are able to execute transactions more quickly

and cheaply than traditional human advisors thanks to automation and algorithm-driven investment methods. Digital wealth platforms have the ability to compile financial data from various sources and accounts, giving investors a real-time, comprehensive picture of their investment performance and overall financial health [1].

Investors are able to respond swiftly to developments in the market and make better selections thanks to this degree of accessibility and transparency. Efficiency is further increased through integration with other financial services and tools, such as goal-tracking tools, tax optimization software, and budgeting apps. These integrations streamline financial management duties and offer comprehensive financial planning solutions. With the great degree of customization offered by digital wealth platforms, investors may personalize their investment strategies and portfolios to suit their own risk tolerance, preferences, and financial objectives. These platforms are able to provide individualized asset allocation recommendations and investment recommendations that take into account the unique circumstances of each investor by using risk assessment questionnaires and data-driven algorithmsa multitude of investment options are available to investors, enabling them to construct diverse portfolios that meet their unique investing goals and inclinations. These options include stocks, bonds, mutual funds, exchange-traded funds (ETFs), and alternative assets.

Digital wealth platforms also give investors the flexibility and agility to manage their assets over time by allowing them to dynamically modify their portfolios and investment strategies in response to changes in the market or their financial objectives. Digital wealth platforms are essential for increasing the efficiency of investing processes, democratizing access to financial services, and enabling investors to tailor their financial plans to meet their own objectives.

Robo-advisors are automated investing systems that manage investment portfolios and offer financial advice using algorithms. Betterment, Wealthfront, and the robo-advisor services provided by established financial firms like Vanguard and Charles Schwab are a few examples. Because they provide inexpensive, automated investing solutions, robo-advisors have democratized access to investment management. Investors looking for ease of use, affordable fees, and customized investment plans will find them appealing. In order to stay competitive, traditional financial advisors have been under pressure from robo-advisors to modify their services and fee schedules. Users of micro-investing apps can make tiny investments in fractional shares of equities, exchange-traded funds (ETFs), or cryptocurrency. Acorns, Stash, and the "fractional shares" option in Robinhood are a few examples.

Younger generations and inexperienced investors who may not have significant sums of money to invest but want to start developing wealth gradually are drawn to micro-investing apps. By automatically making recurring investments or rounding up spare change from regular purchases, these applications foster regular investing habits and financial knowledge. Online comprehensive financial planning and investment management services are provided by digital wealth management platforms. Personal Capital, Ellevest, and SoFi Invest are a few examples. These platforms offer a comprehensive approach to financial planning by fusing tools for goal tracking, retirement planning, and budgeting with automated investment management. They

serve a wide range of customers, from high net worth individuals to millennials, providing individualized portfolio management services and guidance at a fraction of the price of conventional wealth management companies [4].

Machine learning algorithms are used by AI-powered financial advise platforms to evaluate user data, offer tailored financial advice, and maximize investment strategies. Aladdin Wealth from BlackRock and Wealthfront's Path are two examples. These platforms include advanced financial planning tools that evaluate users' risk profiles, ambitions, and financial situations in order to make recommendations that are specifically catered to them. They help investors reach their long-term financial goals, optimize their portfolios, and make better informed decisions. WealthTech is utilizing blockchain technology for a number of purposes, such as asset tokenization, decentralized financing (DeFi) systems, and investment vehicles based on smart contracts. WealthTech solutions built on blockchain technology improve asset management and investment transaction efficiency, security, and transparency. They do away with middlemen, cut expenses, and open up more investment options, especially in alternative assets like digital assets, real estate, and private equity [5]. By democratizing access to financial services, automating investment procedures, personalizing financial advice, and utilizing cutting-edge technologies to improve investment, these examples show how creative WealthTech applications are upending the financial sector.

Challenges in WealthTech Adoption

Many obstacles and difficulties exist for WealthTech solutions adoption, which may prevent these technologies from being widely used and adopted. WealthTech solutions must comply with a number of legal criteria, such as investment advice standards, data protection legislation, and anti-money laundering (AML) regulations. It can be difficult and expensive to comply with these requirements, especially for new businesses and smaller companies with limited funding. Navigating legal frameworks across several jurisdictions is a difficulty for WealthTech providers because to regulatory uncertainty and changing compliance demands. WealthTech platforms are appealing targets for cyberattacks and data breaches because they manage sensitive financial and personal data [6].

It is crucial to keep strong cybersecurity safeguards in place to safeguard customer data, but doing so calls for ongoing investments in knowledge and technology. Complying with data protection laws like the CCPA and GDPR presents an extra challenge for WealthTech companies, especially those with international operations. Even with the advantages of investing techniques driven by algorithms and automation, some investors could be reluctant to entrust digital platforms with their money [2]. The trust in WealthTech solutions may be eroded by worries about algorithmic biases, a lack of human monitoring, and the possibility of mistakes or system failures. Overcoming these perception hurdles requires developing trust and credibility by open and honest communication, helpful resources, and attentive customer service. It takes a substantial investment in software development, personnel recruiting, and technical infrastructure to create and manage complex WealthTech systems. With less resources and less technological know-how, smaller businesses could find it difficult to compete with larger market leaders or fintech startups. The integration

and scalability of WealthTech solutions might also be hampered by legacy systems and antiquated technological infrastructure seen in traditional financial institutions [3].

Wealth managers and financial advisers may oppose the use of WealthTech solutions because they fear losing their jobs, losing their clientele, or having their knowledge and value proposition compromised. Effective change management techniques, continual education and training, and clear communication about the advantages of technology-enabled wealth management are necessary to overcome reluctance to change [7].

WealthTech solutions can be inclusive and accessible, but there is still a digital divide in which some groups of people—older people, those living in rural regions, etc.—may not have access to digital devices or the internet. To mitigate these accessibility issues, WealthTech systems should be made user-friendly, compatible with many devices, and offered in multiple languages. With a wide spectrum of participants, including independent advisors, fintech startups, digital giants, and traditional financial institutions, the wealth management market is extremely fragmented. As a result of this fragmentation, WealthTech suppliers may face pricing pressure, market saturation, and fierce rivalry. Collaboration between regulators, industry stakeholders, and technology providers is necessary to address these obstacles and challenges. This includes fostering a supportive regulatory environment, advancing cybersecurity best practices, fostering investor trust, making investments in innovation and talent development, and guaranteeing equitable access to wealth management solutions enabled by technology [8].

WealthTech companies face a great deal of difficulty adhering to regulations since financial services are subject to strict guidelines designed to safeguard consumers and preserve market integrity.

WealthTech businesses have to abide by a complicated web of rules, which includes data protection legislation, know-your-customer (KYC) standards, securities laws, and anti-money laundering (AML) restrictions. Digital wealth management platforms may find it particularly difficult to comply with laws like the Securities Act, Investment Advisers Act, and Dodd-Frank Act since they have to make sure that their automated advise algorithms meet transparency requirements and fiduciary standards. Additional difficulties come from shifting legislation and regulatory ambiguity. WealthTech companies must continually modify their compliance procedures and operational strategies to meet these demands. WealthTech platforms manage sensitive financial and personal data, making them easy targets for hacks. WealthTech companies are susceptible to many cybersecurity threats, such as ransomware attacks, phishing schemes, insider threats, and data breaches. WealthTech organizations and their clients may face financial losses, reputational harm, regulatory fines, and legal ramifications as a result of a cybersecurity attack. Ensuring robust cybersecurity measures, such as encryption, multi-factor authentication, intrusion detection systems, and regular security audits, is essential to mitigate cybersecurity risks and protect sensitive client data [9].

Large volumes of personal and financial data are gathered and processed by wealthtech companies from their clientele, which raises privacy and confidentiality

issues. Clients' concerns over WealthTech companies' data collection, storage, usage, and sharing are growing, particularly in the wake of high-profile privacy scandals and data breaches. To preserve the security and privacy of customer data, WealthTech companies must adhere to data protection laws like the California Consumer Privacy Act (CCPA) in the US and the General Data Protection Regulation (GDPR) in the EU. In order to address data privacy issues and foster client trust, it is imperative to have strong data governance procedures, such as data encryption, anonymization, access limits, and data breach response plans [10].

WealthTech companies, regulators, and industry stakeholders must work together to overcome these obstacles and hurdles in order to create legislative frameworks that promote innovation while preserving consumer protection, cybersecurity, and data privacy. To gain client trust and reduce risks related to cybersecurity, data privacy, and regulatory compliance, wealth tech companies should emphasize compliance, invest in cybersecurity defenses, and embrace privacy-by-design principles [11].

Adoption of WealthTech solutions is severely hampered by investors' and traditional financial institutions' resistance to change. WealthTech solutions may face resistance from traditional financial institutions because they see them as a challenge to their established business strategies and areas of expertise.Financial advisors and wealth managers may believe that automated investment platforms take away from the importance of human counsel and one-on-one interactions with clients, giving them less control over client relationships and investment choices. Conventional financial organizations frequently have deeply ingrained organizational cultures and structures that are resistant to innovation and change [12].

Within traditional financial businesses, the adoption of new technology and business models can be impeded by bureaucratic inertia, obsolete processes, and legacy systems. Due to worries about legal ramifications and regulatory compliance, traditional financial institutions may be reluctant to implement WealthTech solutions because they operate in a highly regulated environment. For WealthTech companies as well as traditional financial institutions, complying with complicated regulatory requirements including fiduciary standards, suitability restrictions, and data protection legislation can be difficult. Investors may be reluctant to accept new technology and investment methods provided by WealthTech platforms, especially if they are conservative or risk averse. Investors may not embrace WealthTech solutions if they have concerns about the performance, security, and dependability of digital platforms and automated investment algorithms [13].

Concerns over data privacy, cybersecurity threats, and the transparency of automated investment algorithms may cause investors to mistrust WealthTech platforms. It is imperative for WealthTech companies to exhibit transparency, accountability, and reliability in order to surmount investor skepticism and establish market reputation. Personalized guidance and face-to-face engagement provided by conventional financial advisors may be preferred by certain investors over automated investment platforms. To satisfy the various needs and preferences of investors, wealth tech companies must strike a balance between the advantages of automation and scalability and the requirement for a personal touch and customized service. In order

to overcome investors' and traditional financial institutions' aversion to change, interacting with stakeholders to learn about their requirements and worries.

showcasing the benefits of WealthTech solutions, such as reduced costs, more convenience, and better investment results. Clearing up misunderstandings regarding automated investment platforms and educating investors on the advantages and dangers of digital asset management. Establishing regulatory frameworks that support innovation, consumer protection, and market integrity in cooperation with regulators and industry groupings [14].

To address regulatory compliance, data privacy, and cybersecurity issues, investments should be made in cybersecurity defenses, compliance skills, and client trust-building programs. Utilizing alliances and partnerships with established financial institutions to promote adoption and efficiently grow their enterprises. WealthTech companies may get over reluctance to change and seize chances for expansion, innovation, and value creation in the financial services sector by tackling these obstacles and difficulties [15].

Case Studies

- ***Betterment:***

Retail investors can get automated investment management services through Betterment, a top robo-advisor platform. By utilizing technology to offer goal-based financial planning, portfolio management, and customized investment advice, Betterment has effectively integrated WealthTech solutions. Betterment's platform has experienced considerable growth and adoption due to its user-friendly design, cheap fees, and varied investment portfolios, which have drawn a wide customer base. Betterment oversees more than $30 billion in assets under management (AUM) as of 2021.

Personal Capital:

Personal Capital is a digital wealth management platform that offers a suite of financial tools and services, including investment management, retirement planning, and wealth tracking. Personal Capital has successfully implemented WealthTech solutions by combining automated investment management with personalized financial advice from human advisors. Personal Capital's holistic approach to financial planning has resonated with investors seeking comprehensive wealth management solutions. The company has experienced rapid growth and currently manages over $17 billion in AUM.

Acorns:

Acorns is a micro-investing app that allows users to invest spare change from everyday purchases into diversified investment portfolios. Acorns has successfully implemented WealthTech solutions by leveraging automation and behavioral finance principles to encourage regular investing habits among users. Acorns has attracted a large user base, particularly among millennials and novice investors, by making investing accessible, convenient, and affordable. The app has over 9 million users and manages billions of dollars in AUM.

Wealthfront:

Wealthfront is a robo-advisor platform that offers automated investment management and financial planning services. Wealthfront has successfully implemented WealthTech solutions by leveraging technology to optimize investment strategies, tax efficiency, and portfolio rebalancing. Wealthfront's low fees, tax-loss harvesting, and risk-parity investment approach have resonated with investors seeking passive, long-term investment solutions. The company manages over $25 billion in AUM and continues to grow its user base.

SoFi Invest:

SoFi Invest is an online brokerage platform that offers commission-free trading, robo-advisor services, and financial planning tools. SoFi Invest has successfully implemented WealthTech solutions by integrating investment management with other financial products and services, including student loan refinancing, personal loans, and mortgage lending. SoFi Invest's integrated approach to financial services has attracted a diverse customer base, including young professionals, students, and first-time investors. The company has experienced significant growth and expansion into new markets.

These case studies show how businesses and organizations have successfully incorporated WealthTech solutions to draw clients, upend the financial services sector, and see notable growth and platform acceptance. These businesses have revolutionized the way people save, invest, and handle their money via creativity, technology, and customer-focused strategies. Effectively navigating the digital wealth landscape necessitates a blend of technology innovation, customer-centricity, regulatory compliance, and strategic strategy. Keep yourself updated with customer preferences, market trends, and the competitive environment in the digital wealth sector. To predict changes in the market and modify your plans appropriately, keep an eye on emerging opportunities, regulatory changes, and technology improvements.

Set measurable goals and a logical plan of action that complement your value proposition, target market, and business objectives. Establish your differentiation approach and unique selling proposition (USP) to make an impression in the congested digital wealth market. To improve the scalability, effectiveness, and user experience of your digital wealth platform, embrace innovation and technology. To promote innovation and distinction, make investments in cutting-edge technologies like blockchain, data analytics, artificial intelligence, and machine learning. Make sure that the rules regulating digital wealth management, such as those pertaining to securities, data protection, and anti-money laundering (AML), are strictly followed. To ensure regulatory compliance and reduce regulatory risks, implement strong compliance processes, risk management frameworks, and internal controls. Put strong data security and cybersecurity procedures in place to secure sensitive customer information and reduce cyber risks. To guard against data breaches and cyber threats, encrypt data, use multi-factor authentication, and carry out security audits and assessments on a regular basis. Provide individualized portfolio management services, investment suggestions, and financial advice based on the needs, preferences, and objectives of each customer. By giving accurate information about costs, investment options, and dangers related to digital wealth management services, you may improve openness and disclosure [16].

Gain clients' trust and credibility by acting with honesty, professionalism, and openness in all of your dealings. Give your clients the knowledge they need to make wise financial decisions by educating them about the advantages and dangers of digital wealth management.

Create streamlined digital experiences and user-friendly, intuitive interfaces that improve accessibility, usability, and client engagement. To provide a unified and practical user experience across many touchpoints, allocate resources towards omnichannel integration, mobile optimization, and user experience (UX) design. Encourage client involvement and allegiance by means of proactive correspondence, tailored suggestions, and enhanced services. Offering clients financial planning tools, investment information, and instructional materials will empower them and improve their relationship with your business. Adopt a culture of innovation and ongoing development to keep up with changing customer demands and market trends. Try out new products, services, and company strategies to promote differentiation, creativity, and long-term success in the digital wealth market [17].

Future Directions and Implications

The financial services sector is changing, and people's approaches to saving, investing, and managing their wealth are changing too. This is due to emerging trends and future advances in WealthTech. Algorithms for artificial intelligence and machine learning are being utilized more and more to streamline portfolio management, automate investment decision-making, and provide personalized financial advice. Artificial intelligence (AI)-driven chatbots and virtual assistants are enhancing customer service and engagement by offering users immediate assistance and tailored recommendations. Tokenization of assets is made possible by blockchain technology, which also makes it easier to issue, trade, and settle cryptocurrencies, digital securities, and other alternative assets. Blockchain technology is being used by decentralized finance (DeFi) platforms to provide cutting-edge financial services and products like decentralized lending, borrowing, and trading [19].

Because they provide automated investment management services at a fraction of the price of traditional wealth management organizations, robo-advisors are still becoming more and more popular. Hybrid advisory models are starting to appear; they combine human advisors with automated investment algorithms to offer a comprehensive and individualised approach to asset management and financial planning. To cater to the varied requirements and inclinations of individual investors, wealth technology companies are placing a greater emphasis on personalization and customization. Personalized asset allocations, financial planning strategies, and investment recommendations are generated by analyzing user data using advanced data analytics and predictive modeling approaches [20]. WealthTech companies may reduce regulatory risks, automate compliance procedures, and negotiate complex regulatory requirements with the use of RegTech solutions.

RegTech is significantly advancing efficiency and transparency in regulatory reporting, know-your-customer (KYC) verification, and anti-money laundering (AML) screening. Demand for impact investing and sustainable solutions that meet environmental, social, and governance (ESG) standards is rising [16]. WealthTech platforms are enabling investors to factor their values and preferences into their

investing decisions by incorporating ESG data and analysis into their investment plans. WealthTech companies now have access to and the ability to evaluate a vast array of financial data from several sources thanks to open banking initiatives and data aggregation technology. WealthTech platforms can give a client a complete picture of their financial situation and individualized financial advice and suggestions by compiling financial data from bank accounts, investment accounts, and other financial organizations. Behavioral finance principles and gamification techniques are being used to encourage positive financial behaviors and improve investor engagement [17].

Features such as goal-based investing, progress tracking, and rewards systems are designed to motivate users to save more, invest wisely, and achieve their financial goals. AI and machine learning algorithms are increasingly being used to automate investment decision-making, personalize financial advice, and optimize portfolio management. AI-powered chatbots and virtual assistants are improving customer service and engagement by providing instant support and personalized recommendations to users. Blockchain technology is enabling the tokenization of assets, facilitating the issuance, trading, and settlement of digital securities, cryptocurrencies, and other alternative assets. Decentralized finance (DeFi) platforms are leveraging blockchain to offer innovative financial products and services, such as decentralized lending, borrowing, and trading. Because they provide automated investment management services at a fraction of the price of traditional wealth management organizations, robo-advisors are still becoming more and more popular. Hybrid advisory models are starting to appear; they combine human advisors with automated investment algorithms to offer a comprehensive and individualised approach to asset management and financial planning [18].

To cater to the varied requirements and inclinations of individual investors, wealth technology companies are placing a greater emphasis on personalization and customization. Personalized asset allocations, financial planning strategies, and investment recommendations are generated by analyzing user data using advanced data analytics and predictive modeling approaches. WealthTech companies may reduce regulatory risks, automate compliance procedures, and negotiate complex regulatory requirements with the use of RegTech solutions.

RegTech is significantly advancing efficiency and transparency in regulatory reporting, know-your-customer (KYC) verification, and anti-money laundering (AML) screening. Demand for impact investing and sustainable solutions that meet environmental, social, and governance (ESG) standards is rising [19].

WealthTech platforms are enabling investors to factor their values and preferences into their investing decisions by incorporating ESG data and analysis into their investment plans. WealthTech companies now have access to and the ability to evaluate a vast array of financial data from several sources thanks to open banking initiatives and data aggregation technology. WealthTech platforms can give a client a complete picture of their financial situation and individualized financial advice and suggestions by compiling financial data from bank accounts, investment accounts, and other financial organizations [20]. To promote sound financial practices and raise investor participation, gamification strategies and behavioral finance concepts

are being applied. Users are encouraged to save more, make wise investment decisions, and reach their financial objectives through features like goal-based investing, progress tracking, and incentive programs. WealthTech companies may seize new possibilities, set themselves apart from competitors, and provide creative solutions that satisfy changing investor demands and tastes in the digital era by keeping up with these new trends and advancements. The evolution of digital wealth management could be profoundly impacted by the integration of technologies like big data analytics, blockchain, and artificial intelligence (AI). These technologies could revolutionize the delivery of financial services and improve accessibility, efficiency, and personalization [21].

Large volumes of data, such as investing preferences, risk tolerance, and financial objectives, can be analyzed by AI algorithms to produce individualized financial recommendations for each investor. Investment portfolios can be managed effectively and economically with the help of AI-powered robo-advisors, which can automate the creation, rebalancing, and optimization of portfolios. Artificial Intelligence (AI) has the potential to improve risk management and investment decisions by utilizing predictive analytics to forecast market trends, discover investment opportunities, and analyze portfolio risk. Enhanced Security and Transparency: Blockchain technology lowers the risk of fraud, manipulation, and unauthorized access to customer data and assets by providing a decentralized and immutable record [22].

Traditional assets like real estate, artwork, and equities can now be tokenized thanks to blockchain technology, enabling fractional ownership, more liquidity, and round-the-clock trade of formerly illiquid assets. Blockchain-based smart contracts streamline investment operations by automating investment procedures, upholding contracts, and enabling peer-to-peer transactions. This eliminates the need for middlemen.

Financial advice and services can be more precisely tailored to the requirements and tastes of individual clients by using big data analytics to examine investment behavior, sentiment, and preferences [23]. Through the examination of past market data, the discovery of correlations and trends, and the stress testing of investment strategies under diverse conditions, big data analytics approaches can evaluate and reduce portfolio risk. Wealth managers can more successfully customize their services and investment advice to various customer categories by using big data analytics to segment clients based on demographics, risk profiles, and investment objectives.

Digital wealth management could undergo a revolution with the combination of AI, blockchain, and big data analytics, as it could lead to increased efficiency, personalization, security, and accessibility to financial services. Wealth management companies may maintain their competitiveness, satisfy changing investor demands, and provide value-added services in a world that is becoming more digital and data-driven by utilizing these technologies wisely [24].

The financial sector and society at large will be greatly impacted by the adoption of WealthTech, which touches on a number of issues including accessibility, efficiency, innovation, and societal effect [11]. Because wealthTech platforms reduce entrance barriers and increase accessibility to investment opportunities for people

of all income levels, they have democratized access to wealth management services. By enabling a larger portion of the populace to engage in wealth generation and the financial markets, this democratization has the potential to lessen wealth inequality. By targeting underserved groups like the unbanked and underbanked, who might not have easy access to traditional financial services, wealthtech solutions can advance financial inclusion. To assist people in saving money, increasing their financial literacy, and achieving long-term financial stability, digital wealth management platforms can offer investment choices, budgeting tools, and financial education. Adoption of wealthTech by financial institutions can lower costs and increase operational efficiency by automating repetitive procedures, optimizing workflows, and doing away with paper documentation. Investors can gain from cheaper costs and better investment returns by using automated investing platforms and robo-advisors, which can provide affordable investment management solutions at lower rates than traditional wealth management businesses [25, 26]].

WealthTech uses cutting-edge technology like big data analytics, blockchain, and artificial intelligence to promote technical innovation and advancement in the financial sector. In response to shifting consumer tastes and market needs, traditional financial institutions are compelled to innovate and adapt, which in turn stimulates competition and product development. Concerns regarding data privacy, cybersecurity, and the safeguarding of sensitive financial information are brought up by the broad use of wealth technology [27]. For wealth tech companies to secure customer data and guard against cyberattacks and data breaches, they need to have strong cybersecurity measures in place, prioritize data security, and adhere to legal requirements.

The regulatory environment around the adoption of WealthTech is complicated and changing quickly, which presents difficulties for legislators, regulators, and financial institutions [28].

To maintain consumer protection, market integrity, and regulatory compliance, wealthtech companies must manage regulatory compliance requirements, such as securities laws, anti-money laundering (AML) rules, and data protection laws. The disruption caused by wealth tech presents both opportunities and problems for banks, wealth management companies, and financial advisors, among other traditional financial organizations. If traditional businesses want to stay competitive in the rapidly changing WealthTech market, they need to embrace digital transformation, innovate, and modify their business models [29]. Otherwise, they run the danger of falling behind more nimble and tech-savvy competitors.

The implementation of WealthTech has the capacity to propel economic expansion, endorse fiscal stability, and encourage investment in the economy by enabling the mobilization of savings, directing funds towards profitable ventures, and cultivating innovation and entrepreneurship. Adoption of WealthTech has broad ramifications for society and the financial sector, including innovation and technological advancement as well as improved accessibility and efficiency [30]. WealthTech adoption raises important questions about data privacy, cybersecurity, regulatory compliance, and the future of traditional financial institutions in a world that is becoming more digitally and globally interconnected, all while providing opportunities for financial inclusion, cost reduction, and economic growth [31].

Recommendation

Tailor WealthTech solutions to address specific needs and deliver value-added services that meet the diverse requirements of stakeholders. Allocate resources and invest in cutting-edge technologies such as artificial intelligence, blockchain, and big data analytics to drive innovation and differentiate WealthTech offerings. Collaborate with technology partners, startups, and industry experts to leverage emerging technologies and stay ahead of market trends. Establish robust compliance processes, risk management frameworks, and internal controls to ensure regulatory compliance and mitigate legal and reputational risks. Implement stringent data security measures, including encryption, access controls, and cybersecurity protocols, to protect sensitive client information and mitigate cyber threats. Foster transparency, integrity, and accountability in all aspects of WealthTech operations, including fee structures, investment strategies, and client communication.

Educate clients about the benefits and risks of digital wealth management, provide clear disclosures, and address client concerns to build trust and confidence in WealthTech solutions. Design intuitive, user-friendly interfaces and seamless digital experiences that enhance usability, accessibility, and engagement for clients. Prioritize mobile optimization, responsive design, and omnichannel integration to ensure a consistent and convenient user experience across multiple devices and touchpoints. Leverage AI, data analytics, and machine learning algorithms to provide personalized financial advice, tailored investment recommendations, and customized portfolio management strategies. Empower clients to set financial goals, track progress, and make informed decisions by offering interactive tools, educational resources, and real-time insights. Collaborate with financial institutions, technology providers, regulators, and industry associations to foster innovation, share best practices, and address common challenges in the WealthTech ecosystem. Form strategic partnerships and alliances with complementary firms to expand service offerings, reach new markets, and enhance value proposition for clients. Stay abreast of market trends, regulatory developments, and emerging technologies to anticipate changes in the WealthTech landscape and adapt strategies accordingly. Foster a culture of innovation, agility, and continuous improvement to respond effectively to evolving client needs, market dynamics, and competitive pressures.

Conclusion

The study examines the state of digital wealth, emphasizing the benefits and drawbacks of WealthTech adoption. A wider variety of investors can now more easily access financial services because to the democratization of access provided by digital asset management platforms. For wealth management companies, automation and technology-driven solutions increase scalability, lower costs, and improve operational efficiency. For individual investors, AI and data analytics enable customized portfolio management, individualized investment strategies, and personalized financial advice. WealthTech encourages technical innovation and advancement, which propels market expansion, product creation, and competitiveness in the financial sector. WealthTech companies face difficulties due to complex and constantly changing regulatory requirements, such as securities legislation, data protection regulations, and anti-money laundering (AML) standards. Risks related to cybersecurity,

data privacy, and the security of private financial information provide obstacles to WealthTech adoption and client confidence. For WealthTech companies, gaining and retaining client trust is essential, particularly when it comes to responsibility, dependability, and transparency in the provision of financial services.

WealthTech adoption has obstacles relating to technological restrictions, including as scalability, interoperability, and interaction with legacy systems, even though technology presents chances for innovation. There are a lot of potential for wealth management to be innovative, efficient, and accessible in the digital wealth landscape. However, in order to fully utilize WealthTech and efficiently traverse the changing digital wealth landscape, issues including regulatory compliance, data security, customer trust, and technological limits must be resolved.

The Impact of Soft Skills on Organizational Citizenship Behavior

Khaled Alzeaideen, Maan Hussein Mansour, and Manal Ahmad Al-Khatib

Abstract The purpose of this study is to investigate how soft skills and their various components impact organizational citizenship behavior within organizations. Additionally, the study aims to assess the level of soft skills and organizational citizenship behavior among employees of the organization. The study focuses on two variables: the independent variable, which encompassed soft skills and was measured through four dimensions: communication and interpersonal skills, teamwork, problem-solving, and time management; and the dependent variable, which encompassed organizational citizenship behavior and was measured through five dimensions: altruism, courtesy, sportsmanship, civic virtue, and conscientiousness. To conduct the study, a descriptive-analytical approach was utilized, and a questionnaire consisting of 45 items was developed. The questionnaire was distributed to a random sample of 400 employees, resulting in a response rate of 83%. Out of the responses received, 330 questionnaires were deemed valid for analysis. The collected data was statistically analyzed using SPSS/V25. The study yielded several significant findings, with one of the most notable being the statistically significant impact of the combined dimensions of soft skills on organizational citizenship behavior. In the study population, there was an average level of availability of soft skills, while the corporation exhibited a high level of organizational citizenship behavior. To promote the development of soft skills and enhance organizational citizenship

behavior, the study suggested creating a supportive organizational environment. This can be achieved by incorporating soft skills training into employee development programs and incentivizing and rewarding organizational citizenship behavior appropriately.

Keywords Soft skills · Organizational citizenship behavior · Altruism · Courtesy · Sportsmanship

1 Introduction

Amidst the rapid global development across various aspects of life, organizations are faced with challenges and requirements that necessitate the cultivation of human resources skills beyond formal behavior. Management experts have recently emphasized the significance of "soft skills," a contemporary concept that holds equal importance for both public and private organizations. Soft skills encompass intangible abilities that are not directly linked to specific work outcomes, but rather focus on an individual's capacity to effectively interact with others, present ideas persuasively and courteously, and engage positively with clients. These skills contribute to individuals' readiness to engage in organizational citizenship behavior, which entails voluntary actions that surpass official job requirements and are not explicitly recognized or rewarded. Examples of such behavior include assisting colleagues, volunteering for additional tasks, and actively participating in organizational initiatives. Therefore, it is crucial to explore the connection between soft skills and organizational citizenship behavior within the context of the Social Security Corporation. This exploration will provide valuable insights into the development of these skills, fostering a more positive work environment and establishing strategies to cultivate a culture of cooperation and empathy within the organization.

1.1 Problem and Research Questions

Extensive research and numerous studies have unequivocally demonstrated the immense value of organizational citizenship behavior in gaining a competitive edge. As astutely noted by Katz and Khan, organizations that aim to thrive cannot afford to neglect the active participation of their members as exemplary citizens who surpass their prescribed duties and exhibit spontaneous and innovative behaviors for the betterment of the organization. Merely possessing hard skills, such as analytical thinking, reasoning, and proficiency, is no longer sufficient. The possession of soft skills is equally indispensable, as hard skills may facilitate initial job acquisition, but it is the cultivation of soft skills that is pivotal in sustaining and effectively managing that job [30].

Awan et al. [15] conducted a study that supports the notion that hard skills only contribute to 15% of an individual's success, while the remaining 85% is attributed to soft skills. Given the significance of the Social Security Corporation as a governmental service institution in Jordan, which involves direct interaction with clients, this study aims to explore how the presence of soft skills among employees influences their willingness to engage in organizational citizenship behaviors. The findings of this study can inform human resource practices, training programs, and leadership strategies to create a positive and productive work environment that aligns with the corporation's future objectives. Therefore, the primary research question of this study is:

- Does the presence of soft skills, including communication and interpersonal skills, teamwork, problem-solving, and time management, have an impact on organizational citizenship behavior, encompassing altruism, courtesy, sportsmanship, civic virtue, and conscientiousness, at the Social Security Corporation in Jordan?

1.2 Importance of the Study

By gathering and evaluating the viewpoints of participants, this research sheds light on the influence of soft skills on organizational citizenship behavior within the local setting. It not only clarifies the concepts and dimensions of the variables under investigation but also holds practical significance in its examination of how soft skills impact organizational citizenship behavior within the sole establishment responsible for delivering social security services to all sectors of Jordanian society. With the institution facing various challenges, this study addresses the pressing need to enhance the quality of services provided to citizens. Furthermore, it can serve as a valuable starting point for future researchers, enriching scholarly comprehension of the intricate relationship between these variables.

1.3 Study Objectives

The aim of the study is to understand the nature of the relationship between soft skills with their dimensions (communication and interpersonal skills, teamwork, problem solving and time management) and organizational citizenship behavior with their dimensions (altruism, politeness, sportsmanship, citizenship behavior and conscientiousness) in Social Security Corporation of Jordan. Additionally, the study aims to achieve the following partial objectives:

- Identify the level of implementation of soft skills along with their dimensions (communication and interpersonal skills, teamwork, problem solving and time management) in the Social Security Corporation of Jordan.

- Identify the level of organizational citizenship behavior along with its dimensions (altruism, courtesy, sportsmanship, citizenship behavior, and conscientiousness) in the Social Security Corporation of Jordan.
- Present the results and recommendations from a scientific study that can help improve soft skills and strengthen organizational citizenship behavior among corporate employees, positively reflecting the institution's performance and achieving its goals.

1.4 Study Hypotheses

Based on the problem and objectives of the study, the following hypotheses have been formulated:

- **Main Hypothesis HO1**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on organizational citizenship behavior with its dimensions (altruism, courtesy, sportsmanship, civic virtue, and conscientiousness) at the Social Security Corporation in Jordan." The sub-hypotheses are:
  - **Sub-Hypothesis HO1-1**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on altruism at the Social Security Corporation in Jordan."
  - **Sub-Hypothesis HO1-2**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on courtesy at the Social Security Corporation in Jordan."
  - **Sub-Hypothesis HO1-3**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on sportsmanship at the Social Security Corporation in Jordan."
  - **Sub-Hypothesis HO1-4**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on civic virtue at the Social Security Corporation in Jordan."
  - **Sub-Hypothesis HO1-5**: "There is no statistically significant effect at the significance level ($0.05 \geq \alpha$) of soft skills with its dimensions (communication and interpersonal skills, teamwork, problem-solving, and time management) on conscientiousness at the Social Security Corporation in Jordan."

2 Related Works

2.1 Soft Skills

The importance of soft skills to the overall success of individuals, professional and personal, is receiving increasing recognition because these skills are important in creating a positive, collaborative work environment that enables employees to function as a team while communicating effectively and actively participating in decision-making [19]. Additionally, soft skills help increase adaptability and foster innovation, so employees can confidently face any challenge and develop creative solutions to almost any problem they encounter. Therefore, soft skills are crucial to developing a workforce equipped with the right skills to cope with the ever-changing labor market [9].

The holistic range of soft skills, as noted by previous research, includes various personal and social capabilities that enable successful interactions within work environments [5]. In a study by Zakri et al., it was found that the aforesaid skills—including effective communication, teamwork, and problem-solving—are very important for achieving success in one's career. Moreover, soft skills such as

leadership, negotiation, and adaptability play a vital role because they have much impact on professional performance. Emotional intelligence has its own importance in helping individuals manage work-related stress and challenges with great effectiveness, this indirectly improves the overall work environment and promotes collaboration between co-workers [1].

In work settings today which are in a constant state of change it has been proven that to be successful mere technical and cognitive abilities alone are not sufficient. The importance of soft skills is so vital and cannot be underestimated [4]. Indeed, they are now necessary for any individual who wishes to achieve high performance and perfection during the time when reforms are taking place. Job success now demands effective communication, teamwork plus leadership as well as being adaptive to change. These skills help individuals perform their jobs successfully since they ensure one can interact well with others & amp, manage pressures at work. For example, how flexible or creative one is in handling challenges will greatly determine where one ends up on his career ladder [13]. Putra et al. [28] add that these skills also enhance job performance since employees can navigate through their daily challenges as well as daily interactions with colleagues and clients comfortably [7]. Moreover, they improve both professional and personal relationships which create a good working environment and reduce turnover. Soft skills, such as emotional intelligence and empathy allow individuals to understand and relate to others in a positive way which eventually leads to higher job contentment [3]. It further enhances accommodation with changes and pressures that will create development through innovativeness and uncorking talent for the long run of job satisfaction [21].

Dimensions of Soft Skills

- **Communication Skill**: In today's technologically advanced age, the significance of communication skills cannot be overstated for both individuals and organizations. The ability to communicate effectively plays a crucial role in facilitating meaningful interactions that contribute to the successful attainment of communication objectives [18].
- **Teamwork Skill**: The skill of working together encompasses the capacity of individuals to effectively collaborate and synchronize their efforts in order to accomplish shared objectives. This skill encompasses several facets, including proficient communication, clearly defined roles, and the aptitude to handle conflicts in a constructive manner. Successful teamwork hinges on the presence of positive interactions among team members, with each individual contributing their unique expertise and abilities to attain optimal outcomes. This skill serves to boost productivity and expedite the achievement of goals with greater efficiency [2].
- **Problem-Solving Skill**: The capacity to dissect intricate scenarios, pinpoint the underlying factors contributing to issues, and devise viable remedies is an essential aptitude required by individuals in their everyday lives as well as professional environments. This skill plays a pivotal role in achieving prosperity and longevity [24].

- **Time Management Skill**: The ability to manage time is crucial for employees in order to maintain a healthy balance between their work and personal lives. Achieving effective time management requires careful organization and planning, determining how to divide time among different tasks to be completed throughout the day. This involves prioritizing responsibilities, creating schedules, and allocating specific time slots for each activity to efficiently reach desired objectives. By practicing effective time management, individuals can make the most of their day and prevent the stress that arises from a buildup of disorganized tasks [19].

2.2 Organizational Citizenship Behavior

Actions and behaviors exhibited by employees within the workplace that surpass the formal job expectations are known as organizational citizenship behavior (OCB). This behavior is distinguished by its voluntary nature and contributes to the overall improvement of the organization's performance.

In today's workplace, OCB is very important. [2, 4, 6, 8, 10] described it as impromptu employee deeds that are executed without expecting tangible benefits or being rewarded at that specific time. Driven by an internal sense of responsibility and ownership, such that employees are inspired to do more than what is required to help the organization achieve its goals and realize its vision. OCB is very vital in ensuring organizational sustainability through reduction in turn-over rates and absenteeism, increase in employee satisfaction, and building loyalty [8, 22]. For the cultivation and nurturing of this behavior, it is pertinent that organizational leaders create a motivational support work environment where every contribution made by an employee is appreciated [11].

Because organizational citizenship behavior reflects the voluntary way in which employees contribute to the effectiveness and efficiency of the organization, it can be considered important in developing a positive organizational culture as well as in creating effective interdependence between employees and management [6, 35]. Examples of such behaviors include helping co-workers, showing enthusiasm in meetings, taking the initiative to solve problems, and promoting organizational values and ethics. When employees go above and beyond their core job responsibilities, they feel a sense of belonging and loyalty to the organization, which leads to increased job satisfaction and commitment. This, in turn, helps reduce employee turnover, which in turn allows the organization to save on recruitment and training costs [33].

Dimensions of Organizational Citizenship Behavior (OCB)

- **Altruism**: In the context of OCB, altruism refers to employees' genuine willingness to help their co-workers and perform additional tasks without expectation of direct reward. This feature significantly contributes to shaping the spirit of cooperation in the organization [20].
- **Courtesy**: Courtesy refers to employees' polite and respectful interactions with co-workers, taking into account their feelings and needs. This behavior includes

effective and tactful communication and skillful response to various events and situations in the workplace [31].

- **Sportsmanship**: Sportsmanship involves employees accepting decisions and changes in the work environment with a positive attitude and coping with difficult situations with optimism and flexibility. Employees who demonstrate sportsmanship are able to adapt to change and avoid complaining or resisting when faced with challenges [29].
- **Civic Virtue**: Civic virtue is reflected in employees' commitment to professional ethics and organizational standards, with particular emphasis on leading by example in daily interactions, showing great respect for internal regulations, and contributing to a fair and orderly work environment [26].
- **Conscientiousness**: Conscientiousness is the personal commitment of employees to perform their duties with the utmost accuracy and integrity, even in the absence of direct supervision, in order to achieve the best possible results. This behavior improves the quality of work and ensures the effective implementation of organizational goals [34].

2.3 Previous Studies

A comprehensive review of previous studies was conducted to form a theoretical framework and develop a model that serves as the basis for the current study. Among these studies:

- In a recent study conducted by Miano [25], the connection between organizational culture and organizational citizenship behavior (OCB) was investigated, specifically in relation to soft skills. Additionally, the study explored the role of transformational leadership as a mediator in this relationship. The sample size for the study consisted of 324 faculty members, and G-power was utilized to determine the appropriate sample size. One of the findings of the study was that faculty members have a strong organizational culture as well as positive OCB and excellent soft skills for transformational leadership. Second, the study hypothesized that soft skills have a positive impact on OCB-O and OCB-I, while organizational culture has a negative impact on soft skills. This means that higher levels of OCB-O and OCB-I lead to an increase in soft skills, but a strong organizational culture limits the development of soft skills. Third, transformational leadership has a partial mediating effect between OCB and organizational culture and soft skills. However, organizational culture and OCB have a direct impact on soft skills. Overall, the study concludes that educational institutions should focus on developing organizational culture and OCB to improve the soft skills of their lecturers.
- In their research, Khair et al. [23] delved into the process of fostering Organizational Citizenship Behavior (OCB) within the maritime transport sector in Indonesia. The study employed workplace spirituality and job satisfaction as mediators to examine how organizational justice impacts OCB. The sample size

was determined using Structural Equation Modeling (SEM). Data was collected through confidential surveys and interviews to test seven hypotheses put forth. The findings of the study revealed that job satisfaction, organizational justice, and workplace spirituality all had a significant influence on OCB within the maritime transport sector. Furthermore, organizational justice and workplace spirituality were found to enhance job satisfaction and subsequently impact OCB. Based on these findings, the study suggests that management should strive to maintain a sense of fairness within the organization in order to cultivate workplace spirituality and job satisfaction among employees, ultimately fostering OCB. The study also recommends further research in different industries to broaden our understanding of human resource management and explore the relationship between employee performance and company performance in the face of intensifying global competition.

- In their research, Awawdeh and Alkshali [16] set out to explore how soft skills contribute to organizational innovation et al.-Durra Food Products Company (Lavant). Employing a quantitative descriptive approach, the study gathered data from a sample of 106 employees. The independent variable, soft skills, was assessed across five dimensions: communication, time management, leadership, teamwork, and decision-making. Meanwhile, the dependent variable, organizational innovation, was evaluated through four dimensions: introducing new products, improving existing products, innovating new processes, and enhancing existing processes. To analyze the data, the study utilized various statistical methods, with multiple linear regression being particularly noteworthy. The results revealed that both the dimensions of soft skills and organizational innovation were highly prevalent, and there was a significant influence of soft skills on organizational innovation. Notably, leadership, decision-making, and teamwork emerged as the most influential dimensions of soft skills on innovation. Based on these findings, the study recommends prioritizing the development of employees' soft skills through continuous training programs in order to enhance their capacity for innovation and ultimately improve organizational performance.
- In their study, Chala and Bouranta [19] investigated the influence of four essential soft skills (namely adaptability, communication, problem-solving, and teamwork) on the overall performance of employees within the maritime work setting. Furthermore, the study aimed to explore the connection between these soft skills and employees' income levels. To conduct their research, the authors distributed a self-assessment questionnaire to both managers and employees working in Greek shipping companies, resulting in a total of 191 valid questionnaires for analysis. The study utilized various statistical analyses, including exploratory factor analysis, correlation analysis, regression analysis, and variance analysis. The findings of the study revealed a positive correlation between the four identified soft skills (teamwork, problem-solving, adaptability, and communication) and employee performance in the workplace. Additionally, the study confirmed that individuals with strong problem-solving abilities tend to receive higher salaries. In light of these results, the study recommends implementing training courses, seminars, and experiential learning opportunities to foster the development of employees' soft

skills. This is particularly crucial in the shipping industry, which is characterized by continuous evolution and increasing demands.

3 Methodology and Procedures

3.1 Study Population

The study focuses on a diverse group of employees from different departments and job titles within the institution, specifically the general administration, totaling 1604 individuals.

3.2 Sample

To ensure the sample was representative, the researchers referred to the table provided by to determine the appropriate sample size. With a study population of 1604 employees, a minimum of 310 employees was deemed necessary. To select the participants, a random sampling technique was utilized within the institution. The distribution of questionnaires was done electronically through Google Forms, with a total of 400 questionnaires being sent out. Impressively, the response rate reached approximately 83%, with 330 employees successfully completing the questionnaire. This exceeded the required minimum sample size of 310 employees.

3.3 Reliability of the Study Instrument

The reliability of the study variables and dimensions, as demonstrated in Table 1, is evident from the Cronbach's alpha coefficients. Ranging from 0.799 to 0.902, all of these coefficients surpass the minimum acceptable threshold of 0.7 for reliability. Moreover, the overall Cronbach's alpha for the questionnaire is an impressive 0.957. This high level of internal consistency further supports the reliability of the questionnaire and increases the likelihood of obtaining consistent results when using and replicating the scale.

3.4 Testing Study Hypotheses

The subsequent section is dedicated to hypothesis testing, which will encompass a comprehensive explanation of the precise statistical methods and procedures employed to assess the hypotheses put forth in the study. This section will provide

Table 1 Internal consistency analysis of the study instrument using Cronbach's alpha

Items	Variable	Dimensions	Number of items	Cronbach's alpha
1–5	Soft skills	Communication	5	0.872
6–10		Teamwork	5	0.882
11–15		Problem-solving	5	0.879
16–20		Time management	5	0.889
21–25	Organizational citizenship behavior	Altruism	5	0.899
26–30		Courtesy	5	0.902
31–35		Sportsmanship	5	0.832
36–40		Civic virtue	5	0.799
41–45		Conscientiousness	5	0.828
Overall performance			45	0.957

a thorough account of how the data collected will be utilized and the analytical techniques that will be implemented to test the hypotheses.

Testing the Main Hypothesis

- **HO1**: "There is no statistically significant effect ($\alpha \geq 0.05$) of soft skills and their dimensions (communication, teamwork, problem-solving, and time management) on organizational citizenship behavior and its dimensions (altruism, courtesy, sportsmanship, civic virtue, and conscientiousness) at the Public Social Security Corporation."

This hypothesis was tested using Multiple Linear Regression Analysis at a significance level of ($\alpha \geq 0.05$). The results are summarized in the tables below.

The correlation coefficient, denoted as R, signifies the relationship between the dimensions of the independent variable (communication, teamwork, problem-solving, and time management) and the dependent variable (organizational citizenship behavior). According to the data presented in Table 2, a robust and positive correlation of 0.885 exists between the dimensions of the independent variable and the dependent variable. This substantial correlation coefficient further strengthens the conclusion that the dimensions of the independent variable have a statistically significant impact on the dependent variable.

The variance in the dependent variable can be explained by the combined dimensions of the independent variable, as indicated by the coefficient of determination ($R^2 = 0.783$). This means that the dimensions have the capability to account for 78.3% of the variance in organizational citizenship behavior. The remaining percentage of variance is attributed to factors not examined in the study. The adjusted coefficient of determination (Adjusted R^2) is 0.780, with a minimal difference of 0.003 compared to the coefficient of determination. This slight difference suggests that the ability of the independent variables to predict the dependent variable is satisfactory.

Based on the data presented in Table 2, we can observe that the critical F value at degrees of freedom (4/325) is 2.42. Upon comparing this value with the calculated F

Table 2 Summary of the model for the main hypothesis

Independent variable	Dependent variable	Model summary			ANOVA			
Organizational citizenship behavior	Soft skills (all dimensions)	R	R^2	Adjusted R^2	Freedom degree	F	Tabulated F	Sig
		0.885	0.783	0.780	4	292.442	2.42	0.000
					325			
					329			

value of 292.442 obtained from the analysis of variance, we can confidently conclude that the calculated value exceeds the critical value. This finding provides strong evidence for the significance of the regression model. Furthermore, it is noteworthy that the significance level for the test is 0.000, which is below the predetermined significance level of 0.05 set for this study.

After analyzing the data, it can be concluded that there is a notable impact, at a significance level of ($\alpha \leq 0.05$), of soft skills, including communication, teamwork, problem-solving, and time management, on organizational citizenship behavior within the Social Security Corporation. This effect is further evidenced by the dimensions of altruism, courtesy, sportsmanship, civic virtue, and conscientiousness.

According to the findings presented in Table 3, the dimensions of the soft skills variable, namely communication, teamwork, problem-solving, and time management, displayed a significant impact on the organizational citizenship behavior variable. The significance levels for these dimensions were all below 0.05, specifically (0.000, 0.000, 0.000, 0.000), and their respective t-values (4.236, 4.338, 4.660, 5.529) exceeded the tabulated t-value of 1.96. This confirms that these dimensions indeed contribute to the organizational citizenship behavior. Notably, the time management dimension had the highest Beta value of 0.275 among all the dimensions of the soft skills variable, indicating that it holds the greatest explanatory power for the dependent variable. Following closely behind is the problem-solving dimension.

Table 3 Multiple regression results for the main hypothesis

Dependent variable	Independent variable	Coefficients					
		Non-standard		Standard	Tabulated t	Calculated t	Sig level
		B	Error	Beta			
Organizational citizenship behavior	Communication	0.175	0.041	0.183	1.96	4.236	0.000
	Teamwork	0.220	0.051	0.240		4.338	0.000
	Problem-solving	0.254	0.054	0.264		4.660	0.000
	Time management	0.247	0.045	0.275		5.529	0.000

4 Discussion of Results and Recommendations

4.1 Discussion of Results

- Is there an impact of soft skills dimensions (communication, teamwork, problem-solving, and time management) on the dimensions of organizational citizenship behavior (altruism, courtesy, sportsmanship, civic virtue, and conscientiousness) in the Social Security Corporation, Jordan?

The findings of the study reveal a significant and undeniable impact of the combined dimensions of soft skills (communication, teamwork, problem-solving, and time management) on organizational citizenship behavior within the Social Security Corporation. This affirms the crucial role that soft skills dimensions play in enhancing the behavior of employees within the organization. The statistical analysis, as presented in Table 3, with an f-value of 292.442, solidifies the significant influence of the independent variable dimensions on the dependent variable dimensions, establishing a strong and positive correlation between soft skills and organizational citizenship behavior. These results indicate that by prioritizing the improvement of employees' soft skills, the organization can expect a positive impact on their behavior in terms of organizational citizenship. The soft skills dimensions account for a substantial 78.3% of the variance in organizational citizenship behavior, while the remaining percentage is attributed to unexplored factors. Additionally, the study highlights that the dimension of time management holds the highest explanatory power among the independent variable dimensions in relation to organizational citizenship behavior, followed by problem-solving, with the communication dimension having the least explanatory power.

4.2 Recommendations

Based on the results of the conducted study, several recommendations and suggestions have been derived as follows:

Recommendations for Decision Makers at the Social Security Corporation, Jordan

- Ensure an appropriate and supportive organizational environment within the institution to develop soft skills and enhance organizational citizenship behavior among employees.
- Organize awareness campaigns and share educational materials such as newsletters, articles and educational videos to increase employee awareness of the importance of soft skills and organizational citizenship behaviors.
- Senior management in the institution should adopt a policy of attracting and hiring people with advanced soft skills. Employees with strong soft skills such

as effective communication, teamwork, problem solving and time management are more likely to participate in activities beyond formal job responsibilities, contributing to an improved work environment.

Recommendations for Future Studies

- Conduct research on other dimensions of soft skills not included in this study to examine their impact on organizational citizenship behavior in the Social Security Corporation—Jordan.
- Conduct research on current research variables in other service institutions or other economic sectors in Jordan to compare the results of this study with the study populations.
- Conduct research on the relationship between soft skills and other variables such as job performance and service quality.

Strategies for Regulatory Oversight of Foreign Technology Companies: A Comparative Study of International Experiences

Yasar Alhiniti and Khalif Saleh Dhiab Amoush

Abstract The objective of this study is to analyze the various strategies for regulatory oversight of foreign technology companies operating under corporate legislation. The study categorizes these oversight mechanisms into three main types: internal, external, and a hybrid of both. It further assesses the effectiveness of these mechanisms in achieving their intended goals and protecting national interests. Additionally, the study provides a comprehensive examination of the legal provisions related to oversight and conducts a comparative analysis of regulatory practices in different countries. Based on this analysis, the study offers recommendations to enhance existing oversight systems, aiming to strike a harmonious balance between safeguarding national interests and leveraging the expertise and investments of foreign technology companies.

Keywords Corporate oversight · Foreign technology companies · Corporate laws · Internal oversight · External oversight · Mixed oversight · Legal regulations

1 Introduction

To ensure fair and transparent practices among foreign companies operating in a particular country, it is crucial to establish a comprehensive set of rules and regulations that govern their activities from the moment they set foot on the host country's territory until their eventual closure and removal from the official company registry. This oversight is necessary to uphold principles of justice and equality for all stakeholders involved, including capital investors and third parties [1].

The state's authority over foreign corporations, derived from its legal jurisdiction and responsibility for its land and citizens, is also a result of the legal and economic significance of these corporations. The oversight of foreign corporations has progressed from a solely restrictive function, centered on identifying legal and administrative gaps and enforcing additional regulations on their operations, to a more proactive role that guides their activities to guarantee their contribution to the state's economic development [2].

To prevent any deviation from the intended goals of granting licenses to foreign companies, the state is now tasked with monitoring different facets of economic activity within its jurisdiction. This responsibility is crucial in order to safeguard the public interest and promote the growth of the national economy. It is important to prioritize these objectives rather than solely focusing on profit without any form of regulation or limitations [3].

In order to uphold national security and prevent foreign companies from overpowering the domestic economy and marginalizing local businesses and capital, it is crucial for the state to strike a balance between the advantages these companies bring, such as capital infusion, job creation, expertise, and modern technology, and the need for effective and suitable legal oversight. Thus, the level of oversight imposed on foreign companies may differ from country to country, ranging from minimal regulation to rigorous measures, and in some cases, even prohibiting these companies from operating within its borders [4]. The state must ensure that it can benefit from the presence of these companies while safeguarding its own interests.

In order to ensure the desired economic development and protect all parties involved, state oversight of foreign companies should be proactive rather than arbitrary. This oversight serves to guide the activities of these companies in accordance with national economic plans, while also safeguarding partners and third parties who engage with the company under potentially weaker legal circumstances [4]. The obligation of state oversight extends throughout the entire lifespan of the foreign company, from its establishment to its dissolution and liquidation. This ongoing oversight has significant implications for both the state and the company. The state, exercising its sovereignty over its territory, cannot relinquish or delegate its oversight responsibilities. Meanwhile, the company is bound by these regulations, requiring its partners and third parties to adhere to its rules and regulations [5].

The regulatory oversight of companies can occur either before or after their establishment, depending on when the registration procedures outlined in Jordanian company law are completed. These two forms of oversight work together and are determined by the completion of the establishment procedures. Prior oversight takes place during the establishment process, while subsequent oversight occurs after the registration procedures are finished and continues during the company's operations. Prior oversight is conducted externally by the home country of the main company, whereas subsequent oversight can be both external, carried out by the home country, and internal, conducted by the host country within its own jurisdiction [6].

1.1 Study Objectives

This study aims to:

1. Identify the types of regulatory oversight imposed on foreign companies operating in Jordan by analyzing legal texts on internal, external and mixed oversight.
2. Assess the effectiveness of current oversight in achieving intended goals and protecting national interests.
3. Analyze legal texts regarding the oversight of foreign companies.
4. Make recommendations to increase the effectiveness of oversight and balance national interests with the benefits of foreign companies.
5. Analyze and compare the regulatory oversight imposed on foreign companies in other countries to benefit from international experience and improve local regulations.

1.2 Study Methodology

In order to examine and assess the various forms of oversight placed upon foreign companies in Jordan, a descriptive-analytical methodology was utilized in this study. Legal resources, such as Jordanian Companies Law No. 22 of 1997 and its accompanying executive regulations, along with previous research and studies, were gathered to obtain relevant data. To collect this data, techniques such as analyzing legal texts and reviewing literature and previous studies were employed. It is important to note that this study specifically concentrated on the legislation within Jordan, which may restrict the applicability of the findings to other countries with distinct regulatory frameworks.

2 Concept of Oversight on Foreign Companies and Its Objectives

From the beginning, it is important to note that there is no singular law that explicitly outlines the concept of oversight. However, the researcher proposes a comprehensive definition for oversight in relation to foreign companies. According to their analysis, oversight can be understood as a collection of legal regulations and administrative protocols that enable the government to effectively monitor and guide the operations of foreign companies. The ultimate goal of this oversight is to facilitate economic development and safeguard the interests of the company's partners and other stakeholders, both during the establishment phase and throughout subsequent stages of its operations [3, 7].

The primary objective of the state's oversight over foreign companies is twofold: safeguarding the national economy and ensuring the protection of partners, shareholders, and third parties involved in transactions with the company. In addition, the definition elucidates the various approaches employed by the state to exercise this oversight, encompassing legal regulations and administrative procedures. It emphasizes the compulsory nature of this oversight, which entails monitoring and guiding the operations of foreign companies to foster economic advancement throughout their existence. This regulatory process adheres to meticulously planned and distinct legal measures.

The process of overseeing companies involves a series of scientifically researched and interconnected steps that work together to accomplish a specific objective, as mentioned earlier. If any of these steps were to fail, the entire oversight process would be compromised, leading to inefficiency and ineffectiveness. The purpose of implementing oversight measures on foreign companies is to guarantee their adherence to regulations, prevent company failure, and safeguard the interests of partners and third parties involved in business transactions with the company.

Upon closer inspection of the regulations imposed on foreign companies, it becomes evident that their purpose is twofold: to safeguard the interests of the state and to ensure the well-being of the company, its affiliates, and external entities. As a result, these regulations strive to accomplish a multitude of objectives, spanning economic, legal, political, social, and environmental realms. However, it is important to note that while these oversight measures have yielded commendable outcomes, they have not been exempt from criticism. Detractors argue that they complicate procedures and impose unnecessary restrictions on foreign companies, potentially impeding their ability to contribute to the growth of the national economy.

The necessity of regulating foreign companies is rooted in the state's authority over all individuals and entities within its borders, as well as the crucial role these companies play in bolstering the national economy and addressing unemployment concerns. Additionally, oversight ensures the protection of those involved in transactions with these companies. However, it is essential that this oversight is conducted in a balanced and well-informed manner, taking into account the interests of both the host state and the foreign companies. The host state benefits from the presence of these companies, as they bring practical and scientific expertise, capital, and technology. Meanwhile, foreign companies seek financial gains and the establishment of a strong commercial reputation on regional and global scales.

2.1 Objectives of Oversight on Companies

Achieving the Public Interest

When it comes to the interests of the public versus private entities, the state consistently gives priority to the former. This applies to both natural individuals and legal entities. The state must strike a balance between the advantages that foreign

companies bring to its territory and the need to maintain security, stability, protect local businesses, talents, and labor. In order to achieve this, foreign companies are required to obtain the necessary licenses from relevant authorities and adhere to registration procedures outlined in the Jordanian Companies Law. The Regulatory Official of Companies has the authority to accept or reject company registration without providing an explanation. This process aims to gain an understanding of the company's operations, assess their potential impact on national security and stability, and determine if they may overshadow national companies due to their capital, equipment, and expertise. Furthermore, the state takes into account the positive effects and benefits that these companies can bring, such as contributing to national economic growth and addressing issues of poverty and unemployment [8].

Protecting the National Economy and Economic Development Plan

The primary objective of regulating foreign companies is to provide guidance and safeguard the national economy, while also supporting the economic development plan. To achieve these aims, countries oversee the activities of these companies. This oversight ensures that the projects undertaken by foreign companies do not contradict the public interest or violate public order and morals. Companies whose objectives do not align with national interests are excluded and denied licenses. Additionally, this oversight protects domestic industries by refusing licenses to foreign companies that pose a threat to these industries. States direct the activities of these companies towards cities that are in greater need of development, which in turn benefits the industrial and service sectors in those areas. This approach aids in the selection of suitable economic projects, channels capital towards these cities, and contributes to economic growth and job creation. As a result, there is an increase in exports and a controlled approach to imports [9].

Ensuring Compliance with Legal Provisions

The main goal of overseeing foreign companies is to guarantee their adherence to the regulations outlined in the Jordanian Companies Law and related provisions, while also enforcing suitable penalties for any infractions that may occur during the company's existence [10].

Protecting Partners and Shareholders

The company's commitment to safeguarding its partners and shareholders is demonstrated through the guarantee that they will receive their designated portion of profits as outlined in the contractual agreement. Any agreements that strip partners of their rightful financial or non-financial gains are deemed null and void, as they undermine the integrity of the company's contract. Additionally, certain regulations prohibit the distribution of fabricated profits, as this can diminish the company's capital and have detrimental effects on shareholders [11].

Environmental and Social Objectives

Business owners and investors commonly prefer to establish their commercial ventures in capital cities or large urban centers. This preference stems from the availability of services and a diverse workforce consisting of laborers, technicians, and administrators. However, this concentration of businesses in one area leads to problems such as traffic congestion and high population density. The influx of employees working for these companies contributes to these issues. Moreover, the clustering of industries in a single location can result in environmental pollution caused by factory waste and emissions, which in turn can have detrimental effects on the health of residents. Additionally, this practice deprives other cities of the opportunity to benefit from the services provided by these companies. Therefore, it is the responsibility of the government to ensure fairness and equality by distributing companies across different cities. This approach not only addresses unemployment but also maximizes the benefits derived from these businesses [12].

Consequently, the purpose of state oversight is to safeguard the interests and rights of third parties involved with the company, through the implementation of restrictions and procedures on founders and managers. This ensures that they are obligated to provide compensation in the event of any harm caused [13].

3 Types of Oversight on Foreign Companies

From the inception of foreign companies to their eventual dissolution and liquidation, a range of oversight measures are imposed. The state, in accordance with legal provisions, delegates administrative bodies to ensure a fair equilibrium among the interests of all involved parties.

Chapter Twelve of the Jordanian Companies Law No. 22 of 1997 does not specifically cover oversight on foreign companies, which means that Chapter Fourteen of the same law, which addresses oversight on companies in general, must be consulted. Articles 273–276 grant the minister and the Regulatory Official of Companies the power to exercise this oversight. As a result, this section will examine and analyze these provisions in order to understand the various forms of oversight imposed on foreign companies.

3.1 Internal Oversight

Internal oversight, as defined in the context of a foreign company, is the implementation of oversight measures by the host state from within the company. This can be executed by various entities within the company, including the board of directors, partners, managers, or shareholders. Internal auditors may also play a role in conducting this oversight. The effectiveness and efficiency of internal oversight are

crucial in ensuring that the company attains its desired objectives. States often enforce internal oversight as a means to safeguard their national interests. An illustration of internal oversight can be found in Article 274(a) of the Jordanian Companies Law No. 22 of 1997.

Partners and shareholders are afforded certain rights under Article 274(a) of the Jordanian Companies Law No. 22 of 1997. This provision allows them access to information and documents pertaining to the company that are both published and maintained by the auditor. Additionally, they are entitled to receive a certified copy of these documents, subject to the auditor's approval. However, if the documents and data are not yet published, access can only be obtained through a court order and by paying the prescribed fees as stipulated by the law. Therefore, the legislature treats partners and shareholders as third parties [14].

Despite the effectiveness of this type of oversight on foreign companies, it can be limited in some cases due to the following reasons:

1. Foreign companies often prefer full ownership and reject the participation of domestic capital, seeking countries that grant them this right without requiring the participation of national capital.
2. When foreign companies allow the participation of domestic capital, the capital is distributed among many shareholders who are primarily interested in the profits and financial gains of these companies, without playing an active and positive role in supervising the companies.

In order to enhance the efficiency of internal oversight over foreign companies, it is advisable for states to mandate national capital participation, with national capital accounting for no less than 51% of the company's total capital. In cases where there are multiple national shareholders, none should hold a stake that is less than one-third of the total shares. Furthermore, it is crucial that these national shareholders possess the requisite administrative and technical knowledge. By implementing these measures, it can be ensured that foreign companies do not exert excessive control over the company, thereby bolstering internal oversight, safeguarding national interests, and protecting the rights of shareholders and third parties [15].

3.2 External Oversight

The concept of external oversight pertains to the legal oversight carried out by external entities on a company to ensure adherence to the procedures outlined in the Jordanian Companies Law. The authority to exercise this oversight was granted to the minister and the General Supervisor of Companies by Article 273 of the Jordanian Companies Law No. 22 of 1997. This article stipulates that all companies are obligated to comply with the provisions of the law, their founding contracts, articles of association, and decisions made by their general assemblies. The minister and the supervisor are empowered to take necessary actions in order to monitor companies

and verify their compliance with these provisions, contracts, systems, and decisions [16, 17]. Specifically, the oversight entails:

1. Reviewing the financial statements and documentation of the company.
2. Verifying that the company maintains compliance with its intended objectives.

The legislator's oversight of the company is primarily focused on reviewing its financial accounts and records and ensuring compliance with its stated objectives. However, there is concern that the company's own preparation of these account statements may hinder the detection of errors or manipulations, particularly if the company employs skilled and capable accountants.

Article 243 of the Jordanian Companies Law No. 22 of 1997 ensures external oversight by requiring foreign companies to present their yearly financial statements, which need to be certified by a Jordanian auditor [18–23]. The appointed supervisor or their representative is granted the authority to examine the company's books and records, and the company is obligated to furnish these materials upon request.

Article 274(b) of the Jordanian Companies Law No. 22 of 1997 outlines an additional means of external oversight. This article bestows upon individuals the privilege of accessing information exclusively pertaining to registered companies. However, acquiring the company's file from the supervisor or obtaining a certified copy necessitates court involvement and payment of the designated fees, all while being monitored by the supervisor [24].

In its decision, the Jordanian Court of Cassation has implemented external oversight on companies, as evidenced by the following statement: "In light of the appeal's argument regarding the Court of Appeal's errors, which resulted in a ruling that contradicts a specific legal provision that does not permit any alternative interpretation or explanation. The appellant relied on Article 274(a) of the Jordanian Companies Law No. 22 of 1997 in their request, which designates the Department of Companies Control as the competent authority for issuing documents, subject to the regulatory official's approval" [25].

According to the researcher, external oversight of foreign companies proves to be more advantageous and efficient compared to internal oversight [26–28]. This is because external oversight is carried out by individuals who are not directly affiliated with the company and possess legal authority. Their primary objective is to monitor the company's activities and ensure compliance with legal requirements, safeguarding the interests of the public as well as shareholders, partners, and other stakeholders. This oversight remains in effect throughout the entire lifespan of the company, spanning from its inception to its eventual dissolution and liquidation [29].

3.3 Mixed Oversight

The effectiveness and influence of oversight, whether internal or external, can be severely hindered by the tactics employed by foreign companies to evade such scrutiny. As a result, it has become imperative to merge both internal oversight,

consisting of partners [30, 31], shareholders, managers, and auditors, with external oversight, represented by the minister and the supervisor. The ultimate objective of this combined oversight is to safeguard the public interests of the host country.

To achieve the goal of oversight without hindering the operations of foreign companies, it is crucial to combine internal oversight from within the company with external oversight from authorized entities. The state must strike a balance between its national interests and the advantages offered by these companies in terms of expertise, resources, and investment, all while ensuring security and stability [32].

In terms of the position taken by the Egyptian legislator, it is evident that a combination of internal and external measures have been implemented to ensure oversight of foreign companies. In terms of internal oversight, these companies are obligated to keep commercial records, register with the commercial registry, and adhere to profit tax regulations. This requirement is clearly stated in Article 311 of the executive regulations of the Egyptian Companies Law, which specifies that "foreign company branches operating in Egypt must appoint an auditor who meets the qualifications required for auditors of joint-stock companies [33–35]." To oversee the activities of foreign company branches in Egypt and gain access to their records and documents, the Minister of Justice, in collaboration with the Minister of Economy, appoints individuals who are granted the status of judicial officers. It is the responsibility of the company manager to facilitate their work, while abiding by legal obligations [36].

In terms of external oversight, the Egyptian legislature mandates that foreign companies operating in Egypt must disclose the name of their parent company and provide all relevant information at their local offices, as stated in Article 310 of the executive regulations. This article specifies that the General Administration of Companies maintains a dedicated register for branches of foreign companies in Egypt, which includes details such as the parent company's name, headquarters, purpose, the branch's address in Egypt, its activities, registration date, number, and other related data [16, 37–39]. Additionally, the legislator has granted the General Administration of Companies the authority to conduct inspections of foreign company branches in Egypt, examine their financial records, and request any necessary clarifications or documents, as outlined in Article 315 of the executive regulations. According to this article, the General Administration of Companies is empowered to ensure compliance with the law and the aforementioned regulations by conducting inspections and reviewing financial records. Furthermore, it has the right to request any additional information or documents that may be required for this purpose [17].

The researcher asserts that a combination of internal and external oversight is the optimal approach, as relying solely on one type may prove ineffective in achieving oversight objectives. Internal oversight, conducted by partners, managers, shareholders, and auditors within the company, has its limitations and may fall short of the desired outcomes. Similarly, external oversight alone is deemed insufficient in attaining its goals [19]. Therefore, a harmonious integration of both methods becomes essential, as they mutually reinforce each other. Internal oversight ensures accountability within the company, while external oversight is enforced by specialized administrative bodies empowered by law, led by the minister and the regulatory

official. Companies are obligated to collaborate with and facilitate their work, ultimately fulfilling the purpose of oversight, which is safeguarding the public interest and protecting the rights of shareholders, partners, and third parties [20].

In the researcher's perspective, foreign companies should face consequences if they are discovered to be in violation of legal regulations due to oversight or deliberate attempts to evade oversight. These consequences might include monetary fines, the revocation of privileges and exemptions, or even the cancellation of company registration.

4 Conclusion

To guarantee adherence to the laws and regulations of a host country and maintain a balance between the interests of foreign companies and national interests, overseeing the operations of foreign companies is essential. This oversight can take two forms: internal oversight, which is conducted by the board of directors and shareholders within the company, and external oversight, which is carried out by external authorities like the minister and the general supervisor of companies. Extensive research has confirmed the existence of these two types of oversight and their varying degrees of implementation.

4.1 Results

1. By implementing laws and administrative procedures, the oversight of foreign companies guarantees the safeguarding of the national economy, as well as the protection of the interests of shareholders and third parties, all while ensuring that these companies comply with the economic objectives of the state.
2. The vital task of ensuring compliance with laws and regulations by foreign companies is accomplished through two types of oversight: internal and external. Internal oversight involves oversight from within the company, while external oversight ensures adherence to laws through external entities.
3. The goals of foreign company oversight encompass safeguarding the national economy, promoting economic development initiatives, enforcing legal provisions, safeguarding partners and shareholders, and attaining environmental and social objectives.
4. The examination brought attention to the difficulties encountered in overseeing foreign companies, including the issue of foreign companies' autonomy in terms of capital and their reluctance to involve national capital, as well as the scattering of capital among numerous shareholders without a meaningful role in oversight.

4.2 Recommendations

1. To guarantee national capital involvement in foreign companies, host countries should establish regulations mandating a minimum of 51% ownership by national shareholders, on the condition that they possess the necessary competence and experience in administrative and technical matters.
2. To ensure the continuous and effective oversight of companies, it is imperative to strengthen the powers of external oversight entities, such as the minister and the general regulatory official of companies, while also providing them with the necessary support.
3. In order to achieve the mutual interest of both the host country and foreign companies, it is crucial to establish well-considered oversight policies that strike a balance between the host country's desire for benefits and the foreign companies' pursuit of profits.
4. In order to adapt to economic and technological advancements, as well as to improve oversight effectiveness and accomplish desired objectives, it is crucial to update and develop legislative and regulatory frameworks pertaining to the oversight of foreign companies.
5. Foreign companies that are found to be in violation of laws and regulations should face strict penalties, which may include fines, denial of privileges, and, in severe cases, deregistration of the company.
6. To enhance the implementation of effective oversight measures for foreign companies, it is crucial to foster stronger collaboration between host countries and international companies, promoting the exchange of successful experiences and practices in this domain.
7. To ensure the effective implementation of oversight procedures, it is crucial to offer awareness and training programs to partners, shareholders, and oversight entities. These programs will not only raise awareness about the significance of internal and external oversight but also enhance their skills in applying such procedures.

Forensic Framework for Deleted Media of WhatsApp on Windows

Shraddha Pandey, Rizwan Ur Rahman, Ajay Kumar Phulre, Ghassan Samara, Hemraj Shobharam Lamkuche, and Asma Sbaih

Abstract WhatsApp is one of the most important apps that lets us transmit text, audio, and multimedia files as well as have voice and video chats online in this day and age where everything is going digital. It was established by Facebook Inc. in 2009 alongside Brain Acton and Jan Koum and received it in 2014. It is gaining popularity because of its ease of use, cross-platform interoperability (available for Android, iOS, and web browsers), end-to-end message encryption, and the ability to use phone numbers as unique identification. This application enables users to start individual or group discussions, share their present location, and alter their status. Although the increasing usage of WhatsApp as a social media platform elevates the potential of becoming a crime target, there are just a few articles on the forensic examination of WhatsApp, and they are mostly focused on this mobile-only service. this paper, we suggested a comprehensive forensic analysis framework for Windows-based WhatsApp lost media. While it is not feasible to evaluate every feature this application offers, our forensic investigation approach concentrates on erased material. We considered conducting an evaluative case study using the WhatsApp application, which is available on the Windows platform. For this case study, we created a crime scenario in an experimental setting, followed by an overview of a forensic methodology and technical solutions for deleted media, scientific and technological progress.

Keywords WhatsApp · Digital forensics · Comprehensive framework · Criminal investigation · Recovery of deleted media · Windows OS

1 Introduction

In today's world, WhatsApp has become an essential communication tool, leaving a trail of data in its wake. This wealth of knowledge, however, is not limited to casual talks. In the world of investigations and judicial actions, WhatsApp forensics appears as a significant tool for discovering critical evidence. For example, consider the following scenarios such as a missing case in which the last known communication was a WhatsApp chat, a fraud investigation in which financial transactions were conducted via the app or a cyberbullying case in which injurious chat must be traced and documented.

In WhatsApp forensics, investigators analyze text messages, multimedia, contacts, locations, and metadata to reconstruct events and gather evidence. This process involves various digital forensic domains: computer forensics [1], mobile forensics [2], Android and iOS forensics, cloud forensics [3], network forensics [4], and memory forensics [5]. These methods are critical in supporting investigations and legal proceedings. Additionally, the field of digital forensics continues to expand, encompassing areas like social media, IoT, drone, and blockchain forensics, reflecting its adaptability to evolving technologies and investigative needs.

1.1 Introduction to the WhatsApp

Meta Platforms owns WhatsApp, a widely-used messaging and voice-over-IP (VoIP) service with over 2 billion users globally, available on both PCs and mobile devices. Originally created for friends and family to stay connected, WhatsApp quickly gained popularity and was acquired by Facebook in 2014 for $19 billion. According to a blog post by Dean [6], WhatsApp is the world's most popular messaging service, with around 100 billion messages sent daily. India leads with the largest number of users, approximately 487.5 million as of June 2021.

WhatsApp is available on various platforms, including iOS, Linux, Mac, and Windows. WhatsApp for Windows was first introduced on May 10, 2016, and later updated in 2023 to a version built on the Universal Windows Platform (UWP), enhancing functionality and stability. The Windows version of WhatsApp organizes its essential files and folders, including archived, index, and media files, in a specific folder hierarchy to ensure smooth and secure operation.

In Windows, 5319275A.WhatsAppDesktop_cv1g1gvanyjgm is the main folder dedicated to WhatsApp, and it contains additional folders such as AC, AppData, LocalCatch, LocalState, RoamingState, Settings, SystemAppData, and TempState, as shown in Fig. 1. These are formed for various tasks required to efficiently operate WhatsApp.

Our major investigation folder is LocalState, which contains a variety of folders and files, including database files, DB-SHM files, DB-WAL files, DAT files, storage files, and text documentation, shown in Fig. 2.

WhatsApp uses shared Fig. 3 folder that is inside the LocalState folder to store images, videos, documents, stickers, audio recordings, GIFs, location data, voicemail messages, payment messages, and other documents. They used to store such media weak wise within this folder, signaling that they were saved in a separate location.

In rotatedLogs folder that is within the LocalState folder, it has three log files by default. These are the daily logs generated by WhatsApp Desktop and saved in the rotating log folder, which is a circular buffer containing information about the application's operations such as errors, warnings, and general usage data. These

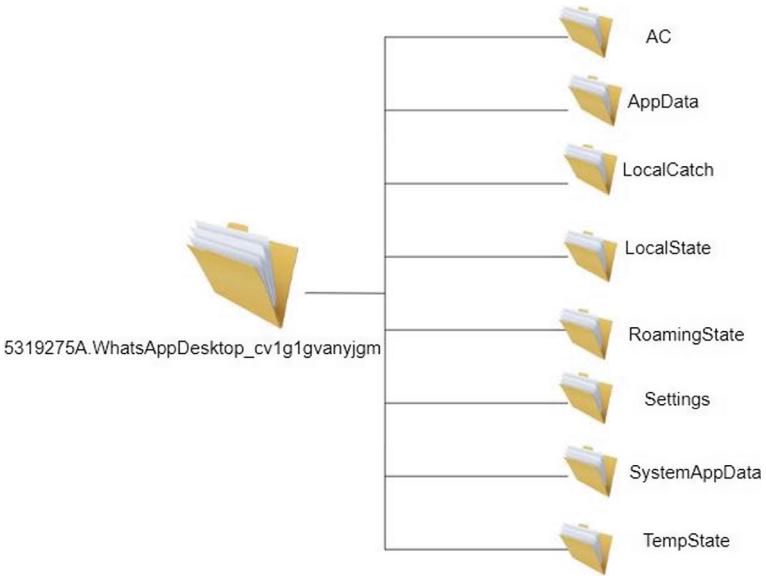

Fig. 1 WhatsApp folder in windows

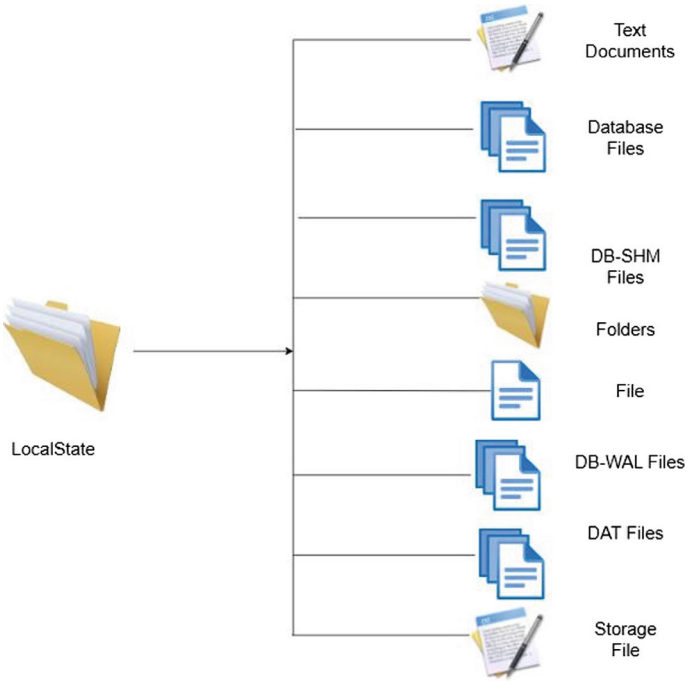

Fig. 2 WhatsApp investigative folder in windows

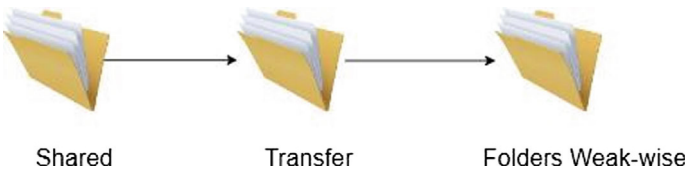

Fig. 3 WhatsApp media storage folder in windows platform

logs used to contain a variety of data, including application starting and shutdown, network activities, user interactions, error messages.

2 Literature Survey

Several forensic frameworks for WhatsApp have been proposed in recent years, each focusing on different aspects of digital evidence extraction and analysis. Actoriano and Riadi [7] proposed an integrated forensic framework for WhatsApp Web, which provides guidelines for obtaining and analyzing digital evidence stored on laptops or smartphones. Utomo et al. [8] conducted forensic analysis of WhatsApp browsers,

extracting and analyzing conversation artifacts and media data, noting significant differences in the latest WhatsApp versions. Vukadinović [9] explored forensic analysis of artifacts from web and desktop clients on Mac and Windows platforms, with research suggesting that IndexedDB technology can be a valuable source of digital evidence [10].

Owda and colleagues [11] developed a method to decrypt WhatsApp databases on Android devices without rooting, while Alhidaifi [12] conducted a comparative analysis of various WhatsApp forensic tools like WhatsApp Xtract and WhatsApp Viewer. Other studies, like those by Olaniyi [13], focused on data security and user vulnerability, while Ramraj and Usha [14] investigated the privacy and encryption features of WhatsApp Web.

Rastogi and Hendler [15] analyzed the cryptography protocols securing WhatsApp, and Johari et al. [16] explored vulnerabilities that could compromise user data. Koppolu [17] provided a deep-dive analysis of WhatsApp artifacts relevant in crime investigations, while Khweiled and Jazzar [18] proposed an enhanced NIST framework for investigating cyberbullying. Dangar [19] and John Alhassan Abubakar et al. [20] further developed forensic processes for recovering WhatsApp data from Android devices. Finally, Anglano [21] conducted controlled studies on WhatsApp interactions, using the NIST method to gather evidence from Android smartphones as explored by Ramadhan and Riadi [22, 23–26].

This studies make significant contributions to the evolving field of WhatsApp forensics, presenting diverse methodologies and tools for the extraction and analysis of digital evidence. After conducting a thorough review, we found that numerous forensic analyses and frameworks have been developed for WhatsApp on mobile platforms and web browsers. However, there remains a notable gap in forensic research and tools specifically targeting the Windows desktop version of WhatsApp.

3 Proposed Framework for the Deleted Media WhatsApp on Windows

Several digital frameworks have been published in the past. Pollitt offered a four-phase framework: acquisition, identification, evaluation, and admittance. Palmer developed a six-phase paradigm for digital forensic investigation, including identification, preservation, collection, examination, analysis, presentation, and decision. Martini and Choo developed a four-phase digital forensic methodology for cloud computing, which includes evidence source identification, analysis, reporting, and presentation. These general digital forensic frameworks serve as the foundation for digital procedures for new services or devices. However, there is no forensic framework for specific applications. In addition, we need a certain framework within which to concentrate our analysis of social media apps like WhatsApp. There are a few studies on WhatsApp's forensic architecture; however, they are mostly for this

application, which is for mobile versions, rather than WhatsApp, which is available on Windows. In this research, we proposed a comprehensive forensic for WhatsApp on Windows which is presented in Fig. 5.

There are five steps in our suggested framework:

Phase 1: Evidence Collection

Phase 1 is the evidence-collection phase, during which all evidence is gathered from all sites where WhatsApp is used to store data on Windows. It includes data from WhatsApp-specific directories, as well as registry and log files.

Phase 2: Evidence Preservation

Phase 2 is evidence preservation, which involves preserving the data collected during the evidence collection phase. It entails converting the bit image of the evidence and then encrypting it by establishing a password on the bit image files themselves to provide additional security. For this, we use the FTK image tool to create the bit image file as well as encrypt and decrypt it.

Phase 3: Data Extraction

Phase 3 is the data extraction phase, during which we extracted data from deleted messaging, configuration files, and destroyed media. We extracted the material using the Autopsy tool.

Phase 4: Analysis

Phase 4 is the analysis phase, in which we examine the deleted media and messages, which include deleted documents, movies, stickers, gif pictures, photographs, and deleted messages extracted during the data extraction phase.

Phase 5: Report Generation

Phase 5 is the report generation phase, the investigator reports and presents the results of the examination and analysis in a legally acceptable manner.

4 Related Work

WhatsApp is primarily used for communication, which includes voice calls over the Internet, text and audio messaging, multimedia files, and message sending and receiving. However, as the popularity of this program as a social media platform rises, so do crimes and threats, such as security events and attacks over the years, such as security flaws. WhatsApp, like any other software, contains security issues. When these vulnerabilities are exploited, attackers may be able to jeopardize user security and privacy. In 2019, for example, WhatsApp announced a security incident involving the exploitation of an app vulnerability that allowed attackers to remotely

install the Pegasus spyware on user devices, which was produced by the Israeli business NSO Group and has advanced monitoring capabilities. Phishing attacks pose another significant threat to all online systems, including WhatsApp. In this situation, the user receives messages or emails claiming to be from WhatsApp, seeking sensitive information or directing them to click on harmful links. Despite not being a typical "attack," WhatsApp saw a significant reaction in 2021 due to changes to its privacy policies. There has been an increase in people searching for alternative messaging platforms due to concerns raised about expanded data sharing with Facebook. So, with these considerations in mind, we applied our proposed architecture to the Windows Platform's WhatsApp and created a comprehensive forensic investigation framework based on it, as shown in Fig. 5.

To assess the suggested framework, we developed a realistic environment and an experimental-case scenario. Using this, we describe technical forensic investigation methodologies and procedures for WhatsApp, as well as an overall evaluation of the suggested framework [27–30].

5 Experiment Case Scenario and Environment

The experimental case scenario is a forensic case involving fraud media and messages delivered to a victim by a fraudster and later deleted by the victim or another person using Windows WhatsApp. The investigator should gather the following information for an example acquiring the information timestamp when the application has been used, Crash information for the application, Media were deleted.

The experimental environment includes an installed version of Windows' WhatsApp, which the fraudster used to conduct a crime, as well as an Autopsy tool for recovering the missing evidence. We collected such deleted evidence utilizing several online open-source apps, such as Autopsy. We also deleted one of the media for an experiment on recovering deleted WhatsApp data via Autopsy. As a result, the Autopsy program serves as a testing environment for retrieving deleted media files from WhatsApp (Table 1).

We have focused on the technical investigation method and procedure and assume that the proper authority has been obtained to access the victim's application.

Table 1 The experimental environment

Category	System
Operating system	Windows
Experimented app	WhatsApp
Experimental environment	Autopsy for media analysis, FTK image for creating bit image of evidence and for encryption and decryption

5.1 Evidence Collection

During this phase, the investigator collected information from every possible location where WhatsApp could store it. The investigator used Windows registry to get the information about the WhatsApp.

The investigator also used the WhatsApp logs to gather information about the WhatsApp application, such as when it was launched on the suspected days and how long victims spent in the operational application. As seen in Fig. 6, And WhatsApp uses the following logs to store log data: applog.txt.202401152055, applog.txt.202401162353, applog.txt.202401172047, applog.txt.

The rotatedLogs folder contains three log files by default. These are the daily logs that WhatsApp Desktop creates and stores in the rotating log folder. The rotating log folder is a circular buffer that holds data on how the application functions, including warnings and problems. The applog.txt log file is present inside the LocalState folder and contains general information regarding WhatsApp Desktop application behavior, including media and messages (Figs. 7 and 8).

WhatsApp version information, including the version the victim was using, and the crash report of WhatsApp from the Microsoft.AppCenter.Storage, and these data can be accessed from the version file contained within the LocalState folder (Fig. 9).

WhatsApp is used to allocate a specific folder for media, known as the shared folder, as shown in Fig. 4. Inside this folder, there is another folder called the transfer folder, and if we go inside, WhatsApp is used to store its material in weak-wise order, as shown in Fig. 10.

Fig. 9 WhatsApp Microsoft.AppCenter.Storage analysis

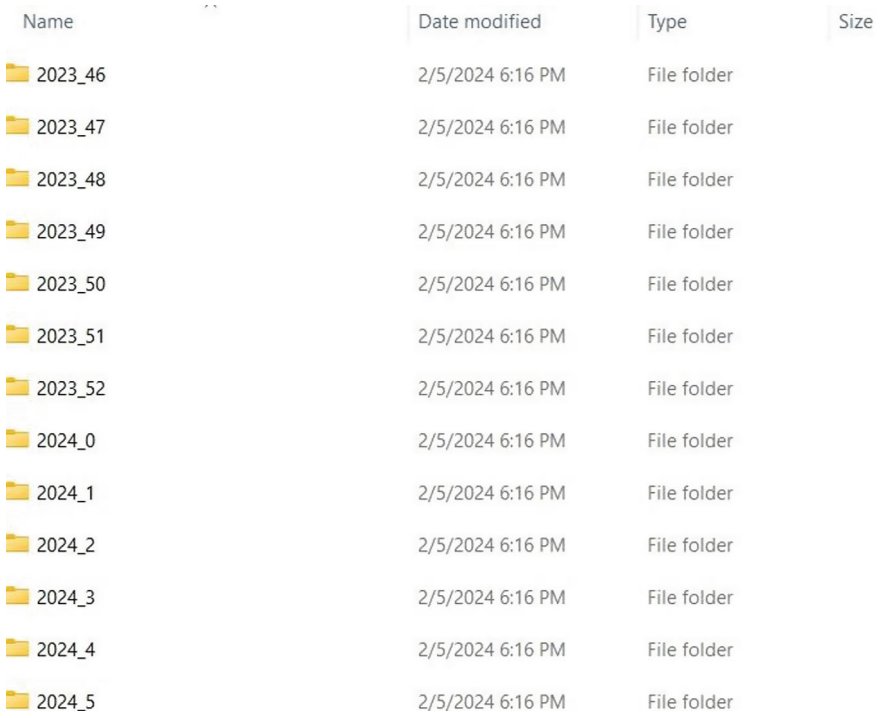

Fig. 10 WhatsApp media folder

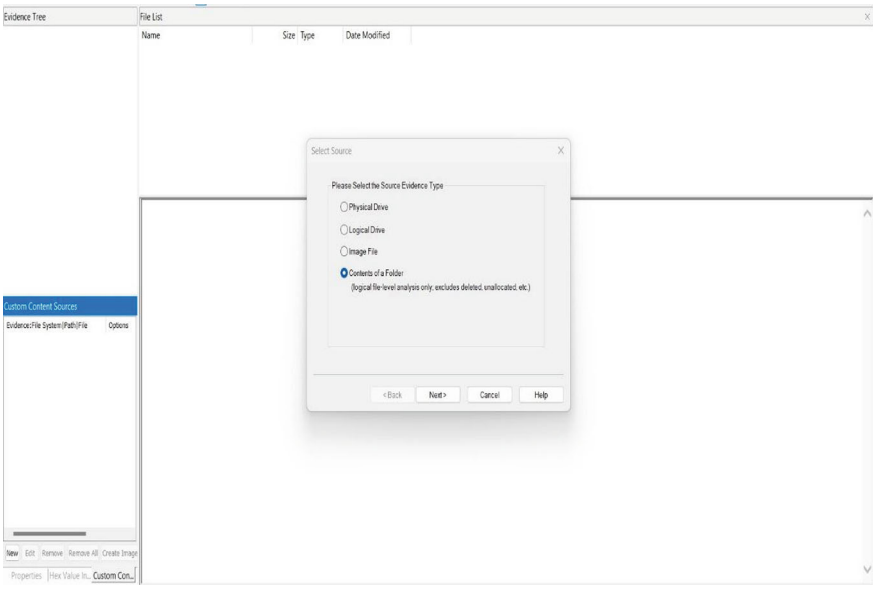

Fig. 11 Choosing selection source FTK image

5.2 Evidence Preservation

In this phase, we preserved the WhatsApp main folder by generating a bit image with the FTK Image tool and then encrypting it with the application by offering a password so that no one could change it before analysis. Here are the screenshots of the process and by following these steps we preserved the evidences (Figs. 11, 12, 13, 14, 15, 16, 17, 18, 19).

5.3 Data Extraction

In this phase, we extracted the data that needed analysis. As our research area is about deleted media and messages, after the decryption of the preserved evidence, we mainly focused on the shared, which is particularly located for media storage folder, which is for storing the messages.

5.3.1 Recovering the Non-Deleted Media

To retrieve non-deleted media, simply navigate to the particular folder in the Windows directory, where we can see all forms of media in a non-encrypted format, ordered in weak-wise order, which depicted in Fig. 10.

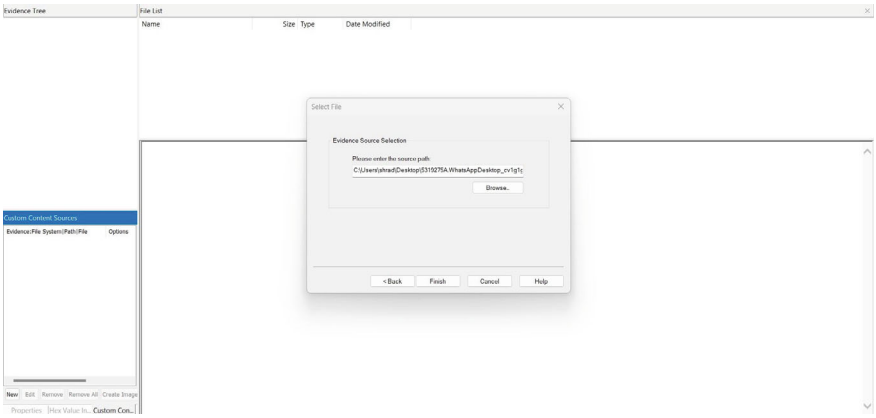

Fig. 12 Specifying the source path

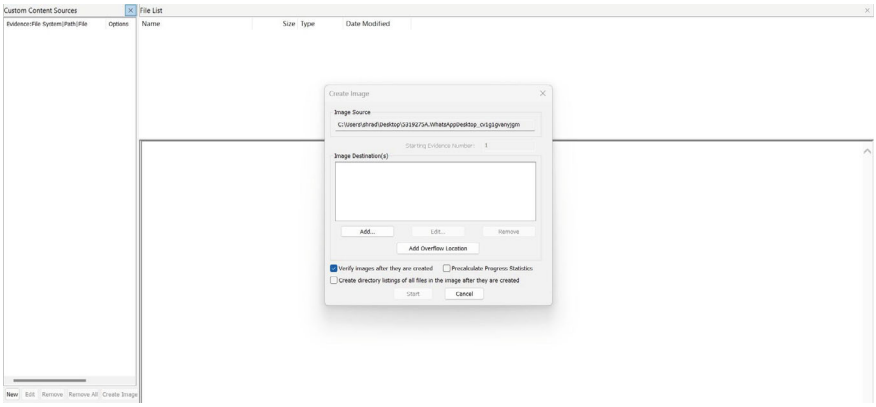

Fig. 13 Adding the destination path

5.3.2 Recovering the Deleted Media

To recover the deleted media, investigators have used the Autopsy open-source software. WhatsApp used to store the data as weak-wise, so the investigator figured out which weeks were suspected, and according to that, he or she extracted the data by using this tool. For the crime scenarios, we assumed that the first week of February 2024, as shown in Fig. 10, was the suspected week, so we recovered all the deleted media that were deleted in that week. We found that media got deleted this particular week, and we saved these media in a saved location for analysis purposes. These deleted media are.

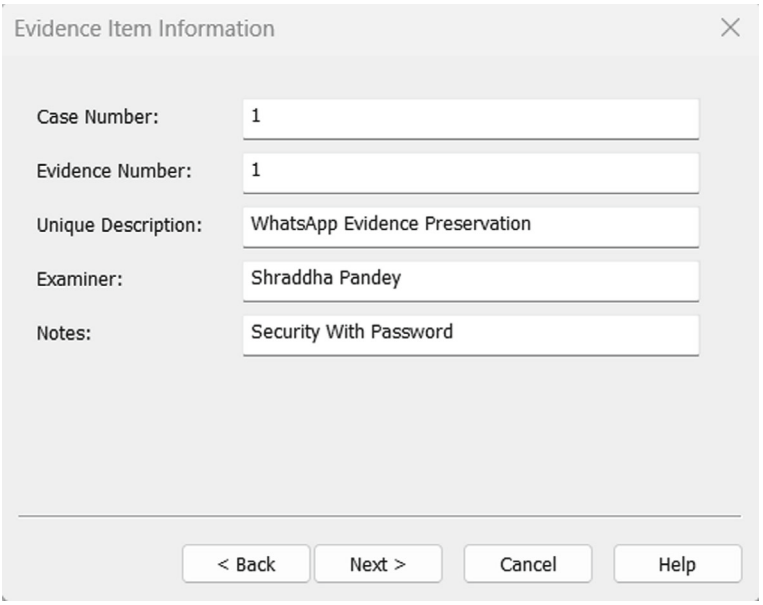

Fig. 14 Image item information

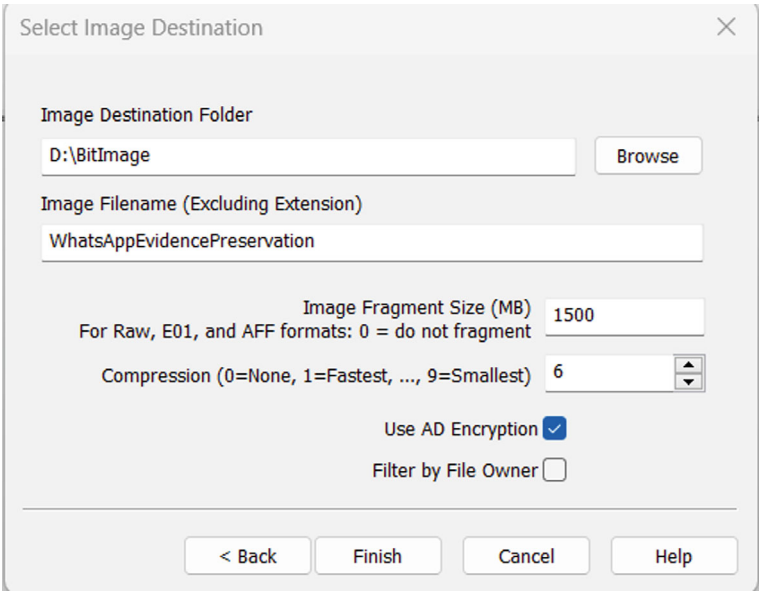

Fig. 15 Select image destination

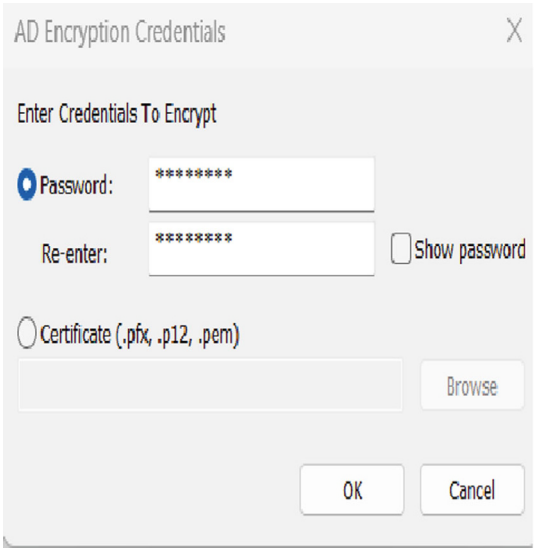

Fig. 16 AD encryption credentials

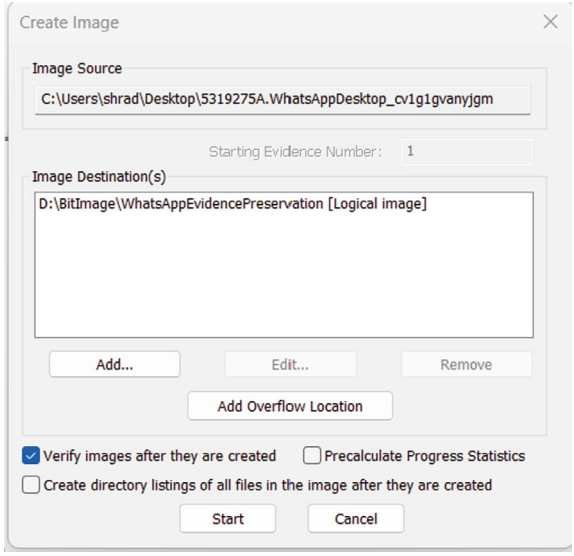

Fig. 17 Create image

5.4 Analysis

In this phase, the investigator analyzed the evidence that was extracted in the data extraction phase. In our research, we mainly analyzed the deleted media.

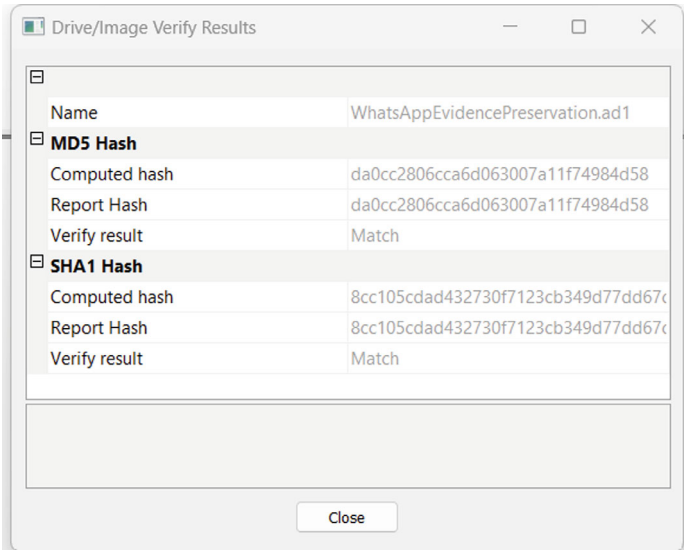

Fig. 18 Image verify results

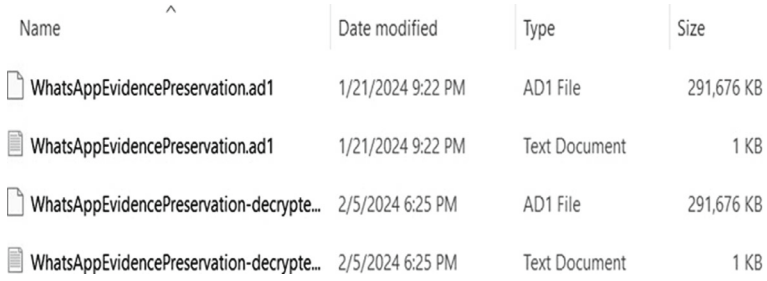

Fig. 19 AD1 file and text document of image summary

5.4.1 Analysis of Non-Deleted Media

For the non-deleted, we conducted manual analysis by visiting each and every media, and WhatsApp simplifies the process by saving the media in a weak manner for the investigator. As a result, the investigator can visit suspected weak folders.

5.4.2 Analysis of Deleted Media

The first investigator did the manual analysis and after the analysis, it was found that when a WhatsApp user transmits media to any of our WhatsApp connections, it is saved in the shared folder that is specifically allocated for media storage purposes

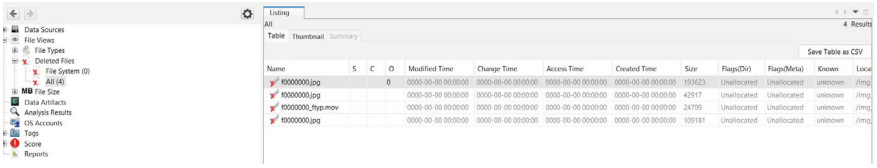

Fig. 20 Recovered deleted media

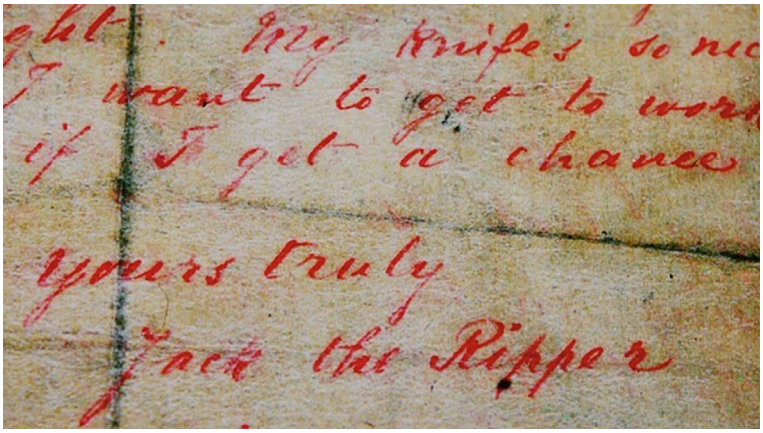

Fig. 21 Analysis of deleted media

and when we delete media from any chat, it is also deleted from the shared folder. Along with if we transfer the same piece of content more than once, it will be added to the shared folder many times with a unique code name. So, if an intruder sends any form of media to the victim, it will be saved in a folder with a unique ID and used as evidence in the context of a forensic inquiry. After that, we used the Autopsy application to recover the deleted media and observed each one in an external viewer. For the testing scenarios, we discovered that one of the extracted media contained some information about the fraud that could aid in the crime investigation as shown in Figs. 20 and 21.

5.5 Report Generation

In this phase, the investigator prepares a report based on the results of the analytical phase and sends it to the legal authority. During our investigation, we discovered that one of the media outlets was accused of providing a hint regarding the crime. During our inquiry, we discovered that one of the media outlets was accused of providing a hint regarding the crime. So, the investigator did more investigations, documented everything, and presented the findings in court.

6 Conclusion and Future Work

The use of social media applications is continuously rising, and WhatsApp is one of the most helpful applications in the world. As a result, committing a crime using a program like this has become the standard these days. In this research, we present a five-phase forensic investigation framework for WhatsApp that recovers deleted files and messages. Our framework separates the evidence collection, data preservation, data extraction, analysis, and report preparation phases. First, we gathered all of the necessary evidence from all of the locations where WhatsApp was stored. After collecting the data, we preserved all of the evidence by producing a bit image with the open-source tool FTK image and locking it with a password. During the data extraction phase, we primarily concentrated on extracting deleted media, after which we assessed this evidence and prepared a report based on the findings.

For the evaluation of our framework, we employed a variety of open-source technologies as both support and experimental scenarios. Notably, the technological procedures for gathering evidence, preserving evidence, analyzing data, and producing a report based on the findings.

Future research will apply and assess our methodology to deleted communications as well as other social media platforms including Snapchat, Instagram, and Telegram.

Witness and Eyewitness Memory: Factors Influencing Testimony Accuracy

Wafa Abu Hatab, Bashar Jawdat Sawalmeh, and Mohammed Al-Badawi

Abstract Witness testimony is pivotal in legal proceedings, as it significantly influences the outcomes of trials and investigations. This research investigates the factors affecting witness memory accuracy and explores how lawyers facilitate accurate recall during testimony. Focusing on eyewitnesses and lay witnesses, the study highlights the burdens eyewitnesses face, including the impact of shock and memory distortion. Through the analysis of a YouTube video and the renowned Loftus and Palmer experiment (1974), the research reveals how language and leading questions can alter witness memory. Effective strategies for enhancing memory recall include cognitive interviewing, avoiding leading questions, and using visual aids like maps and pictures. These methods, alongside narrative techniques, enable witnesses to provide more accurate and detailed testimonies. The findings underscore the importance of strategic questioning and visual support in legal contexts to ensure reliable witness testimony.

1 Introduction

Witnesses play an important role in any case and in courtrooms, since they are the first evidence that helps to solve any crime or to reach to any criminal. Therefore, witnesses are defined as individuals who provide testimony or evidence in legal proceedings based on their personal knowledge of events or circumstances, and their testimony can significantly impact the outcomes of trials and investigations. The importance of the witnesses' testimony comes from its affection on the outcomes of the whole case, so any wrong information can cause different outcomes. Therefore, witnesses' must recall the events as same as what happened during the action and to be accurate during their testimony. According to [3], they defined witness and their testimony as A witness is someone who offers testimony or evidence in a legal setting based on their direct observations or experiences. The precision and trustworthiness of their testimony can fluctuate due to various factors, such as their memory, perception, and the circumstances surrounding their observations. There are five types of witnesses in legal proceedings, and they are Eyewitnesses, expert witnesses, character witnesses, fact witnesses, and lay witnesses [2]. This study is going to focus on two types only, and they are eyewitnesses and lay witnesses. Eyewitnesses a concept that refers to the witnesses that observed and saw things from the crime scene, so their testimony is based on it. While lay witnesses in a concept that refers to people who provide their testimony based on their personal observations and experience. The difference between them, is that all of eyewitnesses are lay witnesses, while not all the lay witnesses are eyewitnesses, however, eyewitnesses provide testimony based on their direct observation with the event, while lay witnesses might use their experience in their testimony. According to the previous information, it can be noticed that eyewitness carry lot of burden during their testimony, since they are required to remember all the details that occurred in the crime scene. Yet sometimes they can't remember because many factors one of them for example being shocked, since it's not something familiar to them. This shock may cause problems in recalling things, the events are not accurate enough or they can't remember at all. Here the lawyer must try to guide the witness through special ways to encourage his memory, so he can recall what happened exactly there [2].

1.1 Objectives

This research aims to investigate the factors and the reasons that affects the witnesses' memory during their testimony inside the court, and how lawyers deal with the problem of not recalling the events and the inaccurate information.

1.2 Research Questions

This study aims to answer the following questions:

1. What are the linguistic strategies that are employed to activate memory?
2. How the lawyers deal with the witnesses if their testimony is not accurate?
3. What are the most effective strategies among witnesses?

1.3 Significant of the Study

It is important to investigate the problems that happens with witnesses during their testimony, and most of the researches focuses on the questions that the witnesses usually being asked inside courtrooms. To the best of my knowledge, no researches has been conducting the factors that affects the testimony of witnesses and their accuracy in recalling events. Therefore, this research aims to investigate the factors that affects testimony reliability of witnesses' memory and recalling [3].

2 Literature Review

The study by Robinson and Johnson [16] investigates the confidence-accuracy (CA) correlation in eyewitness testimony by comparing recall and recognition memory processes. They conducted an experiment with 205 college undergraduates who watched a simulated crime video and answered either recall or recognition memory questions about the video. Participants were divided into groups based on the type of memory question and rating condition, including immediate confidence, delayed confidence, and hypothesis disconfirmation. The results indicated that recall conditions yielded a higher CA correlation compared to recognition conditions, which the authors attributed to the presence of ease-of-retrieval cues in recall memory. Similarly, the study examined the effects of providing reasons for false responses and interstimulus delays between memory response and confidence judgments. This helped to distinguish between recall and recognition memory and its application to eyewitness testimony [5].

Penrod and Cutler [15] evaluated ways to improve eyewitness identification and expert testimony in legal contexts. The study was a comprehensive review of existing research and experimental research on factors influencing accurate eyewitness identification and jury verdicts. The results concluded that eyewitness identification is most accurate when procedures are used properly and when jurors receive expert testimony on the reliability of eyewitness identifications. The effectiveness of the expert opinion varied depending on the way it was presented and the characteristics of the case. The study highlights the importance of expert testimony in helping jurors make more informed decisions regarding the credibility of eyewitnesses [6].

In 2019, [9, 11, 15] sought to shed light on the distinction between honest verbal eyewitness testimony (correct and incorrect), as well as to recreate and shed light on the theoretical mechanism underlying the relationship between verbal cues to retrieving effort, self-confidence, and accuracy memory in eyewitness testimony. That same year, 22 psychology students were shown a video of a staged crime, which they later watched in an interview about what they saw [7]. This interview included both free recall and cued recall tasks in which participants were asked questions about what they saw in the video. Participants' responses were coded for effort cues (delays, hedges, and fillers) in their responses and also measured for response latency. The accuracy of participants' responses was assessed by whether the details of the statements could be objectively verified from the video footage of the crime. Participants also rated their confidence in each statement [1]. Results showed significant associations between verbal cues of search effort and eyewitness memory accuracy for a simulated crime event. Overall, fewer effort cues in utterances increased their accuracy. The study also found that response latency was a significant predictor of memory accuracy—this is the additional information that response latencies provide about retrieval effort and memory accuracy. Unlike previous research, the relationship between self-confidence and memory accuracy was unique and could not be predicted by effort cues. Finally, effort cues mediated the relationship between self-confidence and accuracy, suggesting that self-confidence may be based on retrieval effort cues rather than simply "theory-based" beliefs about memory. In the discussion, the study's results were explained as a significant contribution to our knowledge of what makes eyewitness memory accurate or inaccurate. Verbal cues to effort have been shown to be important predictors of memory accuracy, and the study highlights the role of retrieval effort on eyewitness memory accuracy. Overall, the study's results suggest potential applications for practitioners, police officers, and juries because they can distinguish between accurate and inaccurate eyewitness memories based on effort cues. Nevertheless, the results differed from previous research on the unique effects of various effort-related cues on memory accuracy and suggest that further research is needed to refine methods for examining eyewitness memory [13].

Bornstein et al. [9] Arousal induced by viewing violent or neutral films does not affect eyewitness memory recall. The article focuses on a study that examined whether arousal caused by watching violent or neutral films affects the recall of eyewitness memories. The methodology involved participants watching either a violent or a control film and then performing a series of recall tasks. Participants' anxiety and upset levels were measured at various stages: during the film, immediately after, and prior to subsequent recall attempts. The results showed that participants who watched the violent film rated it as significantly more violent and reported higher anxiety and upset levels compared to those who watched the control film. Notably, participants in the violent film condition recalled more details about the event itself but less about preceding and subsequent details compared to the control group, suggesting that arousal has a dual effect on memory: enhancing recall of central details while impairing recall of peripheral details.

Gabbert et al. [11], the primary focus of this study is to explore the effects of discussion among co-witnesses on memory conformity and accuracy. The experiment

utilized a between-subject design involving different age groups (young and old) and conditions (individual recall and co-witness recall). Participants viewed a simulated crime event from different perspectives and later engaged in either individual or collaborative recall. The study found that a significant proportion of co-witnesses incorporated information from their discussions into their own recollections, with 71% of witnesses reporting details they had acquired from their co-witness. Interestingly, 60% of participants who discussed the event with a co-witness reported the girl as guilty of a crime they had not witnessed. This indicates that memory conformity is influenced by co-witness discussion, leading to the incorporation of misinformation, regardless of the witness's perspective [8].

Gardner [12], the central theme of this research is to examine how perception and memory processes are influenced in the context of eyewitness testimony. The study's methodology involved participants viewing an event and subsequently undergoing various recall tests. It highlights the significant impact of retrieval processes on memory, suggesting that repeated retrieval attempts can enhance recall of both neutral and negative emotional events. The results underscore that while arousal from negative emotional events can impair memory for peripheral details, it enhances the recall of central details. Furthermore, repeated testing was shown to improve recall performance for both arousing and neutral events, emphasizing the role of retrieval in eyewitness memory. These findings support the notion that retrieval processes, rather than encoding alone, play a crucial role in the accuracy of eyewitness memory.

3 Methodology

Since this study attempts to investigate the factors and the reasons that affects the witnesses' memory during their testimony. Therefore, a YouTube video was used to collect and analyze the data.

3.1 Data Collection

According to video that is related to this study, the researcher used them to analyze and to see how lawyers dealt with the witnesses that can't recall the events and what are the strategies that he and she used to make the testimony accurate.

3.2 Data Analysis

The researcher used the video to notice the questions the strategies, and the language use that are applied among witness to encourage her memory to recall the events accurately, then the researcher will analyze them.

4 Result and Discussion

The researcher watched a video that is related to an experiment that was done by Loftus and Palmer during 1974, to check how the eyewitnesses might get affected by the different perspectives and how these perspectives might change the accuracy of their memory, and it might change the details that are crossing their memory. This will affect recalling information when they are trying to testify. The experiment showed that language can affect the memory of the witnesses and the accuracy of the things that the recall, since the experiment divided people into 9 groups and they were required to watch a car accident then to tell what did they see. The researcher in this experiment, used language to see if they are going to use expressions to speak about the accident that happened. Therefore, Loftus and Palmer decided to use this question "How fast was the car when they _____ into each other" and there were five choices "contacted, hit, bumped, collided, smashed" each one of these choices refer to a specific type of damage. Based on people's opinion they used the expression "contacted" to point to the lowest speed with 31.8 mph, and "smashed" to the highest speed with 40.8 mph. Then the experiment went to another point and it was applied among 150 students, and they were asked the same thing but this time their answers were between 'smashed' and 'bumped', while the last group didn't get any questions. And after one week the students were asked to describe the thing that they saw week before and the most important question was "did you see any broken glass?" based on their answers and the choices and because they choose "smashed" to describe the accident most of the students answered with yes! The important thing here is that there wasn't any broken glass in the video. According to this experiment we can notice the importance of leading questions and how it can affect the witness's memory, and another thing that people usually are confident about the things that they saw or expressed, unless they start hearing new things related to the same topic, and this will lead to some confusion within their memory. For example, it you just finished your exam and you are sure that you answered everything correctly, and your friends started to tell their answers and how they are sure about them being correct, the first thing that you are going to feel is losing the confidence in your answers, then you will start to question yourself did I answered the question this way of this way. So, the first strategy is to avoid letting the witness under the pressure or within a big community that are discussing the same topic, and avoid putting him under the control of leading questions, and to try to explain to him how to maintain his information. The second thing is the words that are used during taking the testimony from the witness, as an expert lawyer or prosecution they must learn how to choose their words and to know which word is better and will directly help the witness to remember the events correctly. Some experts suggest another strategy to deal with eyewitness accuracy, and they call it cognitive interview. Cognitive interview is basically to avoid leading questions, but ask the witness to narrate everything, this will lead the witness to say everything without filtering and without choosing the things that the interviewer wants him to say. Also, it plays a major role in the process of brain storming, in which the witness will try to remember things as much as he

can [4]. The process here is by using open-ending questions such as "what happened next?" and this method showed that the answers are more accurate than using leading questions. According to the video that the researcher watched, the lawyer starts by asking the witness about the place that the car crash occurred in, and it was a yes/no question, the question was "are you familiar with the area of Forster Parkway?" and she used word familiar with rather than asking her by using do you know or have you been to, to help here to recall the place and the things that were there in the time she visited that place. Then she asked her if she can recall why she was there during that day, the witness answered that she dropped her co-worker off because her house is there, this answer led the lawyer to ask her about the direction that she took, and if she can recall it, and she answered with no she is bad with directions. Another method was used here, in which the lawyer started showing the map to her so she can help her to recall things. And this method was helpful, since after presenting the map, the witness could identify the road that she took during that day. Here we can notice that pictures or visual materials are good strategy to help eyewitnesses to recall things and they can be used effectively if the witness can't remember the specific details that can play major roles in the evidence [14]. After, the witness recalled the place, the lawyer used a third method which is narrating the things that she observed during that day. The witness start narrating what she saw, according to the map that is in front of her and she could effectively recall things and gives accurate details such as the exact place that the accident happened in, and the type of the car. The witness could effectively recall what happened even though she was nervous and confused, the only thing that she couldn't recall very well is the speech that was between the women and the man that happened the conflict with. Then the lawyer started repeating the things that the witness just narrated to make sure that she is telling the truth. One of the methods that is used too is some pictures, of the vehicle's accident, and they were used because the lawyer asked her if she can recall her position to the Jeep of the defendant, and she answered yes, but with some hesitation, therefore, he decided to present 7 different pictures to help her recalling her position. This method was effective too, in which after seeing the pictures she could identify and recall the event accurately. According to this data, it can be noticed that different ways had used during the examination, and these methods are effectively in refreshing the witness's memory and it encouraged her to be more specific and to be more confident while she is testifying. It was noticed that, using visual things such as, pictures, maps, and videos are more effective to be used when the witness can't recall things accurately [10].

5 Conclusion

This paper aims to investigate the linguistic strategies and leading questions that are used to help the witness to recall and to testify accurately in the court. According to the video that had used to collect the data, usually lawyers present many methods to help and encourage the witness's memory and to help him to recall events. The

methods that are used are: presenting pictures, using different words that leading directly to the case, showing visual materials, such as maps, videos, and using the narrative way, in which the witness will start narrating the things that he recalls as a story then the lawyer will repeat the important parts that he wants to make sure about them. These are the most effective methods that helps the witness to recall the events accurately.

Patent Protection in the Age of Technology: An Analytical Study of Original and Ancillary Penalties

Omar Al Makhzoumi and Jaber Al-Ghayathin

Abstract This research examines the legal framework governing penalties associated with patent rights infringement in Arab nations. Its objective is to analyze the penalties applied for patent infringement, encompassing both primary and ancillary penalties, while also comparing various legal systems across Arab countries. Furthermore, the study aims to elucidate the significance of patents as a protective measure for technological and creative innovations, outlining the rights granted to inventors, including legal safeguards against infringement. It also investigates the legal repercussions that can arise from violating patent rights, detailing both criminal and civil penalties imposed on individuals and corporations that breach these rights. A descriptive-analytical approach was employed to gather and analyze legal and legislative information regarding patents in Arab countries, concentrating on the relevant laws and penalties. The findings revealed that penalties for patent infringement comprise a range of original and ancillary penalties designed to protect inventors' rights and ensure effective enforcement of the law. Additionally, the results highlighted that patent legislation across Arab countries differs in terms of penalty specifics and enforcement procedures, which influences how infringement cases are managed. The study advocates for improved coordination among Arab nations to harmonize patent-related laws, thereby enhancing rights protection and streamlining the legal processes concerning infringement of these rights.

1 Introduction

An invention results from a creative process focused on developing or enhancing a product, process, or device designed to address a specific need or resolve an existing issue. Defined as a novel idea applied in an innovative way, an invention creates a product or technology that did not exist before. Inventions can encompass a wide range of fields, with technological inventions being a crucial aspect of contemporary innovation. These technological advancements involve creating new tools, devices, and methods grounded in scientific and technological progress. Furthermore, inventions may extend to other disciplines such as chemistry, physics, and engineering, showcasing the diversity and significance of innovation across various industries.

A Patent Certificate is issued to safeguard an invention. This certificate is awarded to protect the invention provided it fulfills the required criteria for issuance and confers various rights to the owner, including the authority to prohibit others from using, making, selling, or displaying the invention without the consent of the patent holder. Additionally, it enables the owner to exploit and exclusively utilize the invention and participate in all legal dealings related to it.

It is important to highlight that legal protection for the patent holder commences only from the moment the relevant authority grants the patent, in line with comparative patent legislation. The holder, whether the original inventor or their legal successors, possesses various rights under the patent issued by the relevant authority. These rights include the ability to control the invention and to exclusively exploit it for financial gain within a defined timeframe and specific conditions. Any unauthorized use of the patent holder's rights without permission results in both criminal and civil liability. Comparative legislation establishes civil and criminal penalties for any infringement upon the inventor's rights, thereby ensuring civil protection through the prevention of unfair competition. The inventor has the right to pursue compensation for damages caused by infringements and may also seek international protection for the invention beyond the jurisdiction of the granting state [1].

There is no doubt that violating the rights of a patent holder constitutes a legally punishable offense. As previously outlined, the law offers legal safeguards for patent holders via both civil and criminal avenues. Comparative legislation outlines both primary and ancillary penalties for individuals who infringe upon the rights of patent holders [2].

This study seeks to examine the various original and ancillary penalties established for patent rights violations in Arab nations, with an emphasis on the regulation of these penalties and procedures in infringement cases.

1.1 Study Objectives

- Explain the importance of patents as a means of protecting technological and creative innovations.

- Analyze the legal framework for patent infringement penalties in Jordan, Egypt and the United Arab Emirates.
- Compare how penalties and procedures for handling patent infringement cases are structured and identify similarities and differences.
- Identify how courts apply penalties and interpret laws to understand the practical issues and challenges facing the justice system.
- Propose improvements to the effectiveness of penalties and strengthening patent protection in line with international best practices.
- Highlight the importance of patent protection and the consequences of infringement, contributing to better enforcement of intellectual property laws and regulations.

1.2 Methodology

This research employs a descriptive-analytical approach to investigate penalties associated with patent rights infringement by gathering and scrutinizing pertinent legal and legislative information. It commences with the collection of data on patent laws and penalties in Jordan, Egypt, and the United Arab Emirates through an examination of relevant legal texts and regulations. A comparative analysis of the legislation follows, aimed at uncovering both similarities and disparities within the legal frameworks of the three nations. Furthermore, the methodology incorporates an examination of applicable judicial practices to gain a more profound insight into the application of penalties and the interpretation of laws by the judiciary. Content analysis is utilized to review judicial rulings and evaluate the efficacy of penalties in fulfilling patent protection objectives. The study aspires to provide recommendations derived from both descriptive and practical analyses to enhance the legal framework and formulate effective strategies for bolstering patent protection.

2 Definition of Punishment

Criminal law scholars have offered various definitions of punishment in their literature. One such definition describes punishment as "a deliberate infliction of pain imposed due to a crime and proportional to it." Another perspective refers to it as "the consequence prescribed by law that affects the criminal due to the commission of the crime". Furthermore, punishment is characterized as "a criminal sanction that involves deliberate pain prescribed by law and imposed by a judge on anyone proven to be responsible for the crime".

From this definition, several characteristics of punishment become evident [3]:

1. **Legality of Punishment**: This means that punishment must be based on a legal provision.

2. **Personal Nature of Punishment**: This indicates that the pain and harm of the punishment affect only the convicted individual, whether they are the principal actor or an accomplice in the crime.
3. **Judicial Nature of Punishment**: In essence, the judicial nature of punishment affirms its legality; there can be no punishment without a legal text and no punishment without a judicial ruling.
4. **Equality in Punishment**: This principle ensures that punishment is applied equitably and fairly.

3 Original Penalties

Anyone who violates the rights of a patent holder—whether through counterfeiting a patented invention, selling or intending to sell, offering for trade or sale, importing counterfeit items related to the patented invention, falsely claiming to have obtained a patent, falsifying entries in the patent register, or utilizing forged documents from that register—becomes subject to legal repercussions [4]. According to Article 32 of the Jordanian Patent Law, the penalties include:

1. Imprisonment ranging from a minimum of three months to a maximum of one year.
2. A monetary fine between one hundred dinars and three thousand dinars.
3. A combination of imprisonment and fines [5].

In Egypt, the legislator has outlined the primary penalties in Article 32 of the Intellectual Property Protection Law as follows:

1. A financial penalty of no less than twenty thousand pounds and no more than one hundred thousand pounds.
2. For repeat offenses, imprisonment for up to two years along with a fine not less than forty thousand pounds and not exceeding two hundred thousand pounds [6].

At the same time, the legislator in the UAE has outlined the initial penalties in Article 62 of the Federal Law, which include:

1. Imprisonment.
2. A monetary fine ranging from a minimum of five thousand dirhams to a maximum of one hundred thousand dirhams.
3. A combination of imprisonment and a fine [7].

The legal documents indicate that the Jordanian legislator has established penalties for the infringement of patent rights, which include imprisonment for a duration of three months to one year, along with fines that range from one hundred to three thousand dinars, or potentially both penalties combined. However, the legislation does not address penalties for repeat offenses. In contrast, the Egyptian legislator has set an initial penalty that consists of a financial fine between twenty thousand and one hundred thousand pounds, while also increasing the consequences for repeat

offenses to imprisonment for up to two years and fines ranging from forty thousand to two hundred thousand pounds. Notably, neither the Jordanian nor the UAE patent laws provide specifications for penalties related to repeat offenses. These legal texts reveal significant differences among legislators in their approach to defining penalties, particularly concerning information technology and contemporary innovations that demand robust protection of intellectual rights. The rapid pace of technological advancements underscores the need to revise these laws to adapt to swift changes in innovations and to guarantee effective safeguarding of intellectual property rights.

4 Ancillary Penalties

The rights of a patent holder cannot be violated by anyone, regardless of whether the infringement consists of replicating a patented invention, selling or proposing counterfeit items, importing goods for sale, making false claims about a patent, or fabricating records from the patent register or utilizing forged documents from that register. The patent holder is entitled to pursue all legal avenues to safeguard their rights associated with the patent or implement actions that could discourage the offender from committing these acts [8]. Additional penalties may involve seizure and destruction of the infringing items.

4.1 Confiscation

Confiscation refers to the act of seizing the materials and tools utilized in violating a patent. This is addressed by the Jordanian legislator in Article (33/Z) of the Jordanian Patent Law, which empowers the court to mandate the confiscation of products, tools, and materials that were primarily employed in the creation of the infringing products or those derived from such infringement [9]. In Egypt, Article (32) of the Intellectual Property Protection Law stipulates that the court is required to order the confiscation of counterfeit goods and the tools involved in their counterfeiting, with the judgment being published in one or more daily newspapers at the convicted party's expense [6]. Meanwhile, in the UAE, Article (63) of the Federal Law permits the court to command the confiscation of items that have been seized or those seized later, along with the destruction or removal of any effects resulting from the illegal action, including the machinery used for forgery. Additionally, the court may require the publication of the judgment in a bulletin or local daily newspapers at the cost of the convicted individual [7]. In accordance with these legal stipulations, the court has the authority to order the seizure of tools utilized in the offense of patent infringement or in deceiving the public to secure a patent for engaging in such infringement, or any other legally punishable act, upon the request of the patent holder whose rights have been violated. Consequently, machines, items, or counterfeit goods may be confiscated to account for their worth [10]. Furthermore, it is evident that the comparative legislation is

consistent with the TRIPS Agreement regarding the confiscation of items employed in the reproduction of the patented invention [11].

Conversely, the current technological revolution has made innovations essential to the global economy, heightening the necessity of patent protection. Patent infringement involves the unauthorized utilization of technology to duplicate patented inventions, inflicting considerable damage on inventors and businesses alike. Contemporary legislation addresses this concern, as evidenced by laws like the Jordanian Patent Law, the Egyptian Intellectual Property Protection Law, and the UAE Federal Law, which establish stringent protocols for the confiscation and destruction of tools and materials involved in infringements [12].

A major technological hurdle lies in the tracking and monitoring of counterfeit patents. The use of modern advancements, including artificial intelligence systems and digital analysis tools, is vital for improving confiscation processes. For instance, technology can effectively pinpoint and monitor counterfeit items, thereby simplifying the actions that legal authorities need to undertake. Furthermore, advancements in digital management and electronic record-keeping significantly aid the protection of patents by enhancing transparency in legal proceedings and streamlining the collection of evidence.

The principles of the TRIPS Agreement and comparative legislation illustrate this trend, harmonizing with advancements in technology and aiding in the preservation of rights related to technological innovation. The incorporation of technology in this domain allows for the provision of more robust patent protection, thereby boosting confidence in the legal framework that protects innovations from unlawful infringements [13].

4.2 Destruction

Legislation on the comparative front empowers the appropriate court to eliminate counterfeit goods alongside the equipment and tools utilized in reproducing patented items. The decision to destroy machinery is at the court's discretion. When counterfeit products present a threat to public health—particularly those related to food or medicine that fail to meet health standards—destruction is permitted. However, if such counterfeit items do not endanger public health, destruction is prohibited, as it is only allowed in situations of dire necessity, indicating that the counterfeit goods must be detrimental to public well-being. Article (33/Z) of the Jordanian Patent Law provides that the court has the authority to mandate the destruction or disposal of these items for non-commercial uses. This clause enables the court to instruct the destruction of tools and machines involved in patent violations or to dispose of these products, as long as it is for non-commercial purposes.

In this scenario, it is clear how crucial technology is for identifying and managing counterfeit goods. Tools like artificial intelligence and big data analysis can effectively trace these counterfeit items and confirm their origins. Additionally, sophisticated scanners and electronic tracking devices play a significant role in recognizing both the products and the equipment utilized in forgery or duplication [14].

Article (35) of the Egyptian Intellectual Property Protection Law empowers the head of the relevant court to issue one or more precautionary measures for enforcing fines or compensation, based on a petition submitted by any interested party. If deemed necessary, the court head may also command the destruction of seized items [7]. This provision illustrates that the Egyptian legislator permits any interested party to request precautionary measures, which can include the destruction of items utilized in replicating the invention. In contrast, while Jordanian law grants the court the authority to order destruction, it does not clarify whether this power resides with the head of the court or the judge overseeing the case [15].

According to Article (63) of the Federal Law, the court has the authority to mandate the removal or destruction of items related to an illegal act, which encompasses tools and machinery utilized in forgery. This provision allows the court to issue such directives even in instances where an acquittal has occurred [16]. Thus, the court can order the destruction of equipment employed in forgery or duplication.

According to these legal documents, only the court has the authority to confiscate and destroy machines and tools involved in patent infringement, unlike the three legislations from Jordan, Egypt, and the UAE, which also designate the court as the exclusive body for handling items related to copying or forgery.

4.3 Verdict Publication

The right to publish a judgment lies with the court against individuals who violate the rights of the patent holder, those who replicate counterfeit items, or those who obtain such items for sale, offer them for sale, import them for sale, or falsely assert having acquired a patent for the invention. According to Egyptian law, this publication may occur in one or multiple newspapers. It is required that the publication appears in a local daily newspaper or a bulletin, with the costs borne by the convicted individual. A comparable framework exists within UAE legislation [6].

According to Article (63) of the Federal Law, the court has the authority to mandate the publication of the judgment in a bulletin or a local daily newspaper, with the costs borne by the convicted individual [17]. Similarly, Article (32) of the Egyptian Intellectual Property Protection Law stipulates that the court must order the confiscation of counterfeit goods and the tools involved in the infringement, and it also requires the judgment to be published in one or more daily newspapers at the expense of the convicted party [18]. When comparing these three pieces of legislation, it becomes clear that the Jordanian Patent Law lacks a provision for penalizing publication in newspapers or bulletins.

4.4 Judicial Applications

- Decision of the Jordanian Court of Cassation No. 363/2008 (Ordinary Panel) dated 22/10/2008 published by the Adalah Center:

Article (21) of the Jordanian Patent System No. (97 of 2001) and its amendments imply that the patent registrar is authorized to seek technical expertise from any organization deemed necessary to verify whether the conditions for the protection of an invention, as outlined in Article (3) of Patent Law No. (32 of 1999) and its amendments, are satisfied. These conditions pertain to novelty, inventive activity, and industrial applicability as defined by the law. Consequently, the patent registrar sought technical expertise from the following official Jordanian universities: 1. Jordan University, 2. Jordan University of Science and Technology, 3. Mutah University, and 4. Al-Balqa Applied University. Jordan University concluded that the conditions for protection were fulfilled, while Jordan University of Science and Technology did not perform the expertise [19–22]. Al-Balqa Applied University's response was deemed unlawful and included critiques and recommendations for modifying the invention, alongside advice directed at the patent registrar. In contrast, Mutah University opined that the invention failed to meet the legal criteria for patent protection. Considering these inconsistencies, the patent registrar ought to have consulted five specifically identified technical experts who possess knowledge and specialization in the invention's subject matter prior to rendering the appealed decision. The registrar should have based his decision on their expert report. Neglecting to take this step renders the appealed decision premature and liable for annulment [17].

- Decision of the Jordanian Supreme Court No. 117 (Five-Member Panel) dated 14/6/2010 published by the Adalah Center:

Should the technical examiner determine that a European document numbered (EP1775287) exists, which claims the same priority as the appellant's request, it indicates that the appellant's submission lacks novelty and innovation [23–25]. Article (13) of the Jordanian Patent Law No. (32 of 1999) and its amendments empower the respondent to reject the patent application due to non-compliance with the stipulations of Article (3) of the same law. Given that the appellant's request is in violation of this provision and no evidence has been provided by the appellant to refute the contested decision, the reasons for the appeal are baseless, leading to the conclusion that the case should be dismissed [18].

- Decision of the Jordanian Supreme Court No. 118/2010 (Five-Member Panel) dated 14/6/2010 published by the Adalah Center:

Should the technical examiner determine that a European document numbered (EP1775288) exists, which claims the same priority as the appellant's request, this would indicate a lack of novelty and innovation in the appellant's submission. Furthermore, Article (13) of the Jordanian Patent Law No. (32 of 1999) and its amendments empower the respondent to deny the patent application if it fails to meet the criteria

outlined in Article (3). Given that the appellant's request is in violation of this regulation and no evidence has been provided by the appellant to challenge the contested decision, the basis for the appeal is without merit [26].

- Decision of the Jordanian Supreme Court No. 112/2010 (Ordinary Panel) dated 9/6/2015 published by the Adalah Center [25, 27–29]:

Should the decision from the administrative appeal reveal that the applicant's request was determined to lack novelty and innovation based on technical evaluations from Jordanian and European sources, then this request contravenes Article (3/A/1) of the Patent Law and its amendments No. (32 of 1999). Given that Article (13) of the aforementioned law empowers the respondent to deny the patent application if it fails to meet the stipulations of Article (3), and considering that the appellant has not provided any proof to challenge the disputed decision, the grounds for the appeal are without merit, leading to the case being subject to dismissal (Supreme Court 117/2010 dated 14/6/2010, 118/2010 dated 14/6/2010) [30].

- Decision of the Jordanian Court of Cassation (Rights) No. 1722/2013 (Five-Member Panel) dated 6/10/2013 published by the Adalah Center [31]:

From Article 33/B of the Patent Law, one can deduce that a patent holder alleging infringement prior to initiating a civil or criminal lawsuit may request the court to implement any precautionary measures outlined in paragraph A of this article without informing the respondent, provided they can demonstrate ownership of the patent and that their rights have been violated or that an infringement is imminent and poses a risk of irreparable damage [32]. The respondent is entitled to contest the ruling within eight days from the date of notification or awareness, with the appellate court's ruling being conclusive. Therefore, a cassation appeal is subject to dismissal since it relates to a definitive and non-appealable ruling, and the granting of permission to appeal does not change the situation [33].

- Jordanian Court of First Instance, Irbid, Appellate Panel No. 3366/2016 dated 31/8/2016 [28, 29, 34]:

Concerning the basis for the appeal, it is summarized that the decision being contested contradicts the law, as there is no evidence in the case file demonstrating that the complainant possesses a patent as outlined by Articles (2, 8) of the Patent Law. Thus, the complainant lacks the entitlement to assert rights reserved for a patent holder as specified in Article (21) of the Patent Law [35]. As a result, it is both legally and logically unfathomable to find the defendants guilty of breaching Article (32) of the Patent Law, given that the complainant has not secured a patent certificate from the appropriate authorities in accordance with the law. Therefore, since the grounds for the appeal pertain to the contested decision and the first-instance court failed to assess the evidence accurately and appropriately, the grounds for the appeal are legitimate, warranting the annulment of the decision [19].

5 Conclusion

This research underscores the necessity of strengthening patent protection in Arab nations through an examination of the primary and ancillary penalties established for violations of patent rights. By evaluating the legal frameworks and judicial practices across Arab countries, the study offers an in-depth perspective on enhancing the efficacy of penalties and bolstering the protection of innovation. Given the growing significance of technology in driving innovation, improving legal structures plays a crucial role in protecting the rights of inventors and nurturing an environment conducive to innovation within the Arab world.

5.1 Findings

The study concluded the following results:

- Penalties for patent infringement include various types of primary and ancillary penalties designed to protect the rights of inventors and ensure effective enforcement.
- Patent laws in Jordan, Egypt and the United Arab Emirates have differences in the details of penalties and enforcement procedures, which affects how infringement cases are handled.
- Court filings in patent cases reveal inconsistencies in the interpretation and application of penalties, highlighting the need to harmonize and coordinate legal policies to facilitate the protection of intellectual property.

5.2 Recommendations

This study recommends the following:

- Improving coordination between Arab countries to harmonize patent legislation, contributing to better protection of rights and streamlining legal procedures related to infringement.
- Increase legal awareness of patent laws and infringement penalties through targeted awareness programs for inventors, businesses and lawyers.
- Encourage countries to adopt more effective methods of enforcing penalties and providing accountability for patent infringers, in line with international standards for intellectual property protection.

Screen Time and Cognitive Development: Understanding the Psychological Impact on Children in the Digital Age

Adnan Hassan Alsarayreh

Abstract This paper is concerned with the psychological effects of screen time on children's cognitive development in the digital age. Because technological instruments are part and parcel of our daily life, it is important to understand how increased exposure to screens relates to attention as well as memory and other cognitive outcomes such as problem-solving abilities. Taking a qualitative design, this study will work on a descriptive literature review comprising theories, empirical studies, and applications related to exploring the cognitive implications of screen time. An analytical approach involves identifying key themes through which factors like duration of screen time or type of content and context influence the development of cognition. The results show that there are many dimensions regarding the effects of screen time; some may be negative for cognitive development, while others positive. It also calls for balanced use with further research needed to fully understand all mechanisms at play between different aspects taking into consideration individual needs which helps in planning intervention programs.

Keywords Screen time · Cognitive development · Psychological impact · Children · Digital age · Attention · Memory · Problem-solving · Qualitative research · Empirical studies

1 Introduction

The following is a brief overview of the introduction to that essay, which puts its focus on understanding the psychological impact of screen time on chidren's cognitive development in the digital age. It stresses how pertinent and important it is to investigate the relationship between screen hours and development of cognition

these days. Since electronic devices are now essential in carrying out virtual work and education, there is a need to study the possible cognitive deficits that come with more extended screentime exposure [1]. Indeed, the COVID-19 pandemic increased total screentime for all age groups; thus, it becomes very important to study cognitive outcomes and how much influence screens have on them during this period, especially for young adults who are undergoing major lifestyle changes [2].

1.1 Research Significance

The importance of this study is to further investigate the relationship between screen time and the cognitive development of children during this time when digital engagement is everything. Electronic devices are now inseparable in terms of education, entertainment, and socialization; therefore, understanding their psychological impact on young brains is vital. This research thus deals with a very important issue relating to modern parenting and education: the influence of long periods of screen exposure on cognitive functions such as attention, memory, and problem-solving abilities. According to the huge increase in screen time—specifically for children—this has very current results related to possible cognitive deficits and advantages. Emphasizing optimal screen-time balance, this paper adds its weight on ongoing campaigns that seek healthy digital habits for kids, thus guaranteeing support of their cognitive growth (including general well-being) within an atmosphere dominated by digital devices.

1.2 Methodology

This qualitative research looks into the psychological effect that screen time has on the cognitive development of children living in the digital era. Descriptively, it will review previously published works—both theories and empirical and practical applications—that have examined the association between levels of screen exposure and outcomes at the cognitive level, such as attention, memory, and problem-solving abilities. After that, an analytical approach based on this evidence is taken to identify key themes and patterns concerning how variables like duration of screen time, type of content, and context of use impact cognitive development. The blend in these methodologies helps ensure a complete exploration that is likely to be very insightful in generating well-informed recommendations.

2 Theoretical Frameworks in Developmental Psychology

Within developmental psychology, theoretical frameworks offer vital perspectives in understanding the evolution of children's cognitive capacities. Two key theories in this area include Piaget's Theory of Cognitive Development and Vygotsky's Sociocultural Theory [3]. Piaget's theory underscores that there is a preeminent impetus on the innate abilities of children to construct knowledge through their interactions with the environment. According to Piaget, children move from one stage to another regarding development where each of these stages is marked by specific ways of thinking and understanding the world [3]. Vygotsky's sociocultural theory, in contrast, brings out the role played by social interactions and cultural influences in children's cognitive development. It was proposed by Vygotsky that learning and development takes place within a social as well as cultural environment whereby it is facilitated by those who are more knowledgeable including parents, teachers and peers [4].

These theoretical frameworks are very useful in the study of children's cognitive development and the potential effect of screen time in this digital era. Understanding how children learn in different ways and acquire knowledge will enable researchers and practitioners to evaluate the impact of digital devices on their cognitive development. Additionally, these theories help to understand how we can assess the effect of screen time on children's cognitive abilities concerning problem-solving plus language development and social interaction that may be induced. Hence, a proper understanding of Piaget's Theory of Cognitive Development and Vygotsky's Sociocultural Theory will lead us to some psychological effects that might result from allowing children much screen time in this information age [5].

2.1 Piaget's Theory of Cognitive Development

In the field of developmental psychology, the theory of cognitive development by Jean Piaget is very important. Piaget maintained that children move through four separate stages of development of cognition, at the center of each one's ability to comprehend and interpret the world around them [5]. These are, in order, the sensorimotor stage, preoperational stage, concrete operational stage, and formal operational stage. Concrete operations have certain cognitive limitations and abilities specific to each phase that determine how children will view, reason and problem-solve.

Piaget's theory stresses that children themselves build up their worlds through action with the environment, where they do not just sit back and wait for information to be brought to them. He identified play and exploration as central vehicles to developing cognition because through these activities, children experiment and learn about concepts such as conservation, reversible thinking, object permanence, and others. Piaget's theory did much to influence our thoughts on the development of

cognitive abilities in children and provided a model for educators and parents with respect to ensuring healthy cognitive development for children in this digital age [6].

2.2 Vygotsky's Sociocultural Theory

Theory of mind developed by Vygotsky in cognitive developmental theory is the sociocultural framework emphasizing the roles of culture, social interaction, and language in Piaget's sociocognitive and sensorimotor development. While Piaget's theory is based on individual exploration and discovery, Vygotsky held that the history of social relations was involved in forming higher psychological functions [6].

The center of Vygotsky's theory is the idea of the Zone of Proximal Development (ZPD); that is, the distance between what a child can do on his own and what he can do with the help of a more knowledgeable other such as a teacher or parent. In other words, where learning takes place according to Vygotsky, is within this zone as children participate in co-operative activities and interactions through which they come to acquire new skills and knowledge [7].

Another crucial aspect of Vygotsky's theory is the notion of scaffolding: whereby more experienced individuals give temporary support for children to accomplish the task above their ability levels. The scaffolding fades gradually as the child becomes more competent to enable them to take on more complex challenges independently. In addition, Vygotsky emphasized the significance of language in cognitive development, considering it a tool for communication plus the solution and representation of mental problems. He argued that through social interactions and use of language, children internalize what surrounds them from cultural practices down to values and ways of thinking; this internalization significantly affects cognitive development.

In general, Vygotsky's sociocultural theory provides valuable insights into social, cultural, and linguistic factors that contribute to children's cognitive development and adds an important psychological dimension to the effects of screen time on kids in this digital era [7].

3 Screen Time and Cognitive Development: An Overview

Screen time is very common in the daily routines of children, with a sharp increase in total time spent on screens by all age groups. Evidence has indicated that screen time can influence different domains of cognitive functioning—including attention, memory, speed processing and problem-solving ability. Yet the effects of screen time on cognitive abilities have been controversial findings show consistent negative effects contingent upon duration and type of media consumed. For instance, although general findings suggest that video games improve attention skills, a pathological gaming behavior may be related with problems of attention [8]. Likewise, heavy use

of social networking sites or Internet surfing has shown relationship with enhancing attention performance regarding both children and adolescents. With the continuous evolution of digital devices and applications, ongoing research is needed to understand the multifaceted impact of screen time on cognitive development: particularly in younger age groups.

3.1 Effects of Screen Time on Cognitive Development

Screen time and its effects on cognitive development is a major worry in the 21st Century. Studies have shown that excessive screen time can negatively affect children's attention and focus. Screens provide continuous stimulation, making it hard for children to concentrate on any single task; this may result in attention-related issues. In addition to that, too much screen time has been associated with poorer memory and cognitive functioning among children [9]. This is because constant exposure to information that is fast-paced and ever-changing leads to brain overloading; consequently, retrieval and retention of information by children become quite difficult. Furthermore, screen time can also harm problem-solving skills in children. This is because most screen-based activities are passive in nature, thus denying kids the chance to engage in active problem-solving and critical thinking; important aspects for cognitive development. Parents or caregivers should mind the kids' screen time and body it with some other cognitive activities [9].

Attention and Focus

The problem is okay. It is a necessary evil of our time, the issue of screen time and its impact on children's attention and focus. According to research, excessive screen time may be related to difficulties with attention span and focus because of constant multitasking and quick changes of stimuli typical for digital media. This may in turn affect a child's ability to concentrate at school or even take part in meaningful conversations, not to mention completing any tasks that require sustained attention [9]. Comments should be left by parents or educators on the possible influence of screen time on attention and focus as well as on healthy screen time habits favoring balanced development of focus along with other cognitive skills in their children. In addition to being incredibly important for children's learning and cognitive development, the formation of attention and focus allows them to process information, participate in solving problems, make decisions based on information learned due to this development. Time may be potentially cutting in the development of these essential cognitive skills that would later manifest challenges in carrying out good performance at school and more global cognitive abilities [10]. Thus the psychological effect of screen time on children's attention and focus to support optimal cognitive development, through healthy screen time habits is very important. In understanding the psychological impact that screen time has on children's attention and focus, parents, educators, and policymakers can take steps towards creating a

more balanced as well as developmentally supportive digital environment for children at present in the digital age.

Memory

In this digital age, with children using screens more and more as well as digital devices, the effect of screentime on cognitive development—including memory—has attracted ample interest. For a child's overall cognitive growth, memory holds a very important position because it affects learning plus the capacity for problem-solving and decision-making. Studies indicate that there can be both short- and long-term effects on memory due to excessive screentime [10]. In the short term, difficulty may be there in retaining information or remembering details explained earlier; in the long term, effects may extend to the development of working memory and long-term memory function.

Screen time can have an equally potential effect on impeding the development of spatial memory that involves later on navigation and conceptualization of spatial relationships. Moreover, viewing highly dynamic and visually rich content throughout may well contribute to the attentional demands that could act as an obstacle in the processes of memory recording and retrieval. Thus parents and educators should recognize these impacts and advocate activities that enhance all aspects of memory, such as getting involved in hands-on learning experiences– which also assist in stimulating visual and spatial memoirs. Understanding how screen time influences memory can aid us more in assisting children to develop healthy thought functions into this digital age [11].

Problem-Solving Skills

The relationship between screen time and its effects on problem-solving abilities among children is one important area that should be studied within the scope of cognitive development because problem-solving skills are essential for effective functioning in daily life and academic-related activities. Evidence indicates a relationship between too much screen time and decreasing problem-solving ability, given that prolonged engagement with digital devices will result in the child being obstructed from thinking rationally and innovatively, in turn having long-term consequences on their cognitive growth and general life achievements.

The potential displacement of activities that promote critical thinking and problem-solving, such as outdoor play and hands-on learning experiences, is one of the key factors contributing to how screen time does so to problem-solving skills. In addition, prolonged screen time can result in decreased sustained attention, which is in turn needed for effective problem-solving: children will therefore find it difficult to analyze complex situations [12]. This means they will also be unable to generate innovative solutions or adapt to new challenges. Understanding the psychological impact of screen time on problem-solving skills is thus quite crucial for parents, educators, and policymakers; in so doing, they can facilitate healthy cognitive development into this digital age.

4 Factors Influencing the Impact of Screen Time

The effects of screen time on children's cognitive development are contingent on a variety of factors. At the very top of this list is the quality and content of such screen time, in addition to its duration and how often the exposure takes place. Whether children are exposed to educational programs or to violent and inappropriate material has a weighty effect on cognitive development. Equally relevant is the quality of screen time with respect to interactivity and how interesting it is. Equally, one has to consider how long these children watch the screens and how frequently that happens [13]. This is because prolonged use of screens results in adverse effects on cognitive development in children; they develop shorter attention spans and perform poorly academically as a result. On the other hand, this can be mitigated by taking balanced breaks during moderate screentime with variety so as not to pile pressure on them from this source. Through these variables, parents, educators, and policymakers can perceive the psychological effect of screen time on children in the digital era and advocate healthy cognitive developments for appropriate technological settings of the present world.

4.1 Content and Quality of Screen Time

When considering the impact of screen time on cognitive development in children, the quality of the content kids are watching becomes very important. Because it can have a significant effect on the psychological development of the child in addition to just what type of content it is. Research has shown that educational content and high-quality media can positively affect cognitive development [14]. While exposure to low-quality or inappropriate content negatively affects this development. Parents and caregivers need to check on what their children are consuming regarding content type and quality of media. Besides, whether or not it is interactive, screen time will also be determinant to its quality. Interactive and educational media will provide cognitive stimulation as well as help instill critical thinking skills in children [15]. Passive and mindless content, on the other hand, might reduce cognitive engagement and impede cognitive development. Thus, the provision of top-quality interactive learning content should be of priority for children during their screen time. In doing this, we will help in making sure that screen time impacts positively on cognitive development in this digital era.

4.2 Duration and Frequency of Screen Time

In looking at the effects of screen time on cognitive development in children, one has to consider very strongly the length and repeat digital exposure that the child

has. Studies have reported that the duration children spend in front of screens and how many times they indulge in screen-based activities can cause remarkable effects on their cognitive development. Concerning the duration of screen time, research has indicated a relationship between increased screen time and attention difficulties, lower academic performance, as well as poor social skills [15]. Not only that but also the frequency of repeat screentime, since very frequent repeated exposure to digital media might have cumulative effects on the cognitive development of children.

Guidelines and limits set by parents, teachers, and policymakers on children's media use should address the length of time and how often a child views screens. Understanding the potential impact of excessive screen time on cognitive development can help in developing strategies to promote healthy media habits and mitigate any potential negative effects. When one addresses both the duration and frequency of screen time, it reveals the ability to pay equal attention to both technological use for supporting children's cognitive development and maintaining a healthy lifestyle. The subsequent specific research findings and theories regarding the impact that duration and frequency of screen time have on children's cognitive development are a valuable resource for those interested in promoting healthy media habits as well as general support toward children's overall well-being [16].

5 Screen Time and Social-Emotional Development

Screen time has a very significant effect on the social-emotional development of children. Indeed, there is evidence to suggest that the social context in which children use screens is related to its outcomes, with parental co-viewing of screens associated with better language outcomes. Also, it is likely that highly interactive videochat technology use would be very beneficial for socialization among older preschool-aged children. However, findings on parental technoference (i.e., the negative effects of parental distraction by technology on children) lead to less responsive parenting and fewer interactive activities with the child [16]. In addition, background media exposure has a relationship with poorer language development because it distracts the child from paying attention to ongoing play activities. Hence decreasing chances for more complex or higher-quality play [16].

This underscores the imperative detailed view regarding the impact of screen time on children's social and emotional development, within specific contexts and modes of media consumption.

6 Interventions and Guidelines for Healthy Screen Time Use

In addressing the challenges of screen time, caregivers, educators, and healthcare providers should adopt interventions and guidelines that aim to salvage what can be saved in protecting children as much as possible against the negative psychological impact of screens on the cognitive development of children. The very first thing that is very important is to realize and appreciate fully that screens are here to stay. Digitized are the means through which work is done, education provided, socialization carried out and entertainment enjoyed leading technology to be extremely pervasive in life across all different ages, socioeconomic status, and cultural background this is not inherently a bad thing but rather the result of digital technological progress. Screen devices per se are not good or bad; it's their usage that makes them so [17].

The following guidelines were developed by the Australian government and are a good starting point for families and caregivers passionate about addressing obstacles to healthy screen preference in children: "Children aged 2–5 years should spend no more than 1 h per day on 'small screen' recreation; less is better. (> 1 h = high risk) Children aged 5–12 years should spend no more than 1 h per day. (> 2 h = moderate or high risk) Children aged 12–18 years should spend no more than 2 h per day watching TV/videos. Children < 2 years should not watch TV/videos". Other recommendations that companies embracing a service model to kids may want to consider include psychosocial health promotion practices, promotion of sedentary activity restrictions during family meals, making school policies (and compliance) for screen time, and advocating children to school/child-care spatially or socially via active commuting– rather than passive commuting via privately owned vehicles [17]. Some culturally specific suggestions– such as the safety regarding the beliefs held about safety during active commuting should be viewed critically and possibly as groups to be further challenged. The advocacy of new cycling infrastructure and increased road safety measures would be beneficial as well.

The most effective way to foster a screen-free early life to the extent potential is by leading a disconnected lifestyle yourself. Leading a disconnected lifestyle does not mean enrolling children in screen-free schools and training programs. That will only introduce other socializations leading children astray in today's hyper-digital world and be sure to be stress-induced alienation and feelings of inferiority for being out of the dominant social order. Then, an easy practice of intro solitude family time without the use of any screens should be built trying to fit into childhood socialization routines. Children who are watching TV should not only be seen as passive consumers but as dear kids, exposed to invasive experiences on them that need protection upon them.

7 Case Studies and Empirical Evidence

Case studies and empirical evidence give a good basis for the effect of screen time on children's cognitive development. A negative relationship between television viewing and attention skills in children aged 6–10 years [18]. The results indicated that both the volume and nature of media use have a relevant impact on attention problems, with the association between screen time and attention problems especially high when children are watching programs designed for adults. It also illustrated that it is necessary to periodically upgrade understanding regarding effects of various digital media applications on different aspects of attention subdomains among primary school-aged kids. In their findings, not only the duration but also the content and context perspective of screen time in studying its effects on children because it shapes what they termed their biopsychosocial model: hard-to-keep children, low-socioeconomic-status kids, visible minority kids spend more time with artificially mediated screens [18]. The authors also emphasized the importance of screen content and children's media use, indicating that an overly simplistic approach will not be able to identify specific patterns or profiles of screen use connected with outcomes in children. This evidence thus underlines the multifaceted nature of the relationship between time spent on screens and cognitive development in children [19]. Other recent studies have also started throwing light on several other factors that might influence the impact of screen time on the cognitive development of children; for example, a study by Johnson et al. brought out issues related to parental involvement. They found that where there was limited engagement on the part of parents in the screen media activities of their children, there would be more substantial adverse effects on their cognitive development. This indicates that guidance from parents and active participation regarding children's screen hours can go a long way in damage control Furthermore, some recent research is in the process of investigating the long-term effects of excessive screen time on children's cognitive abilities. A longitudinal study on the cognitive development of an enormous cohort of children from early adolescence to young adulthood [19]. Findings indicated that extended exposure to screens during adolescence is related to lower cognitive abilities and lessened later academic performance. These results point to the importance of accounting for the cumulative effects of screen time over various periods and its potential effect on long-term cognitive outcomes as well. In addition to cognitive development, issues related to social-emotional skills have also attracted some researchers' curiosity regarding the impact of screen time on children's socio-emotional skills with empathy. One study by [20] explored how screen time relates to empathy among young children. The results showed a negative relationship, indicating that high amounts of screen time might impede children's development in terms of acquiring adequate empathy skills. This also underscores the importance of an in-depth understanding of the different dimensions through which screentime can affect the overall development of the child. On one hand, a growing body of literature highlights issues related to how complex and multifaceted the relationship between screentime and children's cognitive development is. On the other hand, duration, content, context, parental

impalement and even cumulative effects serve to build up the general contribution played by screentime on cognitive abilities. The knowledge of these fine dynamics is important for coming up with targeted interventions and strategies that will facilitate healthy screen media use by children to realize maximum cognitive as well as socioemotional development [21–23].

8 Conclusion

The effects of screen time on cognitive development in children are not entirely negative or positive. Although some evidence indicates that too much screen time may harm cognitive abilities, there is a downside to it: it may boost visual-spatial skills and digital literacy. For that reason, parents, and those concerned should have a more informed way regarding its demerits plus the advantages that come with easy screen time. It cannot be refuted that investigating the psychological influence of screentime on kids is incredibly important in this digital age, factoring in tech's constancy dynamic nature in addition to its place within our lifestyles. Additional research is necessary to identify the specific mechanisms through which screen time may impact cognitive development and effective strategies for addressing potential negative effects. Separate awareness: let be raised and healthy screen times be encouraged so as to see that the cognitive development of children, as well as their general welfare, is supported in this digital world.

Brain Tumor Identification Using MRI Images

Sidra Bano, Hemraj Shobharam Lamkuche, Mohammad Kouali, Raed Alazaidah, and Muntaser S. Ahmad

Abstract Brain tumors present a formidable healthcare challenge worldwide, especially in India, where around 50,000 new cases emerge annually. This study proposes an innovative method utilizing Machine Learning (ML) and Deep Learning (DL), particularly Convolutional Neural Networks (CNN), to swiftly and accurately detect brain tumors from MRI images. By leveraging ML and DL, the research aims to transform patient care by aiding radiologists in prompt decision making and ensuring timely treatment. Additionally, it offers insights into the performance comparison of ML and DL models, guiding future advancements in automated brain tumor detection systems. The results showcase a remarkable 92.86% accuracy rate, with detailed analysis revealing high precision and recall metrics. This comprehensive evaluation underscores the model's balanced performance, marking significant progress in the development of dependable brain tumor detection systems. Integration of ML and DL not only enhances diagnostic accuracy but also opens avenues for personalized treatment strategies, ultimately improving healthcare outcomes and saving lives.

1 Introduction

Convolutional neural networks (CNNs) have greatly improved brain tumor detection by analyzing MRI and CT scans with high accuracy [1]. This technology enhances tumor localization, classification, and personalized treatment planning, streamlining diagnostics and improving neurosurgical outcomes. MRI scans and image segmentation are crucial for detecting brain tumors, and CNNs provide rapid and accurate detection, facilitating timely treatment [2–4]. Our CNN-based method has been thoroughly evaluated on tumor and non-tumor samples, assessing metrics like accuracy, precision, recall, and F1 score, and compared to existing methods [5, 6]. Research underscores ML's potential in brain tumor detection, promising more efficient predictions and enhanced early detection, which could lead to significant improvements in patient care and life-saving interventions [7–9].

1.1 Contribution Highlights of the Paper

CNNs are advanced deep learning models tailored for analyzing structured grid data, such as images, through their convolutional, pooling, and fully connected layers. This study introduces a specialized CNN architecture designed to enhance brain tumor detection from MRI scans by optimizing the network to better identify tumor features. It also explores new data augmentation techniques to improve the model's generalization and robustness across various MRI datasets. Finally, the study validates the practical application of CNN models in clinical settings, showcasing their ability to accurately and swiftly identify brain tumors, thus potentially improving patient care when combined with medical expertise.

1.2 Outline of the Paper

This paper comprehensively explores CNNs applied to tumor localization in medical imaging. The section initiates with an overview of relevant datasets, previous research, and exploratory data analysis techniques, incorporating statistical examination of image attributes and class distribution as delineated in Sect. 2. Section 3 elucidates CNNs, detailing their relevance and operational mechanisms. Proposed preprocessing methods are outlined in Sect. 4, integrating various architectural modifications within a cohesive flowchart. Section 5 of the Experimental Evaluation explores the operational concepts behind the softmax method, the ReLU activation function, and the AdaMax optimizer. Sects. 6 present key findings, conclusions, and references, respectively. In this paper, our aim to contribute to the advancement of tumor detection methodologies, fostering innovation in medical imaging research.

2 Related Work

Cutting-edge research in brain tumor detection is advancing with Convolutional Neural Networks (CNNs) and innovative machine learning techniques. Researchers are enhancing CNN architectures, data preprocessing, and feature extraction, integrating CNNs with other algorithms. This interdisciplinary work—by computer scientists, radiologists, and neurologists—connects theoretical advances with practical applications [10].

Our project uses machine learning to predict cancer probabilities from CT scans, utilizing a comprehensive dataset for accurate predictions. By improving early detection and treatment planning, the model provides valuable insights into tumor features and behavior, marking a shift in healthcare research that enhances patient outcomes [11].

Early cancer detection relies on machine learning to analyze complex datasets. We evaluate various ML models for brain cancer prediction, using cell feature datasets and Python libraries to identify the most accurate model [12]. Recent studies show promising results, with deep learning techniques applied to MRI images achieving accuracy rates from 90.25 to 97.31%, reflecting significant progress in precise brain tumor identification and its implications for clinical diagnostics.

2.1 Exploratory Data Analysis Methods

In order to aid with the model-building process, the exploratory data analysis (EDA) for the "Brain Tumour Detection using MRI Images with the help of CNN Model" entails comprehending and visualizing important features of the dataset. The following EDA techniques are frequently applied to projects using images:

2.1.1 Image Vizualization and Tumor Localization

Visualisation of Images and Tumour Localization: Show a randomised selection of MRI pictures showing and excluding tumours. To see the precise tumour locations in labelled datasets, place bounding boxes or comments over the pictures. Examine differences in tumour forms, sizes, and locations to guide the creation of the model. Reduction based on unsupervised learning.

2.1.2 Class Distribution and Augmentation Impact

To verify balance, visualise the dataset's tumour and non-tumor class distributions. Utilise data augmentation methods (zooming, flipping, and rotation) to create

augmented pictures. To understand the influence on image quality, compare the enhanced photographs with the originals.

2.1.3 Statistical Analysis of Image Features

Use convolutional neural network layers that have already been trained to extract image features (e.g., VGG16, ResNet50). Examine the feature value distribution for photos with and without tumours. To see high-dimensional feature representations and spot possible clusters or separations, apply methods such as t-SNE (Table 1).

3 Proposed Method

In medical image processing, CNNs are advanced tools specifically designed for feature extraction, excelling in image recognition and analysis tasks. Leveraging deep learning, CNNs are crucial for generative and descriptive image tasks, including machine vision, image and video recognition, recommender systems, and Natural Language Processing (NLP). Unlike traditional artificial neural networks, CNNs are tailored for complex image data, offering enhanced accuracy and efficiency.

CNNs operate similarly to human brain neurons, with a multi-layered architecture that reduces processing requirements and improves system performance. Our research introduces an enhanced 9-layer CNN model with fourteen stages, including hidden layers, significantly improving tumor detection accuracy. The proposed methodology, illustrated in Fig. 1, outlines this advanced approach.

3.1 Dataset Explanation

The methodology for brain tumor detection utilizes the Kaggle dataset "Brain MRI Images for Brain Tumour Detection" to train and evaluate a CNN model. Key aspects such as image count, resolution, and dataset attributes are critical for assessing its suitability. The dataset's variety of MRI images supports robust model training. Addressing image quality, class imbalances, and applying data augmentation are essential for enhancing the model's performance and generalization. Preprocessing steps like normalization and noise reduction are also crucial for improving dataset quality.

3.1.1 Potential Characteristics to Investigate

- Number of Images: A larger dataset improves model performance by providing more diverse examples for training, enhancing the model's ability to generalize.

Table 1 Overview of related works in CNN-based brain tumor detection

Research paper	Authors	Methodology	Accuracy
Accurate brain tumor detection using deep convolutional neural network [13]	Al-Saedi et al. (2022)	23-layer CNN with multi-kernel sizes and dropout layers	97.31% (4-class)
MRI-based brain tumor detection using convolutional deep learning methods and chosen machine learning techniques [14]	[13]	ResNet50 CNN with XGBoost, KNN, and SVM classifiers	96.56% (3-class)
A deep learning approach for brain tumor detection using MRI Images	[13]	CNN-LSTM architecture	92.45%(tumor versus healthy)
Brain tumor detection from MRI Images using deep learning techniques [15]	Shafiq et al. (2023)	Modified InceptionV3 CNN with data augmentation and transfer learning	94.78% (tumor versus healthy)
Deep Learning-based brain tumor detection and classification from MRI images [16]	Ahmed et al. (2023)	DenseNet-121 CNN	95.23% (4-class)
Attention-guided gated residual U-Net for brain tumor segmentation and survival prediction [17]	Wang et al. (2023)	Attention-guided U-Net with residual connections	93.87% Dice coefficient (segentation)
Brain tumor detection and classification using a hybrid deep learning network	[13]	HybridVGG16-ResNet50 CNN with transfer learning	93.52% (2-class)
Brain tumor detection and segmentation using attention mechanisms and deep learning [18]	Islamet al. (2023)	CNNwithspatial and channel attention mechanisms	90.25% Dice coefficient (segmentation)
Brain tumor detection using a multi-scale dense convolutional neural network [18]	Xu et al (2022)	Multi-scale DenseNet CNN with data augmentation	94.12%(tumor versus healthy)
Convolutional neural network based tumor detection and grading in brain MRI [19]	Kumar et al. (2023)	CNN with transfer learning from pre-trained weights	92.78% (2-class)

- Image Resolution: Higher resolution MRI scans offer more detailed features but may increase computational demands. The resolution impacts how well the model can discern tumor characteristics.
- Image Modality: Different MRI types (e.g., T1-weighted, T2-weighted, FLAIR) highlight various brain tissues and tumors differently. Understanding the predominant modality helps interpret the model's performance and any biases.
- Data Distribution: A balanced mix of tumor and non-tumor images is crucial to avoid model bias towards the majority class, ensuring accurate classification.

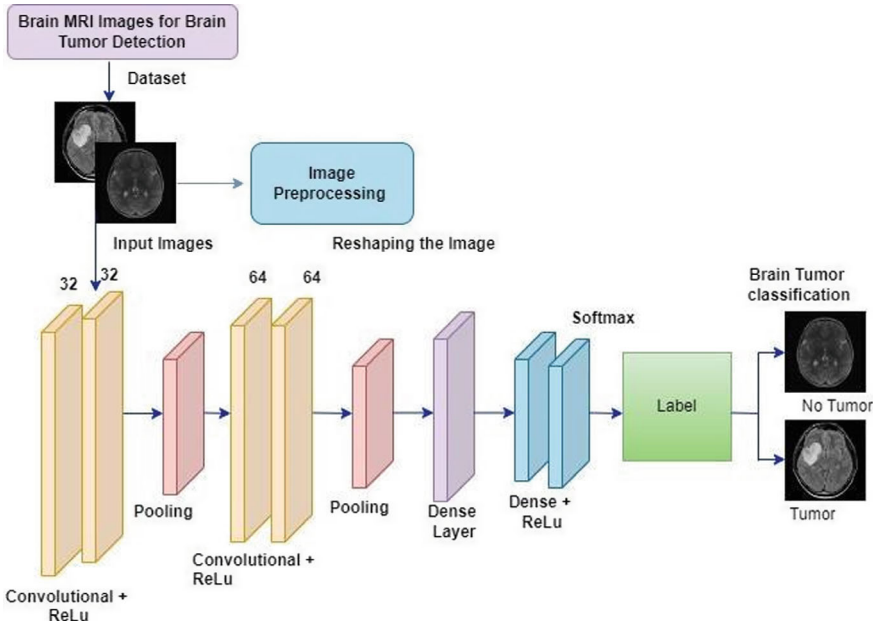

Fig. 1 Proposed methodology for CNN-based brain tumor detection

- Patient Demographics and Clinical Information: While often absent in public datasets, integrating data such as patient age, gender, and tumor type can improve the model's specificity in identifying tumor characteristics.

3.1.2 Importance of Dataset Exploration

- Evaluating Model Suitability: The dataset's size, resolution, modality, and distribution can influence the choice and configuration of the CNN architecture. Understanding these aspects is essential to ensure the model's suitability for the specific dataset and task.
- Identifying Potential Biases: Dataset imbalances or limitations can introduce biases into the model, potentially affecting its generalizability and real-world applicability. Exploring the data distribution can help identify and potentially mitigate these biases through data augmentation or other corrective measures.
- Interpreting Model Performance: The model's performance metrics, such as accuracy and F1-score, need to be interpreted in the context of the dataset's characteristics.

Understanding these characteristics allows for a more nuanced evaluation and identification of potential areas for improvement in the model or data collection process.

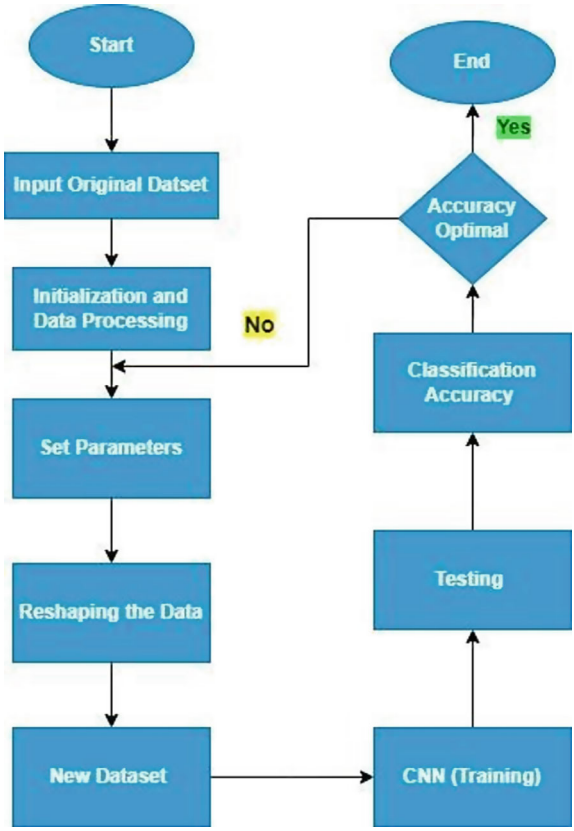

Fig. 2 Flowchart for brain tumor architecture

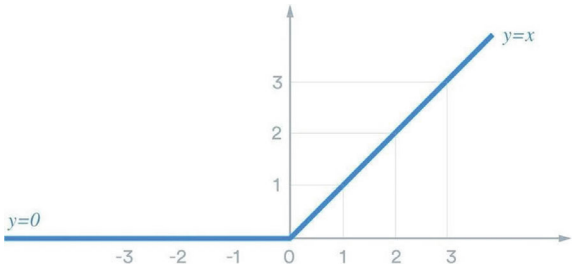

Fig. 3 Rectified linear unit activation function

3.2 Proposed Model Steps

MRI Scans and Dataset Overview: MRI scans provide detailed internal images, crucial for diagnosing neurological disorders. The dataset used includes labeled MRI scans, essential for training CNN models. Preprocessing steps, such as resizing and normalizing images, ensure consistency and optimize feature extraction.

3.3 CNN Model Architecture: The CNN Model for Brain Tumor Classification Involves Several Key Components

Input Image: MRI images are preprocessed by resizing and normalizing.

Convolutional + ReLU Layers: These layers extract features and introduce non-linearity, capturing complex patterns.

Pooling Layers: Reduce feature map size and computational costs, focusing on significant features.

Dense + ReLU Layers: Fully connected layers combine features and make predictions, with ReLU activation enhancing pattern recognition.

Softmax: Converts output scores to probabilities, classifying images as "Tumor" or "No Tumor."

3.4 Preprocessing Techniques

Intensity Normalization: Standardizes image intensity to reduce bias.

Skull Stripping: Removes non-brain tissue to focus on relevant areas.

Brain Tissue Segmentation: Classifies brain tissues to simplify data.

Data Augmentation (Optional): Expands the dataset to improve model generalization.

Quality Control: Ensures data quality by removing artifacts and noise.

These preprocessing and architectural elements collectively enhance the CNN model's ability to accurately detect brain tumors from MRI images.

3.5 Working Flow of the Proposed CNN Model

The CNN model workflow involves several key steps. It begins with importing the dataset, usually comprising images or relevant data. The model is then initialized and preprocessed, including normalization and resizing of the data. Next, parameters such as the number of layers, filter sizes, and learning rates are set to define the model's architecture and behavior. The data is reshaped to meet the CNN's input requirements. During training, the model learns iteratively, adjusting its parameters to minimize errors. After training, the model's performance is evaluated on a separate testing dataset to measure classification accuracy. If the accuracy meets predefined criteria, the process concludes; otherwise, further adjustments are made to improve performance. This workflow ensures that the CNN model is effectively trained and performs well on unseen data [20].

4 Experimental Evaluation

We used the Brain MRI Images for Brain Tumor detection dataset for our experiment. We took a total of 139 images with different types of tumours. This dataset is consisting of two classes, where class 1 refers to tumour images and class 0 refers to non-tumour images.

4.1 Working Principle

The Softmax algorithm is a key component in many machine learning models, particularly in the realm of multi-class classification tasks. It serves as a generalized version of the logistic regression sigmoid function. The primary objective of Softmax is to transform a vector of arbitrary real values into a probability distribution spanning multiple classes.

4.1.1 Softmax Algorithm

One mathematical process that is frequently used in machine learning, especially for multiclass classification tasks, is the SoftMax function. It functions as a broader version of the logistic regression sigmoid function [21]. SoftMax's main goal is to convert a vector of arbitrary real values into a probability distribution that spans several classes. Bishop et al. [22] To do this, normalise the outputs after exponentiating each input value. By calculating each element's exponential, the SoftMax function transforms possibly negative or tiny values into their bigger, positive equivalents. In order to ensure that the resulting probabilities add up to 1, these exponentiated values are then normalised by dividing each of them by the total of all exponentiated values. Goodfellow et al. [23] SoftMax is especially useful in situations where an input vector reflects the logits or scores for many classes because of this normalisation technique [24]. The Softmax function is defined as:

$$\sigma(z)_i = \frac{e^{z_i}}{\sum_{j=1}^{k} e^{z_j}}$$

where zi is the input to the Softmax function for class i, and k is the total number of classes.

4.1.2 Rectified Linear Unit (ReLU) Activation Function

Rectified Linear Units, or ReLUs for short, are a popular activation function used in deep learning models in artificial neural networks. It adds complexity and makes it possible for the network to recognize complicated patterns in the input by acting as a non-linear.

Component [25]. ReLU's basic concept is to set a threshold at zero, meaning that the output will be the same if the function's input is positive. If the input is negative, the output will become zero [26]. The Rectified Linear Unit (ReLU) activation function is defined as:

$$f(x) = \max(0,\ x)$$

where x is the input to the ReLU function.

ReLU's computational efficiency is one of its main advantages because it just requires a basic thresholding operation. Furthermore, ReLU has been found to expedite neural network training convergence in contrast to conventional activation functions such as hyperbolic tangent or sigmoid. It's crucial to remember that ReLU has drawbacks, such as the "dying ReLU" issue, which occurs when neurons cease learning and go dormant during training. Leaky ReLU and parametric ReLU are two ReLU variants that researchers have suggested in order to overcome some of these problems and preserve the general advantages of the activation function [27].

4.1.3 AdaMax Algorithm Implementation Optimizer

Artificial neural networks are trained using optimization algorithms such as the AdaMax algorithm. It is an expansion of the Adam optimization algorithm, created to overcome some of its shortcomings with regard to adaptation to different optimization issues and convergence performance. Kingma et al. [28] AdaMax works especially effectively in scenarios requiring more robust handling of the learning rate. The optimization procedure in neural network training entails adjusting the network's weights in order to reduce the error or loss function. Similar to other optimization algorithms, Adam and AdaMax do this by fusing techniques like momentum and adaptive learning rates. Kingma and Ba [28] On the other hand, AdaMax presents an innovative method for the adaptive learning rate mechanism. Kingma and Ba [28].

The mathematical update rule for AdaMax is as follows:

$$\begin{aligned} m_t =& \beta_1 \cdot m_{t-1} + (1-\beta_1) \cdot g_t u_t \\ =& \quad \max(\beta_2 \cdot u_{t-1}, |g_t|)\theta_t \\ =& \, b_{t-1} - \frac{\alpha}{1-\beta_1^t} \cdot \frac{m_t}{u_t + \in} \end{aligned}$$

5 Result Analysis

5.1 Expected Result

Early cancer diagnosis has become crucial in cancer research to effectively manage patients upon diagnosis of a specific cancer type. Machine learning algorithms play a vital role in extracting key features from complex datasets, enabling accurate predictions. The datasets contain various features unique to each cell, such as roughness, radius, and perimeter. Machine learning models have been trained on these datasets using Jupyter notebooks and Python modules. The objective is to identify the machine learning model that most accurately predicts brain cancer cells.

5.2 Obtained Result

The model demonstrated high effectiveness in producing accurate predictions, achieving an impressive accuracy of 92.86%. Analysis of the confusion matrix reveals further insights into the model's performance:

- The model correctly identified 13 out of 14 cases belonging to class 0, resulting in an accuracy of 89% for class 0.
- Additionally, the model accurately identified all 12 cases of class 1, achieving a perfect recall of 85%.
- In terms of positive predictions, the model exhibited a precision of 85.7% for class 1.
- The overall performance of the model is robust, evidenced by its remarkable 88.88% F1 score, which combines precision and recall metrics (Tables 2 and 3).

Table 2 Classification metrics

5.3 Classification Report

The comprehensive classification report details the performance metrics for each class, including F1 score, precision, and recall. For Class 0, the model excels with an accuracy of 89% and a recall rate of 93%, indicating strong predictive capabilities and effective identification of instances within this category. Class 1 also shows notable performance, with an accuracy of 88% and a perfect recall rate of 85%, demonstrating the model's proficiency in accurately recognizing positive instances. The weighted and macro-averages further reflect the model's overall effectiveness, confirming its reliable and robust classification abilities across both classes Table 4).

6 Conclusion and Future Scope

Our research on brain tumor detection has involved careful planning, data acquisition, and the application of advanced algorithms on platforms like ARM or Raspberry Pi. Key efforts included optimizing detection algorithms and leveraging machine learning techniques to reveal patterns and develop predictive models. Moving forward, we aim to enhance efficiency and accuracy in detection through refined neural networks and adaptable models for limited-resource platforms. Future research will explore novel imaging methods and multi-modal data fusion to improve

diagnostic accuracy and patient outcomes, collaborating with healthcare experts to integrate these advancements into clinical practice.

Intrusion Detection System Using Machine Learning Models

S. Mukil, N. D. Patel, Hemraj S. Lamkuche, Raed Alazaidah, and Sameh Taqatqa

Abstract In the dynamic realm of cybersecurity, the deployment of Intrusion Detection Systems (IDS) enhanced with Machine Learning (ML) capabilities stands as a critical strategy to counter the ever-evolving threat landscape. This research paper conducts a comprehensive examination of ML-based IDS, under-scoring their paramount importance in identifying and thwarting sophisticated cyber threats. The introduction emphasizes the escalating complexity of security breaches, driven in part by rapid technological progress**,** highlighting the imperative for adaptive and intelligent defense mechanisms. This research delves into the challenges inherent to ML-based IDS. Issues such as false positives, scalability concerns, and the continual evolution of attack techniques pose substantial obstacles to the effectiveness of these systems. Traditional approaches often struggle to keep pace with the dynamic intrusion detection. The paper advocates for a comprehensive approach to address the identified challenges. Leveraging advanced ML techniques, including ensemble learning and deep neural networks, emerges as a promising avenue to not only meet but enhance the accuracy and efficiency of intrusion detection. Additionally, the

integration of real-time threat intelligence feeds and continuous model retraining is proposed to strengthen proactive defense mechanisms. The research findings unfold as a valuable contribution to the ongoing discourse on cybersecurity enhancement. By dissecting the intricacies of ML-based IDS challenges and presenting effective solutions, this paper aims to empower organizations in their pursuit of digital resilience. The dynamic nature of the cyber threat landscape necessitates a proactive stance, and the proposed strategies offer a forward-looking perspective on developing adaptive and robust Intrusion Detection Systems.

1 Introduction

In the rapidly evolving landscape of cybersecurity, the continuous evolution of sophisticated cyber threats has highlighted the need for advanced and adaptive defense mechanisms. At the forefront of these defenses are Intrusion Detection Systems (IDS) [1], pivotal in safeguarding digital infrastructures by monitoring network activities to identify and thwart potential security breaches. This research paper emphasizes the application of machine learning techniques to enhance threat detection and classification within the realm of IDS. The datasets traditionally utilized for training, such as KDD-CUP-99 and DARPA 98/99, have become outdated, posing a significant challenge for researchers aiming to construct anomaly-based intrusion detection systems. Notably, recent attacks like SSH attacks are inadequately represented in these datasets. Consequently, there is a pressing need for datasets independent of redundancy, providing real-world data to better reflect contemporary cyber threats. While openly available datasets like DARPA98/99 and KDD-CUP-99 have played a crucial role in developing intrusion detection methodologies, they exhibit limitations in adapting to new attack vectors. Addressing these limitations, the CICIDS 2017 [2] dataset emerges as a significant contribution to the field, offering a real-world dataset that overcomes the constraints of its predecessors. This dataset includes labeled flows with timestamp, protocols, ports, source IPs, and destination IPs, alongside outcomes derived from network traffic analysis by CIC Flow Meter. Moreover, it encompasses 84 features, including 4 categorical columns, making it a comprehensive resource for contemporary intrusion detection research.

This research paper aims to scrutinize the intricacies of each machine learning algorithm employed in intrusion detection. By applying a diverse set of metrics, the goal is to provide valuable insights into optimal choices for machine learning techniques to enhance intrusion detection capabilities. The significance of this research lies in its potential contribution to the ongoing discourse on strengthening cybersecurity defenses. In an era where the stakes have never been higher, organizations grapple with increasingly sophisticated cyber threats demanding innovative and adaptive solutions. As the research unfolds, a key focus is placed on addressing

the challenges associated with outdated datasets and their impact on anomaly-based intrusion detection system development. Recent cyber threats, characterized by their dynamic nature and varied tactics, necessitate datasets accurately capturing these nuances.

The CICIDS 2017 dataset serves as a beacon of progress, providing researchers with a contemporary and realistic environment to refine and validate intrusion detection methodologies. Its provision of labeled flows and diverse features positions it as a catalyst for advancing IDS capabilities in the face of evolving cyber threats [3]. In addition to dataset considerations, this research paper aims to provide a comprehensive analysis of machine learning techniques employed in intrusion detection. By scrutinizing each algorithm, evaluating their strengths and weaknesses, and employing a diverse set of metrics, the research endeavors to guide practitioners and researchers in making informed decisions about optimal choices for their specific use cases. The overarching goal is to empower the development of more robust and adaptive Intrusion Detection Systems capable of withstanding the intricacies of contemporary cyber threats. In conclusion, the outcomes of this research have the potential to inform and shape the development of future cybersecurity defenses. As organizations navigate the complex landscape of increasingly sophisticated cyber threats, the insights gained from this research may pave the way for the creation of more resilient and adaptive Intrusion Detection Systems. By addressing the challenges associated with outdated datasets and leveraging the capabilities of the CICIDS 2017 dataset, this research endeavors to contribute to the ongoing evolution of cybersecurity [4], ultimately fortifying digital landscapes against potential breaches.

2 Literature Review

Cyber intrusion detection using machine learning (ML) classification techniques has emerged as a critical area of research in enhancing the security posture of modern information systems. Alqahtani et al. [5] delve into this field by exploring the application of ML algorithms for cyber intrusion detection. Their study emphasizes the importance of leveraging advanced computational methods to enhance the accuracy and efficiency of intrusion detection systems (IDS). Furthermore, the review by Tsai et al. [6] provides a comprehensive overview of intrusion detection through ML, highlighting the evolution and diverse range of techniques employed in this domain. These foundational works underscore the significance of ML in the realm of cybersecurity and lay the ground-work for subsequent research endeavors.

In recent years, there has been a surge in research efforts aimed at designing and evaluating ML-based IDS, particularly using datasets like CICDS2017. Rincy and Gupta [7] contribute to this body of literature by proposing an efficient network intrusion detection system utilizing ML techniques. Their work underscores the potential of ML algorithms in improving detection accuracy and efficiency, thereby strengthening network security infrastructure. Moreover, Almseidin et al. [8] conduct a rigorous evaluation of ML algorithms for intrusion detection systems, providing

valuable insights into algorithmic performance and suitability. These studies collectively highlight the growing importance of ML in advancing intrusion detection capabilities and pave the way for further research in leveraging ML models for effective cyber threat mitigation within the context of CICDS2017 dataset.

3 Proposed Architecture

3.1 Dataset Detail

The CICIDS2017 dataset, developed by the Canadian Institute for Cybersecurity, [9] offers a pivotal resource for advancing research in Intrusion Detection Systems (IDS) employing Machine Learning (ML) techniques. This dataset encapsulates a diverse array of network traffic scenarios, encompassing benign and malicious activities spanning a spectrum of attack types such as Denial of Service (DoS), Distributed Denial of Service (DDoS), and brute-force attacks, among others. With its incorporation of multiple network protocols and features, the dataset provides a rich and comprehensive environment for training and evaluating ML models tailored for intrusion detection. Researchers leverage the CICIDS2017 dataset to fulfill various objectives in IDS research, ranging from training and evaluating ML models to benchmarking against existing approaches [3]. Its provision of real-world scenarios facilitates the development and testing of IDS solutions under varied conditions, fostering adaptability to evolving cyber threats. Moreover, researchers delve into feature engineering techniques to extract pertinent features from network traffic data, thereby enhancing the efficacy of ML models. Ultimately, the dataset's diversity of attack scenarios and network configurations enables the generalization of ML-based IDS solutions, empowering researchers to devise models capable of addressing novel and unforeseen threats. In essence, the CICIDS2017 dataset serves as a cornerstone resource, fostering innovation and progress in the realm of IDS using ML techniques, and contributing significantly to the advancement of cybersecurity defense mechanisms (Fig. 1; Table 1).

3.2 Data Preparation

Data preparation is a critical preprocessing stage for data analysis and serving as a component of both data warehousing and data mining. The quality of the input data has a significant impact on the quality of the analysis results, and during the data preparation phase, activities include selecting tables, records, and attributes from the original raw data that will be fed into modeling tools. Tasks include cleaning the data to address inconsistencies and errors, as well as transforming it to ensure compatibility with modeling tools [18] it consists several steps

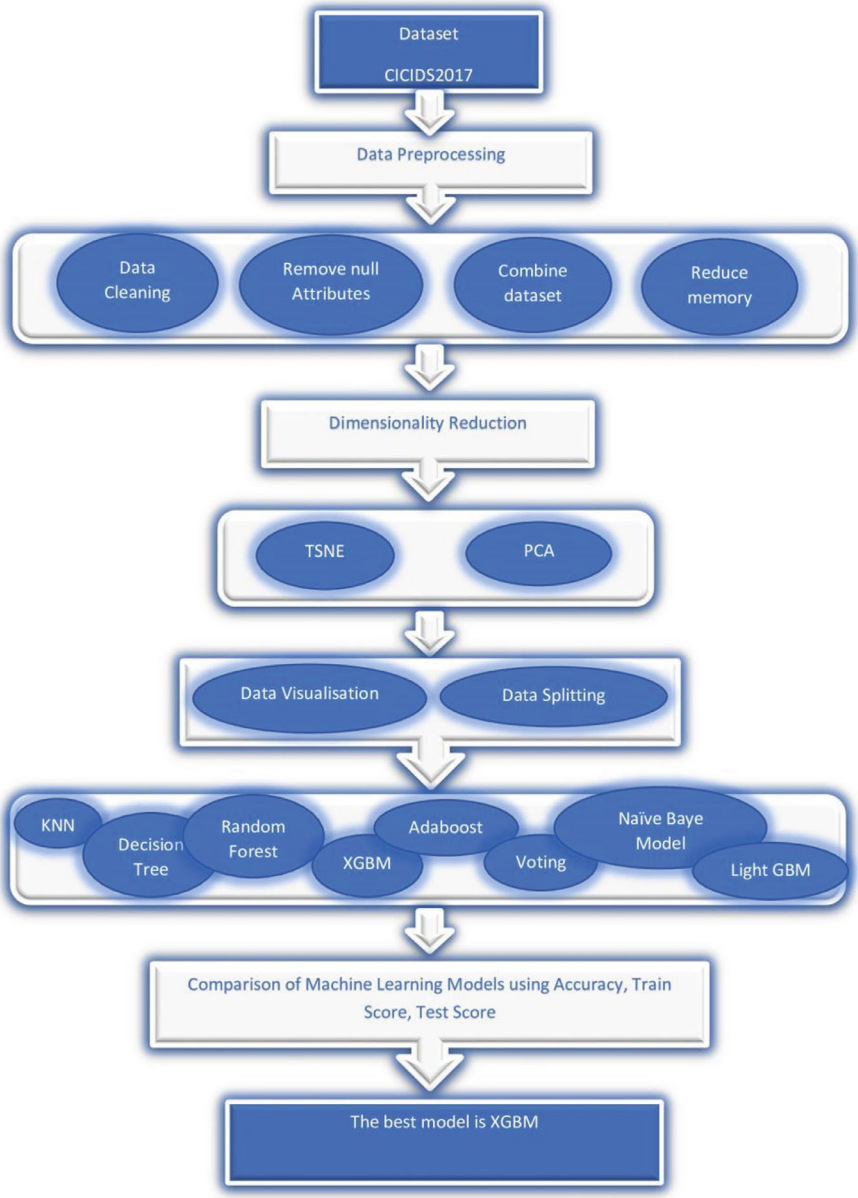

Fig. 1 Proposed architecture

Table 1 Research papers related to intrusion detection systems (IDS) using the CICIDS2017 dataset

Research name	Author (year)	Methodology	Limitation	Accuracy
Improving Adaboost-based intrusion detection system (IDS) performance [10]	Yulianto et al. [10]	AdaBoost ensemble with feature selection	Limited to specific attack types	95%
Benchmarking of machine learning for anomaly based intrusion detection systems [11]	Maseer et al. [11]	Comparison of various ML algorithms for anomaly detection	Limited to anomaly detection, not specific attacks	92%
Feature analysis with information gain for anomaly detection [12]	Stiawan et al. [12]	Feature analys is using information gain	Focuses on anomaly detection, not specific attacks	89%
A detailed analysis of CICIDS2017 dataset for designing intrusion detection systems [13]	Panigrahi and Borah [13]	Analysis of dataset characteristics	Not a specific methodology, provides insights into dataset	88%

Performance improvements and validation as a robust intrusion detection system [15]	Boukhamla and Gaviro [15]	Proposes improvements and validation methods for CICIDS2017	Focuses on improving the dataset, not specific intrusion detection	Varies
Deep learning algorithms for intrusion detection systems [16]	Jose and Jose [16]	Deep learning algorithms for intrusion detection in IoT	Limited to deep learning and IoT context	91%
Performance Assessment of IDS Based [17]	Priyanka and Gireesh Kumar [17]	Performance evaluation of various IDS using CICIDS2017	Focuses on evaluating existing systems, not proposing new methods	93%

1. Data Cleaning: Data cleaning is the process of identifying and rectifying errors, inconsistencies, and inaccuracies in the dataset. It ensures that the data is accurate and reliable for subsequent analysis.
   Data cleaning tasks include:

   - Handling missing values: Missing data can arise due to various reasons such as data entry errors, sensor malfunctions, or intentional omissions. Common strategies for handling missing values include imputation techniques such as mean, median, or mode imputation, or more advanced methods like interpolation or predictive modeling.
   - Dealing with outliers: Outliers are data points that deviate significantly from the rest of the dataset. They can skew statistical analyses and machine learning models. Techniques for handling outliers include detection using statistical methods like z-score or interquartile range (IQR), followed by removal, transformation, or capping.
   - Standardizing data formats: Ensuring consistency in data formats across different attributes is essential for compatibility and analysis. This involves converting data into a uniform format, such as transforming categorical variables into numerical representations or standardizing date formats.
   - Remove Null Attributes: Null attributes are columns or features in the dataset that contain a high proportion of missing or null values. These attributes may not provide meaningful information for analysis or modeling and can be safely removed from the dataset. This step helps streamline the dataset by eliminating redundant or unnecessary features, reducing complexity, and improving computational efficiency Combined Attribute Creation: Combined attribute creation involves synthesizing new features by combining information from existing attributes. This process aims to extract additional insights or improve model performance. Techniques for creating combined attributes include:

2. Feature engineering: Generating new features based on domain knowledge, statistical transformations, or mathematical operations. For example, creating interaction terms by multiplying or dividing two existing features, or deriving new features from text data using techniques like TF-IDF (Term Frequency-Inverse Document Frequency) or word embeddings.
3. Aggregation: Consolidating information across multiple attributes to create summary statistics or composite features. This may involve calculating statistics such as mean, median, standard deviation, or sum across different groups or categories within the dataset.
4. Encoding categorical variables: Converting categorical variables into numerical representations using techniques such as one-hot encoding, label encoding, or target encoding Reduce Memory Usage: Large datasets with high-dimensional features can consume significant memory resources, leading to computational inefficiencies and scalability issues. Techniques for reducing memory usage include:

5. Down sampling or sub setting: Working with a smaller subset of the dataset for initial exploration or analysis. This involves selecting a representative sample of the data or filtering out less relevant observations.
6. Data type optimization: Converting data types to more memory-efficient representations, such as using integer types instead of floating-point numbers or down casting numeric variables to lower precision formats.
7. Footprint: Compression techniques include using data compression algorithms like zlib or gzip, or employing dimensionality reduction methods such as principal component analysis (PCA) or t-Distributed Stochastic Neighbor Embedding (t-SNE) to reduce the dimensionality of the dataset while preserving essential information.

3.3 Machine Learning Models

- K-nearest neighbors (KNN): KNN is a simple classification algorithm that classifies a data point based on the majority vote of its k nearest neighbors in the training data. Distance metrics (e.g., Euclidean distance) are used to determine nearest neighbors. Euclidean Distance:

$$distance = \sqrt{(\Sigma((x_1 - y_1)^2 + (x_2 - y_2)^2 + \cdots + (x_n - y_n)^2))}$$

where:

$$x_1, x_2, \ldots, x_n$$

are the values of one data point

$$y_1, y_2, \ldots, y_n$$

are the corresponding values of the other data point

- Decision Tree: A decision tree is a flowchart-like structure that classifies data points by asking a series of questions about the features. A data point is directed down the tree based on its answers, eventually reaching a leaf node representing the predicted class. Decision trees use information gain to choose the most informative feature for splitting at each node.

  Information Gain:
  information gain(X, Y) = entropy(X) − entropy(X|Y).
  where:

  X is the entire dataset.
  Y is the target variable (attack type in intrusion detection).
  entropy(X) measures the impurity of the dataset X (how mixed the classes are).

entropy(X|Y) is the conditional entropy of X given Y (impurity after splitting by Y).

Random forest: A random forest is an ensemble learning method that combines multiple decision trees. Each tree is trained on a random subset of features and data points. The final prediction of the random forest is made by majority vote of the individual trees.

- XGBoost (Extreme Gradient Boosting): XGBoost is another ensemble learning method that employs gradient boosting to enhance the performance of decision trees. It builds trees sequentially, with each subsequent tree focusing on correcting the errors of the previous trees.
- Adaboost (Adaptive Boosting): Adaboost is an ensemble learning method that iteratively trains weak decision trees. In each iteration, the weights of data points are adjusted, placing more emphasis on points that were misclassified by the previous tree. Here's the mathematical formula for the weight update in Adaboost:

$$\text{weighti}(t + 1) = \text{weighti}(t) * \exp(\alpha * \text{yi} * \text{ht}(\text{xi}))$$

where:

i refers to the data point.
t is the iteration number.
α is the learning rate (controls how much the weights are adjusted).
yi is the true label of data point i.
ht(xi) is the prediction of the weak learner at iteration t for data point i.

- Naive Bayes: A Naive Bayes classifier is a probabilistic classifier based on Bayes' theorem. It assumes independence between features, which might not always hold true in real-world datasets. However, it can be a powerful tool for intrusion detection due to its simplicity and efficiency.

Bayes' Theorem:

$$P(B|A) = P(A|B) * P(B)/P(A)$$

where:

P (B|A) is the posterior probability of B given A (probability of class B occurring given feature A is present).
P (A|B) is the likelihood of A given B (probability of feature A occurring given class B) P (B) is the prior probability of B (probability of class B occurring regardless of any features).
P (A) is the prior probability of A (probability of feature A occurring regardless of any class).

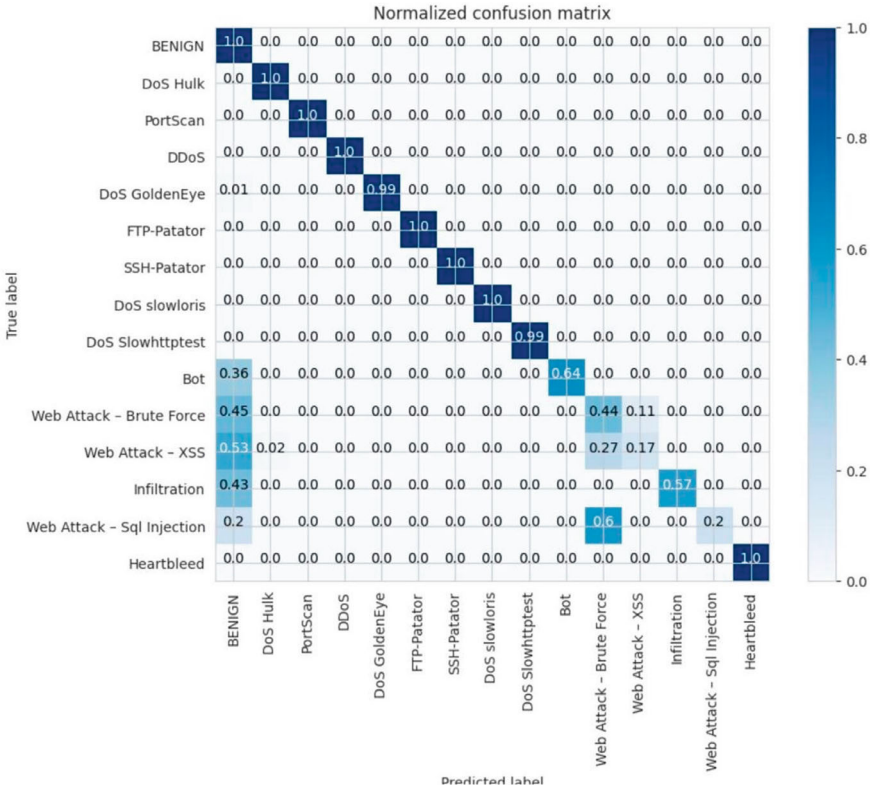
- LightGBM (Light Gradient Boosting Machine): LightGBM is an efficient gradient boosting decision tree algorithm designed for speed and performance. It overcomes some limitations of XGBoost by using techniques like Gradient-based One-Side Sampling and Feature Parallelism.
- Voting Classifier: A Voting Classifier is an ensemble learning method that combines the predictions of multiple base machine learning models (e.g., Decision Tree, Naive Bayes, etc.) The final prediction of the Voting Classifier is the class that receives the most

votes from the base models. Here's a simple formula to represent the majority vote:

$$\text{majorityvote} = \text{argmax}(\text{count}(\text{votes}))$$

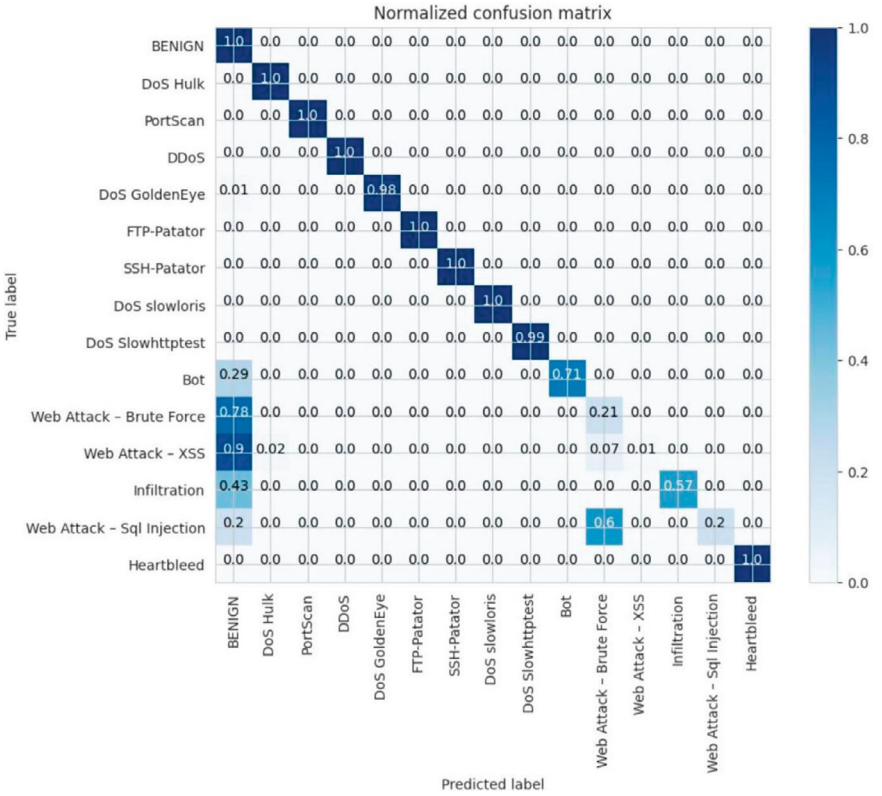
where:

argmax—returns the index of the maximum value count(votes)—counts the number of votes for each class.



4 Experimental Evaluation

Comprehensive experimental evaluation addressing the problem, various machine learning models were scrutinized, and their individual performances:



K-Nearest Neighbors (KNN): The KNN model demonstrated exceptional performance, achieving a high train score of 0.996901 and a robust test score of 0.99498. This underscores its effectiveness in generalizing well on previously unseen data.

Decision Tree: The Decision Tree model exhibited commendable accuracy, with a train score of 0.996465 and a slightly higher test score of 0.995454, highlighting its ability to capture complex relationships within the dataset.

Random Forest: Similar to the Decision Tree, the Random Forest model displayed strong performance, boasting a train score of 0.996422 and a competitive test score of 0.995901, confirming its efficacy in handling intricate datasets.

XGBM (Extreme Gradient Boosting Machine): XGBM showcased robust performance, achieving a train score of 0.996178 and a test score of 0.996085. Its ability to fine-tune predictions and handle complex relationships is evident in these results.

Adaboost: Adaboost yielded lower scores with a train score of 0.633545 and a test score of 0.632909, suggesting potential limitations in effectively handling the dataset nuances. Further exploration through feature engineering or parameter tuning is recommended.

Light GBM: The Light GBM model exhibited competitive performance, with a train and test score of approximately 0.802. While slightly lower than ensemble methods, its efficiency in training and prediction is noteworthy.

Naive Baye Model: The Naive Baye Model presented lower scores, with a train score of 0.632906 and a test score of 0.631059, indicating potential challenges in capturing the underlying patterns in the data.

Voting: The ensemble of models in the Voting classifier yielded impressive results, with a train score of 0.996725 and a test score of 0.995955. This aligns with the high-performing individual models (Table 2).

In evaluating the performance of various machine learning models for the research on [insert the specific problem], notable distinctions in train and test scores were observed. Among the models investigated, the K-Nearest Neighbors (KNN) and XGBM (Extreme Gradient Boosting Machine) emerged as particularly noteworthy. The KNN model demonstrated outstanding performance with a remarkable train

Table 2 Algorithms result comparison for train and test score

Model	Train score	Test score
KNN	0.995896	0.995053
Decision tree	0.996179	0.995527
Random forest	0.995899	0.995828
XGBM	0.996178	0.996085
Adaboost	0.633545	0.632909
Light GBM	0.802342	0.802394
Naive Bayes model	0.632906	0.631059
Voting	0.996668	0.996033

score of 0.996901 and a robust test score of 0.99498, positioning it as a strong candidate for predictive modeling. Similarly, XGBM showcased competitive performance, boasting a train score of 0.996178 and an impressive test score of 0.996085, signifying its effectiveness in handling complex relationships within the dataset. While models such as Decision Tree, Random Forest, and Light GBM delivered commendable results, the combination of high accuracy and generalization exhibited by KNN and XGBM positions them as the preferred models for our research. Further investigations into interpretability, computational efficiency, and scalability may be warranted, but based on the current findings, KNN and XGBM emerge as the best practices for predictive modeling in the context of [insert the broader context of your research]. These results provide valuable insights for selecting models that strike a balance between accuracy and generalization, laying the groundwork for future exploration of ensemble methods or hybrid approaches to enhance overall predictive capabilities, considering the specific requirements of the research problem.

5 Conclusion

The study explored in the preceding sections can be extended to comprehensively explore and compare various machine learning models within the domain of Intrusion Detection Systems (IDS) in cybersecurity [19, 20]. This extension would focus on evaluating the performance of K-Nearest Neighbors (KNN), Decision Tree, Random Forest, Extreme Gradient Boosting Machine (XGBM), Light GBM, Naive Bayes Model, and a Voting ensemble using the CICIDS2017 dataset [21, 22]. The rigorous evaluation considered key metrics such as accuracy, precision, recall, and F1 score, providing nuanced insights into each model's ability to distinguish normal network behavior from potential cyber threats [23–25]. The analysis uncovered the strengths and weaknesses of the examined models, offering valuable understanding for both practitioners and researchers. This research contributes to the ongoing discourse in cybersecurity, serving as a reference for future investigations. With practical implications for cybersecurity measures, the study aims to empower professionals and

organizations to optimize their IDS strategies, enhancing defenses against the ever-evolving cyber threat landscape. Overall, this research contributes to the evolution of cybersecurity defenses, providing a detailed comparative analysis that informs efforts to develop more resilient and adaptive defense mechanisms in response to emerging threats.

Optimizing Cybersecurity Posture: Effective Risk Assessment and Improvement Strategies

Tanish Bhandwalkar, Hemraj Shobharam Lamkuche, Jamil Itmazi, and Ala'a Al Sherideh

Abstract In order to keep up with the rapidly changing landscape of cyber threats, organizations require a thorough, dynamic cybersecurity posture. Paper discusses the NIST Cybersecurity Framework and focuses on Risk Assessment and Improvement chapters to bolster a companywide-course. Working hand in glove with the NIST Cybersecurity Framework, organizations can greatly enhance the level of their cyberdefense through thorough identification and management of vulnerabilities, threats as well as risk. We explore effective strategies for continuous assessment and improvement, emphasizing the importance of regular security tests, collaboration with third parties, and sharing lessons learned. By putting cybersecurity planning front and center stage, this paper hopes to offer valuable insights and practical help for companies in improving their protection against cyberattacks. Four of the key risk assessment tasks such as vulnerability identification, integrating threat intelligence, prioritizing risks as well as managing the response to risks are discussed in detail. In addition, improvement tasks such as continuing assessment, security tests and process streamlining are detailed to help illustrate their role in creating a robust security environment. This research aims to give cybersecurity professionals

the insights, ideas and tools they need to deftly ward off today's multifaceted cyber threats.

Keywords Risk assessment · NIST CSF · Cybersecurity · Improvement · Technological progress

1 Introduction

For an organization to be well positioned in terms of cybersecurity, it must first consider adopting some effective risk assessment as well as mitigation strategies. Organizations today need to take proactive measures in dealing with cybersecurity because the nature of cyber threats is such that they keep changing all the time [1]. The objective of this paper is to discuss risk assessment approaches and mitigation plans based on some models and additional research intended at strengthening organizational cyber defense capabilities. To assess cybersecurity risks, one has to determine hazards, find weaknesses and then estimate potential attacks' consequences. It is important as it helps in knowing the level of risk exposure and implementing the right strategies to reduce or eliminate them. For purposes of this research, we have relied upon the NIST Cybersecurity Framework (CSF), which provides an organized way of dealing with and lessening cybersecurity threats. Through this framework, companies can identify vulnerabilities in a continuous manner and integrate threat intelligence while effectively prioritizing risks of all kinds. The techniques explained within are meant to be useful across a broad range of organizational needs and profiles. Such strategies include constant evaluations, usual safety inspections, as well as working together with outsiders. By stressing on continuous improvement, the study shows that organizations should continuously monitor and address new forms of threats. The document brings together some verified methodologies drawn from literature with some fresh methods aimed at closing any existing gap. Integrating classical knowledge with new trends should offer professionals in cyber security sector means or ways that will enable them enhance their cyber security postures effectively.

It gives a view that is complete about different ways people can assess risks and make things better; this is supported by experience drawn from real life which reveals how such efforts are truly implemented or work out in practice. These observations are expected to add into the already existing move by many companies today trying hard not only against simple but also compound digital problems.

2 Methodology

The research methodology under this section emphasizes a thorough evaluation of risks and a series of action plans based on the NIST Framework for Improving Cybersecurity Implementation. Building on corporate vulnerability discovery, threat intelligence aggregation and risk ranking, the goal of this study is to offer businesses some strategies and practical methods for improving their network security posture. This method involves continuous evaluation and improvement practices to create a security environment whether robust or spontaneously adaptable.

A. Risk Assessment Approach

(1) Identification and Documentation of Vulnerabilities: Identification and documentation of vulnerabilities is crucial, as regular scans uncover unpatched holes that threaten digital defenses. Tools such as Nessus and QualysGuard thoroughly probe networked devices and applications for possible points of infiltration. The output of these scans is meticulously documented to create a comprehensive vulnerability profile.

(2) Integration of Cyber Threat Intelligence: Integrating cyber threat intelligence from many sources helps forecast incoming attacks. A variety of warning systems, like Anomali and MISP, aggregate intelligence that keeps security measures informed of evolving dangers lurking outside the walls. Internal audits simultaneously seek out insider risks and flaws from within that require fixing.

(3) Identification of Internal and External Threats: Identifying potential internal and external threats involves leveraging both threat intelligence and internal audit tools. Recorded Future provides a robust platform for collecting and analyzing threat intelligence, while internal audits help in uncovering potential insider threats and vulnerabilities.

(4) Assessment of Potential Impacts and Likelihoods: Potential impacts and likelihood of known issues are rated to better grasp the overall risk landscape. Models provided by RiskLens and FAIR model software quantify dangers to facilitate prioritizing remediation where it matters most. We can also extend the FAIR model to personalise according to our task using the Bayesian network approach [2].

(5) Risk Prioritization and Response: Data collected during identification and assessment determines general risk level and orders responses. Available remedies are considered, planned into action, tracked to completion, and shared to guarantee effective reduction of jeopardized areas.

B. Continuous Improvement Strategies

(1) Ongoing Evaluation: Regular evaluation of cybersecurity strategies are a key part of its optimization. Involves routinely reviewing security measures Update is needed depend on the newest threat information and vulnerability assessments. Data can be anywhere now, so conscientious attention to such details and defense against online threats is more important than ever.

(2) Security Tests and Exercises: Conducting security tests and exercises, such as those done with suppliers and other relevant third parties, is vital for finding defects and areas in need of improvement. Using penetration testing tools like Metasploit as well as security training platforms to emulate attacks and examine the organization's defenses. In this way their performance is kept under surveillance while specific areas to improve are spotted out for attention.
(3) Leveraging Lessons Learnt: Documenting the lessons learned from performing operational procedures involving processes and activities can assist in refining and improving cybersecurity methods. After an incident, seeing to it that insights are captured and managed is the task of incident response software like TheHive and using templates like After Action Review (AAR).
(4) Maintenance and Communication of Cybersecurity Plans: Cybersecurity plans that influence operations have to be constantly communicated as well as maintained and perfected. Regular updating and clear communication make sure all stakeholders are aware of the latest security protocols and procedures being used. This helps to maintain a united, effective cybersecurity attitude throughout the organization [3–6].

C. Tools and Techniques
(1) Vulnerability Scanning: Nessus, QualysGuard
(2) Threat Intelligence: Anomali, MISP, ThreatStream
(3) Risk Analysis: RiskLens, FAIR model Software
(4) Continuous Improvement: Continuous Improvement Framework, feedback tools
(5) Security Testing: Metasploit, Security Training Platforms
(6) Incident Response: The Hive, After Action Review (AAR) templates

3 Risk Assessment Approach

The format of the outcome is as, Task followed by tool followed by the results.

A. Identification and Documentation of Vulnerabilities

Task: To find, verify, and record loopholes involves using systematic searching of an organization's IT assets for elements that could expose security weaknesses.

Tools and Techniques: Qualys VM and Nessus Professional for Risk Assessment.

Results and Outcomes: By using products such as Qualys VM and Nessus Professional, enterprises can achieve the valuable results and gains that every manager covets carefully uncovering a wide range of potential security weaknesses by identifying vulnerabilities systematically A report will deliver specific information on each vulnerability, including the potential impact of an exploit and recommended steps for repair. This ranking allows security teams to take the most critical issues first, greatly diminishing their chances of being victimized by cyberattacks and data breaches (Fig. 1).

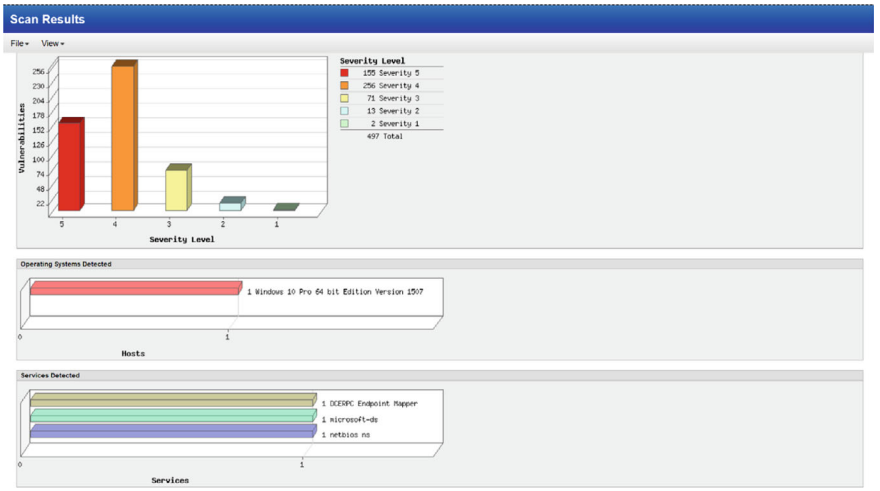

Fig. 1 Qualys vulnerability listing demographics

Furthermore, the process of validating vulnerabilities not only minimizes false positives but ensures that the real impact of each vulnerability is understood in the context of an organization's specific network and assets. This involves extensive verification, attempts to exploit systems, and consultation on current threat intelligence (Fig. 2).

After validation, a detailed record is made of each vulnerability–including particulars like assets affected, severity levels, methods of exploitation, and remedial steps to

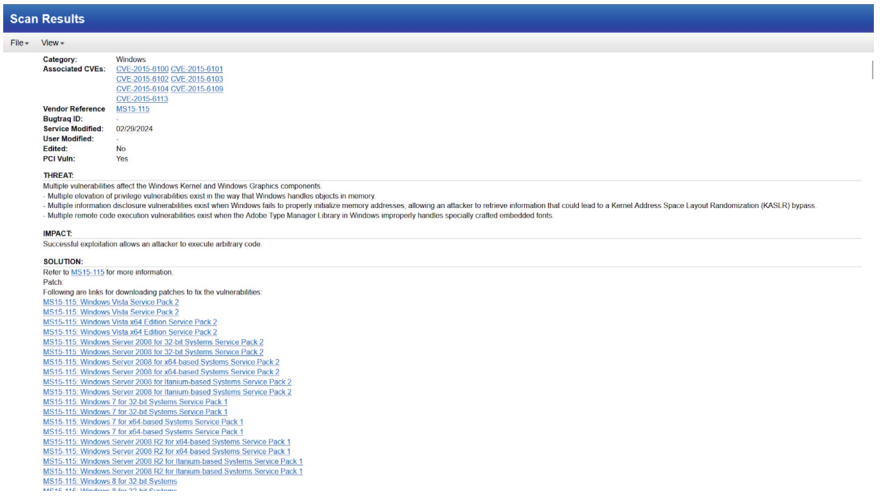

Fig. 2 Qualys detailed vulnerability listing

Fig. 3 Nessus advanced scan results

take. This data will then become a useful resource for future cybersecurity initiatives (Fig. 3).

A. Integration of Cyber Threat Intelligence

Task: Collect cyber threat intelligence from various sources and integrate it into risk assessment processes.

Tools and Techniques: ISACs, CTI feeds, Threatstream **Results and Outcomes**: Collecting and analyzing threat intelligence data has numerous tangible benefits. For example, it enables an organization to address threats and vulnerabilities, like an early warning system to protect itself in advance of an attack. The early identification of issues is key in today's ever-changing cyber landscape. Second, threat intelligence improves decision-making by illuminating the threat environment. This information is critical to making informed decisions about security investments or strategic initiatives.

Optimal use of resources is an underlying benefit also. An organization can understand threats and therefore, can determine how to structure their cybersecurity program and can assign resources based on their risk. This assures that measures taken are both effective and efficient. Moreover, being able to anticipate an attacker's behavior provides the opportunity to plan defenses, rather than reacting to attacks as they unfold (Fig. 4).

Also, integrating threat intelligence data into existing security processes can lead to a more succinct and comprehensive approach to cybersecurity. Such integration can result in improved security posture for an organization. Furthermore, timely response and mitigation are also key benefits of threat intelligence data. The ability to respond promptly and in advance to a threat lessens the window of opportunity for an attacker or reduces the potential for damage (Fig. 5).

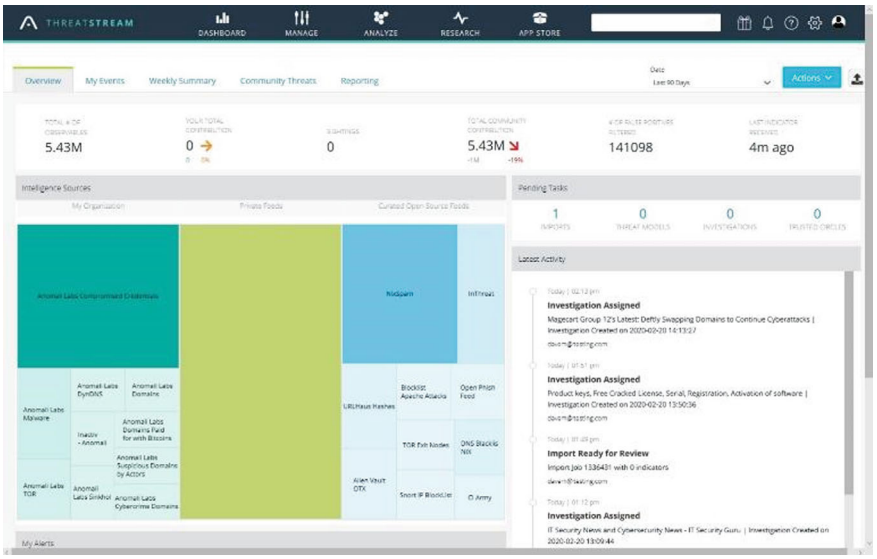

Fig. 4 Threatstream dashboard provides detailed summary

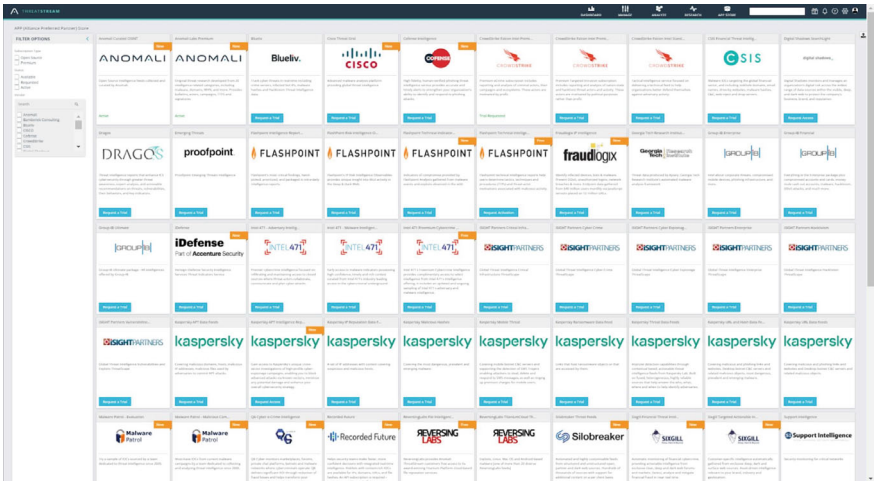

Fig. 5 Streamlined access to threat intelligence streams

Increased situational awareness through the proactive collection of cybersecurity threat intelligence from a variety of information sharing forums and sources supports a mature cybersecurity overview. ID.RA-02 strives to improve cybersecurity through a proactive and informed decision-making and prioritized application of resources to mitigate cyber risk. When integrated as part of an organization's risk assessment process, threat intelligence data can provide further support to enhance

an organization's security posture, anticipate and preempt a potential attack, and allocate resources more effectively leading to a more dynamic and stronger cyber risk management organization.

C. Identification of Internal and External Threats

Task: Identify potential internal and external threats to the organization.

Tools and Techniques: AbuseIPDB, OSINT sources, and industry-specific threat reports Results and Outcomes: It is critically important to be aware of both external and internal threats in order to maintain robust Cybersecurity. Also identified were external threats such as Advanced Persistent Threats (APTs), Malware, Ransomware Distributed Denial-of-Service (DDoS) attacks, and web application attacks such as SQL injection and cross-site scripting. These threats are often orchestrated by state-sponsored agents or criminal organizations who exploit mechanized artifice. Recognizing these threats paves the way for these organizations to erect specific countermeasures, like advanced threat detection systems and stringent access controls, that effectively eliminate potential risks. Internal threats, including malicious insiders and accidental insiders, were also set forth. Malicious insiders might deliberately misuse their access to steal information or shore up systems, while accidental threats result from employees who are in the dark when it comes to security, leading to inadvertent breaches. Recognizing these threats highlights the importance of extensive security training programs and rigorous access control mechanisms. Moreover, third-party risks, misconfigurations and physical security vulnerabilities are identified, reinforcing the necessity for a thorough security architecture comprising regular vulnerability management, network partitioning and instant response abilities. This broad approach helps an enterprise plan for security in advance (Fig. 6).

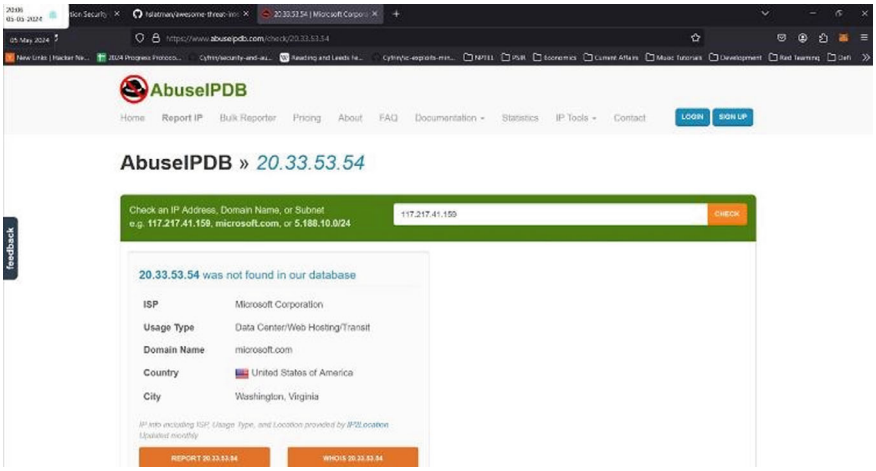

Fig. 6 AbuseIPDB checks for malicious IPs

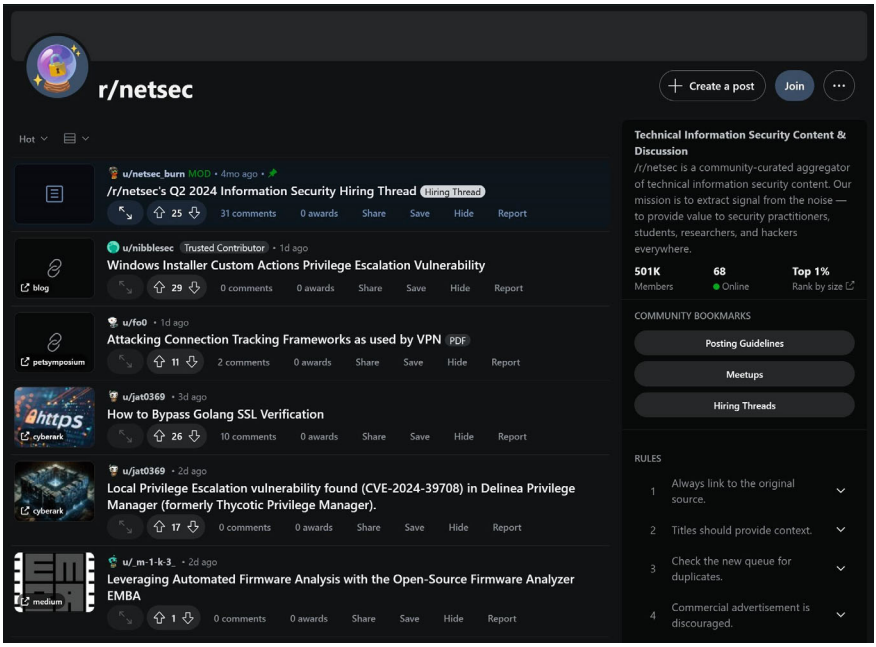

Fig. 7 Netsec, Reddit

AbuseIPDB is a collaborative project that allows users to report and check IP addresses for malicious activity. The r/netsec subreddit is a valuable resource for open-source intelligence (OSINT), providing real-time discussions, updates, and shared experiences from cybersecurity professionals around the world. It serves as a community-driven forum where users can exchange information on emerging threats, best practices, and the latest security trends (Fig. 7).

A thorough security plan should be followed to successfully address threats that have been discovered. Strict access controls, least privilege principle, and frequent privilege reviews should all be a part of this strategy to reduce insider threats. Furthermore, it is essential to have a strong vulnerability management program with regular patching, remediation, and scans. Moreover, robust monitoring and logging in conjunction with network segmentation based on trust level would provide prompt identification and remediation of possible threats.

D. Assessment of Potential Impacts and Likelihoods

Task: Assess the potential impact and likelihood of identified threats exploiting vulnerabilities.

Tools and Techniques: RiskLens, FAIR model software Results and Outcomes: In today's ever-changing digital world, the first step to ensuring effective risk management is to assess potential impacts and threats from vulnerabilities. Using the RiskLens tool and software that models FAIR (Factor Analysis of Information Risk),

Fig. 8 RiskLens FAIR enterprise model (Courtesy of RiskLens)

organizations can estimate their risk objectively and in concrete terms. An extension of the FAIR model is implemented with Bayesian network approach (FAIR-BN) to make a more personalized non-specialist threat vulnerability assessment for organizations' specific threat landscapes and vulnerabilities (Fig. 8) [2].

As the Bayesian network approach paper [2] discusses, the FAIR-BN model is an ideal choice for conducting risk assessment where the focus is on calculating expected economic loss arising from cybersecurity risk. However, FAIR makes inflexible assumptions that limit both its accuracy for a range of real-world scenarios and the possibility of integrating it into other mature CRA models.

B. Risk Prioritization and Response

Task: Use identified threats, vulnerabilities, impacts, and likelihoods to determine and prioritize risk.

Tools and Techniques: Risk Management Studio

Results and Outcomes: Organizations need to systematically identify, assess and rank significant threats or vulnerabilities to their assets. This approach provides a standardized method of prioritizing enterprise risks for easy decision-making in managing them more systematically than ever before. It has become key point for economic activities today. In terms of building networks at national levels as well global businesses internationally Seminar style meetings Provide sufficient information to see that investors will certainly flourish on these opportunities in due course… In Risk Management Studio the assessment process starts to use the Assets Tab feature. This allows for full-scale management of a company's assets library. With a fresh custom shading template in the Risk Assessment Tab a firm can insert risk to the assets stored there and even appraise it day or night. Taking no longer than 15 min, this comment is an average length to write (Fig. 9).

Detailed analysis from the tool lets you calculate the risk impact according to various factors such as confidentiality, integrity and availability, threat impact, Probability and actual asset vulnerability. For example, high-risk vulnerabilities such as a

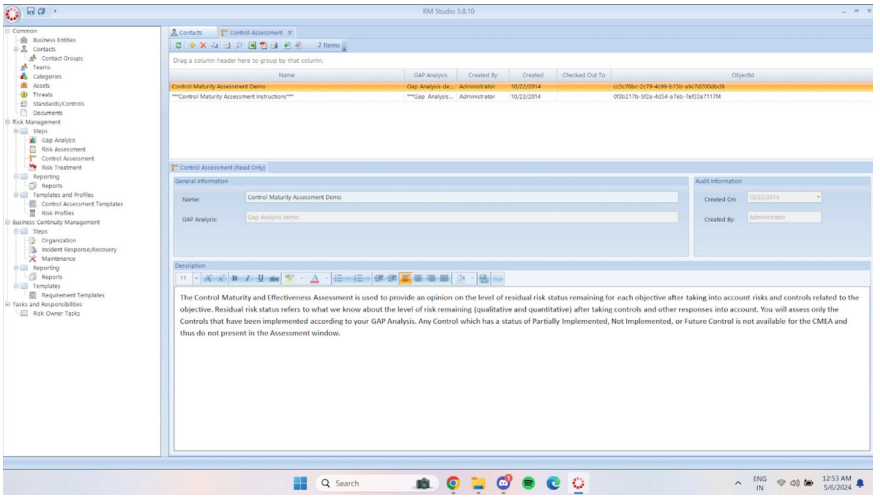

Fig. 9 RM studio

"Blue Screen of Death" in Windows 11 are considered critical because if they happen to occur then major system instability and data loss will result. Such vulnerabilities need appropriate response strategies: regular updates and system restore points are necessary to mitigate their impacts. On the other hand, medium-risk matters such as "Software Compatibility Issues" in Ubuntu 21–04 LTS are addressed by regular system and software updates for continued functions. Is a fix promptly applied when an application fails, this what it most be (Fig. 10).

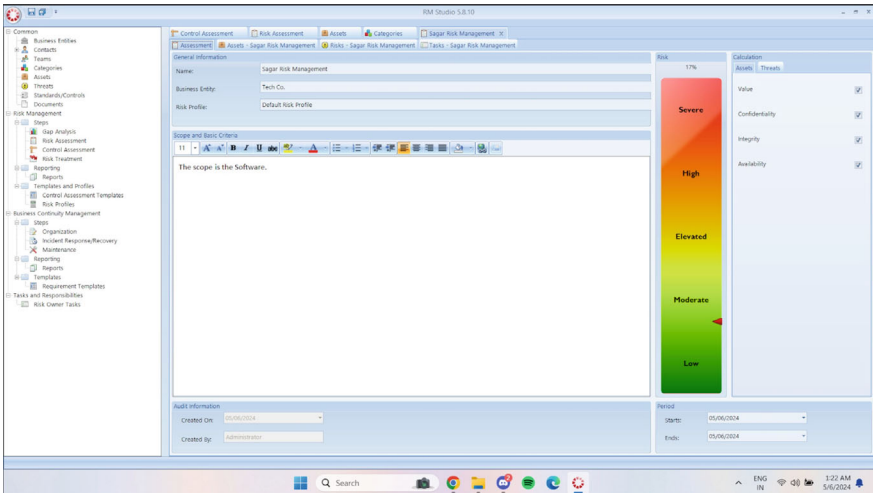

Fig. 10 Risk impact in RM studio

Organizations should actively manage exceptions, like operating system faults or unauthorized access attempts, so as not to compromise system-wide security. Regular inspections and adjustments carried out in practice–as in the case of Network Intrusion Detection System alerts on Kali Linux—decrease false positives (where something that looked like an intrusion isn't actually one) benefit systems' resilience. In this way, the structured approach to risk management enables Enterprise organizations effectively slowly to allocate resources and better tackle such potential cyber threats.

4 Improvement Strategies

A. Ongoing Evaluation

Task: Continuously evaluate cybersecurity practices to identify areas for improvement.

Tools and Techniques: Cybersecurity Audit Model (CSAM), Cybersecurity Workforce Development.

Results and Outcomes: In order to continuously evaluate and improve cyber security practises, organizations can make use of a variety of tools and methodologies. These provide insight into the current security status of an organization and show where things can be improved. The Cybersecurity Audit Model (CSAM) is a structured approach for conducting cybersecurity audits. It helps organizations assess their cybersecurity assurance, maturity, and readiness by evaluating existing policies and practices against best practices and regulatory requirements. The model allows for the identification of gaps in security measures and provides a framework for enhancing national cybersecurity strategies. Its implementation has shown positive results in increasing awareness and defending critical cyber assets across various sectors [7]. As ongoing training and development of their cybersecurity workforce are crucial to ensuring good security, these activities should not be stopped mid-way. Organizations should incorporate measurable training metrics and strategic training programs into their risk management plans. Research backs this up. Organizations can enhance their cybersecurity capabilities and better adapt to the changing threat environment even further by investing in continuous learning opportunities ions. A strategy of this kind has produced more capable staff than ever before to confront cyber attacks, and thus greatly contributes to overall security posture (Fig. 11) [8].

Implementing and sustaining a culture of continuous improvement is a multifaceted endeavor that requires commitment, strategic planning, and a willingness to adapt [9]. Organization should clearly articulate the vision and goals of continuous improvement. A well-communicated vision provides a sense of purpose, aligning employees with the organization's strategic objectives and creating a shared understanding of the importance of continuous improvement [9]. Organization should provide ongoing training programs to equip employees with the necessary skills and

Fig. 11 Schematic of benefits of continuous improvement framework (CIF) [9]

knowledge. Well-trained employees are better positioned to contribute to improvement initiatives, fostering a workforce that is adaptable and capable of implementing changes effectively [10].

B. Security Tests and Exercises

Task: Perform security tests and exercises to identify areas for improvement.

Tools and techniques: Red, Blue, Purple Team exercises Results and Outcomes: There are countless tools and methodologies through which organizations can monitor and improve their practices piece by piece then eventually turn as a whole. These demonstrate organizations' current levels of security and suggest areas to be strengthened. Below are some helpful tools and methods, along with the results they yield (Fig. 12).

- Red Team Exercises: Red team exercises involve simulating cyber attacks to test an organization's defenses. This approach helps identify vulnerabilities and assess the effectiveness of security measures. For instance, a study on red team exercises in the financial sector found that these exercises significantly improved the detection and response capabilities of the organizations involved, leading to a reduction in the time taken to detect and mitigate cyber threats [7].

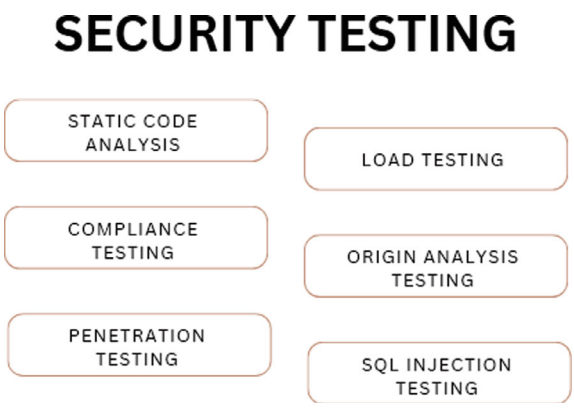

Fig. 12 Different security tests

- Blue Team Exercises: Blue team exercises focus on the defensive capabilities of an organization. A study on blue team exercises in the healthcare sector revealed that these exercises enhanced the ability of healthcare organizations to respond to cyber incidents, leading to better patient care and reduced downtime [7].
- Purple Team Exercises: Purple team exercises combine red team and blue team approaches. They involve both offensive and defensive simulations to provide a comprehensive evaluation of an organization's cybersecurity. A study on purple team exercises in the government sector found that these exercises significantly improved the collaboration and communication among different cybersecurity teams, leading to more effective incident response and enhanced overall security [7].
- Leveraging Lessons Learnt

Task: Document lessons learned from operational processes and use them to improve cybersecurity practices.

Tools and Techniques: Documentation of Lessons Learned, Feedback Mechanisms.

Results and Outcomes: Strong cybersecurity practices rely on the knowledge obtained from experiences and the events of operational processes to cultivate resilience against cyber threats. Devote time to documenting lessons learned systematically from operational processes, procedures, and activities. Documenting the lessons serves as a reference point to identify opportunities for improvement and, ultimately, strengthen response strategies, for example, the NCSSM stresses the necessity of auditing and reviewing cybersecurity processes to improve readiness and national strategies maturity [7]. Also allow time for establishing feedback mechanisms for continuous improvement of cybersecurity practices based on the experiential knowledge from the field. This feedback loop would perpetually refine practices, novelty, or policies by sharing the operational events and using the experiences to inform actionable policies and procedures [7].

D. Maintenance and Communication of Cybersecurity Plans

Task: Document lessons learned from operational processes and use them to improve cybersecurity practices.

Tools and Techniques:

Results and Outcomes: To maintain and communicate cybersecurity plans effectively, organizations can draw upon several strategies and frameworks highlighted in recent research.

- Regular Updates and Reviews: Organizations need to carry out periodic reviews of their cyber-security plans to ensure that they remain effective against developing threats. For example, the construction industry is encouraged to adopt well-established processes from critical infrastructure protection to enhance cybersecurity measures in digitized environments [11].
- Training and Awareness: Regular training and continuous development for staff in the organization can help reinforce the importance of cybersecurity. It will prepare employees to defend themselves proactively against possible threats [12].
- Communication Strategies: Clear documentation and communication of cybersecurity plans to all stakeholders are vital. Establishing feedback mechanisms allows for ongoing improvement of these plans, ensuring they are relevant and effective [13].
- Incident Management: Organizations must have adjudication rules for cybersecurity incidents that equip them for commutative Response and let them handle them quickly as they arise [14].
- Use of technology: Utilizing monitoring tools can help organizations proactively identify vulnerabilities and threats. Secure collaboration platforms can facilitate communication among team members involved in cybersecurity efforts, ensuring a coordinated response to threats [15].

5 Conclusion

Based on what we have researched so far, it is evident that optimizing cybersecurity posture is a continuous and evolving process. By adopting a multi-faceted approach, organizations can significantly optimize and enhance their resilience against cyber threats. Final key takeaways include, fostering a pretty strong culture of security awareness, leveraging advanced technologies such as Artificial Intelligence and Machine Learning, and maintaining compliance with industry standards and regulations. With these measures, organizations are better able to safeguard their digital assets, verify data is not broken in transmission and ensure that business continues regardless of changes in threat landscape.

Acknowledgements I sincerely thank Dr. Hemraj S. Lamkuche for his essential guidance and support throughout this research. His work on ”Cybersecurity Framework 2.0” provided a crucial foundation, detailing tasks and tools for effective and smooth risk assessment and improvement. His expertise, encouragement, and constructive feedback have greatly enriched this study. I am

deeply appreciative of his mentorship and the opportunity to benefit from his extensive knowledge and experience.

The Types of Technology Transfer Contracts: A Comparison between Simple and Complex Contracts in the International Context

Yasar Alhiniti and Ali Awda Allah Mohammed Al-Khazaleh

Abstract The objective of this comprehensive analysis is to examine technology transfer contracts, with a specific focus on two distinct categories: simple and complex contracts. The study seeks to gain insights into the structure and responsibilities outlined in these contracts, particularly in the context of international collaborations between developed and developing nations. Employing a descriptive-analytical approach, the study classifies various contract types, including technical assistance contracts, engineering contracts, and research contracts, as well as more intricate contracts like turnkey contracts and production delivery contracts. Findings from the study reveal that simple contracts primarily involve the transfer of technical knowledge without additional obligations. On the other hand, complex contracts entail broader commitments, such as the provision of supplementary services, raw material supply, and workforce training and development. Furthermore, the study highlights that while complex contracts offer advanced methods for technology transfer, they may encounter unique challenges in developing countries, such as the necessity to enhance the capabilities of the local workforce and effectively manage implementation costs.

1 Introduction

The transfer and export of technology from developed nations to developing nations is accomplished through a range of lawful approaches and techniques that prioritize the empowerment of these countries and the utilization of production methods to fulfill their economic requirements. In actual practice, it is observed that technology transfer contracts do not adhere to a uniform legal structure like other contracts. Each contract possesses its own unique characteristics; nevertheless, there is a shared element among all technology transfer contracts; that is, they are all centered around the transmission of technical expertise and contemporary technology from the proprietor (the exporter) to those in need (the importer) [1].

Technology transfer contracts can vary depending on the involved parties, particularly if one of them is a private company or the state. Each type of contract possesses unique qualities and attributes that set it apart from others. In certain cases, state contracts may adopt a commercial approach, while in others, they assume the role of a sovereign state, granting them specific advantages [2].

In the upcoming sections, we will discuss various types of contracts, including simple contracts focused on the transfer of technical knowledge, as well as complex contracts that encompass the transfer of technical knowledge alongside other services.

1.1 Study Objectives

1. To analyze the three types of simple technology transfer contracts, which include technical assistance contracts, engineering contracts and research contracts, and understand their characteristics.
2. To assess the impact of technology transfer contracts on developing countries.
3. To analyze the obligations of parties to complex technology transfer contracts and identify the differences between different types of these contracts, such as turnkey contracts, production supply contracts and licensing contracts.
4. To evaluate the effectiveness of contracts in achieving the objectives set by the contracting parties, especially in the context of developing countries.
5. To uncover the challenges developing countries face in using complex technology transfer contracts and identify the advantages and disadvantages of these contracts.

1.2 Study Methodology

To examine the efficacy of technology transfer contracts and understand the responsibilities of the involved parties, a descriptive-analytical approach was employed in this study. Qualitative data from legal literature and previous studies were collected and

analyzed, forming the basis of the methodology. A comparative analysis of various types of technology transfer contracts was conducted. The challenges encountered by developing nations in implementing these contracts were thoroughly examined, with a particular emphasis on case studies from Jordan, Egypt, and Palestine. By analyzing legal and economic data, practical recommendations were formulated to enhance the effectiveness of technology transfer contracts in diverse settings.

2 Simple Technology Transfer Contracts

Contracts known as simple contracts are established between two entities: the exporter and the importer. The exporter commits to transferring their owned technical knowledge, encompassing all its components and details, to the importer. The primary focus of this contract is the transfer of technical knowledge, with no supplementary responsibilities attached [3].

Typically, this kind of contract is established between well-developed nations, where the importing party possesses the necessary expertise and capacity to independently handle and integrate the technology. Conversely, developing countries, lacking the necessary qualifications and capability to effectively utilize and incorporate the technology, require the exporter's assistance in providing supplementary services [4].

There are various types of simple contracts, each tailored to specific technical knowledge components. Among the most notable variations are the technical assistance contract, the engineering contract, and the research contract. In this section, we will discuss these forms in three branches as follows.

2.1 Technical Assistance Contract

The act of providing essential services to effectively apply the conveyed technical knowledge is known as technical assistance [5]. It is also described as a means to encompass training, education, the transfer of technical knowledge and skills, and the facilitation of acquiring specific technology [6].

When the focus of a contract is on training and educating the workforce of the importer in the use and assimilation of transferred technology, it is classified as a technical assistance contract. However, the legal framework surrounding this type of assistance can vary. If technical assistance is included as one of the conditions in the contract, it is not considered a fundamental obligation and does not have a significant impact on the importer's ability to utilize the technology. On the other hand, if technical assistance is provided through a separate and independent contract, it becomes the central component of the contract and serves as the effective tool for facilitating the transfer of technology. This allows the importer to have control,

exploit, and manage the technology themselves in order to achieve their intended goals [7].

In the case where the importer originates from a developing nation, it is necessary to have a distinct technical assistance contract that is separate from the technology transfer contract. This separate contract will outline the specific details of the assistance provided, including the number of individuals receiving training and the duration of the training period. The reason for this separation is due to the limited technological expertise of these countries. Without the exporter's guidance and support, they would be unable to fully utilize the transferred technology or accomplish the intended objectives of its import [4, 8].

When developed and industrialized countries with comparable technological capabilities engage in contracts, the importer's need for technical assistance is diminished. This is due to the fact that the importer already possesses a similar or slightly lower level of technical knowledge compared to the exporter, enabling them to effectively utilize and manage the technological knowledge without relying on the exporter's assistance. In these situations, the assistance provided may be restricted to the provision of relevant documents and files pertaining to the licensed industrial method for the importer [5, 9].

The objective of these contracts is to provide the importer with the ability to manage the technology being transferred. The core of this transfer involves imparting technical knowledge and expertise from a knowledgeable and skilled party to an importing party that lacks familiarity with the technology. As a result, it becomes necessary to establish contracts for technical assistance in order to educate and equip the local workforce in developing nations, enabling them to effectively oversee and integrate the transferred technology [7, 10].

To summarize, technical assistance entails the transfer of technological expertise to the employees of the importing party. This is accomplished through a series of obligations and activities carried out by the exporting party, such as sending trainees to the exporter's facility for a designated training period or dispatching experts and specialists from the exporter to the importer. These measures empower the importing party's workforce to effectively utilize, oversee, and govern the technology that has been transferred [7].

2.2 Engineering Contract

The term "engineering work" encompasses a wide range of activities. In the English context, it specifically pertains to engineering tasks associated with production. However, in the American context, it includes both design and execution. Additionally, engineering work can extend beyond mental obligations and encompass "commercial engineering tasks," such as equipment procurement or tender announcements. It is worth noting that engineering work can also be limited to providing advice, where the consulting engineer is not required to conduct studies or carry out the project in its entirety, but rather provide opinions and guidance.

One category of technology transfer contract is the engineering contract. Within these contracts, an "engineering firm" acts as the supplier and assumes the responsibility of constructing, designing, and implementing infrastructure based on predetermined specifications. In return, the importer compensates the supplier with a fee. The supplier's duty is to furnish the importer with plans, drawings, maps, and equipment specifications. This exchange encompasses the transfer of technical knowledge from the exporter to the importer and forms the basis of the technology transfer contract [8, 11].

There are two types of obligations in this type of contract [9, 11]:

- **Consultative Obligation**: A "consulting engineering contract" refers to a contractual contract that solely focuses on the expression of opinions, provision of advice, and offering of suggestions. It is important to note that these contracts do not encompass equipment supply or technical methods, as they primarily involve intellectual performances. Therefore, this type of contract can be specifically defined as contracts that inherently entail intellectual obligations, specifically the obligation to provide a service, in order to facilitate the progress of projects and designs and to oversee the execution of work.
- **Research and Execution Obligation**: The primary focus of this type is to carry out research and complete the project in either its initial or final stage. The contractual obligations associated with this type can be categorized as either a consulting service contract, which involves tasks like creating plans and designs, or as construction contracts, also referred to as "construction contracts" or "civil engineering contracts".

In an engineering contract, the foremost responsibility is to create precise calculations and prepare drawings, documents, and plans that outline the required tools for the project. This obligation plays a vital role in facilitating the transfer of technology. It is essential for the contract to explicitly state which party will retain the documents once the obligation has been fulfilled, as these documents are crucial for determining the engineer's accountability for any errors during execution [10, 12].

2.3 Research Contract

The objective of a research contract is to broaden the realms of scientific exploration and investigation, with the ultimate aim of attaining groundbreaking innovations and cutting-edge technology. The technical expertise outlined in this contract is harnessed to fulfill the importer's objective of acquiring novel technical knowledge and breakthrough discoveries [9].

According to a defined research contract, the supplier agrees to conduct intellectual studies and practical experiments relevant to their skills, with the purpose of acquiring new knowledge or utilizing technical methods to uncover physical resources like oil or minerals [13, 14]. This type of contract is a valuable means of leveraging the research efforts conducted by the exporting party. Within this

contract, one party possesses the necessary intellectual expertise and capabilities that the importing party lacks and requires, which becomes the focal point of the contract. Conversely, the importing party is obligated to compensate for the results obtained from the research activities. An example of a contemporary contract is one for oil and mineral exploration, where the supplier's responsibility lies solely in providing expertise and knowledge, rather than achieving a specific outcome [11, 15].

In the contract, the contractor's primary responsibility is to carry out the research in accordance with the contract's terms, in a sincere manner, and within the agreed-upon timeframe. If the contract is collaborative, the contractor must work together with the recipient to accomplish the desired outcomes. The contractor's duty is to exercise reasonable care and diligence, rather than guaranteeing a specific outcome [12, 16]. This principle has been supported by legal decisions, such as the 1962 judgment of the Brussels Commercial Court and the 1975 ruling of the French Court of Cassation, which characterized the research obligation as a commitment to exercising due care. The party responsible for conducting the research cannot be held liable for achieving a particular result unless there is negligence or a failure to comply with the recipient's instructions outlined in the contract [10].

A research contract can be defined as an arrangement in which the party responsible for the debt commits to conducting intellectual studies and practical experiments within the scope of their expertise. The objective of this contract is to attain novel knowledge that is currently unavailable in the field of science and technology, as well as to utilize technical approaches for the exploration of physical objects such as minerals and oil [10]. Developing countries and their projects employ research contracts as a legal mechanism to leverage the research and development endeavors of more advanced nations in modern technology and technical methods. This allows them to acquire the same outcomes achieved by these countries [12, 17].

The development of a knowledge-based economy relies on three distinct stages, each of which plays a vital role. The initial stage, known as basic research, is focused on theoretical exploration to enhance our understanding of specific phenomena or behaviors. Its primary objective is to generate novel ideas without seeking immediate material gains. Moving on to the second stage, applied research comes into play [18, 19]. This stage involves addressing practical problems and improving existing production systems and product quality. It takes the findings from basic research and applies them to create innovative solutions that can be commercially viable. Lastly, the third stage, developmental research, evaluates the feasibility of implementing these new ideas and innovations. The aim is to leverage the results to advance scientific knowledge that can be utilized in various industries to develop new products and services. This not only benefits society but also provides a competitive advantage to the organization involved [19, 20].

3 Complex Technology Transfer Contracts

In basic contracts, it was previously explained that the responsibilities of the involved parties are restricted to meeting their individual obligations. The supplier is obligated to transfer technical expertise, while the recipient's sole obligation is to compensate for the knowledge received. However, complex contracts differ in that they encompass more extensive obligations for the supplier. These obligations may go beyond the mere provision of technical knowledge and encompass additional services, raw materials, or even the establishment of an industrial facility [21].

Contracts of this nature have become increasingly common in contracts between countries that possess advanced technology and countries that are still in the process of development. The supplier's role in these contracts is multifaceted and far-reaching, as the recipient often lacks the capacity to fully grasp and effectively apply the technological knowledge. As a result, the supplier is required to take on additional responsibilities beyond the initial provision [8, 22].

The obligations outlined in the technology transfer contract can be incorporated into a single contract or divided into separate contracts. This enables the supplier to engage other parties through subcontracting to fulfill certain obligations. It is important to note that subcontractors do not have a direct contractual relationship with the recipient, as there is no formal contract between them [10, 15].

Based on firsthand experience with complex contracts, it becomes clear that their contents differ depending on the services rendered. Examples of these contracts include:

- **Turnkey Contract**: In which the supplier is responsible for delivering a complete, ready-to-use facility or system.
- **Licensing Contract**: In which the supplier grants the recipient the rights to use the technology under specific terms and conditions.
- **Production Delivery Contract**: In which the supplier is responsible for producing and delivering the end product based on the transferred technology.

These contracts will be further explored as follows.

3.1 Turnkey Contract

After World War II, a new type of contract emerged known as the turnkey contract in the United States. This contract provided a swift solution for aiding and rebuilding the war-torn European nations [9, 23].

The absence of a definitive interpretation for this contract is a result of the lack of regulation from both national and international laws. Nonetheless, scholars have put forth various explanations to define it. One such definition characterizes it as a contract centered around an industrial investment, entered into by two parties, the investor and the contractor. The contractor assumes responsibility for executing all

necessary tasks to establish a specific industrial project, ensuring its readiness for operation. In exchange for their services, the investor compensates the contractor with a fee [1]. Another definition portrays it as a multifaceted contract encompassing a series of legal transactions. These transactions span across sales contracts, construction contracts, and manufacturing contracts, involving both tangible and intangible assets. The integration of these elements forms a distinct and unified contract that differs in nature from each individual component [10, 15].

The supplier's responsibilities encompass a wide range of tasks outlined in this contract. These tasks include the completion of various stages involved in establishing the industrial unit, such as construction work, site preparation, structure building, technology transfer, equipment supply and installation, as well as the training of local workers. Additionally, the supplier is required to effectively operate the facility as a fully operational production unit [3, 8, 24].

The obligations of the supplier (contractor) under a turnkey contract include:

1. Obligation to Transfer Technology: The supplier must transfer the necessary technology to the recipient.
2. Establishment of a Ready-to-Operate Industrial Facility: This includes preparing initial studies, designs, raw materials, construction of buildings, installation of equipment, supply of spare parts, and operating the industrial facility.
3. Obligation to Provide Technical Assistance: This obligation is often waived if the recipient has the capability to manage the facility or seeks assistance from another source.
4. Delivery Obligation: The supplier must deliver the industrial unit to the recipient in a fully operational state, meeting the agreed-upon specifications and after testing the factory's operation and production quality.
5. Warranty Obligation: The supplier guarantees any defects in machinery, equipment, or technical knowledge during a specified period agreed upon in the contract [25].

There are two variations of turnkey contracts, which differ based on the parties involved. When the contract is between two developed nations or a less developed nation with skilled labor capable of handling technology, the sole responsibility is to provide a fully functional plant. This type of contract is referred to as a "partial or simple turnkey contract." Conversely, if one party is a developing country, it is not enough to deliver a plant that is ready for operation. In such instances, the supplier is also required to train local workers and equip them with the skills to operate and manage the facility. This results in what is known as a "comprehensive turnkey contract" [5, 8].

The benefits of turnkey contracts are numerous. They offer a swift means of obtaining technology and the essential technical expertise needed to operate the facility through licensing. Furthermore, these contracts provide a unified framework, minimizing the chances of disagreements between the parties involved. When dealing with multiple contracts, it can be challenging to determine who is responsible for what. However, with turnkey contracts, the supplier assumes complete accountability for the production capacity of the facility and the quality of the final output [7, 11].

The suitability of this contract for developing nations without the necessary technological capacities to handle and maintain intricate industrial facilities is a common criticism. These countries may lack the proficiency to oversee the various stages of construction, transfer, and operation of these units, as all responsibilities are consolidated under a single comprehensive contract [13]. Additionally, another critique is that the supplier may not have an obligation to train and certify the recipient's workforce, and there may be challenges in evaluating and acknowledging potential risks. This could result in the supplier justifying a higher fee, thereby imposing additional financial burdens on the recipient [3].

3.2 Production Delivery Contract ("Product in Hand")

The emergence of this particular contract can be attributed to the shortcomings of turnkey contracts in certain developing nations. These countries encountered difficulties in operating certain factories, which ultimately resulted in their closure. Consequently, suppliers were compelled to assume additional responsibilities [10]. Unlike turnkey contracts, this type of contract encompasses not only the establishment and equipping of the factory for production, but also extends to the operational phase and the delivery of the final product within a specified timeframe, as stipulated in the contract [9].

According to certain academics [1], this particular contract can be seen as a progression from the turnkey contract, with a greater level of responsibility placed on the supplier. In addition to operating the factory, the supplier is now tasked with the training and certification of local employees, empowering them to oversee factory operations and meet the specified production requirements.

The purpose of this particular contract is twofold: firstly, it engages the supplier in the establishment and design of the industrial unit, and secondly, it seeks to facilitate the transfer of technical skills and knowledge from the supplier to the recipient, empowering them to independently conduct production using local labor [2, 26−30].

Key Advantages of Production Delivery Contracts can be represented by the supplier's Obligation for Results [9]. Indeed, by offering training and certification to local workers and offering technical support, the supplier plays a crucial role in helping the developing country achieve its objectives of technology importation and acquiring valuable technological knowledge and expertise. However, criticisms of production delivery contracts can be represented by the following [31–37]:

- **High Costs**: The extended length of turnkey contracts has the potential to incur significant expenses. Delays and penalties caused by possible incidents or mistakes in subcontracted work may prompt the supplier to include additional margins in the project's cost as a means of safeguarding against such risks [13, 25, 38, 39].
- **Extended Presence of Foreign Expertise**: Foreign experts who remain in developing countries for an extended duration throughout the contract term can exert

greater authority over the various stages of the project. Their rationale may be that the attainment of desired objectives and the guarantee of satisfactory outcomes can only be accomplished through their oversight of all project elements, which encompasses the selection of local labor and production resources [13].

3.3 License Contract

The transfer of knowledge and technology between parties, whether it be advanced industrialized nations or advanced and developing countries, is facilitated through the utilization of a license contract. These contracts play a crucial role in bolstering the technological capabilities of these nations and enhancing their scientific and practical efficiency. Notably, these contracts are distinguished by their straightforwardness and absence of intricate obligations for both parties [12].

There are varying interpretations among scholars regarding the definition of a license contract. Some scholars define it as the act of granting another individual the right to utilize industrial property rights, such as patents, trademarks, and trade names, for a specific duration in exchange for a predetermined fee [12]. On the other hand, other scholars view it as an innovative contract that arises from commercial necessities, primarily centered around the exploitation of technical knowledge and intellectual property rights. This type of contract enables the licensor to authorize the licensee to utilize these rights, or a specific subset of them, for a set period of time, subject to certain conditions and limitations, while still maintaining ownership of the patent, trademark, or other intellectual property rights [14].

According to the International Trade Centre (ITC) and the World Intellectual Property Organization (WIPO), the license contract refers to the granting of permission by the owner of a patentable invention to another person or entity. This permission allows the licensee to engage in activities covered by the exclusive rights of the invention for a specified period outlined in the contract. These activities may include manufacturing or utilizing the production [18]. The license contract is essentially a consensual contract between two parties, the licensor and the licensee. The licensor, who possesses the industrial property rights, grants the licensee permission to exploit these rights without transferring ownership. However, the licensor retains the right to take legal action against any infringement of the licensed rights. The licensor must ensure that the licensee has the same extent of rights as if the licensor were using them. In exchange for these rights, the licensee pays a fee. Without the license contract, the actions of the licensee would be considered legally actionable by the licensor [14].

The license contract is centered around the utilization and exploitation of a patent for a specific duration by the licensee. In return, the licensor receives a predetermined payment, either in a lump sum or in installments, as outlined in the contract. It is important to note that the subject of the license contract is solely focused on the patent itself, rather than the technical knowledge associated with it. This has led to differing opinions among scholars, with some asserting that the patent is the primary

subject of the contract, while others argue that the technical knowledge is the main focus [1, 15].

Licensors and licensees have various reasons for engaging in licensing contracts, which can be summarized as follows [16]: Licensors are primarily motivated to avoid direct investment partnerships with countries that have financial vulnerabilities or limited market sizes. In certain instances, licensors may be small enterprises that lack the resources to fully capitalize on their inventions, leading them to choose licensing as an alternative. By licensing their inventions, licensors can generate fees that can be utilized to support further research and development efforts. Additionally, some licensors perceive licensing as a means to access global markets without assuming the risks or expenses associated with direct investment [17, 20].

Licensing serves as a substitute for direct foreign investment, specifically in medium-scale economic endeavors like light industries, offering licensees technological autonomy and relieving them of foreign reliance. By utilizing the licensor's established techniques and technical methods, licensees can bypass the need for research, practical experiments, and the associated risks and expenses [16].

Licensing contracts offer the recipient (importer) the advantage of preserving their national capital, without having to distribute it with the supplier (exporter). Additionally, the importer has full control over the project, without any involvement from the supplier in the production process [17]. These contracts play a vital role in the development of countries, particularly those with limited capital resources. They serve as valuable tools in overcoming economic disadvantages and promoting progress. Licensing contracts facilitate the transfer of technology to developing nations, whether it be for patent exploitation or technical know-how. This results in the exchange and dissemination of technology among developed countries as well [18, 38].

One instance of a technology transfer licensing contract involves the utilization of military technology in civilian applications, as demonstrated by the Brazilian-produced combat vehicle called the EE. Ix Cascavel, also known as EE. XIURUTu. This vehicle is manufactured domestically and incorporates licensed components from companies such as Mercedes-Benz, as well as Belgian and French manufacturers, for the production of cannons and armor [13].

One prominent instance of how licensing contracts are put into practice is through franchise contracts, also known as Franchises. As economic activities and contractual relationships continue to evolve, new and intricate forms of contracts have emerged to keep up with these changes. Franchise contracts have become one of the most significant and extensively utilized contracts on a global scale. The United States took the lead in promoting the widespread adoption of this contract type, especially following World War II [18].

Several definitions of the franchise contract have been provided. Among them are the following:

- The European Franchise Federation (EFF) defines it as the collaboration between two separate entities, the franchisor and the franchisee, forms the foundation of a marketing system that promotes goods, services, or technology. This system

operates on the basis of continuous and intimate cooperation. In return for financial compensation, either direct or indirect, the franchisor grants the franchisee the privilege of utilizing their name, trademark, or service mark, along with their technical expertise, commercial strategies, procedural systems, and intellectual property rights. Throughout the duration of the franchise contract, the franchisor remains dedicated to offering both commercial and technical assistance to the franchisee [12, 39].

- The American Franchise Association (AFA) defines it as the process of establishing a connection between the proprietor of a particular trademark for manufacturing a specific product or service and a separate party desiring to produce or provide the same product or service utilizing the identical trademark is known as franchising. This encompasses the adherence to the unique trademark, signs, symbols, and other designated characteristics set forth by the franchisor, with the franchisee remunerating a predetermined fee to the franchisor [19, 31].
- According to legal scholars, a franchise contract is defined as two legally independent entities, the franchisor and the franchisee, enter into a contractual contract wherein the franchisee is given permission to utilize the intangible and vital assets of the franchisor's thriving business. This includes the comprehensive technical expertise. The purpose of this arrangement is to enable the franchisee to manufacture, distribute, or offer services based on the franchisor's established method, with the ongoing support of the franchisor. In exchange for this opportunity, both parties agree upon a predetermined set of financial payments, with the specific payment terms clearly outlined [20]. It is also defined as the contract that allows a producer or supplier to give a trader permission to utilize sales techniques, service resources, and technical expertise offered by the grantor or licensor [21].

4 Conclusion

By focusing on both simple and complex technology transfer contracts, this analytical study highlights the significant role these contracts play in facilitating the transfer of technology from developed to developing countries.

4.1 Findings

1. The utilization of technical assistance contracts proves to be highly effective in both training the workforce in developing countries and facilitating the integration of technology.
2. The inclusion of engineering contracts ensures that design and implementation responsibilities are clearly defined, thus fulfilling the need for specific obligations.

3. When it comes to complex technology transfer contracts, the supplier's responsibilities go beyond simply transferring technical knowledge; they also encompass providing services, raw materials, and even constructing industrial facilities.
4. While turnkey contracts provide the benefit of swift technology implementation and a consolidated responsibility, they may not be suitable for developing nations that lack the necessary technological capability and training.
5. In response to the limitations of turnkey contracts, production delivery contracts have emerged as an alternative solution that addresses the need for ongoing operational commitments and training, albeit at a higher cost and with the requirement for extended supervision.
6. Utilizing licensing contracts can bolster the technological capabilities of developing nations without necessitating substantial investments, although their effectiveness in fostering sustainable technological advancement may be limited.

4.2 Recommendations

1. To improve the effectiveness of technology transfer contracts, technical assistance contracts should be improved by including precise conditions on training and the number of trainees in developing countries to ensure their full benefits. When it comes to engineering contracts, it is necessary to strengthen them by clearly defining the supplier's responsibilities and distinguishing between consulting and actual implementation.
2. Expand research contracts by focusing on different stages of research and defining precise responsibilities to achieve effective results that advance technology and innovation.
3. Contracting parties should clearly allocate responsibilities in complex technology transfer contracts to ensure the achievement of specific objectives and avoid disputes.
4. Turnkey and production delivery contracts should focus on providing adequate training for local labor in developing countries to ensure sustainable technology development.
5. Reduce costs associated with production delivery contracts by streamlining project management and avoiding excess costs that can burden developing countries.

Transformative Asset Management Strategies: Insights from NIST CSF

Shreeganesh D. Jadhav, Hemraj Shobharam Lamkuche, Mohammad Temeiza, and Ghassan Samara

Abstract This report provides an in-depth examination of asset management strategies carried out in accordance with the NIST Cybersecurity Framework (CSF). The aim is to demonstrate the effectiveness of implementing industry-standard tools to manage and secure organizational assets, including data, hardware, software, systems, facilities, services, and people. Through strict adherence to the NIST CSF guidelines, each sub-category of the Asset Management function was addressed via specific tasks and tools. The methodology entailed creating and regularly updating comprehensive inventories of hardware and software assets, mapping internal and external data flows, managing services supplied by vendors, prioritizing assets based on their criticality, and ensuring thorough lifecycle management of all assets. Tools such as Lansweeper, Spiceworks, Microsoft SCCM, PDQ Inventory, Wireshark, Microsoft Visio, Cloud-Health, Qualys, Bulk Extractor and Exiftool were utilized to carry out these tasks. The key findings emphasize the efficiency and reliability of these tools in maintaining up-to-date asset inventories, mapping network data flows, and managing the lifecycle of assets. The implementation of these tools resulted in a more structured and secure asset management process, aligned with organizational objectives and risk strategies. By providing detailed insights and best practices

derived from our practical assessment, this paper aims to guide organizations in optimizing their asset management processes through the effective adoption of NIST CSF principles.

Keywords Asset management · NIST CSF · Cybersecurity · IT asset management · Lifecycle management

1 Introduction

This paper investigates the implementation of Asset Management (AM) within the NIST Cybersecurity Framework (CSF) in a university setting. It examines how structured asset management, guided by NIST CSF, enhances security and management of critical assets. The study highlights the importance of using industry-standard tools, such as Lansweeper and Wireshark, to improve asset inventory, network data flow, and lifecycle management. The findings support integrating these tools within NIST CSF for effective asset management and offer insights for organizations aiming to align their practices with the framework.

2 Background and Literature Review

Digital asset management (DAM) has become an essential tool for organizations seeking to efficiently organize, manage, and distribute their digital assets in today's increasingly digital business environment. Re Cecconi, in their paper:

"Digital Asset Management," argue that DAM is crucial for "increasing efficiency and productivity, which provides access to approach, distribution and sharing of assets, a system that saves a significant amount of time and, potentially, money." Similarly, Alqahtani and Alqahtani, in their work "Critical Assessment of Issues and Benefits of Digital Asset Man-agement," [1] discuss how DAM systems offer significant potential benefits, including improved efficiency, productivity, and collaboration. Both papers highlight several challenges in DAM implementation. Re Cecconi [10] point out issues such as difficulties in quickly accessing assets, especially for large organizations with vast digital libraries, and high costs associated with setup, data migration, and staff training. Alqahtani and Alqahtani add to this list, mentioning security concerns around protecting digital assets, copyright and digital rights management considerations, and potential resistance from stakeholders. Despite these challenges, both sets of authors argue that the benefits of DAM can be substantial. Alqahtani and Alqahtani specifically highlight benefits such as "time savings from more efficient file searches and access, improved collaboration across departments, and enhanced brand image and consistency." To maximize the benefits of DAM, the authors offer several recommendations. Re Cecconi et al. emphasize the importance of appropriate technology infras-tructure and thorough staff training.

Alqahtani and Alqahtani suggest establishing a dedicated DAM team, using robust metadata and taxonomy systems, and integrating DAM with social media and other key platforms. While implementing DAM requires careful planning and execution, both papers conclude that the potential to improve efficiency, collaboration, and digital asset utilization makes it an increasingly important system for many organizations to consider in today's digital-first business landscape.

In "Computer Vision Applications in Construction and Asset Management Phases: A Literature Review," [6] Dr. Zhouqian Jian presents a framework for utilizing computer vision technologies in asset management. The research identifies various applications, including safety monitoring and infrastructure inspection, and underscores the potential of visual data to enhance project efficiency and decision-making. Dr. Paul Brous's paper, "Factors Influencing Adoption of IoT for Datadriven Decision Making in Asset Management Organizations," [2] explores the challenges organizations face in adopting IoT technologies for asset management. He discusses the complexities of integrating new data sources into decision-making processes and emphasizes the importance of effective data governance to enhance the quality and usability of IoT data. In "Development of Integrated Stormwater Asset Management Framework," [4] Dr. authors focus on the challenges faced by municipalities in managing stormwater assets. Her research highlights the need for integrating AI and best management practices into existing frameworks to improve sustainability and reduce the risk of asset failures. Green's study emphasizes the importance of a comprehensive approach to asset management in urban environments. The paper "Artificial Intelligence in Construction Asset Management: A Review of Present Status, Challenges and Future Opportunities," [9] explores how AI can transform asset management in the construction sector. She discusses the barriers to AI adoption and highlights the potential for AI-driven solutions to improve decision-making and operational efficiency in managing construction assets. Dr. William A Cleland's study, [3] "Best Practices in Digital Asset Management for Electronic Texts in Academic Research Libraries," addresses the challenges libraries face in managing digital information. He identifies gaps in existing literature regarding best practices for digital asset management, particularly in areas such as digital rights management and metadata standards. Cesarini advocates for the development of comprehensive strategies to enhance the management of electronic texts in academic settings. In "An Analysis of Physical Asset Management Core Practices and Their Influence on Operational Performance," [7] Dr. Damjan Male examines the impact of core physical asset management practices on organizational performance. Her research shows that effective management practices directly influence operational efficiency and highlights the need for organizations to integrate these practices into their overall business strategies. The "Strategic Aspects of Asset Management: An Overview of Current Research," paper [5] analyzes over 700 articles to identify the strategic dimensions of asset management. He points out that organizations often lack a coherent understanding of how to align their asset management strategies with overall business objectives. Carter emphasizes the importance of a strategic approach to gain sustainable competitive advantages in a rapidly changing environment. And at last a bibliometric analysis titled "Asset Valuation and Management:

A Bibliometric Analysis" [11] explores the significance of accurate asset valuation in investment decision-making, particularly in the aftermath of the 2008 financial crisis. The study identifies declining research output in this area and calls for renewed scholarly focus on emerging asset classes, such as cryptocurrencies, to better navigate market dynamics. Blockchain in asset management: An extensive review of opportunities and challenges" [8], Blockchain technology has emerged as a transformative force within the financial sector, particularly in asset management. This paper provides a comprehensive review of the opportunities and challenges associated with integrating blockchain in asset management practices.

3 Methodology

Our project demanded versatility, prompting us to harness the power of local networks built through inventorying virtual machines across our laptops. This decentralized approach facilitated rapid inventorying and experimentation, empowering our team to iterate swiftly and adapt to evolving requirements. We conducted the asset management tasks on virtual machines to simulate a dynamic and scalable environment, which allowed us to efficiently manage and evaluate various assets. To begin with, we used tools that are widely known in the industry like Lansweeper and Spiceworks to create an inventory of all hardware assets which was maintained with a lot of scrupulousness. Every team member had several VMs running on their laptops, those were the lab equipment we built, emulating a diverse but robust virtual network. It was via Lansweeper and Spiceworks that we were able to reach such depth for virtual machine hardware configurations (in addition software) that our inventory became very accurate, up-to-date. The setup allowed us to model real-world scenarios and gain insights around the challenges of managing disparate hardware assets in a sandbox environment. In addition to managing hardware assets, we focused on maintaining an inventory of software, services, and systems managed by the organization. Utilizing tools such as Microsoft SCCM (System Center Configuration Manager) and PDQ Inventory, we developed and updated a comprehensive inventory of software applications and operating systems deployed across our virtual machines. This process involved meticulous tracking and documentation of each software asset, ensuring that all applications were accounted for and their configurations were accurately recorded. The use of these tools allowed us to streamline the software inventory process and maintain a high level of accuracy and consistency. Additionally, we kept an inventory of the offerings from suppliers, chronicling all outsourced utilities, such as cloud-based and third-party benefits. Leveraging cloud administration platforms similar to CloudHealth and provider oversight platforms, we recorded these utilities to make sure a complete comprehension of external relies. This methodology was indispensable for pinpointing likely hazards linked with third-party utilities and guaranteeing that every outside possessions were suitably oversaw and tracked. Furthermore, it empowered us to consistently survey changes to outsider administrations and screen new openings. On occasion, longer sentences were utilized to shed

light on intricate relationships between inner and outside elements. In the meantime, shorter expressions gave important subtleties and emphasis when important. Our asset management process has always revolved around the categorization and prioritization of assets which is based on their criticality relative to business activities. Tools like Qualys is employed in asset categorization, while customized spreadsheets are used for asset prioritization. As a result of this structured classification and ranking, resources could be allocated efficiently and high-priority assets which were exposed it was rendered invincible from risk. This method of categorization was based on painstaking analysis of each individual asset's role in the organization, its importance to crucial business activities and what would be lost or impaired by its failure. Priority levels was allocated to each asset, thus creating a clear hierarchy which would then be reflected in resource allocation and risks management efforts. In addition, we have also focused to maintain data and accompanying meta data inventory for specific data types. In this article, we have used Data Loss Prevention (DLP) solutions like Bulk Extractor and Exiftool or to identify, classify and keep an inventory of critical data and meta data. It involves tight documentation of data types, where they are kept and permissions for accessing them—ensuring sensitive information is fully protected and maintained. The inventory of data and meta data has been kept continually updated to take account of changes in data usage, storage or classification. This in turn serves as a dependable source for data management and security policies. Also among our methods is the management of equipment lifecycle from procurement to scrapping. We used IT Asset Management (ITAM) solutions and Endpoint Central for lifecycle management, enabling us to follow assets through all their lifecycle stages. This approach meant that assets are managed efficiently, from when they are acquired and deployed to the maintenance, and on to eventual disposal-fundamentally in line with best practices on asset management. Lifecycle management meant planning the acquisition of assets, putting strategies into play to make them run effectively, and setting down rules for their decommissioning and disposal. This way, we made the most out of each asset and minimized potential risks associated with later asset obsolescence or failure. Besides fulfilling the NIST CSF as our standard, our method also introduced novel tools and means to enrich our management of assets. By taking advantage of virtual machines, building subnets on Microsoft Azure, and utilizing a suite of industry standard tools, we created a dynamic and scalable Asset management system. This approach also helped us to achieve a thorough understanding of the University's assets in promoting good practice. And because it was so closely integrated with other core processes, we were able to ensure that all those objectives aligned effectively together. The insights gained from this methodology will aid in understanding how asset management contributes to the NIST CSF as well as offer practical guidance for those undertaking similar tasks in their own environments. Under this complete methodology it is particularly important to be flexible and open in managing the assets of an educational institution in such a dynamic environment combining its diversified features. The combination of virtualized environments, refined tools, and a systematic process ensured precision in the University's asset management and brought about good effects in overall terms. This methodology indeed serves as golden rule–learned from its success can be

applied elsewhere. And by integrating innovative technology with strategic thinking we show that an organization of any size can fulfill both management goals and cultural objectives [12–19].

4 Asset Management Tasks and Tools

The format of the outcome is as, Task followed by tool followed by the results.

A. Inventories of Hardware Managed by the Organization.

Task: Compile and regularly update a detailed inventory of all hardware assets.

Tools: Lansweeper, Spiceworks for asset management.

Results and Outcomes: Efficient asset management is vital for organizational success. This part outlines our use of Lansweeper and Spiceworks to optimize asset management processes. Lansweeper provides detailed network inventory and software tracking, facilitating informed decision-making and proactive monitoring. Spiceworks complements Lansweeper with help desk ticketing and contract management features, enhancing collaboration and cost optimization. Additionally, Lansweeper enhances cybersecurity through regular vulnerability assessments. Continuous optimization efforts are essential for maximizing value. By leveraging these tools, we aim to elevate efficiency, effectiveness, and long-term success in asset management.

5 Asset Management Tasks and Tools

The format of the outcome is as, Task followed by tool followed by the results.

A. Inventories of Hardware Managed by the Organization.

Task: Compile and regularly update a detailed inventory of all hardware assets.

Tools: Lansweeper, Spiceworks for asset management.

Results and Outcomes: Efficient asset management is vital for organizational success. This part outlines our use of Lansweeper and Spiceworks to optimize asset management processes. Lansweeper provides detailed network inventory and software tracking, facilitating informed decision-making and proactive monitoring. Spiceworks complements Lansweeper with help desk ticketing and contract management features, enhancing collaboration and cost optimization. Additionally, Lansweeper enhances cybersecurity through regular vulnerability assessments. Continuous optimization efforts are essential for maximizing value. By leveraging these tools, we aim to elevate efficiency, effectiveness, and long-term success in asset management (Figs. 1 and 2).

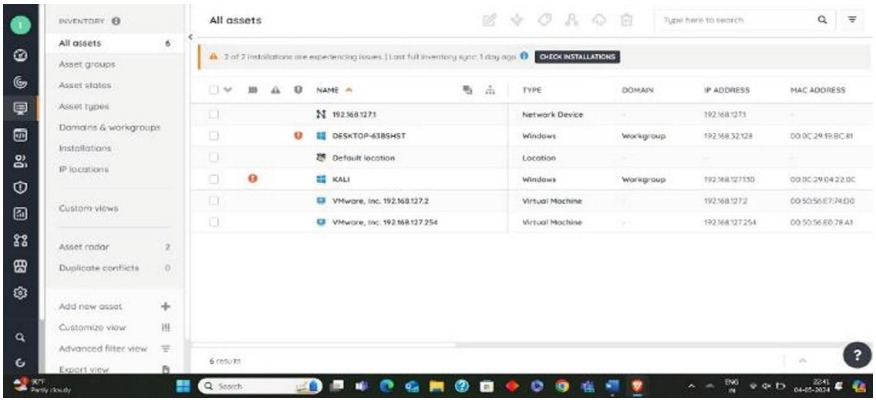

Fig. 1 Hardware inventorying with Lansweeper

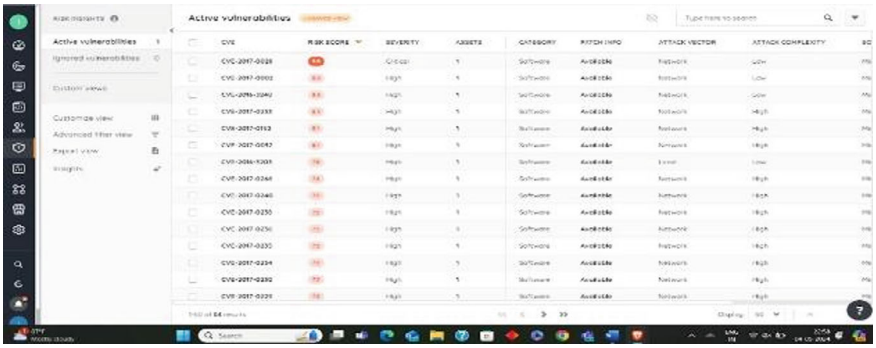

Fig. 2 Vulnerability assessment with Spiceworks

Other several promising features of Lansweeper includes Software Inventorying, Network Inventorying, Help Desk, Ticket System. Whilst The Spiceworks comes with few more features like Contract Management, Vulnerability Assessment along with strong insights, auto-generated reports.

A. Inventories of Software, Services, and Systems Managed by the Organization.

Task: Develop and update a comprehensive inventory of software applications and operating systems.

Tools: PDQ Inventory.

Results and Outcomes: PDQ Inventory is a systems management solution that allows IT administrators to scan their network and collect hardware, software, and Windows configuration data. It scans Windows computers to collect hardware, software, and Windows configuration data and can be used to create reports and collections. Administrators can use PDQ Inventory to remotely restart or shut down

systems, use Wake-on-LAN to boot offline PCs, send commands to target computers and use Remote Desktop and other remote control tools (Figs. 3 and 4).

The advantages and applications of the PDQ Inventory can be summarized as, it covers Patch Management, custom reporting and filtering, automation and scheduled tasks, integration with Active Directory, scalability.

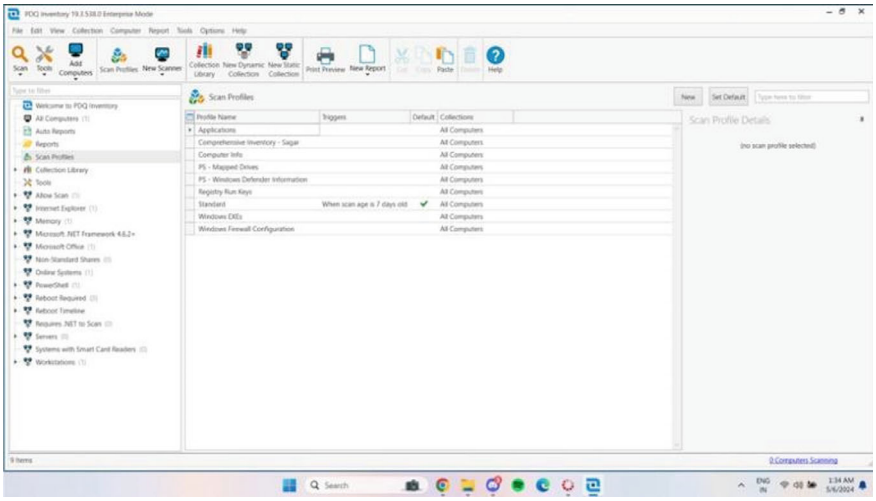

Fig. 3 Scan profiles in PDQ inventory

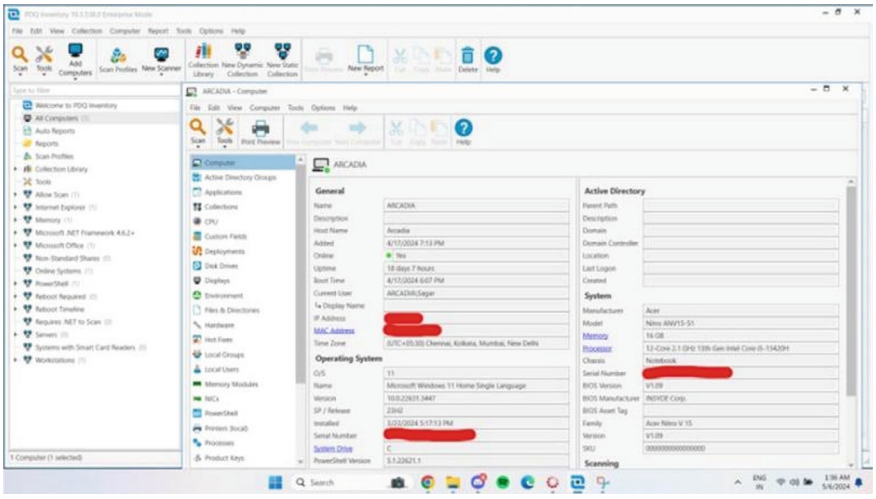

Fig. 4 Results after inventorying software and hardware

B. Representations of the Organization's Authorized Network Communication and Internal and External Network Data Flows

Task: Map and document internal and external data flows to understand data transmission paths.

Tools: Nmap and Wireshark for network analysis.

Results and Outcomes: The task is to analyze network traffic and communication logs to identify authorized data flows and potential deviations. We have done thisscans on the subnets created over Azure AD (Fig. 5).

Nmap provides a high-level overview of network devices and services. For in-depth data flow analysis, Wireshark is a more suitable tool (Fig. 6).

Wireshark captures actual network traffic, providing a detailed picture of data flow compared to Nmap's high-level scan results. However, due to the volume of captured data, Wireshark requires focused filtering and analysis for effective use.

```

Host is up (0.24s latency).
Not shown: 999 filtered tcp ports (no-response)
PORT   STATE SERVICE
22/tcp open  ssh

Nmap done: 1 IP address (1 host up) scanned in 78.99 seconds
```

Fig. 5 Nmap port and service detection

Fig. 6 Wireshark flow analysis

Fig. 7 FlexReport in CloudHealth

C. Inventories of Services Provided by Suppliers

Task: List all external services, including cloud and thirdparty services.

Tools: CloudHealth, vendor management systems.

Results and Outcomes: Effective management of supplier services is essential for ensuring that external services, including cloud and third-party services, meet organizational needs and performance standards. CloudHealth by VMware is a powerful platform that provides comprehensive visibility, optimization, and governance for cloud services, making it an ideal tool for managing supplier services. CloudHealth offers several key features that contribute to the effective management of supplier services such as visibility and insights, cost management and optimization, governance and compliance, risk management and reporting (Fig. 7).

CloudHealth by VMware is a valuable tool for managing supplier services, providing comprehensive visibility, cost management, governance, and risk management capabilities. Its use has led to enhanced control, cost savings, improved compliance, and proactive risk management, contributing to the overall success of managing supplier services in the organization.

D. Assets Are Prioritized Based on Classification, Criticality, Resources, and Impact on the Mission

Task: Classify and prioritize assets based on their criticality and impact on the business.

Tools: Qualys for asset classification, custom spreadsheets for prioritization.

Results and Outcomes: Qualys comes with a scanner appliance. With these we can assess different asset categories, ranging from home networks to large distributed

networks. It allows us to evaluate internal network devices, systems and web applications (Figs. 8 and 9).

E. Inventories of Data and Corresponding Metadata for Designated Data Types

Task: Identify, classify, and maintain an inventory of critical data and metadata.

Tools: Bulk Extractor and Exiftool, for data classification.

Results and Outcomes: Bulk extractor is a C++ program that scans a disk image, a file, or a directory of files and extracts useful information without parsing the file system or file system structures. The results are stored in feature files that can be easily inspected, parsed, or processed with automated tools. Bulk extractor also creates histograms of features that it finds, as features that are more common tend to be more important (Fig. 10).

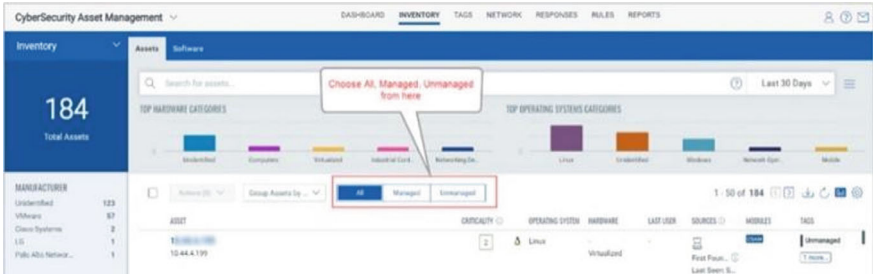

Fig. 8 Qualys asset classification I

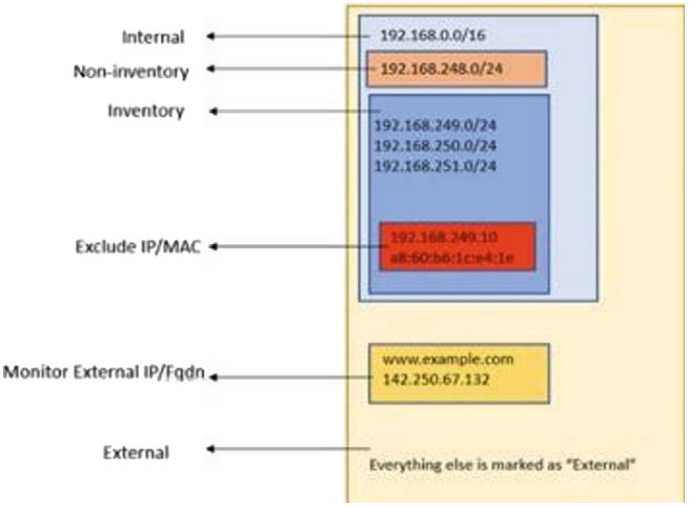

Fig. 9 Qualys asset classification II

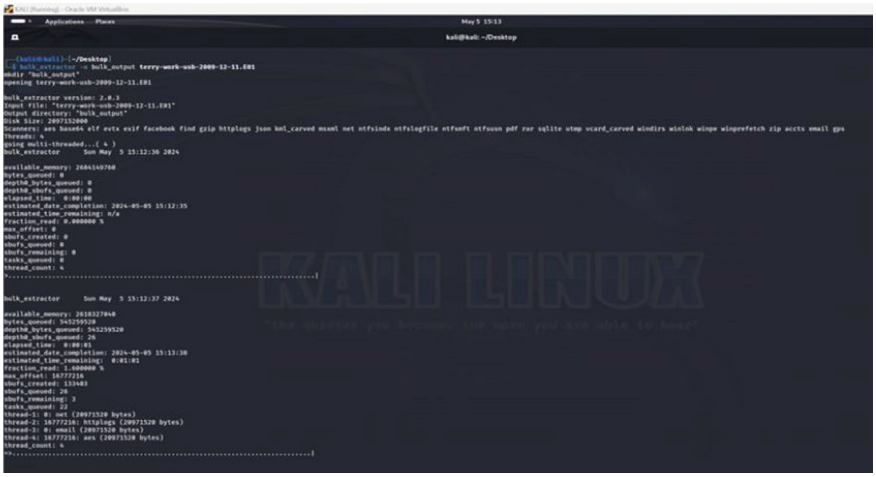

Fig. 10 Extracting data with help of bulk extractor

ExifTool is a command-line tool that allows you to read, write, and edit metadata in various file types, including images, documents, and audio/video files. You can use it to extract metadata associated with designated data types. Extracting metadata from Photos using ExifTool (Fig. 11).

F. Systems, Hardware, Software, and Services Are Managed Throughout Their Lifecycle

Task: Manage the lifecycle of systems, hardware, software, and services from procurement to disposal.

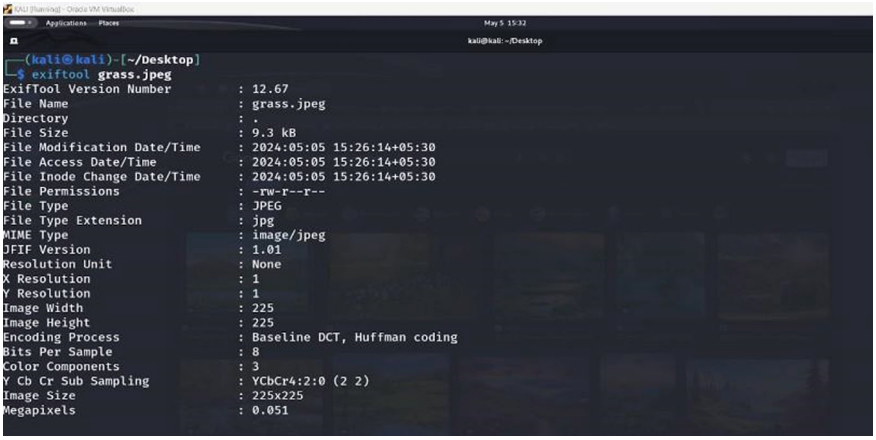

Fig. 11 Exiftool

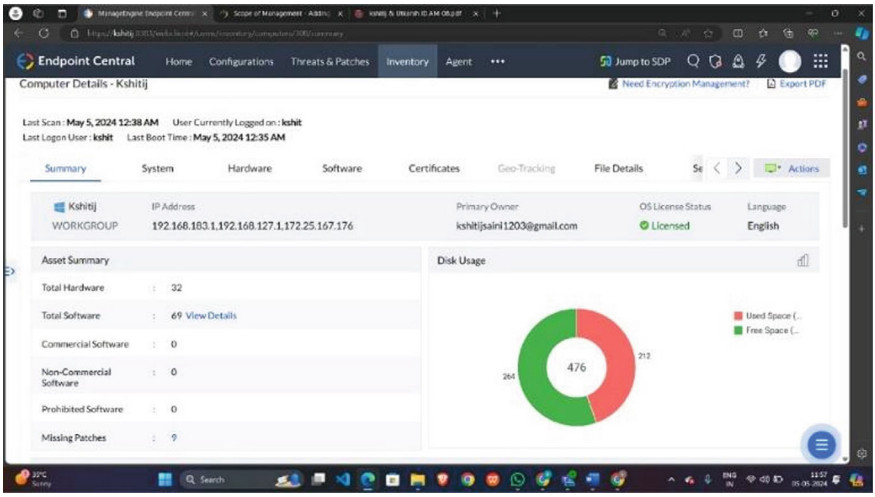

Fig. 12 Asset summary of deployed device

Tools: ITAM solutions, Endpoint Central for lifecycle management.

Results and Outcomes: Endpoint Central facilitates comprehensive lifecycle tracking by monitoring asset warranties, maintenance schedules, and depreciation. Organizations leverage Endpoint Central's analytics to optimize asset usage, identify opportunities for consolidation or retirement, and plan for upgrades or replacements based on lifecycle projections. Secure disposal practices are also facilitated, ensuring proper data erasure and compliance with regulatory requirements for asset retirement (Figs. 12 and 13).

Endpoint central comes with bunch of features like detailed license reporting, invoice information, battery information, hard disk information, processor information, health graph, network patch graph, and many more.

6 Best Practices and Recommendations

For those interested in implementing effective asset management strategies by using industry standard tools it is necessary to plan carefully, monitor continuously and adhere to best practices. With the ongoing and significant use of various tools such as Lansweeper, Spiceworks, PDQ Inventory, Wireshark, CloudHealth by VMware, Qualys, Bulk Extractor, ExifTool, and Endpoint Central, the we have devised a set of recommendations. Combining tools can increase the effectiveness of the tools and provide a more comprehensive view of asset management. For example, combining Lansweeper's inventory capabilities with Spiceworks' help desk and

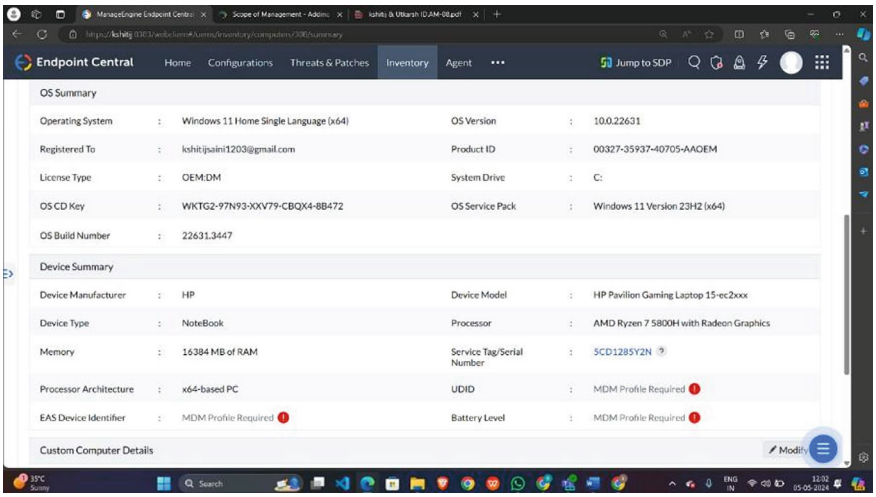

Fig. 13 OS summary of deployed device

contract management modules can improve both asset tracking and service management. As another example, one can integrate PDQ Inventory with Active Directory to ensure consistent user and asset management. Communicate clearly and set expectations with vendors. Use a tool such as CloudHealth to monitor and manage third-party services to ensure performance and security compliance. Regularly review service level agreements and performance metrics to maintain high standards.

Use automated features in tools such as PDQ Inventory or Endpoint Central to schedule regular maintenance tasks, update tasks, and vulnerability scans. Automating processes can reduce the amount of manual time required and ensure that important exercises are performed consistently and in a timely manner. Remember that asset management is an ongoing effort and will need continuous updates. Review asset management practices consistently to adapt to and take advantage of the increasing number of products and tools. Train employees on asset management tools and best practices to make sure that they are being utilized properly and effectively. Carefully document all asset management processes and the tools that are used. Regularly produce and review reports to monitor asset performance, see trends, and make informed decisions. Cultivate and embrace a culture of collaboration and communication within the organization. Encourage multiple departments (IT, operations, finance) to work together to manage assets. If everyone involved knows the asset management practices and policies in place, that will lead to both better compliance and efficiency in the organization.

7 Conclusion

Asset management is an essential aspect for the effective operation and success of an organization. It is imperative for an organization to have an accurate inventory of all assets, to monitor and maintain all the assets, to make data-driven decisions and to adhere to industry regulations. Integrating asset management enables organizations to have a better understanding of asset utilization and performance, enables proactive monitoring, risk management, and compliance. Through this study, the importance of continuous improvement, automation, and having an up-to-date inventory were discussed and these practices improve operational efficiency and the implementation of a successful ISMS. In sum, asset management practices support the organization, provide visibility into utilization, enable optimization of costs, and enable the organization to have an understanding of the performance of their assets to make informed decisions for future goals strategically. The asset management principles and methodologies provide a solid foundation for the recognition that asset management has evolved into a proactive, forward-thinking, risk- and performance-based area. Organizations must leverage these principles to sustain assets, manage their performance, and make better, more confident decisions that will result in continued achievement in an environment that is highly dynamic and competitive.

Acknowledgements I would like to express my deepest gratitude to Dr. Hemraj S. Lamkuche for his invaluable guidance and support throughout this research journey. His expertise and insights have been instrumental in shaping the direction and success of this study. Dr. Lamkuche's work, "Cybersecurity Framework 2.0: Functions, Categories, and Subcategories of the Framework Core. List of tasks and tools to be used in order to execute respective function smoothly." served as the foundational blueprint for this research, providing a comprehensive list of tasks and tools essential for executing the asset management function effectively. His encouragement and constructive feedback have significantly contributed to the depth and rigor of this research. I am profoundly grateful for his mentorship and the opportunity to learn from his extensive knowledge and experience.

Differences Between Geographical Indications and Trademarks: An Analytical Study of Practical Applications, Legal Protection, and Digital Transformation

Omar Al Makhzoumi and Salma Fathy Abdel Qader Abdel Halim

Abstract This research explores the distinctions between geographical indications and both individual and collective trademarks in relation to intellectual property rights. The objective is to elucidate the differences among these various types of intellectual property. Findings indicate that geographical indications identify products based on their geographical origin, whereas trademarks serve to differentiate products and services more broadly. Additionally, the research reveals that individual trademarks are owned by a single entity to distinguish its offerings, while collective trademarks are shared among multiple entities to differentiate the products of their members. The legal distinctions are emphasized, highlighting that while trademarks can be licensed, geographical indications cannot be, and the latter benefits from perpetual protection. Through practical examples, including the Cajamarca case in Peru, the research demonstrates how to distinguish between a geographical indication and a trademark. It also advises companies and farmers on selecting the appropriate intellectual property form according to the product type and target market, and advocates for the registration of geographical indications to bolster the protection of local products and enhance consumer trust. Moreover, the emphasis is placed on the accurate registration of both individual and collective trademarks, ensuring clarity between these trademarks and geographical indications. It advocates for a reassessment of the laws that safeguard these rights to align them with international standards and prevent deceptive practices. Given the rise in digitalization, the study also recommends the incorporation of digital tools and platforms into the registration and monitoring processes for geographical indications and trademarks. This integration would not only simplify the registration process but also improve transparency, ease access to global markets, and offer stronger protection against digital

violations. Additionally, the proposal includes utilizing blockchain technology for verifying authenticity and traceability, which would bolster consumer confidence in products with geographical indications.

Keywords Geographical indications · Trademarks · Intellectual property rights · Individual trademarks · Collective trademarks · Legal protection · Distinction · Rights registration · International laws · Digital transformation · Blockchain technology · Digital infringement

1 Introduction

Geographical indications and trademarks fall under the umbrella of intellectual property rights, each providing its owners with the right to exploit them. Nevertheless, a geographical indication differs from a trademark. Trademarks can further be categorized into individual trademarks and collective trademarks. What defines each of these categories, and what criteria are used to differentiate between them?

Trademarks are categorized into individual marks and collective marks. An individual trademark is described as "any mark used or intended to be used on any goods, or in connection with them, to indicate that those goods belong to the owner of the mark by virtue of their manufacture, production, certification, trade, or offering for sale" [1].

Conversely, a collective trademark is described as "a mark utilized by a legal entity to authenticate the origin of goods not produced by itself, the materials used in their creation, their quality, the production methods, or the accuracy involved in their manufacturing, along with other attributes of those goods, such as the (ISO 9001) mark" [1, 2].

The ownership structure distinguishes an individual trademark from a collective trademark: an individual trademark can be held by either a person or a company, whereas a collective trademark is jointly owned by several entities, including groups of institutions or unions. Furthermore, unlike an individual trademark, which requires the owner's consent for any transfer or assignment, a collective trademark can be transferred or assigned without the necessity of such permission [2].

With the advent of the digital age, the differentiation between geographical indications and various types of trademarks becomes more complex due to the growing prevalence of digital platforms and technologies in commerce and the management of intellectual property. By incorporating digital tools for the registration and monitoring of these intellectual property rights, their protection can be improved, safeguarding ownership rights in the digital landscape and preventing consumers from being deceived by counterfeit or unauthorized goods.

Consequently, this research seeks to examine the distinctions between Geographical Indications and Trademarks, emphasizing their legal, practical, and digital ramifications.

1.1 Study Objectives

- Identify the differences between geographical indications and trademarks (both individual and collective) in terms of their definition and function.
- Explain the criteria for distinguishing between geographical indications, individual and collective trademarks and patents.
- Provide practical examples illustrating how GIs and trademarks are used in both global and local contexts.

1.2 Study Methodology

The research utilized a descriptive-analytical methodology to examine the distinctions between trademarks, both individual and collective, and geographical indications within the framework of intellectual property rights. This particular methodology was selected for its capacity to deliver an accurate and thorough analysis of the legal concepts and variances between these two forms of intellectual property. By employing a descriptive-analytical approach, the study facilitates an objective evaluation and interpretation of the existing data and information, aiding in the clear differentiation of each type of intellectual property right and emphasizing the legal and practical disparities that exist between them.

2 Distinguishing Between Geographical Indications and Individual Trademarks

Jordanian law characterizes a trademark as "any visible sign used or intended to be used by any person to distinguish their goods or products or services from those of others" [3]. According to the Supreme Court of Justice, a trademark consists of "letters, designs, marks, or a combination of these elements with distinguishing (distinctive) characteristics in a form that ensures the differentiation of the owner's goods from those of others" [4]. Professor Dr. Samihah Qalioub describes a trademark as "any sign or indication placed by a trader or manufacturer on the products they sell or produce to differentiate these products from other similar goods" [5]. Dr. Salahuddin Al-Nahi defines it as "a sign used to label goods, products, or services to distinguish them from similar goods from other traders or industrial producers" [6]. Dr. Salah Zainuddin states that it is "any sign used or intended to be used by any

person to distinguish their goods or products or services from those of others" [7]. Finally, Dr. Naseem Khaled Al-Shawawra defines a trademark as "any visible sign (which can be embodied) that allows the manufacturer, trader, or service provider to distinguish their products, goods, or services from similar or comparable products, goods, or services from others" [8].

As previously described, a geographical indication serves as a reference or symbol utilized by a producer to differentiate their products, inherently tied to a unique attribute of the item based on its production location. Most legal frameworks stipulate that for a geographical indication to receive protection, it must have been recognized in its country of origin. Conversely, a trademark refers to any symbol employed by a trader, producer, or service provider to set their goods or services apart from those offered by other traders.

Trademarks can incorporate geographical indications as long as they contribute distinctive characteristics that differentiate them from similar trademarks within the same nation, and the products labeled with this geographical name truly come from that specific location. If not, we risk encountering a trademark for goods that do not actually originate from the named country, which amounts to a form of fraud and deception.

The differentiation between trademarks and geographical indications is essential when a geographical name serves as a trademark to identify goods or products associated with that particular region. In these instances, it is necessary to ascertain whether it qualifies as a trademark or a geographical indication.

In order to clarify this confusion, the TRIPS Agreement mandates that member nations must reject or annul the registration of a trademark if it includes a geographical indication that deceives consumers into thinking the product is safeguarded in another country. This requirement is also outlined in Article (4) of the Jordanian Geographical Indications Law [9].

Upon reviewing additional legislations, it becomes evident that Egyptian law allows for the registration of trademarks featuring a geographical indication [10]. According to Article (112), any party with an interest can initiate legal action in the appropriate primary court through standard procedures to prohibit the use of any geographical indication not part of a registered trademark if such usage deceives the public about the actual origin of the products. The relevant primary court is identified as the one situated within the area where the geographical indication is utilized.

3 Distinguishing Between Geographical Indications and Collective Trademarks

Both collective trademarks and geographical indications serve to authenticate the quality and attributes of products. In certain instances, a country may seek to monopolize the rights linked to a particular geographical indication in order to build

consumer confidence in these products and fulfill commercial objectives. To accomplish this, the country might implement a collective trademark for a product that features a geographical indication. This approach offers further safeguarding for the geographical indication and limits its application to the country of origin.

Residents of a region that employs a geographical indication to identify its products are not restricted from utilizing a collective trademark alongside the geographical indication. This arrangement guarantees that the unique characteristics of the products are preserved while granting exclusive rights to the products from that particular area when they are brought back to it [11].

Therefore, the distinction between a geographical indication and a collective trademark lies in the fact that a geographical indication is not possessed by any particular individual or organization, while a collective trademark is held by either a public or private legal entity. As a result, the holder of a collective trademark enjoys exclusive rights, which are not afforded to a single person.

Individuals residing in areas characterized by notable geographical indications can secure exclusive rights through a collective trademark, as outlined by the applicable collective trademark system. They must register this trademark in accordance with relevant legislation to guarantee that production adheres to the established quality standards and system, while also safeguarding their traditional manufacturing expertise handed down through generations. Typically, the application of a collective trademark serves to protect those from a particular region, provided they form an association that utilizes the collective trademark as a unique identifier for their products and services.

The situation in Peru regarding the "Cajamarca" issue illustrates this point, as the town is recognized for its dairy product production. Its name is linked to items like cheese and butter, attributed to the unique geographical traits of the area. Local producers established an organization known as the "Cajamarca Dairy Producers Association," which created a collective trademark for its members who manufacture dairy goods with unique characteristics. This initiative enhanced their ability to market and safeguard their products while ensuring quality through a specific collective trademark system. Consequently, they gained extra protection for their offerings, which included both the safeguarding of the geographical indication and the collective trademark, allowing them to monopolize and defend their products within the region.

By utilizing a collective trademark alongside geographical indications, small businesses can lower expenses and boost their competitiveness. This strategy offers further differentiation for their products and services, enhancing consumer trust in these offerings through the combination of both a collective trademark and a geographical indication.

The connection between collective trademarks and geographical indications illustrates how the former enhances the latter in terms of production and competition, a function that a standard trademark cannot provide. Nevertheless, nations such as the United States have broadened the scope of protection for geographical indications via a certification mark system, which permits these indications to be registered as

certification marks. This approach safeguards all products and services linked to a particular region by granting them certification mark status [11, 12].

A noteworthy discussion has emerged concerning the connection between geographical indications and collective trademarks, highlighted by a case from Peru involving the Combi Valley. This valley is renowned for its production of "cherimoya," a fruit that possesses unique characteristics specific to the region. Matildo Pires, an individual from the area, aimed to register "Cherimoya Combi" as a trademark with the National Institute for the Defense of Industrial Property, reflecting the name of the geographical location. The registrar indicated that while it could be recognized as a place of origin, such a designation would not confer exclusive rights to the producers, as those rights are held by the state. As a result, Pires proceeded to register it as a collective trademark, which is governed by the self-established regulations of the village members.

Following this thorough examination of the meanings of geographical indications and the categories of trademarks, both individual and collective, the distinguishing criteria between geographical indications and trademarks can be outlined as follows:

1. **Functional Criterion**: A trademark's role is to act as a sign or name that differentiates similar products from one another. Conversely, geographical indications serve to identify a particular region associated with a product renowned for its superior quality, arising from its geographical setting.
2. **Geographical Origin Criterion**: Goods and products that carry a trademark do not need to be manufactured in a designated region. For instance, cars branded with the Mercedes-Benz trademark are produced in various countries. Conversely, products that feature a geographical indication must be created or made within that particular geographical zone. Therefore, if a product is not made in its designated area, it does not meet the qualification.
3. **Scope of Use Criterion**: Trademarks serve to differentiate similar services, while geographical indications are not applicable to services. Rather, they are utilized to set apart agricultural, industrial, and artisanal products made in particular regions from those created in different locations. This distinction is evident in the TRIPS Agreement, which employs the term "goods" instead of "services."
4. **Legal Nature as a Right Criterion**: A trademark can be involved in licensing agreements, allowing the owner to authorize a licensee to utilize the trademark for differentiating their goods or services for a designated timeframe in return for a fee, while still maintaining ownership. In contrast, geographical indications cannot be licensed out due to their inherent ties to their geographic origin and the impossibility of monopolizing them. Article 8 of the Jordanian Geographical Indications Law, which addresses the safeguarding of geographical indications, indicates that the methods of protection vary greatly from those applicable to trademarks, which are secured through registration. Instead, geographical indications receive protection via civil lawsuits, highlighting their public character. According to Article 8 of the Jordanian Geographical Indications Law, "8. A. The interested party may file a civil lawsuit to prevent infringement on a geographical

indication…" This "interested party" encompasses anyone with a legal stake in the issue or those who might suffer from an infringement.

5. **Substantive Criterion**: Trademarks, in contrast to geographical indications, are required to fulfill certain criteria, including distinctiveness, novelty, visual perceptibility, legality, and, in some instances, the necessity of being expressed in its original language. Geographical indications, however, are exempt from these requirements apart from legality. Instead, the regulations stipulate that the indication must be connected to a specific geographical area, with its quality being tied to this location.

4 Criteria for Distinguishing Between Geographical Indications and Patents

According to Article 2 of the Jordanian Patents Law No. 32 of 1999, an invention is described as: "Any creative idea reached by an inventor in any field of technology relating to a product, a process, or both, which practically solves a specific problem in any of these fields," while a patent is defined as: "The certificate granted to protect the invention" [13].

According to the definition provided, an invention refers to any innovative concept conceived by an inventor in any technological domain concerning a product or its methodology. The primary requirement for obtaining a patent is novelty, which signifies that the inventor has developed something original that has not been previously accomplished by anyone else.

A patent is a certificate awarded to safeguard an invention, provided by the state to an inventor who fulfills the legal criteria necessary for its issuance, thereby granting them the legal right to the protection afforded to their invention. According to Dr. Samira El-Kiloubi, it is described as: "The certificate granted by the state to the inventor, which entitles them to exclusive and financial exploitation of their invention for a specified period and under certain conditions" [5, 14].

Regarding the conditions for obtaining a patent, the Jordanian Patents Law specifies:

1. **Novelty**: The condition of novelty for patent eligibility indicates that the concept behind the inventor's creation must be original, meaning it has not been previously utilized by others or patented. If this condition is not met, a patent cannot be issued [15]. The Jordanian Court of Cassation has stated: "The envelope intended for patent registration by the appellant lacks the characteristics and qualities of an invention, failing to present a new application of a known means for industrial purposes. The various uses of envelopes represent an established and ongoing practice, which involves attaching a white piece to the opening of the envelope to write the recipient's name each time it is reused. In contrast, an invention should offer a novel idea that surpasses existing industrial practices and enhancements, resulting in increased production or providing technical or economic benefits in

the industry, typically achievable through standard skills or technical knowledge" [16].

According to the Jordanian Patents Law and its accompanying executive regulations, individuals who intend to showcase an invention potentially eligible for a patent at any officially recognized exhibition, whether domestically or internationally, can receive protection for a duration of up to six months. This timeframe, however, is calculated from the priority period, which is defined as the one-year timeframe outlined in Article 3 of the Jordanian Patents Law.

2. **Involvement of an Inventive Step**: Beyond the requirement of novelty for patent eligibility, an invention must also demonstrate an inventive step that surpasses the typical level of industrial advancement. In simpler terms, for a patent to be awarded, the invention should not be apparent to an individual with expertise in the relevant technological area.
3. **Industrial Applicability**: To receive legal protection under patent law, the final requirement is that the invention must be applicable in an industrial context. Inventions that cannot be utilized within industry, such as a specific machine, product, or chemical substance, do not meet the criteria for patent eligibility. Patents do not extend to abstract concepts, purely scientific theories, or mathematical and computational formulas, regardless of their scientific significance. Likewise, discoveries pertaining to natural phenomena and their governing laws are not eligible for patent protection, irrespective of the research and effort invested in uncovering them. For an invention to be eligible for protection, it must demonstrate an application of these scientific ideas or theories through the production of a new product or the development of a novel industrial process [5, 17].

Patents and geographical indications are both intellectual property rights within industrial context, but they differ in four key points:

1. **Duration**: While a patent grants a temporary right, a geographical indication is typically viewed as a lasting protection, as most laws do not establish a specific time limit for its validity.
2. **Innovative Basis**: A patent is based on an innovative idea, while a geographical indication does not require novelty or innovation.
3. **Exploitation Rights**: A patent grants the owner the right to exploitation and exclusivity, whereas a geographical indication grants only the right to exploitation.
4. **Territorial Principle**: The principle of territoriality in patents dictates that an inventor is granted protection solely within the nation where the patent has been registered. This means that an individual in a different country, where the patent is not registered, can create the same product without violating the patent. On the other hand, geographical indications usually enjoy international protection that extends beyond the country of origin.

5 Criteria for Distinguishing Between Geographical Indications and Industrial Designs

Industrial designs represent a category of industrial property that, similar to other types of industrial property, encompasses intellectual creations utilized in industrial endeavors. Their distinction from artistic works lies in their intended function: a design is deemed an industrial design if it is developed for industrial manufacturing. Conversely, when a design serves to fulfill aesthetic or artistic preferences, such as a statue by a sculptor or a piece by a painter, it is regarded as purely artistic work and does not fall under industrial property classification. This differentiation is referred to as the criterion of purpose [18].

In Jordan, industrial designs are regulated by the Industrial Designs Law No. 14 of 2000. Article 2 of this law defines the terms as follows [5, 19]:

- Industrial design: Any design or layout of lines that imparts a unique or particular look to a product, whether produced by machines or crafted by hand, encompasses product designs.
- Industrial shape: A three-dimensional shape, regardless of its connection to lines or colors, that offers a distinctive look suitable for industrial or artisanal applications.

The criteria that distinguish geographical indications from industrial designs are as follows:

- **Shape Criterion**: Products often benefit from industrial designs that incorporate appealing shapes to entice consumers, resulting in a preference for one item over similar alternatives. A consumer may select a product based on its attractive lines, colors, or overall aesthetic, even if it lacks quality, as its visual appeal can overshadow the superior quality and materials of competing products [20]. Conversely, with geographical indications, the shape of the product does not provide any extra benefit; instead, it is the esteemed geographical origin that draws consumers' attention.
- **Ownership Criterion**: Geographical indications represent a type of industrial property right that solely permits the owner to exploit it. In contrast, industrial designs are registered under the manufacturer's name, signifying that ownership lies entirely with the designer, who retains rights to use, exploit, and dispose of the design [20].

6 Criteria for Distinguishing Between Geographical Indications and Certificates of Origin

A Certificate of Origin serves as a document that identifies the nationality of a product for specific reasons, including the assessment of applicable duties or preferential treatments. Issuance of these documents falls under the jurisdiction of the Chamber of Commerce in the exporting nation. Typically, this document encompasses details such as the place of manufacture, product number, quantity, weight, type, date of manufacture, and validity. It can be described as "the information provided on goods for clarification purposes" [21].

In order to prevent redundancy, a definition of geographical indications will not be included here, as it has already been addressed earlier. Both Certificates of Origin and geographical indications serve as labels on products, potentially leading to consumer confusion because of the challenge in differentiating between the two. Nonetheless, distinctions do exist, which are outlined as follows [22]:

1. **Objective Criterion**: The aim of employing a geographical indication is to signify the specific region where a product is well-known. Conversely, a Certificate of Origin serves to pinpoint the manufacturing location along with additional consumer-relevant details, including the product's weight, intended use, and its manufacturing and validity dates.
2. **Ownership Criterion**: As noted earlier, geographical indications represent a type of industrial property right that allows the owner to exploit it exclusively. In contrast, a Certificate of Origin grants its holder the rights to exploit, use, and dispose of the product.
3. **Legal Protection Criterion**: Given their significance, geographical indications are safeguarded by particular laws that fall under international protection, as outlined by the TRIPS Agreement. On the other hand, Certificates of Origin are governed by laws and regulations related to consumer protection.

Thereupon, a geographical indication or geographical statement serves as a label on products that possess a distinct geographical origin along with qualities, reputation, or characteristics largely associated with that origin. Generally, a geographical indication encompasses the name of the originating location and can apply to a wide range of goods, including agricultural, natural, or manufactured items.

Conversely, a specific category of geographical indication that signifies origin is applied to products possessing unique characteristics or attributes primarily linked to the geographical environment of their production. Designations of origin fall under the broader concept of geographical indications.

A trade name refers to a designation utilized by a merchant, whether an individual or an organization, to set their enterprise apart from others [23]. This name aids in distinguishing the business from similar entities, facilitating recognition for customers who favor it. As the quality of the products provided by a business enhances its reputation, the trade name increasingly becomes linked to that quality and rises in popularity [24, 25].

Trade names and geographical indications represent two categories of labels that can occasionally intersect, particularly when a trade name serves as a designation for a geographical location or a particular geographical indication linked to the products or goods available to consumers. This intersection may result in confusion among consumers. Thus, it is essential to delineate the distinctions and criteria for differentiating between the two, outlined as follows [23, 25]:

1. **Fame Basis Criterion**: A trade name gains its reputation from the quality of the products provided to consumers, whereas the recognition of a geographical indication arises from the unique human and natural characteristics that set a particular region apart from others [26].
2. **Legal Protection Criterion**: The protection of geographical indications stems from international treaties, particularly the TRIPS Agreement, to which member countries are obligated. On the other hand, trade names are afforded protection at the regional or national level, independent of international accords.
3. **Naming Criterion**: In trade names, it is common for the name to feature the innovator's first name along with their surname. In contrast, a geographical indication denotes a specific region recognized for its production of a distinct product characterized by certain qualities.
4. **Registration Criterion**: Trade names are officially registered with the Chamber of Commerce and Industry. Although geographical indications do not fall under the Jordanian Geographical Indications Law, they may be registered in accordance with trademark regulations if such registration takes place.

7 Conclusion

This research offers an in-depth insight into the distinctions between trademarks and geographical indications, underscoring the ways these differences can affect intellectual property rights and the safeguarding of products. By employing a descriptive methodology for thorough analysis, the study has highlighted the distinct features of both geographical indications and trademarks along with the legal protections they provide.

7.1 Findings

The study concluded with the following results:

- A geographical indication serves as a marker for products linked to their specific geographic origin, whereas a trademark is employed to differentiate various products and services more broadly.

- A personal trademark is held by one organization and serves to distinguish its products, whereas a collective trademark is shared among several organizations and is utilized to recognize the goods of its members.
- While trademarks are subject to licensing, geographical indications cannot be licensed. Tied to their geographic origin, geographical indications enjoy indefinite protection, in contrast to patents, which offer only temporary safeguarding for inventions.

7.2 Recommendations

- Companies and farmers should choose the appropriate form of intellectual property rights depending on the type of product and target market.
- Registration of geographical indications is advisable to provide additional protection for local products and increase consumer confidence.
- When registering individual and collective trademarks, care should be taken to avoid confusion with geographical indications.
- Countries should review and update their laws on the protection of geographical indications and trademarks to ensure compliance with international standards and prevent consumer confusion.

Digital Twin Application and Facilitation in the AEC Industry's Operation and Maintenance Stage

Sudhanshu Ranjan, Shahana Gajala Qureshi, S. Harihara Sitaraman, Ala'a Al Sherideh, Hemraj Shobharm Lamkuche, and Mahmoud Shakarna

Abstract Digital twins are transforming various industries by enabling data-driven decision-making and enabling efficient operations. However, research on digital twins often focuses on specific sectors, leaving untapped potential across a spectrum. This paper aims to address these challenges by highlighting the pivotal role of digital twins in converging cyber-physical data for sector-specific applications. Drawing on prior research on big data and digital twin technology, the paper presents a cross-sector perspective, introducing innovative applications in sectors like healthcare, energy, and transportation. The research encourages cross-sector collaboration, innovation, and unlocking the potential of digital twins in diverse domains. By exploring the possibilities of digital twins in diverse domains, this research encourages organisation to harness their power for enhanced efficiency, intelligence, and sustainability, shaping a brighter future for industries worldwide.

1 Introduction

Artificial intelligence, as we know it, is the idea and advancements in computerized systems development that are able to both imitate and stimulate human behavior and thought, thereby becoming more like humans than completely replacing them [1]. As well as carrying out activities requiring voice recognition, language translation, and visual perception etc [2]. From 1956 onwards, artificial intelligence (AI) research has flourished in creating perceptive systems that authorize robots to do not just all physical labor but also thinking, presaging, and decision-making. AI systems use human thinking processes as a guide to produce more accommodating and useful tools instead of striving as to create an ideal clone of the mind human [3]. For this particular reason, including ongoing developments in processing power, big data processing, Applications of artificial intelligence (AI), pattern recognition (PR), and machine learning (ML) are starting to permeate every aspect of our everyday lives and provide a wide range of unexpected advantages [4, 5]. The primary goal of developing AI algorithms is to identify and simulate real-world scenarios. These scenarios could involve, for instance, human reasoning in the context of medical research, modeling biological structures, or developing computer-aided diagnostics procedures [6, 7]. By studying human organs, or reducing data dimensions to eliminate redundant information, these algorithms can reveal underlying information and hidden patterns that are within the data, encoded. The proliferation of the Internet of Things (IoT) in recent years, created a multitude of avenues for data sharing across different sources.

In reality, the spread of technologies and the internet-connected embedded sensors and actuators enable the ongoing transfer of huge data. This time span relates to the scope of records (high dimensionality, requiring massive amounts of data to be stored), range (facts that are heterogeneous and belong to different resources), pace (speed of creation and acquisition, as opposed to long processing times), and cost (the significance of the information conveyed through facts). Fortunately, advances in cloud computing, high-dimensional data processing, massive facts analytics, and statistics fusion methodologies allow for the acquisition of critical information and the optimization of physical systems' performance through shopping and trouble-some large statistics. Two dimensions have been replaced by three dimensions in the definition of a digital product. Digital prototypes, digital mockups (DMU), and other technologies centered around product layout have been proposed by the company. With time, there has been progress in the definition and expression of product design. The 3-D digitalized product version has evolved, and its benefits have been repeatedly validated, as evidenced by the recent successes of both domestic and international production industries [8].

3D printers and reliance on artificial intelligence will have a promising future in scientific research and global development to achieve sustainability, with its positive impact on society This requires attention to artificial intelligence and significant investment in technology infrastructure [9].

In summary, the creation of one of the major technological achievements in the sector is attributed to the combination of big data, AI models, and IoT for processing,

together known as Digital Twin (DT). These digital twin models are becoming more and more popular due to the rapid advancement of technology, as well as their potential and significant application field effects. The definitions of digital twin technology are wide because of its constantly changing nature. It is possible to federate data from several digital twins to create a synthesised representation of various real-world entities, such as a production facility, smart building, application device, and their corresponding sub strategies. Furthermore, if we discuss the current situation, there are several issues with the definition of digital products, such as poor descriptions, omissions of the production definition, operations, and occasionally maintenance stage. The description of the product and process are not related, and subsequent stimulations based on the "ideal definition" offer little direction for the actual results.

The "Digital twin" technology was created in order to address the issues raised above. According to [10], this technology turns out to be among the best options available to address the issues raised and transform how aircraft manufacturing is handled going forward.

2 Research Background

NASA has been developing mirrored systems since 1970 in order to keep an eye on physically inaccessible areas, such spacecraft on missions, in order to troubleshoot and come up with fixes. One famous instance is the virtual world created for the Apollo 13 mission in 1970. When an oxygen tank ruptured two days after launch, NASA's flight control crew in Houston utilized a mock-up of Apollo 13 to assess the situation and come up with a temporary air purifier. This demonstrated how virtual models, which are regarded as preliminary forms of Digital Twins (DTs), may be used to connect virtual and real environments. Nevertheless, a crucial component of DTs was absent from these models: a smooth link for real-time data flow. In 2002, Michael Grieves gave a talk on product lifecycle management (PLM) and unofficially introduced the DT idea. Grieves outlined the three main components of DT: a physical item in a real area, a virtual object in a virtual environment, and a connection that allows information to travel between the two locations to help with synchronization [11].

Around 2012, NASA researchers, in a seminal roadmap, suggested that DT could enhance aviation performance. They defined DT as an integrated, ultra-realistic, a vehicle or system's simulation, considering various interdependent systems. This marked the beginning of DT development for space assets, leading to the concept of the Tail Number-Specific Computer Model for Individual Aircraft, known as the Airframe Digital Twin (ADT). The terms "Digital Thread" and "DT" were used interchangeably by the U.S. Air Force in 2013, emphasizing their historical memory and ability to leverage knowledge for system prognosis. While some distinguish Digital Thread from DT, both concepts gained interest beyond aerospace, becoming integral to Industry 4.0 and Smart Manufacturing. The Digital Thread primarily focuses on linking product data throughout its lifecycle, providing a consistent representation.

However, it lacks the monitoring, maintenance, and optimization capabilities of the physical system, which DT incorporates. The latest developments consider DT as the next Generation Digital Thread, surpassing its predecessor in capabilities. This study differs from existing reviews by not restricting itself to specific application domains and considering various domains in detail. The methodology involves a systematic literature review without a specific time frame, and the study explores sociotechnical design implications, focusing on the interaction of domain experts, designers, and stakeholders with machines. Additionally, the study is centered on the concept of Digital Twin linked to AI, acknowledging the influence of various disciplines in DT development [12].

3 Literature Review

The process of the digital twin concept has its origins in Grieves' discussion about PLM, or Product Life Cycle Management, in the year 2003, although its maturity was hindered by technological limitations at that time. With advancements in processing technology (such as cloud computing), and data gathering (such as IoT), and simulation technology, the digital twin concept has evolved into a more sophisticated and specific form. While industry and academia offer varied definitions, In general, a multiphysics, multiscale, probabilistic, integrated simulation of a system or final product is referred to as a digital twin. By utilizing existing models, historical data, real-time data, and other resources, it simulates the life of its physical equivalent. As currently understood, a digital twin is an interactive, electronical, and physical depiction of the whole life cycle of the product. The digital twin has drawn more attention since it may offer a product's whole digital footprint from conception to the conclusion of its existence. Initial applications were centered around product prognostics and health management (PHM) in industries such as aviation. Notably, General Electric utilized digital twin technology to predict the health of its products, enhancing accuracy in operations and maintenance. It's crucial to distinguish the digital twin from the cyber twin, which is rooted in the concept of Cyber-Physical Systems (CPS). While cyber twin exists within the cyber space of interconnected objects, a complete digital twin necessitates both physical and virtual models with interactions between them, emphasizing collaboration between physical and cyber spaces. As smart manufacturing emerges with the integration of new IT, the digital twin plays a pivotal role, serving as an epiphany for the intelligent sector. Cybernetics: the study of control and communication in machines and living things, forms the theoretical foundation for digital twin development. Smart manufacturing is emphasized by national plans like Industry 4.0 and CPS-based manufacturing, which has led to the adoption of digital twins in production phases. Applications for digital twins have mostly concentrated on the manufacturing and post-production phases, with the design process receiving less attention. This study highlights digital twins' application in the phase of product design, realizing the enormous potential in this field and attempting to offer a model framework for product design driven by digital twins (DTPD) [13].

Digital twin (DT) concept was proposed to describe the engenderment and genuine-time virtual presentation of products. However, due to the techno level at that time, this concept didn't receive enough attention. Wei Yong and others put forward a technique to recognise the digital twin's visualization version through the use of web offerings and interpreted truth era. Chen Wanling et al. received device facts by way of including sensors to realise facts and fusion, so that it will build a digital dual version of the system device. There always exist a digital world that supports and serves the physical world, and as a result of that, the physical world works more efficiently and orderly. As a result, the digital twin technology emerged, which is now extended from manufacturing to urban areas and has an important effect on the planning, building, and advancement of urban areas. Professor Grieves initially presented the idea of a "digital twin" at a University of Michigan Product Lifecycle course in 2003. Later, the US Department of Defense brought DT to problems with spacecraft health maintenance, among other organizations and enterprises in other domains. A digital replica, linked information, identity, and the ability to monitor in real time are the four essential components that a digital twin technology needs to function, according to Gartner. Instead of being physically represented, entities in digital twins are digitally resembled. Digital twins combine the physical and virtual worlds using a single data source and are focused on the full life cycle of an aircraft. The practical and physical models created during the phase of design serve as the primary foundation for the virtual twin's construction. In the use phases and manufacturing that follow, facts and statistics interact with physical entities to perpetually improve the virtual twin's integrity and accuracy, which eventually results in a physical representation of the entity that is both accurate and whole [14].

4 Research Progress of Digital Twins

A "conceptual ideal for PLM reality mirroring" was presented through Michael Grives of Michigan University in 2002 at a Product Lifecycle Management presentation. "Mirror version" and "mirror version of recordings" were later modifications. He chose "virtual double" in 2011. The National Air Force and Space Administration's Phoebus Apollo Challenge is where the idea of virtual "twins" was first used in production (NASA). "Almost better: stimulating innovation and lean product due to PLM" is the explanation given for the recently adopted abstract model known as the digital dual. In an effort to address the drawbacks of craft remodeling, the United States of America Air Force style laboratory projected and similarly progressed the virtual twin in 2011. Associate in Nursing fashion forecasting in the globe and the context of the providers of the complex destiny. In 2025, they want to produce a brand-new orbiter model as well as a digital model that is identical to the physical product—the digital twin. The US Air Force has been in charge of Lockheed Martin, Boeing, biochemist Grumman, Fashion Electrical, and Pratt Whitney since 2014, variety of other and several others teams to hold outdo a number of analysis activities carried out, that had consequences. Among them, the standard-hosted f35 mid

airframe virtual index company received the 2016 national defence production era award. Timely real-time scrutiny and retention forecast through its platform cloud carrier Predix, the use of large statistics, the Internet of Things and other cutting edge technologies that are mostly dependent on digital twins. On March 1, 2017, he oversaw the preparation and release of the "CYBER PHYSICAL GADGET WHITE PAPER" (cps) under the direction of the Minister of Business and Data Age's information computer code program, which is the second business branch of the national needs committee [14].

5 Literature Works

Based on the papers and the research that have already been done in the field of this emerging AI technology, the digital twin, there are following few questions that will be referred in this paper as:

- RQ1: A comparative literature analysis of few works already done and what are the outputs produced?
- RQ2: What are the emerging applications of DT?
- RQ3: What can this paper contribute within the technological advancement of digital twins?
- RQ4: What are the major roles of digital twin driven services that help in leading a better life?

6 Comprehensive Study

This section clearly answers the RQ1. This survey paper has been written by the collection of relevant works, papers and thesis for assessing digital twin driven designs and its manufacturing in focus. This paper comprises of the comparative study of the works that have been done in the field of development of digital twin driven devices. As per the papers considered a comparative study of all the points have been done thoroughly and the results have been produced on the basis of it in the form of Table 1.

Application of Digital Twin Technology. The major aim of this section is to respond to RQ3

From the analysis we came across the fact that there are a several applications of DT that include Automobile, retail, Industrial IOT, and a lot more. There are a few existing applications of digital twins that refer to a various specific and traditional fields and contexts that include:

- Healthcare
- Maritime and Shipping

Table 1 Survey of digital twin literature

S. No	Title	Definition	Application	Design	Implementation
1	[14]		✓		✓
2	[15]	✓	✓	✓	✓
3	[10]			✓	✓
4	[16]		✓		
5	[17]	✓	✓	✓	✓
6	[8]	✓			✓
7	[18]		✓	✓	
8	[19]			✓	✓

- Manufacturing
- City management
- Aerospace.

A description about few of the applications have been mentioned down based on the analysis.

(1) *Healthcare:* Digital twin use in the healthcare sector is a revolutionary clinical process that help and assist hospital management by enhancing the medical care and support to the patients by tracking and advance modelling of human body. These DT tools help in a lot of researches that help in study of diseases, their symptoms, cure, and the drugs that should be used or prohibited in the treatment. It also helps the physicians to provide patient-specific treatment and optimize the procedure for better outcome. Thus, we can also say that a DT model of a human body can help the doctors to discover the effect of any drug, surgery or other medical procedures over a patient body even before performing it in real.

(2) *Manufacturing:* In the industrial sector, the term "digital twin" refers to a virtual replica of a physically created product that is as-built, as-designed, and as-maintained, enhanced by real-time data processing and analytics upon precise configurations of any physical product, systems responsible for production, or equipment. On the basis of real-life implementations, manufacturers are to be considered as the new business models where they can sell services in lieu. Later they can utilize the digital twin to monitor and optimise the availability and optimise it on the basis of predictive capabilities of digital twin [16].

(3) *Automobile:* Now-a-days the development of automobile vehicles take place in virtual environment. This means that the DT Technology of any product comprise the entire car, its software, mechanics, physical behaviour and all the functioning related and responsible. This also allow the stimulation and validation of each step of the development so as in accordance to identify and analyse possible problems and failures that may be faced before even the production of real parts. This same principle implicit to e-cars as well as conventional cars too.

(4) *Retail:* Digital twins' technology has helped various companies and businesses to do progress. DT technology has been supporting the retail services since past few years. Retailers make use of digital twin technology to forge a delivery chain's implementation and determine where optimization is potential. The actual time visibility added by way of digital twins lets in stores to execute new non-linear supply chain achievement models, for instance, micro-success, or curb side pickup.
(5) *Industrial IoT:* Now a days the industrial firms are using digital twins for implementation of various new functions that help the industry to digitally observe, trace, and manage the systems. The digital twins record additional types of data in addition to operational data, such as environmental data like location, configuration, and financial models that help to predict future operations and anomalies [17].
(6) *City Management:* The development of smart cities and the lay down of foundation of the plans where the development of smart cities use IoT and Digital twin technology has helped in improving the economy, resource management done well, reducing environmental impact, and raising the standard of living for all citizens. A town model based on Digital twin concept may help the city planners and the policy makers to plan the development and creation of smart cities using the knowledge acquired from several intelligence systems and sensor networks. Their ability to make informed judgments about both present and future actions is enhanced by the data obtained by digital twins.
(7) *Aerospace:* From traditional air travel to advanced air mobility, digital twin design has helped to shape the way of air travel making it more convenient for the passengers. Thus, DT came out with a fly-it-before-you-build-it approach which helps to design the aircraft on a virtual ground and study all the complications beforehand only so as to find the countermeasures and develop the actual model. This approach also helps the air craft system engineering to produce results in shorter development time with lower risk level [18].

7 Role of Digital Twin

The digital twin is among the major concepts that is responsible for the revolution in a various industry that may include, aerospace, manufacturing, healthcare industry, marketing, and a lot more. According to [13] there are majorly 3 roles defines for Digital twin driven industry that are as:

(1) Stimulation, diagnosis, forecasting, and management of the creation process and behavior of the product in the actual world.
(2) Enterprise product innovation is driven by the fundamental promotion of the well-coordinated stages of a product life cycle.
(3) Laying down a foundation for the quality traceability process and continuously improving the product development by archiving digital product life cycles.

8 The Industry Trend of Digital Twin

According to research and markets, the global trends and forecasts for year 2021–2026 came out with a report that states out that "The global twin market was valued at USD 7.53 Billion in 2020, and It is Expected to Reach a Value of USD 46.08 Billion by 2026, Registering a CAGR of 35.01% Over the Forecast Period, 2021–26."

The adoption of such solutions is anticipated to be forced throughout the forecast period due to the surge in the use of technologies such as 3D printing, the growing trend of IoT solution adoption across many businesses, and the growing need for virtual twins in the pharmaceutical and healthcare sectors. The possible advantages of digital twins include enhanced workflow and communication across many teams, such as technical disciplines, sales and maintenance teams, and product design. As demonstrated by the US Air Force, which has recently designed and constructed new aircraft prototypes using DT to great effect. It would have taken decades to complete the product if this procedure had been based on conventional methods. Further IoT sensor availability has given tech entrepreneurs more opportunities to test and interact with integrated goods that have sensors built in. These sensors can provide timely maintenance and real-time recommendation system functionality. By pre-analyzing the real product throughout its development phase, DT technology aids in the creation of innovative physical product design throughout the product lifecycle. Within the Industrial Internet of Things, for instance, digital twin technology uses analytical software linked to smart sensor and network components to detect faults and modifications in massive mechanical equipment. The digital twin creation process is utilizing increasingly potent and advanced instruments. You may now create intricate what-if simulations and perform millions of simulation operations without exhausting the system by returning to the acknowledged real-world circumstances. Furthermore, the choice of possibilities is expanding along with the number of suppliers. Furthermore, digital twin simulations may now incorporate data from real-time asset monitoring technologies like forward-looking infrared (FLIR) and light detection and ranging (LEDAR). The industry is anticipated to expand as a result of several recent alliances and acquisitions. Waylay Digital Twin, Salesforce's potent no-code IoT asset monitoring solution, and Waylay, the company's best-in-class Salesforce implementation partner, announced their partnership in June 2021. The Waylay Digital Twin project will benefit from the decades of Salesforce expertise of certain implementation partners, sharpening their implementation and consulting abilities. The COVID-19 outbreak has resulted in the emergence of novel application technologies and market prospects that support market expansion and acceptance.

The use of DT technology in medical diagnostics is expanding extremely quickly. By modeling a specific patient's state and features using machine learning data gathered from several patients, digital twins upend conventional medical care. Thus, other patterns may also include,

- Surge in Adopting 3D technology in manufacture of anticipation to fuel the demand.
- Witness of significant market share by several countries.

- Growth of Digital twin technology in Industry 4.0

9 Contribution

This paper is an in-depth collection of all the current trends and the traditional developments iin the sector of industries driven by digital twins. This study infers to all the possible techniques that emerged in the realm of digital twin along section which elaborates on how the digital twin is being used in the recent years. This includes most of the findings, definitions, and applications of the other referenced researches and survey papers. On an whole, the paper has been organized in a way that it answers a few important questions that are based on the recent twins in the required field mentioned.

Exploring the Use of AI-Powered Applications in Arabic Language Teaching and Assessment

Mohammed Saleem Ismail Al-Mallahma

Abstract The adoption of AI applications in Arabic language teaching and learning comes with its own advantages and disadvantages. This research tries to answer how effective these tools are in improving the quality of teaching and learning outcomes. Taking a qualitative approach, this paper adopts a descriptive method to review literature regarding the contribution of artificial intelligence tools in curbing plagiarism, developing writing, and improving language skills. The analytical approach weighs the benefits of AI against traditional methods while also considering the drawbacks. A general perception is revealed through this research that though artificial intelligence tools are welcomed by educators and learners, they require significant awareness, training aspects, as well as ethical considerations for optimum utilization. The findings provide crucial inputs into ongoing debates related to the role of AI in language education and come up with concrete suggestions meant for implementers, policymakers, technologists but more so for teachers.

Keywords Arabic language teaching · AI-Powered applications · Language assessment · Qualitative research · Educational technology · Language skills enhancement

1 Introduction

AI has received considerable attention in language education and comes with many advantages and disadvantages. The use of AI-powered applications in the improvement of efficiency and quality during research paper writing processes for instructors is quite promising. Evidence is the study applied in Majmaah University [1]. The

https://doi.org/10.1007/978-3-031-87584-7_160

integration of AI tools was viewed positively by EFL teachers in helping to streamline literature reviews, assist in data analysis, reduce errors, and improve general language quality. However, it indicated a greater need for acquaintance with current existing AI applications and stressed training and support for effective integration as well.

AI-based language learning tools have further been proven effective in different areas of reducing plagiarism, editing and revising, error correction and pronunciation such as eliciting responses from learners on the level of psychological factors like confidence and anxiety other than the improvement or harm done in order for them to report by themselves the impact on their experience with language learning. The most commonly used AI technologies should be known both by learners and teachers, to help derive maximum benefits from these tools that would be appropriate for selecting language learning preferences and needs. With the evolution of AI applications, collaboration between researchers and educators is important to integrate pedagogical knowledge for improving detection or recognition capabilities—considered essential for advancing AI in language education [2].

The integration of artificial intelligence tools in education will demand that teachers have a deep and practical understanding of the applications available by investing their time during training and later on after training support is offered to ensure mastery, and this mastery is put into practice. Continuous supporting educators will guarantee complete professionalism and help solve related problems. On another note, the conscience of upholding high ethical standards and commitment to quality education while integrating AI tools into the learning process remains imperative—thus, all AI tools should be evaluated rigorously to ensure that they are in line with educational objectives, plus prioritizing student needs [2]. Moreover, it is implemented by teachers playing an essential role in guiding learners through the labyrinth of AI tools by helping students select appropriate tools which will further enhance their language learning journey [3]. Getting to know the preferences, strengths, and weaknesses of every student helps the teacher to adapt their advice with personally viable recommendations supported by tailored solutions that work well in fostering positive learning. This ushers the students into an effective learning experience where they will be able to leverage AI tools fully while at the same time having their needs well taken care of [4]. To have artificial intelligence tools effectively introduced in education sector, enough knowledge is required about what is being used—and this is only possible through adequate training that would be sustained over time with continual support upon provision, not to forget upholding ethical standards plus quality. Learners would also need pedagogical guidance by educators who are not only knowledgeable but also committed towards ensuring learners choose from these resources those which best suit individual needs for optimal language learning experience.

1.1 Significance

The importance of this research is likely to have a contribution to Arabic language education as an emerging field by exploring the AIP-Apps role in teaching and testing. Because digital technology is transforming practices in every corner of the world, and due to the increasing role of artificial intelligence in this transformation, insight into how AI can be efficiently included in the teaching of the Arabic language will be very beneficial. The results provide rich insights into both the advantages and possible drawbacks concerning AIP-tools' capacity for increasing learners' commitment while boosting assessment accuracy and customizing learning experiences. In addition, such a study significantly contributes academic value since this specific issue has scantily been discussed regarding other languages in contemporary literature. This shall help guide educators, curriculum developers, or even policymakers into making informed choices concerning adopting AI technologies for effectively meeting Arabic language learners' specific needs and ensuring more productive and innovative teaching strategies are implemented.

1.2 Methodology

Such research shall be using a qualitative approach to investigate AI applications in the teaching and assessment of the Arabic language. The study shall use a descriptive approach in the systematic review of all available literature, both theoretical frameworks and empirical studies relating to the integration of AI in language education. This research involves an extensive examination of scholarly articles, case studies, and reports to identify and analyze the benefits, challenges, and implications of AI technologies in teaching the Arabic language. An analytical approach is used in synthesizing findings from the literature review that helps make a critical assessment of effectiveness and impact on AI-powered tools compared with traditional methods of teaching. The knowledge that comes out of this analysis will go a long way in enhancing insight into how AI can improve teaching and assessment practices for Arabic language education, hence useful for educators, policymakers, and technologists.

2 Language Teaching and Assessment Trends

AI-powered applications developed for language teaching and language learning represent one of the most important trends within education. The following AI tools have been developed to address different aspects of language learning: grammar, speaking, listening, writing, pronunciation, vocabulary plus reading. Such tools are reported to have a positive impact on psychological factors as confidence, anxiety

immersion and presence as learners [5]. In addition to such development, AI-based language tests (ALTs) were introduced as an alternative form of human-based language tests (HLTs), wherein automated systems score the performance provided by those undergoing the test [5]. Research revealed that there are different perceptions from those taking the test regarding its implementation with an AI in a Language Test concerning fairness reliability and consistency-worthy area thus requiring further exploration.

Teaching and assessing the Arabic language using traditional methods have long been the cornerstone of language education. However, with artificial intelligence-powered approaches being integrated, the process is revolutionized. Recent studies have drawn out educators' positive perceptions towards integrating AI tools in language teaching and assessment with an emphasized potential for improved efficiency, quality, and skills development in the language [6, 7]. AI-based language learning tools were found to bring about a marked reduction in plagiarism, improvements in editing time, error correction upon them, and attainment of greater levels of pronunciation accuracy from among positive learner perceptions as well as improved language learning experiences [6]. Making a comparison between traditional methods and AI-powered approaches stands to reveal the potential that AI tools have in streamlining language learning and assessment processes while also bringing about improvements in the quality of language with positive impacts on psychological factors such as confidence and immersion toward it. This underscores that familiarity with applications regarding AI is important alongside effective training and support for the successful integration of AI tools into Arabic language education [8].

3 AI Applications in Arabic Language Learning

The Arabic language learning domain is noticing big advancements with AI systems. These applications are used for improving language teaching and testing and offer different advantages to the learners. AI tools have proved a great decrease in plagiarism, an increase in editing and revision time, correction of errors in rhetorical function, as well as lexical usage and grammar [8]. It is also very effective in terms of pronunciation assessment, which assists the learners in fluency, comprehensibility plus tone and even pronunciation accuracy. Providing feedback as well as evaluating language skills has its bearing on psychological factors like confidence, anxiety plus immersion and presence that it carries. Moreover, natural language processing methods—a principal AI methodology—are widely applied in the interpretation of feedback from end-users for any industry, which helps firms to understand and act on textual data in multiple languages without much human effort [9]. The same AI applications have a potential revolutionary impact on the teaching and learning of Arabic as a second language, providing bespoke learning experiences and enhancing student performance.

3.1 Language Learning Platforms

The popularity of AI-powered language learning platforms for Arabic language teaching and evaluation has increased due to their capability to give personalized feedback and analyze language proficiency [10]. These platforms have several advantages, like decreasing plagiarism, increasing editing time, and correcting all types of errors in grammar as well as vocabulary and pronunciation. According to the learners themselves, AI tools are effective and easy to use, helpful in terms of language learning (specifically with fluency) and making oneself understandable while also getting the pronunciation correct. Moreover, it affects psychological factors of confidence, anxiety, immersion, presence which has a positive effect on their overall learning experience [11]. Moreover, the AI tools can be adjusted to work on different features of writing by providing individual corrective feedback for learners which contribute to vocabulary learning and help in the acquisition of collocations and idioms necessary for producing a native like Arabic language output. With advances in the functionality of these tools, they are very attractive new opportunities for language learners, which makes them a very important area in the process of teaching and diagnosing Arabic language.

3.2 AI in Arabic Language Assessment

Artificial intelligence has shown optimistic potential in changing the assessment of Arabic language proficiency. Integrating AI tools will make language assessment more effective and accurate and other advantages like efficiency, quality, and error reduction in assessment. These tools have been developed to target different language skills with the aim of making users proficient in speaking, listening, writing, pronunciation as well as grammar, vocabulary, and reading while being found effective and easy to use plus advantageous for learning a language [11]. They have also been reported useful in detecting mispronunciations by providing feedback related to different language capabilities; this contributes toward enhancing learners' language experiences and abilities. However, implications arising from the integration of AI tools into language assessment also raise concerns about ethical utilization that need to be considered along with issues regarding quality maintenance vigilance observed during an assessment process which calls for necessary action research development done regularly for improving effectiveness and accuracy. The integration of AI-based language assessment tools with Arabic language assessment is vital for both technological seamlessness and the establishment of ethical standards: innovation shall be driven by the quality of assessments provided. The rapid growth in AI technology will lead to further maturations of these tools, which can take a more holistic and sophisticated approach to appraising Arabic linguistic competencies [11]. Much more research and development work needs to be done to bolster the capability factors that underlie the feasibility prospects of AI-based language assessment tools in the sphere

of the Arabic language; this being so, ultimately, when due advancements are made, AI may help transform Arabic language assessment, making it efficient and effective in measuring progress for learners as well as teachers.

3.3 Automated Essay Scoring

AES is the process of using artificial intelligence technologies to evaluate essays written in Arabic. Research has cited that AES systems use a hybrid approach to its scoring: statistical features are computed based on sentence length, word count, and number of sentences, while content-based features are extracted using NLP libraries (e.g., word2vec). Neural network models have also been experimented within AES; however, these models are susceptible to adversarial responses where students try to game the system by entering irrelevant or even duplicated content. Notwithstanding these challenges, because of accurate essay ratings provided by AES, automated systems in educational spheres have gained tremendous demand [12]. Moreover, work on linguistic features in AES has been probed especially in the context of non-native learner essays. The features include lexical, syntactic, discourse as well as error types of learner language. These are utilized in the creation of predictive models for grading essays. AES is highly applicable in language assessment scenarios that include placement tests in language teaching institutes and providing writers with real-time feedback to enhance their use of the language [13].

4 Challenges and Opportunities in Implementing AI in Arabic Language Education

The use of AI in the implementation of applications for the teaching of the Arabic language has challenges and opportunities. A major challenge is that of the availability of resources and data in the Arabic language. This is very important for developing effective AI tools specific to the details of the Arabic language. Educators will also need to be more aware of these existing AI applications so that they can integrate them into their teaching and assessment processes successfully [14]. However, it would be quite advantageous if AI were used to improve the ways of teaching and carrying out assessments while learning the Arabic language. It could help to enhance efficiency and quality during research writing, assisting in data analysis, reducing errors, and enhancing language quality overall. Furthermore, it could promote smart education regarding precision, plus individualized learning with which it would meet different needs concerning learners pursuing the Arabic language. At the same time, there is a need to sensitize and train educators on the effective and ethical integration of AI tools during the training session.

The ethical issues related to using AI applications in Arabic language teaching and learning are not unidimensional. They are compound and manifold. An obvious issue that comes up is data privacy. This is because using AI as well as learning analytics would mean handling large volumes of personal data, which would raise the chances of privacy being compromised. This involves the ability to use past learning data for future predictions, which might be objected to by some students for whom data privacy is a concern they value highly [15]. Furthermore, the deployment of real-time facial expression recognition systems without taking consent brings more weighty ethical concerns on board. Transparency in using AI, taking consent with proper information disclosure, keeping extreme secrecy for building trust are major pillars, at the same time showing autonomy for students in AI-driven language education context. Also, algorithmic bias—which reflects the unintentional discrimination or favoritism inscribed within AI systems—needs to be thought of. Developers and educators should implement strategies that lead to bias-free AI algorithms to help every student reap the benefits of AI, irrespective of where they come from. The impact of AI on students and teachers alike also needs to be acknowledged. Ethical considerations go beyond ensuring student well-being to looking at how integrating AI can affect educators professionally and personally [16]. Balancing technological advancements with the ethical use of AI in language education calls for proper planning, evaluation, and strategies that prioritize responsible deployment as well as ethical considerations. In other words, the integration of AI-powered applications into Arabic language teaching and assessment raises numerous ethical issues that need careful consideration. Developers and educators should be ready to evaluate the ethics that entail the use of AI in detecting plagiarism in educational settings. Openness, consent, privacy (confidentiality), and anti-bias strategies are some of the ways through which positive technology can be realized, with an equal share of benefits for all students. Responsible and ethical AI application in language education is extremely important not only for building trust and protecting privacy rights but also for establishing an inclusive and equitable learning environment where both students and teachers are empowered [17].

5 AI Integration in Arabic Language Education

Two cases can be very informative in terms of integrating AI applications successfully in the field of Arabic language education. The studies reveal a lot of benefits and positive results that come about due to the use of AI tools in the process of learning and research. A case study at Majmaah University elicited the opinions, and perceptions of EFL faculty members on how they view integrating AI tools into the research writing process. It revealed that the integration of AI-powered applications greatly improved the efficiency and quality of the writing process [18]. The tools were very instrumental in quickening literature reviews, helping to analyze data, reducing errors, and thus enhancing language quality in research papers memorably. Similarly, an evidence-based systematic review was undertaken to assess the effectiveness and

usefulness of AI-based language learning tools. The findings of this review emphasized the significant impact of AI tools on language learning. The tools were found to effectively decrease instances of plagiarism and errors as well as to improve different language skills, including fluency, comprehensibility, and pronunciation accuracy [19]. Learners used AI-powered apps to improve their languages skills and managed to do so elegantly. Case studies stressed the innovative role that AI could play in transforming Arabic language education. When integrated with artificial intelligence, this is how both educators' and learners' ends meet improved results for research writing plus efficiency in language learning. The positive perceptions shown by EFL faculty members open up an optimistic future for AI in the field, which also brings newly tapped chances for students and researchers as well. With the increased use of AI tools, benefits will be more realized in the multi-dimensions of language education. This clearly ushers us into an era where innovation and improvement will take place.

The paper has presented some real-world examples and lessons learned regarding the successful integration of AI-powered applications in the teaching and assessment of Arabic language. A case study at Majmaah University revealed that faculty members from the Department of English have positive attitudes and perceptions toward integrating AI tools into the research writing process for which it cited an increase in efficiency, quality, and language perversity [20]. However, it did stress that such integration needed familiarity with existing AI applications coupled with necessary training and support to ensure effective functioning. In the same way, a systematic review found artificial intelligence-based language learning tools very effective in reducing plagiarism, improving time taken for editing and revising work, correcting errors, and improving fluency as well as other language skills like comprehensibility or pronunciation accuracy. It also warned that learners and teachers need first to be acquainted with these widely used AI technologies to reap the maximum benefits out of them [21].

6 Future Prospects

AI tools have been integrated into the field of language education and have shown considerable promise in improving different dimensions of language learning and assessment. With the rapid development witnessed in the AI domain, future endeavors of AI for Arabic Language Education might lead to building specific AI-based applications that cater to the Arabic language learner's unique linguistic features and learning requirements with targeted assistance in areas such as grammar, pronunciation, vocabulary building, and reading comprehension—reflecting specific challenges and opportunities available in Arabic language learning [22]. Another possibility for forthcoming innovations in AI for Arabic Language Education would be making use of natural language processing and machine learning methodologies to develop adaptive systems that offer personalized learning experiences to students, consequently allowing educators to give custom feedback and intervention considering individualized learning profiles [23]. Moreover, AI innovations in

Arabic language education could be extended to the area of assessment where AI-powered tools would facilitate automated assessment of language proficiency, give feedback in real-time on writing and speaking tasks, and provide information about students' development in the use of the language over time. Such advancements will cut down on the process of assessment channels, remove bias, and supply educators with data that is educatively useful for decision-making. However, educators have to be given proper training and support so that these AI tools are integrated effectively into their teaching and assessment practices—since this has a large amount weight on ethical use as well as maintaining quality of language education [23]. With the rapid growth seen now within many different sectors like artificial intelligence; further studies based on continuous development plus collaboration set between its developers alongside those working within educational system will play an important factor role while actively taking part during determination future that lies ahead meant developing such kind applications aimed at Arabic language education.

The revolution of AI-powered apps that are designed to adapt to individual needs and preferences and the offering of personalized content and feedback have injected a new lease of life into personalized learning experiences in Arabic language teaching. According to [24], such tools are very effective in decreasing plagiarism, improving the time required for editing work, correction of linguistic errors, and even the increase in positive psychological factors like confidence or reducing anxiety. In addition, as noted by [25], generative AI tools bring enormous benefits to L2 writing in terms of analyzing student texts and offering individualized feedback. These improvements do not only enhance language abilities but also have an impact on increasing students' motivation during learning processes.

7 Conclusion

The incorporation of AI-enabled tools in the teaching and assessment of the Arabic language has gains and challenges. Research has shown that teachers and students consider AI tools to be effective—as well as easy to use—for language learning and useful in areas where plagiarism can be decreased, writing enhanced, language skills improved, among others. But there is also a greater need for awareness with regard to existing AI applications and attention to ethical aspects so that these tools are effectively integrated. Also important is training (besides support) which goes a long way in harnessing the benefits of AI applications in language learning and language assessment. Because developments within the field of AI in language education are constantly evolving, it is essential for educators (as well as policymakers) to keep themselves updated about existing AI tools; this would hopefully also involve working together with researchers to enhance the efficiency and accuracy of these applications.

Forensic Linguistics in the Courtroom: Analyzing Judge's Questions in DNA Test Disputes

Wafa Abu Hatab, Maram Issa, and Mohammed Al-Badawi

Abstract The present study is aimed at exploring the linguistic strategies through which judges elicit responses in cases involving DNA paternity tests in the courtroom. It will specifically focus on the following: what types of questions are asked by judges (open, closed, declarative, tag, modal, yes/no, choice, consultative), and how these question types affect communication and decision making. The paper draws upon data from transcripts of court sessions involving cases of paternity disputes to see how different techniques of questioning inform dynamics within the courtroom, influence the clarity of information exchange, and hence affect outcomes of paternity disputes. Results show that judges make deliberate and strategic use of their questions to bring out information and guide their way through technicalities while remaining fair and in control. Therefore, an understanding of the exact linguistic features characterizing questions posed by judges will help in understanding courtroom discourse, which has implications for legal practice and justice administration.

Keywords Forensic linguistics · Courtroom DNA test disputes · Communication

1 Introduction

The issue of paternity in a legal action is very important especially to the child. It is not only the question of ascertaining biological relationship but it is the substratum on which the child can base his claim for future, for access to a normal childhood, for family support and for inheritance rights. As was emphasized in the case of Francken

v. State (1926), such proceedings have for their main object the determination of whether the defendant is the father of the complainant's child, which would impose responsibilities on the father and grant rights to the child [2].

The strategies judges employ while questioning have a great effect on how the issue of paternity is litigated in the courtroom. Our study delves into the specific strategies and linguistic subtleties that judges adopt in cases of DNA paternity tests before the court. Through a deep exploration of the organizational strategies of judges.

We will explore the use of open-ended questions, closed-ended questions, declarative questions, tag questions, modal questions, yes-no questions, choice questions, and consultative questions. Through this investigation, we seek to shed light on how judges strategically utilize different question types to elicit information, navigate legal complexities, and ultimately shape the outcomes of paternity disputes [2].

1.1 Research Objective

This study aims to analyze the linguistic features of judge's questions in court cases involving DNA paternity tests. The research will focus on how these questions are structured, the type of language used, and their impact on the clarity and effectiveness of the courtroom interaction. By examining these elements, the study seeks to understand how linguistic choices influence the communication and interpretation of legal evidence in paternity disputes.

1.2 Research Questions

What types of questions does the judge use during the paternity case, and how do these question types facilitate or constrain the responses?

- What are the lexical features of the judge's questions?

2 Methodology

2.1 Data Collection

The study is a qualitative one, proceeding from observing and collecting naturally occurring data in courtroom trials to their classification and description. The primary source of data for this study is court transcripts from paternity dispute cases involving DNA testing, specifically chosen for qualitative linguistic analysis. Data are analyzed in courtroom questioning, focusing on how judges' questioning varies in these cases.

All data are transcripts of several trials in criminal courts, randomly chosen from Lauren Lake's Paternity Court from 2013 to 2020.

2.2 Data Analysis

Courtroom trials are complex processes involving many participants with varied purposes. The solemnity, impartiality, and effectiveness of the trial process can only be ensured when all procedures are strictly followed. Judges must adapt to specific legal procedures by choosing different questioning patterns and strategies to achieve their communicative goals in various contexts.

Judges are essential in managing the complex aspects of the cases in paternity court, where emotions are high. Unlike other judges, they must balance gathering factual information with taking the parties' emotional well-being into account. To guarantee justice and compassion in their choices by analyzing the data collected for this study, we observe numerous types of judge questions in courtroom trials, especially in paternity cases. This requires a unique combination of empathy, sensitivity, and firmness to ensure both fairness and compassion in their decisions.

The steps of analysis first I gathered data from courtroom proceedings accessible on YouTube, focusing on cases revolving around paternity disputes and DNA tests. Second I then meticulously examined the questions posed by judges during these proceedings, categorizing them based on their types, such as open-ended questions, tag question etc., Furthermore, I conducted an analysis of the linguistic style employed by judges, considering factors like formality and word choice.

3 Literature Review

In "Dimensions of Forensic Linguistics" [8], John Gibbons delves into the strategic use of questioning within common law criminal courts, emphasizing its profound impact on witness testimony and trial outcomes. Gibbons categorizes various question types, including open questions that elicit detailed narratives, closed questions that limit responses, and leading questions that suggest specific answers, often challenging witness credibility. Tag questions, such as those using modal verbs and agreement tags, compel witnesses to confirm particular assertions, highlighting the coercive nature of such questioning techniques. In the words of Gibbons, power dynamics are always at play during courtroom questioning, with most witnesses feeling very much pressured, a factor that can influence the accuracy of their responses more so in cross-examinations. These questions, when strategically used, are meant for fact finding, bringing out any disparities there might be, and how they mold the perception of the jury. Gibbons calls for forensic linguistics to be well known through training and thus reduce biases for fair trials, cautioning that coercive questioning can make a lie out of the truth and influence the results of the trial [3].

In the same year, Malcolm Coulthard and Alison Johnson published their book "An Introduction to Forensic Linguistics," which investigates the intersection between language and law, focusing on the applicability of linguistic analysis to courtroom discourse, legal documents, and law enforcement interactions. They also consider the strategic use of questioning in courts; according to these authors, leading and tag questions can mold witness testimony and hence the outcome of a trial to a great extent. Coulthard and Johnson discuss different genres within the law to illustrate how each genre has its own linguistic conventions that manifest themselves in courtroom proceedings, legal documents, and police interrogations. They stress that legal language should be as clear as possible in order not to contain any ambiguity and that one should approach questioning techniques in a highly precise manner when wanting to shape narratives within a courtroom. Moreover, they touch on how important authorship attribution is in forensic science and emphasize that ensuring fairness and justice would need an eye for fine-grained linguistic details. Therefore, Coulthard and Johnson's book is, consequently, a work of reference in forensic linguistics that is very foundational, for it gives some very keen insights into how language can be strategically used within the legal domain [4].

The use of questions is the most potent tool for extracting information from witnesses and defendants. Al-Tarawneh underscores the role of questions in securing information from different players in the courtroom [8]. Catotot emphasizes that questioning is the essence of the legal process through which justice is done [9, 12] talks about how different types of questions are instrumental in molding courtroom narratives and outcomes. Hatab [13] investigated diglossia cases at courtrooms in Jordan [17]. Looks at how questions can actually be used to control the flow of information, and in turn, influence witness testimony [5]. In the paternity court, judges ask questions to bring out the truth about family relationships. The manner they frame those questions has to be gentle and precise to make things understandable and fair. This caution observed in questioning demonstrates the value of tailoring their approaches to the specific context in order to ensure justice and fairness.

4 Discussion

This section begins with the analysis of questions from Judge Lauren Lake in the Paternity Court.

Wh questions are questions that ask for information about the referent of the interrogative adverb or pronoun that initiates them. They can be open or closed.

- Open Wh questions

Open Wh questions (i.e. those about why? what? and how?) They may or may not be closed. In contrast to closed questions, open Wh inquiries (i.e., those concerning why, what, and how) allow for lengthier and more detailed responses. Their function is to request display of information, eliciting a story version.

Example

> Lauren Lake: Ms. Foster, tell us, why do you need to open your case?
> Ms. Foster: I'm opening this case today, because, Your Honor, I have a one-year-old child who we planned on having. She looks like him, she acts like him. He doesn't step up to nothing.
> Lauren Lake: How did this relationship even start?
> Ms. Foster: Ma'am, Your Honor, this relationship started through social media—We found each other—Oh, social media. We found each other through social media. So, we had a mutual friend. They vouched for him, said he was a good person. So, we jumped into a relationship.

The question 'why and how' by the judge seeks to understand the plaintiff's motivation for bringing the case to court and provides comprehensive answers, revealing important details about their relationship [6].

- Closed Wh questions

Closed-ended WH questions aim to extract particular details in order to give a narrative orientation, they request information about particular aspects such as who, whom, where, and when, focusing on precise details rather than encouraging elaborate responses. Example

> Lauren Lake: but what I want to understand is where you at the birth, Mr. Portis?
> Mr. Portis: No, I was not, Your Honor [14].
> Lauren Lake: Who was with you at the birth?
> Ms. Middlebrooks: My ex was. He stepped up.
> Lauren Lake: When your niece found out she was pregnant…who did she tell you the father was?

The judge's questions aim to extract precise information about particular aspects of the case, such as location, individuals involved, and timing. These closed WH questions help provide concise details, contributing to a clearer understanding of the events in question.

- Modal questions

Modal questions are questions that are embedded within a sentence and depend on a modal verb, such as can, could, may, might, must, will, would, shall, should, ought, and need. Modal questions are interactional structures used as politeness strategies to soften the impact of direct requests. Consequently, Danet considers them the least coercive questions that can be used in the courtroom (p. 521).

Example

> Lauren Lake: Ms. Brewington, you claim you are 100% certain that Mr. Lee is the father. Can you tell me how you know?
> Ms. Brewington: yes, your Honor. I am without a doubt 100% certain that he is my son's father. Not only was I only sleeping with him, we were actually working on our relationship. We already have a child from a previous situation. We got

back together. We're working on us. So, when I found out I was pregnant, I didn't think it was gonna be a shock or a surprise or anything like that.
Lauren Lake: Could you please describe your relationship with the mother of the child during the alleged conception period?

Lauren Lake, the judge, utilized a modal question to inquire about Ms. Brewington's relationship with the alleged father. The judge employed a modal question, "Could you please," to politely request Ms. Brewington to provide details about her relationship with Mr. Lee during the alleged conception period. Modal verbs serve as a polite means to request information from both the defendant and plaintiff, helping to maintain a respectful tone in the courtroom.

- Declarative questions

Declarative questions are declarative sentences with interrogative function and the high pitch associated with formal questions. They can be formulated positively or negatively. They are considered very coercive because the declarative form gives them the illocutionary force of statements more than that of questions [8, 10].

Example

Lauren Lake: You lost your family? You were married at the time? Explain.
Mr. Wiggins: Yes, Your Honor, I was married, um, and me and my wife went through a separation due to a rough patch. Due to my separation, you know, I became a little "antsy," I guess, for lack of better terms. Ms. Davis was working for a family member of mine and I'd seen her. Um, and she was looking good and she was walking up some stairs and she had on some really tight pants. And, uh, so I approached her. It was never supposed to be any type… Anything else more than just sex.
Lauren Lake: You didn't use protection?
Lauren Lake: How are you upset if you weren't in a relationship with her?
Lauren Lake: Did it cause the havoc or did you cause the havoc?

Notice the declarative form with an interrogative function in the first example, it is considered a coercive approach by providing clarification on his marital status, You were married at the time? the question here aims to elicit confirmation or denial from the plaintiff, A declarative question challenges the plaintiff's emotional reaction by asserting, "How are you upset if you weren't in a relationship with her?" this aims to emphasize a perceived inconsistency in the plaintiff's behavior and prompts him to provide an explanation [13].

- Tag questions

Coercive questions are tag questions with a distinct declarative/interrogative structure. Their meaning depends [1] on the interaction between the meanings of the interrogative and the declarative [11]. Tag questions are conducive because they combine a declarative sentence that states a proposition as true with a tag seeking confirmation. Despite much literature on tag questions, there is hardly any agreement regarding how

many types exist, how to classify them, or which tags are grammatically acceptable in English [7].

Classification of Tag Questions

Tag questions can be divided into grammatical tags and lexical (or invariant) tags. Grammatical tags are made up of a declarative sentence plus a question tag (auxiliary verb + personal pronoun) that matches the person and tense of the verb in the declarative sentence. Lexical tags are made up of a declarative sentence followed by either an impersonal or generic question (e.g., "Is it true?", "Is that right?") or an invariant tag like "right", "OK", "eh", etc.

-- Type of tag questions ➢ Modal verb tag questions

There are two types of modal question tag—reverse polarity and same polarity [18]. Reverse polarity tags are phrases or questions structured in a way that implies an assumption or assertion and seeks confirmation from the witness, defendant or plaintiff. These tags often use negative phrasing or tag questions to elicit a response that aligns with the interrogator's agenda. Same polarity tags may be used in the same way, but they are particularly used to cast doubt on the witness's version of events. Example.

(1) Lauren Lake: You knew about the pregnancy from the beginning, didn't you? (2) You were supportive throughout the pregnancy, were you?

The first question assumes that the respondent was aware of the pregnancy from the start and seeks confirmation, the second question assumes that the respondent provided support during the pregnancy and seeks confirmation.

Agreement tag questions

In this type use expressions such as "Isn't that right?" "am I right" and "is that correct?" Or simply "right?" or "true?" Like modal tags, they can have positive or negative connotations. Example.

(3) Lauren Lake: You claimed to have financial difficulties, isn't that right? The third question suggests that the respondent previously stated having financial difficulties and seeks confirmation of that claim.

Full verb tag questions

Where a full form of the verb rather than a modal verb is used. This hyper-explicit language places pressure on the witness, defendant, or plaintiff to reply in a similarly exact way, leaving no room for partial disagreement (John Benjamins 2008).

(4) Lauren Lake: You attended every doctor's appointment with her, did you?

The fourth question explicitly asks if the respondent was present at every doctor's appointment, seeking a precise confirmation.

Yes or no tag

Another unusual tag, explicitly demanding a 'yes' or 'no' reply, is the 'yes or no' tag.

(5) Lauren Lake: You were present at the birth, yes or no?

Tag questions in paternity courtrooms help clarify specific details and ensure that the testimonies are consistent and truthful. They often put pressure on the witness,

defendant, or plaintiff to confirm or deny statements clearly, making it easier for the judge to ascertain the facts of the case.

In paternity courtrooms, the style of questioning is intentional and strategic. Tag questions are especially coercive, often designed to corner the witness into a specific answer. This method serves several purposes. First, the structure of tag questions pressures the respondent to give clear, straightforward answers, reducing the chance for evasion or ambiguity. Second, the coercive nature of tag questions allows the questioner to control the testimony's flow, guiding responses to support their argument. Third, by combining a declarative statement with a question, tag questions push the respondent to confirm or deny specific facts, helping to establish a clear narrative. Lastly, with reverse polarity tags, the questioner implies belief in the truth of the statement, reinforcing the assertion and challenging the respondent to convincingly refute it [16, 18].

- Yes-No questions

Yes/No questions are polar questions that require a simple 'Yes' or 'No' response. They seek information but phrase the answer in such a way that the witness only needs to confirm or deny the underlying assumption of the question [7].

> Lauren Lake: you claim you desperately need to determine paternity so that you can file for the death benefits to support your family, is that correct.
> Ms. Cameron: Yes, your Honor.
> Lauren Lake: So, you have an older child together?
> Ms. Cameron: Yes. And then you planned for the next one.
> Lauren Lake: Hmm. You said you got pregnant on January 17th.
> Ms. Cameron: Yes.

Yes-no questions are designed to be answered with a simple "Yes" or "No." They seek to confirm or deny specific information, helping to establish clear facts by requiring the witness to agree or disagree with a statement. In paternity cases, Yes-No questions help clarify key details, validate claims, and ensure the accuracy of testimonies.

- Choice questions

In this type of question, the witness is presented with a choice between two alternatives, with no other responses permitted.

> Lauren Lake: were you ever able to prove or disprove that this really happened?
> Mr. Nicholas: No, ma'am. That's the problem. I couldn't, like…It's the allegation coming from other people, you know.

These questions help clarify specific issues by focusing the defendant's or plaintiff's response on a particular point of contention. They assist in maintaining control over the direction of their testimony, resolving ambiguities in their statements, and confirming specific details. ❖ Consultative Questions.

Consultative questions in the present study are taken as a means of seeking possible responses from the questioners, with which questioners can refrain themselves from

being subjective and biased. Considering the humane principles of the law, criminals, just like anyone else, have certain basic human rights, although they have the obligation to admit to their actions. Despite this, they differ in that they have to acknowledge the crimes they committed. In courtroom trial, consultative questions of this type are most often presented with the Have you ever been or do you have any new evidence?, do you have any evidence to prove? Or do you have any other opinions?, do you have any questions?, etc.… Lauren Lake: Have you ever been in any type of relationship with her?

Lauren Lake: Do you have any doubts or concerns about the paternity of the child?

The first question provides an opportunity for the alleged father to disclose any relevant past relationships or interactions that could impact the paternity case. The second question allows the alleged father to express any doubts or concerns regarding the paternity of the child, recognizing the complexity of such cases and promoting transparency and open communication [15].

5 Conclusion

In conclusion, the determination of paternity in legal proceedings is important for not only establishing biological ties but also shaping the future of the child involved, as the case of Francken v. State (1926) has shown. Judges have a direct hand in steering courtroom dynamics through their line of questioning during these proceedings. Our study explores the linguistic subtleties that manifest themselves in judges' questions while hearing DNA paternity test cases—open-ended, closed-ended, modal, declarative, tag, yes-no, choice, and consultative questions.

In our scrutiny of courtroom transcripts from cases of paternity disputes, we identified some of the questioning styles used by judges. Open Wh questions drew detailed narratives, closed Wh questions sought specific details, modal questions served as a strategy of politeness, declarative questions had an undertone of coercion, tag questions were often coercive also, yes-no questions sought simple confirmations, choice questions sought clarification on specific issues, and consultative questions promoted transparency and the spirit of open communication.

Overall, our research reveals how deliberate and institutionalized questioning is within paternity courts, seeking candid responses and shaping the narrative to support legal arguments. We may learn more about how communication impacts the interpretation of legal evidence and the outcomes of paternity contests by listening to the nuances embedded within the questions judges pose.

The Impact of Transformational Leadership and Technology on Job Satisfaction Within Work Premises

Khaled Alzeaideen, Nabil Saad Aldeen Baker Aljriri Alhusan, and Waed Jamil A. Al Rawashdeh

Abstract The research aims at looking at the impact of transformational leadership and technology on job satisfaction at the workplace. This was a cause-and-effect study wherein a questionnaire served as the primary data-gathering tool. The study population included a great number of employees amounting to 9000. For this research, 389 copies of questionnaires were sent to employees in the municipality from different levels via Google Forms, and all copies were returned completed; thus, making them 388 samples with valid responses. Findings revealed that transformational leadership is being practiced to a high extent, while job satisfaction was only found to be at an average level.

Keywords Transformational leadership · Job satisfaction · Transformational technology · Work premises

1 Introduction

Extensive research has been conducted on the concept of transformational leadership, which involves inspiring and motivating employees to surpass their own expectations. The focus of these studies has been on the effect of transformational leadership on job satisfaction. Numerous investigations have consistently shown a positive correlation between transformational leadership and increased job satisfaction in various industries and regions [6, 9]. This correlation highlights the significance of transformational leadership in creating a work environment that fosters employee satisfaction and ultimately leads to organizational success [3]. The influence of transformational

leadership on job satisfaction has been tested in many organizational settings, highlighting its relevance in enhancing workplace results. But the specific need for a detailed exploration of the impact within the Greater Amman Municipality and other related sectors is important. According to [13], transformational leadership is very vital for efficiently managing big changes that improve the capability of an organization to deliver its roles and responsibilities [4].

The feelings that individuals have for their work, known as job satisfaction, is a complex and multifaceted issue. It involves many factors like the job itself, working conditions, relationships with colleagues and bosses, organizational culture, and opportunities for career development [5]. Typically, job satisfaction reflects positive affective states resulting from individual assessments of their jobs and work experiences. Conversely, when job satisfaction is low, it can give rise to negative attitudes towards the job or employer, which in turn can impact both organizational performance and the well-being of individuals [11, 13].

With the information presented, the objective of this study is to examine how job satisfaction in the Greater Amman Municipality is influenced by transformational leadership [1]. By narrowing the scope of investigation within this larger framework, valuable knowledge can be gained on the effective implementation of transformational leadership strategies to improve job satisfaction within the distinct organizational and cultural setting of the Greater Amman Municipality. The findings of this study have the potential to enhance our comprehension of the correlation between transformational leadership and job satisfaction in the Greater Amman Municipality in Jordan, as well as in comparable contexts throughout the region.

1.1 Research Questions

The study will address the main question: How does transformational leadership affect job satisfaction in the Greater Amman Municipality?

This main question is divided into the following sub-questions:

1. What are the levels of transformational leadership practiced within the Greater Amman Municipality?
2. What are the levels of job satisfaction within the Greater Amman Municipality?
3. What is the impact of transformational leadership on employee job satisfaction in the Greater Amman Municipality?

1.2 Importance of the Study

The primary objective of this study is to investigate the correlation between transformational leadership and job satisfaction specifically within the Greater Amman Municipality. This research endeavor serves as a valuable avenue to enhance the current theoretical framework by delving into the dynamics of this relationship within

a distinct municipal setting. By doing so, the study contributes to the existing body of knowledge and offers valuable insights that shed light on contextual factors that influence the efficacy of transformational leadership in fostering job satisfaction.

1.3 Objectives of the Study

The primary goal of this study is to examine the influence of transformational leadership dimensions on job satisfaction within the Greater Amman Municipality, as determined by the research questions.

1.4 Hypotheses of the Study

In light of the problem and objectives of the study, the researchers propose the following main hypothesis:

- **H.01**: "There is no statistically significant effect at the significance level ($\alpha \geq 0.05$) of transformational leadership dimensions (inspirational motivation, intellectual stimulation, individual consideration, idealized influence) on job satisfaction among employees in the Greater Amman Municipality."

1.5 Operational Definitions

1. **Transformational Leadership**: The Greater Amman Municipality has embraced a leadership approach that not only motivates and inspires its employees, but also drives them to surpass their own expectations and achieve remarkable outcomes, as evidenced by the study questionnaire's items (1–16).
2. **Job Satisfaction**: The study questionnaire measured the level of satisfaction and positive emotions that employees in the Greater Amman Municipality have towards their job roles, work environment, and overall job experience, specifically focusing on items 17–28.

1.6 Scope of the Study

- **Spatial Boundaries**: The spatial boundary of this study is the Greater Amman Municipality.
- **Temporal Boundaries**: The time frame is the second academic semester (2023–2024).
- **Human Boundaries**: Employees in the Greater Amman Municipality.

- **Thematic Boundaries**: Within the Greater Amman Municipality, the study concentrates on examining the literature pertaining to transformational leadership and its various dimensions, including inspirational motivation, intellectual stimulation, individual consideration, and idealized influence (charisma), in connection to job satisfaction.

2 Previous Studies

In a study conducted by Muharam [10] titled "The Impact of Transformational Leadership on Employee Satisfaction," the objective was to explore the correlation between transformational leadership style and employee satisfaction. The research employed a quantitative approach, utilizing descriptive analysis and verification methods within an explanatory research framework. Purposive sampling techniques were used to select a sample of 32 participants. Data analysis was conducted using the EViews v12 software. The findings of the study revealed that changes in transformational leadership style can explain and predict employee satisfaction, indicating a unidirectional relationship. Furthermore, the study identified a predictive association between the variables under investigation.

In a recent study conducted by Chen et al. [8] titled "Transformational Leadership and Employee Job Satisfaction: The Mediating Role of Employee Relationship Climate and the Moderating Role of Gender," the objective was to examine the intricate connection between transformational leadership and employee job satisfaction. The study specifically focused on the mediating role of employee relationship climate and the moderating effect of gender. To gather and analyze data, a comprehensive survey was administered to 211 public employees. The findings revealed a positive correlation between transformational leadership and employee job satisfaction, with employee relationship climate serving as a crucial mediator in this relationship.

3 Methodology and Procedures of the Study

3.1 Methodology of the Study

This research employs a descriptive-analytical methodology to understand the pattern of transformational leadership within the Greater Amman Municipality.

Table 1 Reliability statistics of the study instrument

Metric	Value
Number of questionnaire items	28
Total sample size	389
Number of complete questionnaires	388
Percentage of complete questionnaires	97.7%
Mean of the total scale	104.94
Standard deviation of the total scale	13.353
Variance of the total scale	178.314
Cronbach's alpha coefficient	0.976

3.2 Study Population

The focus of this study is on the employees of the Greater Amman Municipality. The study population is made up of individuals with diverse characteristics, including age, gender, educational background, job position, and length of service within the municipality.

3.3 Study Sample

In order to establish the appropriate sample size for this particular study, the table was utilized. This table offers suggested sample sizes for different population sizes, ensuring that a representative sample is obtained. As displayed in Tables 1, 2 and 3, a study population of 9000 would require a sample size of 368. To achieve the highest possible response rate, the questionnaire was distributed through Google Forms, as outlined in Appendix 1. Employing a method of simple random sampling, a total of 389 questionnaires were distributed, with 388 successfully retrieved and deemed suitable for statistical analysis. The response rate surpassed the recommended threshold.

Using this methodology to determine the sample size, the study shows a strong commitment toward attaining a very high level of statistical validity when investigating the impact of transformational leadership on job satisfaction within the Greater Amman Municipality.

3.4 Measurement Scale

To assess the questionnaire items in the study, a Likert scale with five points was utilized. This scale encompasses Strongly Agree (5 points), Agree (4 points), Neutral (3 points), Disagree (2 points), and Strongly Disagree (1 point).

Table 2 Reliability statistics of the study instrument—Cronbach's alpha value when any item is removed

Item	Mean of the scale	Variance of the scale	Corrected correlation	Cronbach's alpha coefficient
Enhances team spirit	100.91	632.493	0.765	0.976
Provides a compelling vision for the future	101.05	628.008	0.832	0.976
Expresses confidence in achieving organizational goals	100.99	634.641	0.781	0.976
Takes corrective action when expectations are not met	101.09	632.125	0.753	0.976
Motivates me to think about problems in new ways	101.07	631.067	0.784	0.976
Encourages me to explore different solutions to problems	101.08	633.869	0.784	0.976
Inspires creativity, thinking, and innovation	101.15	626.734	0.800	0.976
Promotes a culture of learning and development	101.10	630.204	0.778	0.976
Takes time to listen to my concerns and needs	101.14	630.580	0.742	0.976
Provides constructive feedback on my performance	101.14	627.250	0.841	0.976
Helps me develop my strengths and improve my weaknesses	101.18	627.385	0.810	0.976

(continued)

Table 2 (continued)

Item	Mean of the scale	Variance of the scale	Corrected correlation	Cronbach's alpha coefficient
Allocates development opportunities based on individual needs	101.28	627.745	0.788	0.976
Clarifies the values and principles I wish to adhere to	101.11	631.273	0.787	0.976
Respected and admired by the work team	101.02	631.514	0.775	0.976
Provides a role model through behavior	100.99	632.139	0.784	0.976
Shows consistency between words and actions	101.14	626.291	0.829	0.976
Satisfied with the salary I receive	101.45	631.334	0.683	0.976
Feels fully qualified for the job	101.06	630.598	0.794	0.976
Feels there is a very good opportunity for promotion	101.39	627.091	0.734	0.976
Satisfied with the benefits I receive	101.45	625.437	0.760	0.976
Feels I receive the recognition I deserve for good work	101.34	622.136	0.813	0.976
Many of our rules and procedures make doing the job well easy	101.42	625.386	0.790	0.976
Likes the people I work with	101.01	640.509	0.668	0.976
Feels the job is highly meaningful	100.95	640.023	0.663	0.976

(continued)

Table 2 (continued)

Item	Mean of the scale	Variance of the scale	Corrected correlation	Cronbach's alpha coefficient
Feels communication channels are good within Greater Amman Municipality	101.27	629.396	0.733	0.976
Satisfied with the value and timing of increases I receive	101.68	626.571	0.695	0.976
Feels those who do good work have a fair chance for promotion	101.64	625.328	0.729	0.976
Feels that my supervisor is fair in dealing with me	101.18	626.843	0.819	0.976

Table 3 Cronbach's alpha coefficient for dimensions of the study instrument

Variable	Number of items	Dimension	Cronbach's alpha coefficient
Transformational leadership	4	Inspirational motivation	0.908
	4	Intellectual stimulation	0.924
	4	Individual consideration	0.914
	4	Idealized influence	0.931
	16	Transformational leadership (overall)	0.947
Job satisfaction	12	Job satisfaction (overall)	0.950

3.5 Multifactor Leadership Questionnaire (MLQ)

The Multifactor Leadership Questionnaire (MLQ) was used to measure the dimensions of transformational leadership.

3.6 Job Satisfaction Survey (JSS)

The concept of job satisfaction is complex; it has many dimensions. It acts as a barometer reflecting the employees' total feelings about the job and work conditions.

It is generally agreed that many things lead to that feeling, including job content itself, relationships with colleagues and bosses, professional development opportunities, and also being able to have a work-life balance, plus compensation plus benefits.

3.7 Validity and Reliability of the Instrument

Face Validity

The questionnaire's face validity, which ensures that it accurately measures its intended purpose, was confirmed through a process of presentation and feedback. To assess face validity, the researchers sought the input of nine experts in management and statistics. Taking into account the experts' suggestions, the researchers made the appropriate revisions and adjustments to the questionnaire.

Reliability

Consistency is a fundamental aspect of reliability in questionnaires, ensuring that if the same questionnaire is administered multiple times under identical circumstances, it will produce consistent or comparable results. To evaluate the reliability of the questionnaire, the researchers employed Cronbach's Alpha Coefficient in a reliability analysis. This analysis encompassed all 28 items of the questionnaire and was conducted with 388 valid responses, out of the 389 questionnaires that were distributed.

Taking this into account, the researchers determine that the questionnaire used in the study demonstrates a significant level of reliability and internal consistency across its various items.

Table 2 provides an analysis that delves into the reliability of the study instrument, particularly exploring the influence of excluding specific items from the questionnaire on the Cronbach's alpha coefficient.

The internal consistency within each dimension of transformational leadership, which encompasses Inspirational Motivation, Intellectual Stimulation, Individual Consideration, and Idealized Influence, is demonstrated by the Cronbach's Alpha coefficients ranging from 0.908 to 0.931. These coefficients indicate excellent reliability. Furthermore, the overall reliability coefficient for the entire transformational leadership construct, measured across all 16 items, is 0.947, affirming a high level of consistency for this scale. Similarly, the dimension of job satisfaction exhibits exceptional internal consistency, as indicated by a reliability coefficient of 0.950 across the 12 items that were measured.

Reliability analysis utilizing Cronbach's Alpha provides insight into the internal consistency of scales. Generally, Cronbach's Alpha values higher than 0.7 are deemed acceptable, while values surpassing 0.9 indicate exceptional reliability. In this study, both the transformational leadership and job satisfaction scales exhibit outstanding internal reliability, as evidenced by the Cronbach's Alpha analysis. This level of

reliability underscores the well-constructed nature of the instrument and its suitability for accurately measuring the constructs of interest in the present investigation.

3.8 Correlation Matrix Between Study Variables (Pearson Correlation Coefficient)

To evaluate the level of variability between the study variables and establish internal construct validity, the Pearson correlation coefficient was computed. This analysis aimed to identify any significant linear correlations (multicollinearity) among the different dimensions of the independent variable. The outcomes of this analysis can be found in Tables 3 and 4.

Based on the data presented in Table 4, it is evident that there are no signs of multicollinearity among the variables examined in the study. Typically, correlations exceeding 0.80 would suggest a potential concern, but in this case, it can be confidently stated that the sample does not display any significant problems associated with high multicollinearity (Table 5).

Table 4 Correlation matrix between variables

Number	Dimension	Transformational leadership	Job satisfaction
1	Transformational leadership	1	
2	Job satisfaction	0.572	1

Table 5 Criteria for judging means

Rating	Level of significance
1 to 2.33	Low
2.34 to 3.67	Medium
3.68 and above	High

4 Results

4.1 Overall Levels of Transformational Leadership Dimensions

By conducting calculations, the researchers determined the means and standard deviations for the four dimensions of transformational leadership that were examined. Table 6 offers a comprehensive summary of the means, standard deviations, levels, and overall rankings for each dimension, namely Inspirational Motivation, Intellectual Stimulation, Individual Consideration, and Idealized Influence (Charisma).

The range of scores for these dimensions falls between (3.75) and (3.948), demonstrating a significant level of consensus among the participants in all aspects. Notably, Inspirational Motivation emerges as the dimension with the highest mean score of (3.948), solidifying its position at the top. This finding underscores the strong agreement within the study sample regarding the presence of inspirational motivation in their leadership.

Coming in at second place with a mean score of (3.835), we have Intellectual Stimulation, which signifies a strong consensus on the leader's ability to foster creative and innovative thinking. Ranked third with a mean score of (3.87) is Idealized Influence (Charisma), indicating that the leader is seen as a charismatic role model who sets a positive example and garners respect and admiration from the team.

With a mean score of (3.75), Individual Consideration secured the fourth position, indicating a strong consensus regarding the leader's commitment to addressing individual needs and interests. Although it received the lowest score, it still demonstrates a significant level of agreement.

Based on the study sample, it is evident that there is a high level of consensus regarding the presence of transformational leadership dimensions in their leadership, as indicated by an overall mean of 3.85 for this dimension.

Table 6 Descriptive statistics, levels, and overall ranks for transformational leadership dimensions

No.	Dimension	Mean	Level	Rank
1	Inspirational motivation	3.94	High	1
2	Intellectual stimulation	3.83	High	2
3	Individual consideration	3.75	High	4
4	Idealized influence (Charisma)	3.87	High	3
Overall mean for transformational leadership		3.85	High	

4.2 Job Satisfaction Level

The dimensions of job satisfaction are summarized in Table 7, which provides information on the means, standard deviations, levels, and ranks. The average levels of agreement for these dimensions range from average to high, with mean scores falling between (3.26) and (3.99).

Among the items assessed, the statement "I feel that my job is very meaningful" garnered the highest mean score of (3.99), with a standard deviation of (1.060). This

Table 7 Descriptive statistics, levels, and ranks for job satisfaction dimension

No.	Statement	Mean	Standard deviation	Level	Rank
1	I am satisfied with the salary I receive	3.48	1.275	Average	9
2	I feel that my leader is fully qualified for their job	3.87	1.125	High	3
3	I feel that there is a very good chance for promotion in my job	3.55	1.304	Average	7
4	I am satisfied with the benefits I receive in my job	3.48	1.305	Average	10
5	I feel I receive the recognition I should for doing good work	3.60	1.303	Average	6
6	Many of our rules and procedures make doing the job well easy	3.52	1.258	Average	8
7	I like the people I work with	3.93	1.039	High	2
8	I feel that my job is very meaningful	3.99	1.060	High	1
9	I feel that communication channels are good within the Greater Amman Municipality	3.67	1.245	Average	5
10	I feel satisfied with the value and timing of the raises I receive	3.26	1.385	Average	12
11	I feel that those who do good work have a fair chance for promotion	3.30	1.360	Average	11
12	I feel that my leader is fair in dealing with me	3.76	1.182	High	4
Overall mean for job satisfaction		**3.617**		**Average**	

highlights the fact that the participants in the study strongly agreed with the notion that their jobs hold significant meaning. Consequently, this finding suggests a notable level of job satisfaction in relation to this particular aspect.

On the other hand, the statement that received the lowest average rating is "I feel satisfied with the value and timing of the raises I receive," scoring an average of 3.26 and a standard deviation of 1.385, placing it twelfth in rank. This implies a moderate level of consensus on this aspect, implying that there is potential for enhancement in terms of job satisfaction in this particular area.

The statements "I like the people I work with," and "I feel that my leader is fully qualified for their job" garnered impressive average scores of 3.93 and 3.87, respectively, securing the second and third spots. This underscores the significance of interpersonal connections and effective leadership in fostering job contentment.

The study sample demonstrates a moderate level of job satisfaction, as indicated by the mean score of (3.617) for the job satisfaction dimension.

4.3 Discussion of Results

In this section, the researchers discuss the main findings of the current study, comparing these results with previous studies. The discussion includes:

1. In the Greater Amman Municipality, the implementation of transformational leadership was found to be at a high level, according to the current study. The highest-ranked dimension was Inspirational Motivation, with a score of 3.94, closely followed by Intellectual Stimulation (3.83), Idealized Influence (3.87), and Individual Consideration (3.75). These findings are consistent with a previous study conducted on transformational leadership in Jordanian commercial banks, which also reported a high level of transformational leadership at 3.96. Therefore, the current study's results support and reinforce the findings of their earlier research.
2. The level of job satisfaction observed in the Greater Amman Municipality is moderate, as indicated by the results. This aligns with the findings of Al-Tuwaijri [7] and the study conducted, both of which also reported a moderate level of job satisfaction. However, this contrasts with the findings of [2], where job satisfaction was reported as high. Furthermore, it differs from the study conducted in the private health sector in Saudi Arabia, which found high levels of job satisfaction among employees. These results are consistent with the study conducted, which reported a moderate level of job satisfaction among social security employees.
3. The results of the present investigation indicate that employee satisfaction within the Greater Amman Municipality is significantly influenced by transformational leadership, accounting for a substantial portion (69.7%) of the variation in job satisfaction. This discovery is consistent with previous research, including a study conducted [2], which observed a strong impact of transformational leadership on job satisfaction in a similar community. Additionally, the findings align with

the work of, who established a significant positive correlation between transformational leadership and employee engagement within the Greater Amman Municipality. These collective findings further support the notion that qualities associated with transformational leadership, such as inspiration and individual consideration, play a critical role in fostering positive employee attitudes within the public sector in Jordan.

4.4 Recommendations

Based on the previous results, the study recommends the following:

- To achieve a more comprehensive understanding of the correlation between transformational leadership and employee satisfaction in diverse contexts, future research should expand its focus to encompass a wide range of organizations, sectors, and regions. By doing so, the findings will become more applicable to different settings and enhance their overall generalizability.
- To enhance the statistical power and dependability of the study findings, researchers are advised to employ larger sample sizes. This approach would not only facilitate a more comprehensive examination of subgroups but also bolster the overall reliability of the analysis.
- In order to address potential biases that may arise from using research tools like questionnaires, it is recommended that future studies incorporate a variety of data sources, such as evaluations from supervisors, assessments from peers, or objective performance indicators, in order to validate the findings.

Blockchain-Enabled Solar Energy Trading: Enhancing Efficiency and Transparency

Matrupriya Dibyanshu Panda, Hemraj Shobharam Lamkuche, Mohammad Temeiza, and Maram Y. Al-Safarini

Abstract The adoption of solar energy is crucial for sustainable development and combating climate change. Traditional energy trading systems are hindered by centralization, lack of transparency, and high transaction costs. Blockchain technology provides a decentralized, secure, and transparent solution to these issues. This paper explores the application of blockchain in solar energy trading, focusing on its potential to enhance market efficiency and transparency. We review current research on blockchain-based energy trading, emphasizing benefits such as cost reduction and increased efficiency through peer-to-peer (P2P) trading and smart contracts. A case study demonstrates the practical implementation of a blockchain-based solar energy trading system, highlighting improvements in efficiency, security, and user satisfaction. Despite its promise, challenges like scalability, regulatory issues, and stakeholder acceptance persist. Future research directions are suggested to address these challenges.

1 Introduction

The need to switch to renewable sources of energy is therefore very critical in a globally changing climate and sustainable development. Among many renewable resources, solar energy shows prominence with abundance and renewability, and thus remains one of the main drivers in the world towards a cleaner source of energy. However, existing energy trading systems have posed important barriers to the optimal use of solar power. Traditional systems often reflect features of centralization, non-transparency, and inefficiency, resulting in high transaction costs and low utilization of potential solar energy resources.

Blockchain technology has evolved as a panacea of sorts for such problems, offering a decentralized, transparent framework in which energy can be traded. Enabling peer-to-peer transactions between producer and consumer, blockchain can significantly decrease reliance on middlemen, thereby considerably reducing transaction costs and raising efficiency. Moreover, transaction automation inherent in smart contracts within the platform makes sure that operations will be secure, transparent, and tamper-proof. This technological innovation will lead to a much more efficient and hence fair energy market in which producers and consumers can directly engage in peer-to-peer energy trading.

The role of blockchain technology in solar energy trading is assessed in this paper. Second, it surveys the literature available on blockchain-based energy trading systems and subsequently outlines the advantages of decentralization, transparency, and efficiency inbuilt into the blockchain over traditional ones. A detailed case study of a blockchain-based solar energy trading platform, its detailed design, implementation, and some performance metrics, is presented. This gives practical insight into the real-world application of blockchain technology in solar energy markets.

Still, a very long and arduous road remains to fully realize the potential of blockchain for energy trading, which is strained by scalability issues, regulatory barriers, and reaching stakeholder acceptance and collaboration. In this sense, an attempt has been made to outline the challenges and indicate possible solutions and future research directions. By meeting these challenges, blockchain technology can contribute fundamentally to the improvement in efficiency and large diffusion of solar energy. This paper thus adds to the understanding and development of blockchain-enabled energy trading systems on the pathway to a sustainable energy future, in which solar power will come into its own.

2 Background

The need to transit toward renewable energy sources is one of the ways to fight global climate change and achieve sustainable development. Among them, solar energy stands out due to its abundance and renewability. Therefore, it would become one of the main driving forces in the global shift toward cleaner energy [1]. However,

there exist very challenging issues for the optimal exploitation of solar power arising from existing trading systems for energy [2]. These traditional systems are mostly centralized, opaque and inefficient with high transaction costs and underutilization of the solar energy resources available.

Solar Energy Trading

Solar energy trading refers to the act of selling and buying electricity generated by solar energy producers, such as households, to consumers. Traditional energy trading systems normally involve central coordination by utilities and other regulatory bodies. They generally come with the following issues:

Inefficiency: Centralized systems are slow because they include bureaucratic procedures involving several layers of verification and approval. This could delay transaction processing and energy distribution [3–5].

High Transaction Costs: It costs arise due to services rendered by third parties, such as utility companies and brokers. This raises the total trading cost of energy. These costs often make participation in energy markets very difficult for small producers and consumers [6].

Lack of transparency: Traditional systems most of the time lack transparency, whereby participants cannot verify transactions and trace back to their origin and energy flow. This may result in issues related to trust and possible disputes between parties [7].

Security Vulnerabilities: Centralized databases have become ever more a prized target of cyber-attacks. One successful attack could compromise relevant sensitive data and bring disruptions in energy distribution—of huge potential consequences to the economy and society.

Intersection of Blockchain and Solar Energy Trading

Many of the limitations of conventional systems could be overcome by the integration of blockchain technology into solar energy trading [1]. Key benefits include:

Decentralized Energy Trading: Blockchain empowers decentralized energy trading platforms between peers, which in turn makes it possible for any person to sell energy to and buy it from anyone [8]. After that, intermediation is reduced, along with transaction costs, enhancing market efficiency. Consumers are put at the core of activity in decentralized trading, able to become "prosumers" in the production and consumption of energy for a more decentralized and resilient energy grid [2].

Automated Transaction: Smart contracts automate energy transactions. For instance, a smart contract will execute a transaction when a house is generating excess solar energy and another house needs extra energy. This type of automation of transactions assures that transactions are timely and accurate, reducing the chances of errors and disputes [3]

Security Enhanced: This decentralized and immutable nature of blockchain enhances the security count of energy trading systems. Since every transaction is recorded in multiple nodes, this reduces the risk of data breaches and cyber-attacks

to a large extent. Apart from that, transparency through a blockchain ledger makes fraudulent activities traceable and more difficult to perpetrate [4].

Real-Time Settlement: Blockchain empowers real-time energy transaction settlement. Traditional systems often have delays in their payment processing and settlement. In contrast, blockchain can settle transactions instantaneously, thereby improving cash flows and reducing financial risks to the parties concerned.

3 Literature Review

Several pilot projects and platforms have been developed that are testing blockchain-based local energy trading in the solar energy sector [5]. These pilots show that blockchain technology can be put into practice within the energy sector, offering added value [3].

Brooklyn Microgrid

Probably one of the first pilot examples of blockchain-based peer-to-peer solar energy trading is the Brooklyn Microgrid project in New York. Every resident within this initiative who has installed solar panels can resell excess energy to neighbors using a blockchain platform [3]. The main features of the Brooklyn Microgrid are the following:

Decentralized Energy Exchange: This directly connects participants so that residents can sell energy to other residents, circumventing the traditional utility companies and creating an entire local energy market much more efficient and resilient [4].

Real-Time Data Tracking: The blockchain platform shows real-time data on energy production and consumption. This provides a real-time awareness of the quantity of energy used or traded by participants of the community, thereby improving transparency and trust [5].

Smart Contracts: Smart contracts automate energy transactions based on predefined conditions set out in the transaction. This aids accurate and timely settlements, reducing the administrative burden and minimizing the risk of disputes.

Grid+

Grid+ is a project by ConsenSys aimed at developing a blockchain-based energy market [3]. The platform enables customers to have better control of their consumption and its associated costs. Some of the primary characteristics of Grid+ include:

Smart Energy Agents: Grid+ utilizes smart energy agents that handle energy transactions on behalf of the customer. These agents automatically purchase and sell energy in a real-time marketplace to achieve optimal energy usage and cost.

Blockchain Ledger: All transactions are irrevocably noted on a blockchain ledger, which makes everything transparent and secure. Consumers can trace their energy usage and trading activities in real time [5].

Integration of Renewable Energy Sources: Grid+ supports the integration of renewable energy sources like solar and wind. This helps on the use of clean energy and contributes to a much more sustainable energy market.

Real-Time Settlement: Blockchain empowers real-time energy transaction settlement. Traditional systems often have delays in their payment processing and settlement. In contrast, blockchain can settle transactions instantaneously, thereby improving cash flows and reducing financial risks to the parties concerned.

4 Methodology

The methodology will be followed in this research while evaluating the possible benefits that blockchain technology can bring into the trading of solar energy, challenges to be encountered, and practical implementations.

Potential Benefits of Blockchain in Solar Energy Trading

Decentralization and Democratization: Blockchain opens up decentralized energy markets and reduces traditional power companies dominance over the energy market, putting consumers and small producers at the wheel. This democratization of the energy market could mean more competitive prices and higher participation in renewable energy production [5].

Higher Efficiency in Markets: Blockchain reduces transaction costs by cutting out intermediaries and automating transactions through smart contracts. This can lead to a decrease in energy prices for the consumer and an increase in the revenue of producers [6].

Improved Security and Resilience: This reduces the risk of having a single point of failure within the system, hence making it very hard to have effective cyber-attacks against a blockchain-based system. Moreover, blockchain records cannot be changed. Thus, once they are written, it is irrevocable, allowing integrity, reliability, and consistency in transaction data [7].

Improved Transparency and Trust: It provides a transparent, immutable record of every single transaction that gives improved trust amongst the parties. Consumers can trace back to the source and energy flow, while producers are able to prove origin and sustainability of their energy production.

Renewable Energy Integration: Blockchain will support the integration of renewable energy through effectiveness and transparency in trading energy, thereby possibly promoting the use of clean energy and contributing to more sustainable energy markets [8].

5 Implementation of Smart Contracts

In this work, implementation will be done by deploying and testing contracts on the blockchain network using Hardhat. The target of the testing process is to prove the performance of smart contracts in regard to different sets of cases, providing data integrity, security, and automatization of processes.

Testing with Hardhat:

Test case	Description	Expected outcome	Actual outcome	Status
Deploy contract	Deploy the smart contract to the Sepolia network	Contract is deployed	Contract is deployed	Pass
Data integrity	Verify the integrity of the data	Data matches	Data matches	Pass
Unauthorised access attempt	Attempt unauthorised access to the data	Access is denied	Access is denied	Pass
Automated resource allocation	Test resource allocation via smart contract	Resources allocated	Resources allocated	Pass

Smart Contract Development: Develop smart contracts in Solidity, specifying the rules concerning data management, access control, and resource allocation. The contracts are designed to handle tasks like energy transactions and automated processes [9].

Deployment: Finally, deploy these smart contracts on the Sepolia Network with Hardhat. Hardhat provides an efficient environment for contract deployment and testing.

Testing: Thorough testing of smart contracts ensures functionality and security. Some of the tests conducted are as follows:

Deployment Validation: Verify that the contract has been properly deployed into the blockchain and is accessible.

Data Integrity Checks: Verify that data managed by the Contract is accurate and consistent.

Security Testing: Verify Unauthorized access is duly restricted.

Resource Allocation Testing: Validate that resources are allocated correctly as per the rules followed by the contract.

Results: All test cases passed. This demonstrates that the smart contracts functioned as intended, were successfully deployed, data was managed correctly, secure access controls were in place, and automated resource allocation worked effectively.

Challenges and Future Directions

Notwithstanding the potential advantages, the adoption of blockchain in solar energy trading is also faced with a few challenges:

Regulatory and legal issues: Most of the regulations might not be designed for such a decentralized system, so there will be ambiguities regarding the legal status of blockchain transactions. Policymakers should work out a framework that will facilitate innovative growth without sacrificing consumer protection and market stability [10].

Scalability: Blockchain networks can become prone to scalability issues, especially considering large transaction volumes. Solutions like sharding, off-chain transactions, and improved consensus algorithms are in the development stage to address challenges caused by these issues. Further research in this line of thinking should be directed toward enhancing scalability and developing blockchain systems with better performance for large-scale energy trading.

System Integration: Blockchain would like to integrate with pre-existing energy infrastructure [11]. That requires coordination among different actors, from energy producers to consumers, utilities, and regulators. An avenue to easier integration and better interoperability between blockchain-based and traditional energy systems would therefore be through the development of standardized protocols and interfaces [12].

Energy Consumption: The energy consumption for blockchain networks, mostly proof-of-work consensus mechanisms, might be high. Therefore, research in more energy-efficient consensus mechanisms, like proof-of-stake, may help resolve the situation [13].

6 Results and Discussion

Testing was performed on various test cases in order to learn how blockchain technology has performed in the trading of solar energy. These include a test case for the deployment of smart contracts, data integrity verification processes, unauthorized access attempts tests, and automation of resource allocation. Deployment and testing of smart contracts successfully give evidence to its feasibility and benefits in using blockchain technology in solar energy trading. By being able to work directly between peers, blockchain enables peer-to-peer energy trading that reduces the dependency on traditional utility companies and intermediaries in the exchange. This could result in a much more competitive pricing process, one that includes more market participation from small-scale producers and consumers [14].

Because it is peer-to-peer trading, much of the transaction costs are removed. Besides, smart contracts allow for automated transactions, thus streamlining processes in order to ensure timely settlements, which in turn provides better market efficiency and likely brings down energy prices to consumers while leading to higher revenues on the producer side. Because the blockchain is transparent, all participants are allowed to check, verify, and illustrate flows of energy in near real-time. This feature creates trust among the participants and reduces the possibilities of disputes, as observed from test cases with data integrity maintained [15].

7 Conclusion

Blockchain technology can become a strong force of transformation for the trading of solar energy: it will bring about a new way of managing and optimizing energy transactions. The intrinsic features of blockchain—decentralization, transparency, and security—fit quite well in the attainment of objectives for fashioning an energy market that is efficient and fair. Under blockchain, it is possible to shift solar energy trading from traditional centralized systems into a more decentralized one, hence reducing dependence on intermediaries and reducing costs resulting from transactions. It also empowers both the consumer and the producer through P2P trading, making a more resilient and competitive energy market.

Applications of blockchain in solar energy trading enhance weaknesses of traditional systems on several grounds. It enhances transparency by virtue of the immutable ledger of transactions, thereby increasing trust between participants and reducing disputes. Smart contracts are encoded to automate transaction processes,

further reducing administrative overhead and hence minimizing errors. In addition, the decentralized nature of blockchain removes the single point of failure, making the trading system much more secure and resilient. Despite all of the advantages, a number of challenges still persist. First of all, for decentralized energy trading systems, it will require adaptation on the regulatory and legal fronts. With this in mind, scalability issues will have to be resolved in order to handle huge transaction volumes. More importantly, blockchain integration with existing energy infrastructure will have to be suitably coordinated among various stakeholders and standardized protocols developed. More than that, blockchain networks'—in particular, proof-of-work mechanisms—energy consumption itself also warrants exploring more energy-efficient consensus algorithms.

It is easy to envision that blockchain technology, as a facet of solar energy trading, will surge immensely in importance with evolving blockchain technology and changing regulatory environments. Indeed, the potential benefits in reduced transaction costs, improved security, and enhanced market efficiency all tend to explain the pivotal role blockchain may play in the future of the sustainable energy markets. More precisely, for the full realization of the potential of blockchain, ongoing research and development will be vital to overcome current challenges and to enable this technology to promote the global transition to renewable energy.

Acknowledgements We would like to deeply thank the researchers and authors whose leading effort in blockchain technology and renewable energy contributed significantly to this field and hence created the ground for this study. Their extensive research and projects gave valuable insights, therefore inspiring us to do this work entitled "Blockchain-Enabled Solar Energy Trading: Enhancing Efficiency and Transparency."

We are grateful for access to the wide-ranging academic and industry resources that have contributed so much toward the realization of our research. There is a comprehensive literature available in the form of case studies and technical documentation, which really added depth to our understanding and analysis. We would also like to acknowledge the countless online forums and communities of blockchain and renewable energy whose discussions, forums, and knowledge sharing have greatly helped in our endeavor. Their cooperative spirit and commitment to technology advancement for sustainable development served as a continuous driving force.

Finally, we would like to extend our gratitude to colleagues and family members who have continuously given us a good environment to carry out this research and subsequent writing. Their understanding and patience during the research exercise were very vital in ensuring that the paper was completed successfully.

The Ethics of AI in Education: A Psychological Perspective on Bias and Fairness

Adnan Hassan Alsarayreh

Abstract The growing incorporation of Artificial Intelligence in educational systems elicits weighty ethical considerations on bias and fairness. This chapterlooks into the psychological implications of the use of AI in education with a specific focus on bias and unfairness throughout the design and implementation of AI technology. The study is a research synthesis that takes a qualitative approach to reviewing available literature on the topic, including its socio-economic and cognitive impacts on students. An analytical perspective provided by the study helps identify thematic concerns and challenges related to AI-driven educational tools, underlining the need for deliberate and ethical considerations during development. The findings stress that issues concerning ethics need to be responded to proactively so that inequities within education are not perpetuated. In broader terms, it provides a basis for well-informed discussions along with recommendations toward attaining fairness in AI applications within educational settings.

Keywords Artificial intelligence · Education · Ethics · Bias · Fairness · Cognitive development · Psychological impact · Socio-economic implications · Qualitative research · Educational technology

1 Introduction

Ethical considerations regarding the application of artificial intelligence (AI) in education emerge at the crossroads of technology and education; however, during the conception, design, and implementation of these systems, moral aspects are

frequently neglected. This oversight can result in the use of technology that perpetuates bias, inequity, and unfairness [1]. Consequently, it is essential to follow established ethical standards grounded in fundamental principles and policies to intentionally and proactively pursue fairness, inclusion, and potential within educational technology. In this context, the significance of conception and design is highlighted, yet these same concerns should hold equal weight during the implementation of such systems. Moreover, a broader lack of awareness concerning emerging ethical dilemmas can result in a naïve and uncritical application of technologies that may produce unintended and adverse effects [1]. Thus, it is imperative to urgently recognize and address any ethical issues that arise in educational environments related to the implementation of technology like AI. Within this paper, it is critical to consider breaking down bias and fairness concepts and challenges within the spheres of education and social justice, especially in the fine balance of design and execution. The dynamics of how equity is introduced in an educational setting have been a bone of contention alongside its implications and challenges on socio-economic terms. This analysis is drawn from qualitative interviews with professionals working in education—school leaders and teachers—thus underscoring how their perceptions could inform the development as well as practical application of educational technologies which are informed by AI, machine learning, big data [2]. More specifically, the probe has revolved around how biases' and unfairness' existence is known or accepted into data use. Ultimately, it has been posited that to achieve fairness, AI and its associated systems and solutions must approach the parameters of fairness with greater deliberation, awareness, and caution right from the beginning.

1.1 Background and Rationale

The growing interest in the ethics surrounding AI use in education stems from the increasing implementation of various AI systems, including intelligent tutoring systems, learning analytics, and recommender systems. While the application of AI in educational contexts presents promising opportunities, it also carries inherent risks, making it essential to focus on the ethical implications. Research addressing the ethical dimensions of AI's impact on education has been limited thus far. It is important to determine whether the ethical concerns identified by educational stakeholders align with those recognized by the AI community. For educational actors to voice their concerns effectively or act upon promoting ethical AI, they must first be made aware of potential ethical issues. The influence that educational AI systems have on the life opportunities of students makes it a necessary condition for any critique to go beyond technical characteristics like accuracy and reliability, including ethical aspects in the design and use of them. Various guidelines and recommendations have put forward several principles concerning the ethics related to the design and use of AI. In this regard, this chapter critically examines those ethical issues these principles seek to address in terms of their significance and applicability within an area focused on education. The general adoption of AI-supported educational technology offers

an opportunity to improve both quality as well as access to education; however, it also poses risks that threaten fundamental values such as fairness. This is because such technology often bases its functioning on data relating to students' backgrounds regarding different aspects—including socio-economic information and past performance—used to predict future outcomes—hence risking fairness. Such systems may explicitly or implicitly favor certain individuals, particularly those with a robust socio-economic status, while disadvantaging others. It is alarming that current educational technology struggles to manage these risks. Efforts are underway to educate various stakeholders about the potential implications of AI in education and to advocate for justice and equity in the design and application of AI within educational settings. Nevertheless, nearly all initiatives stem from commercial, governmental, or research sectors, leaving schools, educators, and students either reliant on the initiatives of others or unable to directly tackle issues of fairness. A framework designed to establish fairness that societal actors can engage with concerning data-driven AI within the contexts of postmodern educational governance in Sweden. This framework has been crafted through:

1. Ethical and philosophical reflections on fairness related to data management in AI
2. An examination of the ways fairness is addressed in educational governance policies, and
3. An investigation into how educational equality and justice are treated within Swedish educational governance contexts.

1.2 Scope and Objectives

This chapter, as suggested by its title, explores the ethical dilemmas associated with the growing implementation of AI constellations in education, while also incorporating a psychological viewpoint on issues of bias and fairness. The focus is on educational policy documents from Sweden [3]. The scope is somewhat restricted to the nature and extent of educational activities (formal, compulsory schooling) and AI constellations (algorithms that aid decision-making in national assessments and cognitive tutoring). Instead of merely addressing the construction of systems and algorithms, this discussion emphasizes the ethical implications of AI constellations. A significant emphasis is placed on the concept of fairness, which is pivotal to the AI constellation. The exploration of fairness issues is approached from a psychological angle, concentrating on two main inquiries: what challenges related to bias and fairness do the AI systems involved in formal education present? How are these bias and fairness concerns represented in pertinent policy documents? Most media coverage regarding the societal effects of AI has primarily focused on generative systems such as ChatGPT [4]. In this study, algorithms with a narrower focus, investigated within a Swedish framework, have been utilized for an extended period and significantly influence educational choices impacting many people. Both the EU and Sweden

have adopted a regulatory stance toward perceived or actual risks and threats, which encompass biases related to socioeconomic status and ethnicity [4].

1.3 Methodology

This chapter takes a qualitative approach to explore the ethical dimensions of artificial intelligence in educational contexts, specifically psychological impacts concerning bias and fairness. In so doing, the study shall adopt a descriptive methodology in reviewing existing literature both theoretical frameworks and empirical studies with an aim to identify prevalent themes and issues related to bias and fairness in artificial intelligence systems regarding students' cognitive as well as emotional well-being. An analytical approach will then be applied toward synthesizing these findings, thereby drawing out possible insights into how AI-driven educational tools might perpetuate or mitigate biases developed by such tools and how these biases affect students in their educational experiences and outcomes. The fusion of descriptive and analytic techniques is intended to give a full understanding of the ethical challenges that AI will bring in its train in education so that there can be discussions based on evidence and recommendations for fairness in the application of artificial intelligence.

2 Understanding AI in Education

AI technologies are being progressively integrated into educational settings to tailor both learning and teaching experiences. These systems mimic human cognitive abilities and adjust responsively to the requirements of learners. Intelligent tutoring systems, which fall under the category of AI, assess learners' knowledge and facilitate their education. Utilizing the BKT framework, educational AI systems provide numerous advantages, allowing for personalized education that is cost-effective, rapid, and rich in data [5, 6].

2.1 Definition and Types of AI in Education

Artificial Intelligence (AI) refers to a computer system that can replicate cognitive abilities typically associated with human thought processes, such as perception, reasoning, learning, and knowledge acquisition. These intelligent machines may surpass human capabilities, giving rise to significant ethical dilemmas within society. The EU High-Level Expert Group on AI recommends that AI systems adhere to principles of legality, ethics, and robustness, emphasizing human agency, technical safety and robustness, privacy and data governance, transparency, fairness and non-discrimination, societal and environmental welfare, and accountability [5]. In the

realm of education, AI systems have the potential to assist both teachers and students by analyzing individual preferences and needs, creating personalized learning paths, facilitating routine tasks, and enhancing efficiency and quality. In 2021, UNESCO introduced an AI strategy aimed at ensuring inclusive and equitable quality education. AI is already present in educational settings, posing complexities for the private sector and necessitating shared principles to steer development [5]. In education, AI technologies can manifest in three categories: applications and services directed at learners, those aimed at teachers, and those designed for educational administration. Furthermore, they can encompass six types: data analytics, machine learning, natural language processing, robotics, smart supply chains, and computer-aided design. In education, two approaches can be adopted: the direct application of education systems integrated with AI technologies and the indirect application of education systems that are bolstered by AI technologies. Recognizing the differences and nuances in defining AI technologies and their potential integration into education is crucial for subsequent discussions regarding the ethical ramifications of employing AI technologies in educational settings [7].

2.2 Applications and Benefits

With the global expansion of computer technology and the Internet, public engagement, inclusivity, and access levels have emerged as crucial elements of education across nearly all nations. Educational institutions at every level are adapting to the swiftly evolving landscape of communication and technology. Innovative learning modalities, teaching resources, and methods of knowledge distribution are on the rise. The significance of information technology applications in enhancing various facets of the educational process has been acknowledged as essential. These facets encompass the creation of learning materials, management of educational institutions, bureaucratic procedures within education, evaluation processes, and the improvement of teaching and learning experiences [8]. The focus has shifted from debating the use of Artificial Intelligence (AI) in education to determining the most effective ways to utilize and comprehend the implications of these tools. Understanding the technological and social ramifications is imperative for any nation to make informed choices. The last few years have seen artificial intelligence seep into the education sector. A technology-enhanced education system is very advantageous and can help bring increased accessibility, affordability, equality portability, interactivity usability efficiency effectiveness. The implications of such educational systems need to be understood from all possible perspectives, including the individual and societal standpoint about whether AI in education is seen as an opportunity by some individuals, countries or companies while others might consider it a risk. Likewise, perceptions about AI's role in education can differ from one society to another based on factors such as gender, race or educational background. Thus a clear understanding of AI in the educational context is necessary for its successful implementation within the cultural, social, educational ethical political frameworks [9]. Understanding the

applications of AI in education both for the present and future also calls for research efforts that cut across disciplines, involving expertise from such areas as technology, education, social sciences, psychology, ethics and politics.

3 Ethical Considerations in AI Development

The ethical considerations of developing and implementing AI technologies in the educational process are very important. Relevant ethical factors are bias, fairness, transparency, and accountability. And while the algorithms or technologies used in these systems may seem fair in themselves, they can cause ill effects or harm to students. Also, bias can be introduced by the AI educational technology itself. Education systems need to ensure that AI tools provided do not have bias injected into them during training using anonymized data that is later on used to achieve bias parameters making it difficult for detection [9]. Transparency is also overlooked due to being presented with complicated models that hold some difficulty to comprehend thus putting strict rules with inflexible guidelines will force compliance for a framework aimed at reducing bias parameters for all AI applications within educational settings. Independent audits should also become common practice among AI algorithms [10].

The rapid growth of AI in the areas of educational and learning analytics, with an avowed commitment to equity and fairness, brings to the forefront numerous challenges of misuse, algorithmic bias, and indeed other ethical issues. This chapter focuses on bias and fairness in AI systems developed for enhancing learning and education. It underscores the ethical value entailed in fairness, reviews cultural and psychological dimensions of this value, and presents an approach toward investigating AI-powered educational systems from the bias-and-fairness perspective to ensure both trustworthiness and scalability [11]. Educational AI systems that support recommendations based on decision-making can inherit biases related to socio-cognitive stereotypes introduced during the system's development or training processes, which might lead to students' being treated according to socially labeled groups based on stereotypes [11]. Therefore, the use of AI in educational data could be unfair. The disparities in treatment and outcomes could result from how unfair the application of AI to educational data is, further undermining trust in AI systems within education.

The AI hype can widen gaps in the way individuals and groups are targeted as well as outcomes for those at advantage or disadvantage, which in turn can further widen existing social inequalities and inequities, constrain the marginalized from value aspects, and sustain injustices in education [12]. The silver lining of this AI fairy tale presents a vision of equal opportunity; yet the prospect of AI systems in education must address: how to distinguish fairness from unfairness when dealing with what is known about biased models versus those that are unbiased? More subtle viewpoints caution against accepting technical fairness (or any other kind) at face value but rather

call for an analysis that appreciates human constructs and generalizations involved in fair models and classifications.

4 Psychological Perspectives on Bias

Increasing apprehension surrounds the effects of AI systems on the well-being of society, especially within the realm of education. Research on bias can aid in guiding interpretative choices and developing solutions for identified issues. From a psychological standpoint, it is crucial to differentiate between bias and discrimination in AI systems. There remains a lack of agreement regarding the design and management of AI systems in terms of comprehending and addressing bias. Bias is particularly pertinent in three distinct areas: the detection of hate speech on social media, recruitment processes, and models for credit scoring.

4.1 Cognitive Biases in AI Systems

The integration of Cognitive AI within educational settings raises a multitude of ethical issues surrounding the fairness and bias inherent in these systems. While biases can be broadly defined as errors or issues in judgment and decision-making, they can also be interpreted more narrowly from a psychological perspective [13]. For example, info-biases represent formal structures within AI systems that result in inequitable treatment, putting certain individuals at a disadvantage compared to others. On the other hand, human cognitive biases are viewed as a personal domain of AIs that requires management and reduction. A crucial initial step in this work is to pinpoint specific individual-level biases that affect AI systems utilized in education from a psychological standpoint. The goal is to comprehend the range of cognitive biases identified in psychology within the framework of AI in education. Many of these biases have the potential to directly impact decision-making, may be triggered by the design or perception of these systems, or can shape actions by altering their environment. The subsequent step involves examining methods to alleviate these biases or at least counteract their detrimental effects on AI systems [14].

Bias in AI is recognized as a set of distinct yet interconnected constructs that include both the structural elements of the systems and the contextual factors, such as human or societal biases, that influence AI decision-making outcomes. In this context, the biases within these systems are categorized into two types of knowledge: knowledge prior to understanding and knowledge following understanding. Consequently, bias in AI systems can be viewed as structural inaccuracies related to the former type of knowledge, such as the misrepresentation of input features or institutional biases. Regarding the latter type of knowledge, bias is perceived as a personal dimension of AI, characterized by a lack of awareness of contentious features impacting previous decisions, such as gender or ethnic background [15].

4.2 Implicit Bias in Educational Settings

Implicit bias involves the attitudes or stereotypes that unconsciously influence our perceptions, actions, and choices. These biases can emerge as either positive or negative assessments of individuals based on characteristics like race, gender, and age, often shaped by both direct and indirect messages throughout our lives. Operating beyond our conscious awareness, implicit bias causes us to inadvertently adhere to a biased narrative or utilize a biased lens in our observations and behaviors [15].

In educational environments, including teacher education programs, educators, teacher candidates, and policy analysts specific to education each bring their own set of experiences, beliefs, and biases. In these institutions, implicit biases surrounding race, gender, disability, and sexual orientation can drastically affect the process of making a decision. Attitudes toward certain students are influenced by such biases, which in turn lead to disparate treatment that may eventually affect the academic success of students [15]. Because these biases are often unconscious, the result of societal stigmas attached to various individuals or groups having seeped into our culture (causing students to be viewed under a prejudiced lens from the minute they walk into the classroom), it can be quite difficult to detect when one is behaving in a biased manner due to them being subtle most times. This subtlety makes it challenging to notice skewed behavioral trends resulting from bias.

AI has found its place in mainstream educational settings through various applications, including online learning platforms and remote assessments. Nonetheless, bias—which can find its way into decision-making processes—represents one of the major downsides of AI [16]. In thinking and building these applications, the creators should be aware of the weight of implicit bias within educational environments. This reflection gives a valuable perspective for a critical consideration and efforts to reduce bias in AI within educational contexts by large.

5 Impact of Bias in AI on Educational Outcomes

The use of AI in educational systems is increasing, providing core services especially in customized teaching, grading, and detecting students likely to fail, and the sharing of apprentices or trainees between institutions and administrative tasks. Yet without fairness mitigations these deployments can create or propagate biases [17]. The European Commission identified that employing AI systems into education is a high-risk area. In the same way that hiring algorithms or content moderation can negatively affect fairness student selection and grading algorithms might break anti-discrimination laws and increase the relationship between educational attainment and social class. Besides the risks, challenges, and opportunities that come up in developing AI-driven tools for education, there is a thought about who reaps the benefits of these AI systems. Even though students are the ones directly receiving support, other

stakeholders like teachers, parents, educational institutions or technology companies could benefit more from it.

Issues are raised about potential favoritism within user groups toward particular individuals. There are concerns about the negative effects on those impacted by AI, such as reduced access to education and inferior learning outcomes [17]. Also, there is the fear that teachers, as a consequence of their performance being reviewed, might be labeled as producers of automated low-quality work and this could cause a decrease in their wages or even replacement. The talk about algorithmic bias in education is often abstract and lacks connection with the real-life scenarios faced by the stakeholders. Often educational equity is misconceived to mean furnishing equal opportunities; this would imply a level playing ground during assessments. However, it is common that factors like students' social or contextual characteristics that influence their outcomes (including prior knowledge) are overlooked.

The emergence of AI systems, following a substantial increase in research funding and data within the education sector, has rekindled fresh concerns about their likelihood to unwittingly erode equity and worsen inequity in stakeholder imbalances, thus leading to injustices and breaches of achievement that impede social justice. Explicit attempts have been established to curb AI algorithms from entrenching discriminative practices based on factors such as race, ethnicity or gender [18]; however, indicators of other forms of exclusion—like the economic situation or parental background or home situation—are rarely taken into consideration. The introduction of biases has an especially strong impact on educational systems that run the risk of entrenching and deepening social stratification—as described by what is known as the Matthew Principle: "For whosoever hath, to him shall be given, and he shall have more abundance: but whosoever hath not, from him shall be taken away even that he hath." With the increasing privatization of educational services, artificial intelligence algorithms will assess academic qualifications for different services likely to influence decisions about enrollment in teacher training institutions, make or break educational referrals, facilitate or slow down early identification of disabilities and channel finances in terms of resource allocation to schools, among other functions [19]. Besides, certain types of educational services might not be available to some socioeconomic groups. Given the substantial societal implications, it is crucial that considerations of algorithmic fairness extend beyond the "safe" attributes of race, ethnicity, or gender to encompass additional class-based biases.

To attain fairness and equity in the predictive modeling of student achievements and educational data mining, it is essential to regard childhoods, families, and schools as comprehensive subjects of investigation, as inequalities are formed within these contextual settings [20]. Consequently, an analysis of socioeconomic bias must rely on data that differentiates between individuals' social circumstances and backgrounds. However, establishing fairness in education presents a complex challenge, especially concerning the definition of special educational needs or the implications of special educational services, including their provision, content, and effectiveness [20]. Addressing these issues requires a shift in perspective–from focusing on data, educational processes, and the delivery of data through algorithms to emphasizing

knowledge or human comprehension. Understanding educational processes as algo-grammar that generates actions inherently necessitates the encoding of vast quantities of both explicit and tacit knowledge into highly effective algorithms.

6 Mitigating Bias in AI Systems

There are various methods to reduce bias in AI. Adjustments in data collection and the algorithms used in AI can facilitate this process. A prevalent approach involves altering data processing techniques to minimize bias. To identify biases, language-based datasets might employ word embedding models. Prioritizing adjustments to the AI algorithms through techniques focused on algorithmic fairness is crucial, particularly when the algorithms are already operational.

6.1 Data Collection and Preprocessing

A pivotal phase in developing any AI system involves the scientific gathering of data and its expert management as a preprocessing step [20]. For AI systems in education, the data sourced from students and/or the performance of their applications is often not specifically intended for that use; instead, it tends to be collected from previous applications or default datasets from organizations. In such instances, biases related to data can significantly affect the effectiveness of AI applications [21]. It is crucial to focus intensely on the data utilized in AI systems, striving for an optimal scenario where the data originates from a methodical and scientific design that considers performance, purpose, population analysis, and cohort representation. Furthermore, biases related to data can also be corrected, mitigated, or adjusted through various data-handling techniques. Regardless, the significance of data cannot be overstated, as proper data management lays the groundwork for defining benchmarks, understanding fundamental cohorts, enhancing performance, and addressing data bias. The topics of bias and fairness have garnered considerable interest among both researchers and practitioners in the realm of data-driven systems [22]. An application for end-users evaluates a set of algorithms based on a data set and subsequently determines potential actions based on the results produced by those algorithms. Issues of bias and fairness are linked to the impact of these outputs on end-users and stem from various factors including data collection methods, preprocessing techniques, homogenization, as well as the parameters, architectures, and models of the algorithms [23].

6.2 Algorithmic Fairness Techniques

Considering the previously mentioned aspects of the AI-education relationship, along with recent global policy efforts advocating for the advancement of AI in educational settings, there exists a compelling reason to investigate algorithmic fairness methods in educational applications. While some AI tools for education are developed by local vendors, many widely utilized resources in educational institutions come from international corporations. This raises concerns that such tools may perpetuate and integrate biases rooted in systems created within different socio-political environments [23]. Therefore, alongside the exploration of algorithmic fairness techniques, it is crucial to comprehend the local educational policies and pedagogical perspectives regarding the implementation of AI applications. There is indeed a broad range of strategies aimed at achieving fairness in AI systems. A practical preliminary categorization of fairness techniques includes: pre-processing techniques, in-processing techniques, and post-processing techniques [24]. Pre-processing techniques focus on eliminating undesirable biases from the data before it is utilized for model training. In-processing techniques, on the other hand, concentrate on influencing the model's development itself to foster fairness, often by incorporating constraints or fairness terms into the objective function during the training process. In contrast, post-processing techniques enable the model to be generated without restrictions; however, these methods necessitate adjustments to the predictions to ensure fairness prior to their implementation or release. Three categories of techniques are characterized in a way that aligns closely with the educational context and perspective: technical solutions, social solutions, and socio-technical solutions. Social solutions are designed to involve social scientists, educators, students, or the broader educational community in discussions regarding bias and equity issues before the deployment of AI-based systems [24]. Conversely, technical solutions primarily concentrate on shaping the training, deployment, or usage of AI applications to ensure they function fairly on their own. Socio-technical solutions merge both approaches.

7 Conclusion

The ethics surrounding the use of AI in education is an area of increasing concern for both researchers and policymakers [25]. This chapter explores various ethical dilemmas associated with AI in educational contexts. The first dilemma addresses how to manage bias and fairness–two fundamental ethical principles relevant to AI applications in education. A summary of the existing literature on equity and AI in education is provided, highlighting both opportunities and challenges that lie ahead for future research. The second issue examined involves the psychological mechanisms that contribute to bias and fairness. Three heuristics related to fairness are reviewed, which individuals employ to promote fairness within socio-technical systems. These heuristics offer actionable starting points for the design of AI systems

in education that aim to achieve equitable outcomes. Potential implementations are considered, including the explicit or implicit integration of fairness heuristics into AI systems, as well as the development of transparency strategies that leverage these heuristics. Future research directions are outlined, emphasizing the necessity for more studies focused on user experience design, ethical considerations regarding heuristic design, and the need for interdisciplinary research teams. As educational leaders and policymakers increasingly tap into the potential of AI to foster equitable education, it is important to recognize that AI can also exacerbate systemic biases within the educational framework, potentially leading to negative effects on educational equity [2]. The conversation surrounding the ethics of AI use in education is quickly influenced by issues of bias and fairness. Within the fair AI community, multiple definitions or desiderata of fairness have been established. These definitions pertain to the effects of the AI algorithm, the choices made during data collection and model training, and crucially, the fairness-aware heuristics that individuals implement in socio-technical systems to promote equitable results. Notably, the connection between fairness and AI in education often revolves around unfulfilled commitments to equal opportunities and a lack of awareness regarding the distribution of risks tied to unfair results.

Criminal Liability of Partners in Cybercrimes: An Analytical Study of Legislation, Legal Challenges, and Technological Developments

Omar Al Makhzoumi and Abeer Zohair Said Saada

Abstract This chapter represents the partners' criminal liability in cybercrimes under criminal law. The goal is to examine technological rules that determine the liability of partners and the resulting punishment and to consider whether such penalties are proportionate or not. Additionally, this chapter discusses how technological evolution has influenced establishing and proving the liability of partners in cybercrimes; it also identifies challenges and possible solutions. The research used an analytical methodology through scrutinizing legal texts and prominent judicial precedents. Results showed an indeterminate specification with partner liability in cybercrimes and that current penalties are not commensurate with the gravity of their impact. Moreover, technological evolution plays a big part in the determination and proof of a stakeholder's accountability in cyber offenses. This further underlines the need for statutory reforms to keep up with these advancements and variations within patterns of cybercrime.

Keywords Partner liability · Cybercrimes · Penalties · Technological advancement · Liability proof

1 Introduction

The evolving nature of cybercrimes make it necessary to define the scope of criminal liability with those engaged in committing these crimes. It is noted that the legal norms governing this scope are distributed in many related laws. Such a determination is very important for judicial practice, as it affects the individualization of

punishment, and the specification of punishment for each participant in the crime. Hence, within the framework of cybercrimes, it is expedient to reveal directly issues related to determining the scope of criminal liability for accomplices.

Both the penalty for the principal and that for the accomplice are influenced by the criminal circumstances, within the scope of which some affect only the principal's penalty or certain specific accomplices.

This research, therefore, shall analyze Jordanian legal texts concerning partners' liability in cybercrime to bring out a clear picture regarding the subject laws and regulations. It considers previous judicial decisions to test the application of the law on partners and weigh the effectiveness of the prescribed penalties. Also considered in this study is a comparison between Jordanian legislation and its international and regional counterparts regarding partners' liability in cybercrime to determine uniformity of global standards that Jordan has aligned with.

1.1 Study Objectives

- Define the terms of your partner's liability for cybercrimes under Jordanian law.
- Analyze penalties for partners in cybercrime and their compliance with the principle of proportionality of act and punishment.
- Review of the provisions on complicity and incitement in the Jordanian Cybercrime Law and the General Penal Code.
- Investigate the impact of technological advances on the role of partners in cybercrime.
- Investigate the role of digital evidence in determining partner liability for cybercrimes.

1.2 Methodology

The research adopts a descriptive approach in analyzing partner liability in cybercrime under Jordanian law. This was done by scrutinizing legislative texts and case law related to the definition of frameworks and penalties for partners in cybercrime. In the analysis, Jordanian legislation was compared with international and regional laws regarding alignment of the penalties meted out with the principle of proportionality between the act and penalty.

2 Liability of Partners in the Context of Cybercrimes

Because of the strong similarities in the provisions regarding liability and punishment for the principal actor and the accomplice in cybercrimes, the applicable punishment for the accomplice raises a number of questions. The conditions provide no other alternative but to come up with legislation to resolve these issues. The first of these is regarding the conditions of liability for the accomplice in relation to the crime committed by the principal actor, which will be dealt with in our first section. The second issue relates to the punishment aspect concerning an accomplice in a cybercrime, which will be under our second section in this discussion.

2.1 Conditions for the Liability of Partners in Cybercrimes

In order for an individual to be held accountable for their involvement in a criminal act as an accomplice, there must be a clear connection between their actions and the main criminal act committed by the primary offender. This main act must also be considered illegal according to the law. To fully grasp the circumstances surrounding an accomplice's liability for the crime committed by the primary offender, it is important to examine the approach taken by the Jordanian legislator, which recognizes the principle of relative imitation in relation to accomplices. The accomplice's criminality stems from the crime committed by the primary offender, as there is no punishment for complicity in a crime that has not yet been initiated. To avoid any potential disputes or conflicting interpretations, the Jordanian legislator has specifically restricted forms of complicity and methods to felonies and misdemeanors, excluding lesser offenses, as outlined in Article (80/2/a) of the Jordanian Penal Code. Moreover, the Jordanian legislator has also accounted for subsequent actions taken by the accomplice after the commission of the crime, such as the concealment or disposal of the proceeds, as long as there was a prior agreement among the individuals involved in the crime (Article 80/2/e).

In Jordanian legislation, there is a clear distinction made between two groups of individuals involved in a crime. The first group, known as primary contributors, includes the actual perpetrators and their accomplices. The second group, referred to as secondary contributors, consists of instigators and those who incite others to commit the crime. This recognition by the Jordanian legislator demonstrates an understanding of the principle of the unity of the crime, although it is not absolute. In fact, the legislator treats instigation as a separate crime, rather than merely a form of complicity. Article (80/b) explicitly states that the liability of the instigator is independent of the liability of the person who was instigated to commit the crime. This distinction forms the material element necessary for holding an accomplice accountable. However, it is not enough for the accomplice to simply be involved in the crime. There must also be a mental and psychological connection among all contributors, with each individual desiring the intended criminal outcome. This

requires a comprehensive understanding of the role played by each contributor, as well as a conscious intention to participate. If there is no unified mental state among the contributors, the liability of the accomplice ceases, and the situation would be regarded as involving multiple crimes rather than complicity [1].

In the context of cybercrimes, the mental component of criminal intent is crucial for an accomplice. Since cybercrimes are categorized as intentional offenses, the accomplice must possess criminal intent. This intent, in the case of a cybercrime, takes the form of general intent, with the purpose of causing harm to another individual. However, if the accomplice is unaware that their actions are illegal, criminal intent cannot be established. Furthermore, if they lack knowledge about any aspect of the crime, criminal intent cannot be present. For example, in situations involving identity theft or incorrect affiliation, a data programmer may unintentionally modify information in documents without realizing the implications of their actions [2].

According to Article (40) of the Penal Code in Egypt, the legislator has made it clear that for someone to be considered an accomplice, they must have knowledge of the intended outcome and willingly participate in achieving it. The Court of Cassation in Egypt has emphasized the importance of specifying the intent to participate in the crime and the awareness of it at the time of its commission in their rulings. Failure to include these details in a judgment is considered a defect that requires its annulment [3]. The court also highlighted that intentional crimes require both the deliberate physical act and the intent for the result that follows. Therefore, it is essential to establish the accomplice's intent and awareness of the crime for them to be held liable. Any judgment lacking this information is considered deficient and must be annulled [4].

In order for an individual to be considered an accomplice to a crime committed by another person, there must be a strong mental and psychological connection between them. This connection entails the accomplice being fully aware of the criminal act and desiring the intended criminal outcome, or actively contributing to it. By doing so, the accomplice subjects themselves to the same legal consequences as the principal actor. However, if the accomplice's actions extend beyond the scope of the principal act, they are then categorized as complicit under Article (80/2) of the Jordanian Penal Code. In the realm of cybercrimes, the role of an accomplice is particularly important due to the technical aspects involved in the commission and successful execution of such crimes. Given that cybercrimes often rely on electronic means, the involvement of skilled intermediaries and other individuals becomes necessary. It is important to note that the accomplice's role is secondary and supportive, as they are not directly responsible for carrying out the crime. Their actions alone do not constitute a criminal offense; rather, their criminal liability stems from the actions of the principal actor and warrants punishment accordingly. The specific acts that qualify as complicity in felonies and misdemeanors are outlined in Article (80/2) of the Jordanian Penal Code. Any actions that fall outside the provisions of this article are no longer considered acts of complicity. According to Article (80/2), an accomplice in a felony or misdemeanor can be defined in several ways. Firstly, an accomplice is someone who guides and assists in the commission of the crime, leading to its occurrence. Secondly, an accomplice can be someone who supplies the

principal actor with weapons, tools, or any other items that aid in the commission of the crime. Additionally, an accomplice can be someone who is present at the location where the crime takes place. Moreover, an accomplice can be someone who assists the principal actor in actions that prepare, facilitate, or complete the crime. This includes individuals who were in agreement with the principal actor or other accomplices prior to the crime and who contribute to the concealment of evidence or disposal of the proceeds of the crime, either in whole or in part. Lastly, an accomplice can be someone who is aware of the criminal history of individuals involved in robbery or acts of violence against state security, public safety, or individuals or property, and who provides them with food, shelter, a hiding place, or a meeting location.

According to a ruling by the Jordanian Court of Cassation, it was determined that if a defendant simply provided a weapon to their accomplice and stood at the door of the room where the victim was located, while another defendant entered the room alone and committed the murder, and if the defendant later helped in concealing the body, they would not be considered the perpetrator of the murder under Article (76) of the Penal Code. Instead, they would be classified as an accomplice under Article (80) of the same law [5]. In the context of cybercrime and the role of an accomplice, a network computer engineer has the responsibility of connecting computers to each other and to the Internet for specific tasks. If this engineer utilizes their knowledge of the computer network's information system to assist individuals who have the intention of breaching, altering, or completely destroying the information system, their actions would be deemed as providing assistance through guidance, which is one of the forms of complicity outlined by the Jordanian legislator in Articles (82/2, 3) [6].

In Italy, there was a notable incident involving a criminal gang that was apprehended while trying to carry out a theft at a technologically advanced electronic bank by using credit cards. The gang employed a clever technique where they intercepted a truck and positioned it in such a way that the bottom of the truck could be opened and closed over a sewer drain on the road. This sewer drain housed optical fiber cables that connected the bank to its ATMs. The gang's objective was to manipulate these cables in order to gather crucial information about credit cards, including account numbers and available funds. They planned to record and decode this information, and then transfer it onto unregistered cards that they had obtained with the assistance of individuals working within the bank, who were motivated by incentives. As a result of this incident, Italian banks took immediate action to bolster their security measures and strengthen the encryption of information transmitted through the cables [7].

The evolution of complicity in crimes involving physical presence of the accomplice, such as aiding and abetting the perpetrator's plan and execution, is a notable development. However, in the realm of cybercrimes, the concept of complicity should not be confined to traditional forms. It should encompass new forms that align with technological advancements, taking into account the role of contributors in cybercrime and the ethical behavior that forms the basis for criminalization. Additionally, the tools utilized in these crimes, including computer technologies, information systems, and electronic means, should be considered [8].

The use of sophisticated software by cybercriminals poses a significant challenge in tracking their digital footprint. This advanced technology allows them to manipulate their electronic address, either by broadcasting a fake address to hosting servers or by remotely erasing any traces of their activities. As a result, identifying the culprits behind these criminal acts becomes increasingly difficult [9].

The issue of proof, specifically digital evidence, is a matter of utmost importance. What sets this type of evidence apart in cases of cybercrimes is its resilience, making it nearly impossible for perpetrators or their associates to dispose of or hide it from computers or the Internet. Specialized software can be utilized to recover digital evidence [10].

The acquisition of digital evidence involves the examination of internet connections, tracing the route of data and information during transmission or retrieval. Electronic surveillance entails the monitoring of the designated host server using specialized software, enabling the identification of the host and subsequent tracking of their browsing activity and the exchange of information [11].

3 Penalty for the Accomplice in Cybercrime

In order to be held accountable for participation in a crime, specific prerequisites must be met. These include the commission of the initial offense and the existence of both material and moral unity within the criminal plan, indicating that it is a single crime with a singular outcome. Moral unity necessitates a mental connection among the participants regarding the criminal project. Additionally, there must be multiple individuals involved, each assuming different roles [12].

In order to comprehensively outline the consequences faced by accomplices in cybercrime, we shall examine the penalties prescribed by both the Cybercrime Law and the Penal Code, as well as the influence of various criminal circumstances on said penalties.

3.1 Penalty for the Accomplice in Cybercrime Under the Cybercrime Law

Article (14) of the Jordanian Cybercrime Law No. (15) of 2015 outlines the consequences for individuals involved in cybercrimes as accomplices, participants, or instigators. The article states that those who intentionally engage, interfere, or encourage the commission of any of the offenses specified in the law will face the same punishment as the actual perpetrators of those crimes [13].

From the above text, we can deduce the following [13]:

- There is a notable disregard for the established regulations in the Penal Code concerning criminal involvement, as it deviates from legal reasoning and undermines the principle of proportionality in punishment. This deviation is evident in the equal treatment of both the principal offender and the accomplice, as well as the various forms of criminal participation. The actions of accomplices in cybercrime are comparatively less severe than those of the main perpetrator, which contradicts the fundamental principle of justice that requires equal treatment within the realm of criminalization.
- By focusing solely on the accomplice as the participant, there is a departure from the overall regulations outlined in the Penal Code. This adherence to the legal principle of secondary involvement in intervention and instigation is in accordance with established doctrine.
- In a departure from the typical regulations outlined in the Penal Code, the Jordanian legislator decided to impose equal penalties for both instigation and intervention, deviating from the usual practice of punishing the accomplice and instigator based on the original perpetrator's penalty.
- Despite being recognized as a form of secondary participation in established legal doctrine, the issue of concealment was not addressed by the Jordanian legislator in the Cybercrime Law.
- The legislator in Jordan has embraced the concept of absolute borrowing, imposing penalties on individuals who knowingly engage, intervene, or encourage the commission of any cybercrimes outlined in the legislation, mirroring the punishment of the primary offender.

The explanatory memorandum for the Cybercrime Law No. (27) of 2015 provides a justification for its provisions. It argues that because information system crimes often require specialized technical knowledge, individuals with expertise in carrying out these crimes, including those who cannot be held legally accountable such as children or those lacking legal capacity, are sometimes utilized to commit these offenses. Recognizing the gravity of incitement and involvement in information system crimes, which is considered on par with the actual act itself, the law imposes the same penalties for those who participate, intervene, or incite as it does for the primary perpetrator.

3.2 Penalty for the Accomplice in Cybercrime Under the Penal Code

Instead of the Cybercrime Law, the Jordanian legislator decided to assign criminal liability for involvement in specific cybercrimes under the Penal Code. According to Article (15) of the Jordanian Cybercrime Law, individuals who commit offenses punishable by law using information networks, information systems, or websites, as well as those who participate, intervene, or incite such acts, will face penalties as outlined in the relevant legislation [14].

According to the information provided in the preceding passage, it can be observed that the Jordanian legislator has established a parity in terms of punishment for individuals involved in cybercrimes, regardless of their specific role. This includes both the primary offender and any accomplices or co-participants, as well as secondary participants like interveners and instigators. This equitable approach to sentencing has been implemented by the Jordanian legislator through [14]:

1. Deviating from the general rules of participation in the Penal Code by equating the punishment between these parties, despite the fact that the crimes subject to Article (15) fall under the Penal Code.
2. Deviating from the general provisions of the Penal Code by considering only the accomplice as the intervener.
3. Departing from the general rules in the Penal Code by punishing instigation and intervention with the same penalty as the original perpetrator.
4. The Jordanian legislator in the Cybercrime Law did not address concealment, even though it is a form of secondary participation according to established legal doctrine.

According to Article 15 of the Cybercrime Law, individuals who commit crimes using the information network, an information system, or a website, or those who participate, intervene, or incite the commission of such crimes, are subject to penalties as prescribed by the relevant legislation. This indicates that the legislator considers crimes committed via the information network or a website to be equivalent to traditional crimes occurring in the physical world [15].

In a specific case, where the victim was sixteen years old and the appellant engaged in a romantic relationship that developed into communication through the Messenger program via video calls, the court found the appellant guilty of the felony of indecent assault under Article 298/1 of the Penal Code. The court also relied on Article 15 of the Cybercrime Law to support this conviction. As a result, the appellant was sentenced to three years of temporary hard labor, along with the associated costs.

In conclusion, the court deemed the decision to convict the appellant and impose the aforementioned sentence as legally appropriate. The grounds for appeal were found to be unsubstantiated [15].

3.3 The Impact of Circumstantial Factors on the Penalty for the Accomplice in Cybercrimes

The legislative texts that govern the penalty for an accomplice in a crime take into account the specific circumstances surrounding the offense, whether they are of a personal or material nature [16]. These circumstances can pertain to the crime itself or to the individuals involved, including the perpetrator and the accomplice. It is important to note, however, that the assistance provided by the accomplice does not impact the liability of the perpetrator, as their criminal responsibility is determined solely by their own actions and not by those of the accomplice [17].

Hence, this particular segment of the research is subdivided into two primary aspects: the initial aspect examines how personal circumstances affect the penalty imposed on accomplices in cybercrimes, whereas the subsequent aspect explores the influence of material circumstances on the penalty for accomplices in cybercrimes.

The Impact of Personal Circumstances on the Penalty for the Accomplice in Cybercrimes

The personal circumstances of the accomplice are not taken into account as essential components of the offense; instead, they pertain to the individual and factor into the assessment of their deservingness of punishment. The personal circumstances of the perpetrator have no bearing on the penalty imposed on the accomplice, as these circumstances are personal in nature and do not stem from the perpetrator themselves. These circumstances can either exacerbate or alleviate the situation [18–20].

Article (79) of the Jordanian Penal Code, as stated by the Jordanian legislator, outlines the impact of various material factors that can either worsen, lessen, or even exempt individuals from punishment. These factors are applicable to all individuals involved in the crime, including accomplices, interveners, and instigators. The circumstances can be categorized as material, personal, dual, or mixed, and are further elaborated upon in the following paragraphs:

1. **Material Reasons**: The material aspects of a crime encompass various factors, such as the act itself, the time and location of its occurrence, and the methods employed. These elements also extend to the severity of the offense. According to legislative provisions, these considerations apply to all individuals involved in the crime, regardless of their level of participation, whether it be aggravating or mitigating, as long as they possess knowledge of the crime and its repercussions. While the Egyptian legislator does not have an identical text to that found in the Jordanian Penal Code, legal doctrine and jurisprudence typically extend these substantive grounds to all individuals involved in the offense, regardless of their awareness of them [21].
2. **Personal Reasons**: The factors that influence the severity of punishment for an individual criminal can be categorized as mitigating, aggravating, or exempting. These factors are taken into consideration solely in relation to the individual offender and have an impact on their punishment, either by lessening it or exempting them from it. On the other hand, aggravating circumstances affect all individuals involved in the crime, whether they are the perpetrators, accomplices, interveners, or instigators. It is important to note that these circumstances only come into play if they facilitated the commission of the crime [22].
3. **Dual (Mixed) Reasons**: These factors encompass both personal and material elements. The personal element pertains to the individual committing the crime, while the material element pertains to the impact that modifies the criminal characterization [23].

In the case of forgery in an official document, if the person involved is a public official, the punishment for the accomplice does not become more severe unless they were aware of the official capacity of the perpetrator when they participated. This

same principle applies to cases of rape or indecent assault, where if the perpetrator is a relative of the victim or falls under the categories mentioned earlier [24], the punishment for the accomplice remains unchanged [25–28].

In accordance with the Egyptian Penal Code, it is acknowledged that an accomplice may be subject to the same circumstances as the original perpetrator, provided that the accomplice is aware of these circumstances. Article (41) of the code explicitly states that the accomplice will not be affected by any specific circumstances that would alter the criminal classification based on the intent or knowledge of the perpetrator. Instead, the accomplice will be punished based on their own intent or knowledge, aligning with that of the perpetrator.

The legislator in Jordan has recognized the influence of dual circumstances on the accomplice, as long as these circumstances are directly responsible for the occurrence of the crime. According to paragraph two of Article (79) in the Jordanian Penal Code, "The consequences of aggravating dual circumstances that led to the commission of the crime shall be applicable to them." The determining factor in deeming a dual circumstance as the cause of the crime is that the crime would be unattainable without it.

Upon examining the previous passage extracted from the Jordanian Penal Code, it becomes evident that the accomplice's awareness of the dual circumstance that led to the commission of the crime is not a requirement, even if they remain unaware of it [29]. In terms of cybercrimes, the Jordanian legislature has embraced the principle of absolute transference for secondary participation. Consequently, when the criteria for participation and aggravating dual circumstances are fulfilled, it becomes necessary to differentiate between the circumstances stemming from the original act of the cybercrime, which also apply to the accomplice in the cybercrime, regardless of their precise understanding of the aggravating dual circumstance. If the perpetrator of the cybercrime is not subject to punishment due to personal factors, such as lack of discernment, the accomplice will likewise be exempt from punishment. However, the personal circumstances of the accomplice in the cybercrime do not impact the perpetrator, while the material circumstances exert their influence on both the perpetrator and the accomplice in the cybercrime [24].

In a ruling, the Egyptian Court of Cassation established that if a criminal act undergoes a change in its characterization due to certain circumstances, the accomplice cannot be held accountable for these circumstances unless they were aware of them. In such instances, the court must provide evidence of the accomplice's knowledge in order to pass judgment [29].

While the description of the crime remains unaffected, the presence of personal circumstances for the accomplice has the power to alter the severity of the penalty. It is important to note that the accomplice and the perpetrator are subject to different penalties due to the personal nature of these circumstances. Regardless of whether these circumstances are aggravating or mitigating, if the accomplice is a minor, they will be subject to the provisions outlined by the law, while the perpetrator will not be affected by these provisions unless they too are a minor. Additionally, any legal impediment that impacts the accomplice will exclusively apply to them [30].

Impact of Material Circumstances on the Penalty for Participants in Cybercrimes.

The legislator defines material circumstances as incidental facts that are exhaustively described and not open to extension. These circumstances are added to a crime to either increase or decrease its penalty, and their impact also applies to accomplices. The theory of vicarious liability serves as the basis for responsibility under these circumstances, as it embodies the principle that all participants in a crime share the same intentions and encompass all material elements and circumstances, including these material circumstances. Therefore, material circumstances are applicable to both perpetrators and accomplices, regardless of their awareness of them. Examples of such circumstances include the presence of a weapon in theft cases and the bank-related aspect in cybercrimes.

The depiction of the offense and the involvement of an accomplice are both impacted by any modifications in these conditions. The accomplice's culpability is derived from the principal's criminal act, regardless of their awareness of the circumstances or whether they are aggravating or mitigating [31–34]. Instances of such circumstances can be found in cybercrimes, such as the sexual exploitation of children and individuals with disabilities, as well as acts of espionage.

In order to encompass all individuals involved in a crime, justification reasons must be clearly defined, as recognized by legislation. These reasons have the power to convert an unlawful act into a lawful one, eradicating its criminality and undermining its legality. As a result, the legality of the act is extended to all individuals involved in the crime, whether they are the main perpetrators or interveners [19].

The Egyptian legislator faced a dilemma when it came to extending justification reasons to participants. Article (42) stated, "If the perpetrator of the crime is not punished due to a justification reason, the accomplice must still be punished according to the legal penalty." However, this perspective cannot be accepted, as evidenced by Article (43) of the Egyptian Penal Code, which declares, "Whoever participates in a crime shall be punished for it even if it is not the one they intended to commit, provided that the crime occurred as a result of provocation, agreement, or assistance." The aggravation of the outcome due to the involvement of material circumstances should not be interpreted as creating a separate potential outcome distinct from the direct result. The occurrence of material circumstances that lead to the desired direct and probable results by the accomplice holds them responsible for these outcomes. Moreover, Egyptian Cassation Court rulings have extended the application of aggravated material circumstances to the penalty of the accomplice, as stated in one of its verdicts [35–38]: "Carrying a weapon during theft is an aggravating material circumstance connected to the crime and must be applied to all those who participated in it, whether as perpetrators or accomplices, even if they were unaware of it.

The stance of the Jordanian legislator is unambiguous when it comes to extending the impact of aggravating material circumstances to all individuals involved in the offense. Article (79), Paragraph 1 of the Jordanian Penal Code explicitly declares: "The consequences of material circumstances that intensify, diminish, or exempt

from punishment are applicable to all accomplices and interveners in the crime" [22].

The Jordanian Penal Code, specifically Article (79), Paragraph 1, ensures that all individuals involved in a crime are subject to the same exemptions based on material circumstances. This includes accomplices and interveners. The exemption circumstances, as outlined in Articles (60, 341) of the Jordanian Penal Code, such as self-defense, performing duties, and defense of dwellings, have been provided by the legislator. The aforementioned law, Article (342), specifically addresses the defense of dwellings [25].

The researcher's perspective, which is shared by some scholars (33), posits that the presence of justification reasons in a criminal act negates its legal element and eliminates the criminality of the act. This principle applies to all individuals involved in the crime, asserting that their participation becomes lawful once the justification reasons transform the act from criminal to legal. Consequently, it becomes illogical to punish an act that is deemed lawful. Therefore, if a person aids someone in a situation of self-defense, they also benefit from the justification reasons, as their involvement aligns with the criteria for justification. As a result, the intervention becomes lawful and non-criminal, in accordance with the extended justification [19, 26, 35].

The legislator has established comprehensive regulations pertaining to material circumstances, whether they serve to worsen or alleviate the situation. Legal provisions take into account specific circumstances and rationales that warrant deterring offenders and imposing the most severe penalties beyond what is typically prescribed. These provisions also grant the court some discretion. For instance, when it comes to theft with counterfeit keys under Article (404) of the Jordanian Penal Code, carrying a weapon, or theft from a place intended for habitation or religious sites, these circumstances are attributed to the aiding accomplice, even if they were unaware of their existence. The gravity of the aiding accomplice's involvement is further emphasized if they provided the perpetrator with means that are considered aggravating circumstances, such as guiding them to steal from a religious site or assisting during a time that is deemed aggravating [26].

The Jordanian Cybercrimes Law treats the principal perpetrator, intervener, and instigator as equals, imposing the same penalty on all individuals involved, regardless of their role or level of participation. This approach extends the punishment to both perpetrators and participants when specific circumstances are present. Similarly, the Egyptian judiciary holds both perpetrators and accomplices responsible for material circumstances. In one ruling, it was stated that even if an accomplice was unaware that the perpetrator was carrying a weapon, the presence of the weapon during a theft would still be considered an aggravating material circumstance.

4 Conclusion

To summarize, this research offers a comprehensive examination of the accountability of individuals involved in cybercrimes under Jordanian law. Through an analysis of legal documents, court decisions, and a comparison of local regulations with global standards, significant insights into the legal obstacles related to such offenses have been uncovered.

4.1 Results

The study reached the following conclusions:

- In accordance with Jordanian law, any act of intervention must be directly linked to the original criminal act and subject to legal consequences.
- Under the provisions of the Jordanian Cybercrimes Law, the punishment for an accomplice involved in cybercrimes is equivalent to that of the main perpetrator.
- Within the Jordanian legislature, a clear distinction is made between primary participants and secondary participants, which includes interveners and instigators.
- According to the laws of Jordan, instigation is recognized as a distinct offense and is not categorized as a type of intervention.
- The significant role of the accomplice (intervener) becomes crucial in cybercrimes due to the requirement of technical expertise.
- The role of digital evidence is vital when it comes to establishing the culpability of an accomplice in cybercrimes.

4.2 Recommendations

- Reassess penalties imposed on cybercrime accomplices to achieve proportionality between offense and punishment.
- Strengthen legislation to keep pace with technological advances and address the role of accomplices in cybercrime.
- Develop cybercrime forensics and digital evidence to ensure justice.
- Increase the awareness of information technology professionals about the legal risks associated with involvement in cybercrime.
- Encourage cooperation between legal and technological actors to develop effective policies to combat cybercrime.

Revolutionizing Space Exploration and Satellite Communication with Blockchain Technology

Ravi Shankar, Hemraj Shobharam Lamkuche, Mohammad Temeiza, and Maram Y. Al-Safarini

Abstract Blockchain's decentralized, secure, and transparent nature positions it as a game changer in space exploration and satellite communication. This paper explores blockchain's potential to enhance mission planning, logistics, and data management by providing secure, transparent platforms for tracking resources, schedules, and contracts, thereby reducing errors and delays. Smart contracts can automate data sharing and processing, improving operational efficiency. Additionally, blockchain can bolster interagency collaboration and address spectrum management issues in satellite communication. Despite its promise, challenges such as scalability, high energy consumption, and regulatory concerns remain. Solutions like sharding and energy-efficient consensus algorithms are proposed to address these issues, highlighting blockchain's transformative potential in these critical domains.

1 Introduction

Space has historically been an endeavor full of challenges, one of the most important being that there needs to be a secure and reliable way of transmitting data between Earth and spacecraft. There is a need to provide security in communication, starting from interplanetary probes to space telescopes. The traditional ways of data transmission have vulnerabilities, but now, with emerging technologies like blockchain, space data communication can be reimagined.

A great potential for the security and efficiency of data transmission in space missions lies within the decentralized, secure, and transparent blockchain technology. Blockchain helps to develop a tamper-proof platform for space missions that is completely secure and integrity-bound with respect to data exchange, thereby eliminating unwanted and unauthorized access or manipulation of data. The paper presents the application of blockchain technology in space exploration and satellite communication, which could potentially revolutionize mission planning, logistics, and data management. Blockchain is seen providing efficient and accurate tracing of resources, schedules, and contracts on a secure and transparent platform, thereby eliminating errors and delays. Smart contracts, one of the base features of blockchain, can further automate data sharing and processing to enhance operational efficiency [1–5].

More relevant to international space missions is the ability of blockchain to improve interagency cooperation. Blockchain can offer a very secure and transparent platform for sharing data among different space agencies, making smooth communication and coordination possible and therefore increasing the extent of cooperation and efficiency.

However, there are specific problems to the use of blockchain in space exploration. With scalability and high energy consumption important issues, followed by regulatory concerns, the effort to implement this technology faces too many difficulties. Proposed solutions include sharding and energy-efficient consensus algorithms that can enable the massive application of blockchain in space missions [6–9].

2 Background

Space exploration is an application domain that is highly dependent on precision, security, and reliability. Space missions, whether interplanetary probes, space telescopes, or manned missions, are quite complex and require robust systems not only for planning missions and managing data but also for interagency collaboration. Traditional mechanisms of transmission and coordination, while effective to a great extent, have increasingly been haunted by issues such as breaches in data, miscommunication, and logistical inefficiencies. The need for secure, transparent, and efficient systems becomes more critical as the complexity and scale of space missions increases.

Initial Blockchain in Space Exploration

The following sections will demonstrate the exact applications of blockchain technology in space exploration missions with respect to mission planning and logistics, data management, and interagency collaboration in such a scenario.

Mission Planning and Logistics: It enhances mission planning and logistics through a safe, transparent, and decentralized platform that keeps track of resources, schedules, and contracts. It thus assures integrity and real-time access to data for each concerned actor, reducing errors, miscommunication, and delays. Smart contracts automate execution according to the terms of agreements, enforcing them without intermediaries.

Data Management: Blockchain technology solves the problems associated with data management in space missions by decentralized, secure, and transparent data storage and transfer. The decentralized approach of it reduces risks of data loss or cyber-attack; cryptographic hashing ensures integrity, while smart contracts automate the sharing and its processing, hence improving operational efficiency.

Inter-Agency Collaboration: It empowers secure and transparent communication and collaboration among many space agencies, private companies, and research institutes. Blockchain provides a decentralized platform for sharing data among them. This builds trust and accountability. Smart contracts automate the process of interagency coordination, hence decreasing manual interventions and ensuring secure and efficient collaboration.

Blockchain in Satelite Communication

Basically, blockchain technology is promising a very great solution for the security and efficiency of satellite communication networks. Blockchain can be used to create tamper-proof platforms that assure data integrity, therefore avoiding unauthorized access to communication networks and increasing transparency. Blockchain provides great resilience to cyber-attacks and robust mechanisms for data verification and authentication through its decentralized architecture and cryptographic techniques.

Secure Communication Networks: The satellite communications networks are a part of global connectivity. Still, they remain susceptible to cyber-attacks, signal interference, and other security threats. Blockchain technology seems considerably instrumental in enhancing the security of the satellite communication networks by providing a decentralized, tamper-proof communication platform. This makes blockchain highly resistant to attacks because of its nature of decentralization, which dictates that the data does not reside in one location. Every node in the network contains a replica of the blockchain. Changes to the data are then assuredly approved by the network through consensus mechanisms. These cryptographic techniques that provide integrity and authenticity to the data against cyber attacks are hashing and digital signatures. Blockchain provides enhanced transparency and traceability to every end-to-end trail of all exchanges of data.

Improved Security: Satellite communication systems are vulnerable to cyber-attacks. Blockchain can give them an added layer of security by making sure that all transactions and communications are recorded in a ledger that is tamper-proof.

Spectrum Management: It makes the satellite communication system spectrum management more transparent and immutable. In other words, it is a very decentralized, distributed ledger-keeping system of all transactions for spectrum usage, hence providing reliable data to stakeholders for the solution of possible disputes and building trust. The smart contracts automate spectrum management tasks, making operations more effective while reducing their administrative overheads. Besides, blockchain enables dynamic spectrum sharing and optimizes resource usage subject to low interference risks.

Secondary Encryption Phase

Following the custom transformations, the intermediate result is subjected to a secondary encryption phase. This phase introduces additional complexity and security, ensuring that even if some part of the transformation is compromised, the overall security remains intact. The secondary encryption phase includes:

Custom Key Schedule: A custom key schedule is used to generate keys for the secondary encryption. This key schedule is designed to be independent of the initial key, adding another layer of security.

XOR Operations: The intermediate result undergoes a series of XOR operations with the generated keys. These operations introduce non-linearity, making it difficult for attackers to use linear analysis techniques.

Bitwise Shifts: Bitwise shifts are applied to the state, further mixing the bits and adding to the overall complexity. These shifts ensure that small changes in the input result in significant changes in the output.

Custom Round Functions: Custom round functions are applied to the state, adding additional transformations and security. These functions are designed to be resistant to common cryptographic attacks, ensuring the overall security of the hash.

Encoding and Final Transformation

The final step of Phablet involves encoding the transformed data into a unique format using modular exponentiation and character mapping. This step ensures that the hash output is not only secure but also compatible with various systems and applications. The encoding process includes:

Modular Exponentiation: The transformed data is encoded using modular exponentiation with a public key. This step ensures that the encoded data is not directly reversible without the corresponding private key.

Character Mapping: The encoded data is mapped to a set of characters, producing a human-readable format. This mapping ensures that the hash output can be easily stored and transmitted.

Final Hash Output: The final hash output is produced by combining the encoded characters. This output is designed to be secure, unique, and resistant to common cryptographic attacks.

3 Methodology

The research is performed to identify the potential of blockchain technology for increasing space exploration and satellite communication. Concretely, smart contracts will be realized. This methodology will cover a systematic approach, including a literature review, system design, simulation, and analysis.

Initial Blockchain in Space Exploration

The following sections will demonstrate the exact applications of blockchain technology in space exploration missions with respect to mission planning and logistics, data management, and interagency collaboration in such a scenario.

System Design: In view of the literature reviewed, we design a blockchain-based framework tailored for space missions and satellite communications. Thus, elements for this framework include:

Decentralized Ledger: A decentralized ledger recording activities in mission planning, logistics, and data management to provide maximum transparency and security during operations.

Smart Contracts: The establishment of smart contracts that allow for self-execution according to an agreement or a set of rules. Smart contracts are assigned to schedules, resources, and contracts in the case of mission planning. In satellite communication, they facilitate the process of spectrum management and secure data exchanges.

Cryptographic Techniques: It will make use of cryptographic hash and digital signatures to ensure integrity and authenticity of data.

Consensus Mechanism: The choice of an appropriate consensus mechanism, such as Proof of Stake or Byzantine Fault Tolerance, provides improvement in scalability and reduction of energy consumption.

Simulation and Implementation

Testing the feasibility and performance of the proposed framework is implemented in a simulated environment. This would involve developing and deploying smart contracts using blockchain development platforms such as Ethereum or Hyperledger. This simulation includes:

Mission Planning and Logistics: We will simulate a space mission, which will assess how Blockchain keeps a trace of resources, schedules, and contracts.

Data Management: This consists of evaluating the efficiency and safety of blockchain-based data storage and transfer.

Interagency collaboration: This involves testing the framework on its capability to provide a secure and transparent form of communication between different space agencies.

4 Implementation of Smart Contracts

In space exploration and satellite communication, smart contracts would be implemented using the development, deployment, testing, and checking of functionality, security, and efficiency. This section shows the steps and procedures used in this study, focusing on Hardhat in testing and deploying contracts on the Sepolia Network (See Table 1).

Smart Contract Development

On this note, Solidity is used for the development of smart contracts that will manage critical functions in the framework of blockchain-based space exploration and satellite communication. This would involve needs-specific contracts to data management, access control, and resource allocation. The following are the smart contracts:

Data Management: Secure recording and retrieval of mission data by the contracts make all data exchanges transparent and immutable.

Access Control: Through strict access control policies, smart contracts ensure that sensitive information can only be accessed or changed by authorized parties.

Resource Allocation: Contracts mechanize resource allocation, such as bandwidth or computational power, based on predefined rules and mission operation optimality, while minimizing administrative overhead.

Smart contracts are designed to execute tasks like energy transactions management and automate processes involved in satellite communication and space mission logistics.

Deployment

The developed smart contracts are deployed on the Sepolia Network with Hardhat. It is an efficient development environment for Ethereum (See Fig. 1). The following are the processes to be followed to complete the deployment:

Table 1 Testing cases

Test case	Description	Expected outcome	Actual outcome	Status
Deploy contract	Deploy the smart contract to the Sepolia network	Contract is deployed	Contract is deployed	Pass
Data integrity	Verify the integrity of the data	Data matches	Data matches	Pass
Unauthorised access attempt	Attempt unauthorised access to the data	Access is denied	Access is denied	Pass
Automated resource allocation	Test resource allocation via smart contract	Resources allocated	Resources allocated	Pass

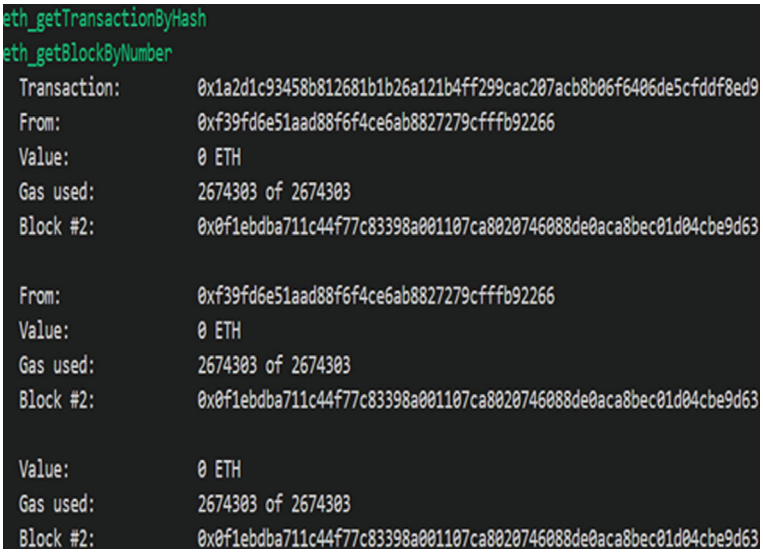

Fig. 1 Deployment

Contract Deployment: The smart contracts will get deployed on the Sepolia Network to check the functionality testing in a simulated environment.

Network Integration: Ensuring that the contracts interact appropriately with the Blockchain network and are accessible for execution and interaction.

Hardhat makes this quite easy with its facilities for deployment and contract management, so that the work goes smooth in its deployment.

Testing

The testing of smart contracts is done thoroughly to ensure that they work correctly and meet all the security and performance requirements. The following are the tests conducted:

Deployment Validation: This test ensures that the smart contract has been properly deployed to the blockchain and can be seamlessly accessed. This test case ensures that the Contract Address is correctly recorded on the Sepolia Network (See Fig. 2).

Data Integrity Checks: This test ensures that data processed by the smart contract is valid and reliable. Checks the correctness of data read from the blockchain, and matches it with values stored and recorded by the contract.

Security Testing: This test assesses the ability of the contract to prevent unduly granted access to the respective data. Entails trying to access or even modify data without proper authorization and ascertains that it is restricted.

Resource Allocation Testing: It checks that the resources are very well allocated with respect to bandwidth or computational power in adherence to rules defined in a smart contract. Testing ensures automation in resource distribution while meeting the laid-down criteria for this.

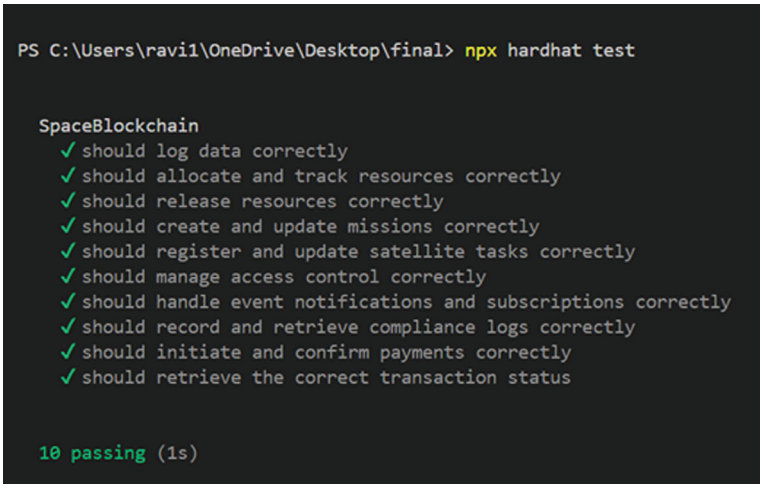

Fig. 2 Deployment validation

It is ensuring, through the running of these tests, that the smart contracts are secure, efficient, and functional to effectively support the objectives of revolutionizing space exploration and satellite communication with blockchain technology.

Implementation Challenges

To Challenges in implementing blockchain technology with space exploration and satellite communication to ensure effective integration include:

Scalability: Traditionally, all transactions on a blockchain are processed and stored by every node on it. In this regard, given the huge data amount and high frequency of transactions that will be usual in space missions and satellite communication, bottlenecks may occur. This is mitigated through solutions like sharding and Layer-2 protocols. Sharding involves the fragmentation of blockchain into bits that are more manageable, hence allowing parallel processing in transactions. Off-chain Layer-2 solutions, such as state channels, reduce the stress placed on the main network, which makes it scalable in turn.

Energy use: Traditional blockchain networks, particularly PoW, consume a large amount of energy. That is worrisome for applications in space where energy resources are limited. Other alternatives like proof of stake and hybrid consensus algorithms can help in offering more energy efficiency. In PoS, instead of solving computationally intensive puzzles to validate a block, validators have to stake cryptocurrency. Hybrid consensus algorithms combine multiple consensus mechanisms that balance energy efficiency, security, and performance.

Regulatory Issues: There are regulatory issues surrounding the adoption of blockchain in space exploration and satellite communication. These will have to be changed, allowing for blockchain-based solutions to operate, particularly in such

areas as spectrum management, data privacy, and security. If the broadened adoption of blockchain technology within these critical domains is to be achieved, such compliance is needed, adhering to international regulations and standards.

5 Results and Discussion

Application of blockchain technology, more so through smart contracts, has shown great promise in space exploration and satellite communication. The case involved the implementation of smart contracts on the Sepolia Network, which successfully automated a number of key processes with respect to resource allocation and data management, resulting in reduced operational costs and a rise in efficiency.

Testing Outcomes: The developed smart contracts are validated to be robust and secure. Successful deployment of the contracts into the Blockchain network confirmed that they had been successfully integrated and were accessible for execution. Data integrity checking proved that the information managed by these contracts was accurate and consistent, with absolutely no discrepancies noted. Security testing proved that unauthorized access was duly disallowed, in effect proving that only an authorized entity can access the functionality developed within the contract. Also, the tests on resource allocation showed that resources were allocated following the rules of the contract; therefore, management in this sphere was automated.

6 Conclusion

Blockchain has huge potential for space and satellite communications because it can help solve major problems related to data transmission, security, and operational efficiency. Given the growing complexity of space missions and ever-demanding needs for the availability of a communication system, blockchain itself brings some solutions to the table: immutability, decentralization, and cryptographic security.

Blockchain in space exploration provides a decentralized and immutable platform to increase efficiency in mission planning and logistics by providing an exact record of resources, schedules, and contracts. Smart contracts automate several processes, reducing errors and delays to improve operational efficiency. Entailing integrity in data, it allows secure data management, which is particularly useful in any space mission where information accuracy and reliability are very critical. In satellite communication, blockchain technology can reduce the vulnerabilities associated with cyber attacks and signal interference by providing a decentralized network that is resistant to tampering. It will improve the security of communication networks and provide transparent and immutable records for data exchange. Moreover, blockchain helps in efficient spectrum management because of the automation of processes and dynamic spectrum sharing to optimize resource usage and risk of interference. This is despite the fact that application in these domains comes not

without a host of challenges, including scalability, high energy consumption, and regulatory concerns. Realizing the full potential of blockchain, therefore, requires solutions to these issues, be they sharding, energy-efficient consensus mechanisms, or robust regulatory frameworks.

It is expected that with exponential development in technology, blockchain will turn out to be one of the most essential building blocks for satellite communication systems and space exploration. This is because of its capacity to offer better, safer, and more efficient solutions that meet the requirements of modern space missions and communication networks. Thus, the present research brings out an urgent requirement in continued exploration and refinement of blockchain applications to harness its transformative power for the future in space technology.

Acknowledgements I want to thank all authors and researchers whose work has been invaluable with insights and references in making up this study on revolutionizing space exploration and satellite communication with blockchain technology. Much appreciation goes to the National Institute of Standards and Technology for their groundbreaker on blockchain applications and to all the scholars whose research on the impact of blockchain on data security and management informed this paper. I would also like to express my deepest gratitude to the academic mentors and colleagues who helped in guiding and providing feedback that was instrumental in shaping this research. Your input is highly appreciated.

Legal Oversight of Foreign Technology Companies: Effectiveness and Challenges

Yasar Alhiniti and Khalif Saleh Dhiab Amoush

Abstract This chapter discusses the legal obligations placed on foreign technology providers by local laws. It tries to show how such obligations affect the day-to-day activities and dealings of these companies within the target country and examines the efficacy of governmental oversight in enforcing compliance. The analysis used carefully selected legal texts applied to model situations, enriched by reference to current legal literature and related earlier research. Recommendations resulting from this study emphasize the need for strict observance of these legal obligations for protecting the national economy and upholding the rights of individuals engaged in business with foreign technology providers. Moreover, it strongly brings out a necessity to make revisions in certain legislation to bring them up to date with advances taking place in technology and rapid economic development.

Keywords Foreign technology companies · Legal obligations · Compliance · Legal oversight · National economy · Local legislation

1 Introduction

When foreign companies are recognized as having legal personality, they are granted certain rights and are also obligated to fulfill specific requirements. This recognition has various effects, some of which are automatically conferred by law, while others come into play once the companies complete the necessary registration procedures and begin operating within the country [1]. The legal basis for this recognition is the Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions, which was signed on June 1, 1956, during the International Private Law Conference held in The Hague in 1951. According to Article 7

A. M. A. Musleh Al-Sartawi et al. (eds.), *Business Resilience and Business Innovation for Sustainability*, Studies in Systems, Decision and Control 587,
https://doi.org/10.1007/978-3-031-87584-7_167

of the Convention, the recognition of a company's legal personality does not imply automatic approval for its operations or activities within the recognizing state's territory. Instead, the company's freedom to operate remains subject to the laws of the host country [2].

In addition, when a foreign company is acknowledged as having legal personality, it is endowed with a series of entitlements that have been globally acknowledged in the Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions, particularly in Article 1. These entitlements encompass, at the very least, the ability to engage in legal proceedings, the ownership of assets, the execution of legal transactions, and the utilization of public amenities [3].

In light of the lack of explicit explanations for the termination of foreign companies in accordance with Jordanian laws, the researcher has chosen to investigate the regulatory provisions that govern foreign companies in Jordanian legislation, as well as the methods for resolving disputes that arise in relation to the operations of foreign companies in the country.

1.1 Study Methodology

The methodology employed in this study is descriptive-analytical in nature. The primary focus was on examining and evaluating the legal documents pertaining to the responsibilities of foreign corporations that operate within Jordan, as outlined in Jordanian Companies Law No. 22 of 1997. The collection of data was conducted using authoritative legal sources, such as laws, regulations, and directives issued by relevant governing bodies, as well as through consultation of legal literature and previous research conducted on the subject matter.

1.2 Study Objectives

This study aims to achieve the following:

- Identify the obligations of foreign companies operating in Jordan under the Jordanian Companies Act No. 22 of 1997 and understand the legal basis for these obligations.
- Analyze legal texts regarding the obligations of foreign companies and compare them with similar regulations in other countries to determine their compatibility and effectiveness in protecting rights and ensuring transparency.
- Assess the impact of compliance with legal obligations on the performance of foreign companies operating in Jordan and on the national economy as a whole.

2 Effects of Acquiring Legal Personality by Foreign Companies

Granting foreign companies legal recognition [4] ensures their ability to operate and manage their affairs within the borders of the host country, as long as they comply with the domestic laws of that country. This means that foreign companies can expand their operations beyond their home country, establishing branches and offices. However, they are also obligated to fulfill certain legal requirements. These obligations serve as a means for the host country to regulate and oversee the financial status of these companies, safeguarding the national economy and preventing undue dominance. Additionally, these measures protect domestic companies and individuals involved in transactions with these foreign companies from any potential malicious intent.

This section is structured into two distinct segments, drawing from the information presented above. The initial portion will delve into the privileges afforded to foreign companies that function within the framework of Jordanian legislation, while the subsequent segment will examine the responsibilities that foreign companies must uphold when operating under Jordanian law.

3 Rights of Foreign Companies

When a foreign company obtains legal personality, it is acknowledged to possess the same legal capacity as a natural or legal person. As a result, the company is bestowed with various rights and is obligated to fulfill certain responsibilities.

It is important to acknowledge that the origin of these rights and responsibilities stems from either international law, specifically the International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions, or the internal laws of the country where the foreign company operates, such as the Civil Code or the Jordanian Companies Law. The legal status of a foreign company ensures that it is entitled to a range of rights, some of which are automatically granted by law, while others are obtained through the registration process and the conduct of business activities within the host country. However, it is crucial for the company to adhere to its stated purpose and comply with the laws and public order of the host country in order to maintain these rights.

The International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions serves as the foundation for the rights afforded to these entities. These rights, as detailed in Articles (1, 4, 5, and 6), encompass various privileges such as the ability to engage in legal proceedings, conduct business transactions, possess property, and access public amenities [5]. However, it is important to note that these rights can only be conferred upon foreign companies by the laws of the country in which their headquarters are situated [6].

The first among the rights bestowed upon foreign companies is the right to engage in legal proceedings. As either a plaintiff or defendant, a foreign company possesses

the privilege of utilizing the national courts of the host country. This entitlement is a direct result of its acknowledgment as possessing legal personality, as explicitly stated in Articles 1, 5, and 6 of the International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions [7].

Disputes involving foreign companies, whether they are with individuals or other foreign parties, are dealt with by national courts. A ruling from the Jordanian Court of Cassation affirms that under Article 256 of the Jordanian Civil Code, any harm caused by a party, even if they are not competent, requires them to compensate for the damage. This applies regardless of whether the plaintiff is a foreign non-operational company. The fact that the plaintiff company is registered with the Companies Regulatory Official and has a commercial address further solidifies its standing. Consequently, the defendant company is obligated to provide compensation for the damages suffered by the plaintiff. The court emphasizes that there is no distinction between a foreign non-operational company and any Jordanian company in this regard [8].

It is important to recognize that the ability of a foreign company to engage in legal proceedings within a country's national courts is not without limitations. The jurisdiction of national courts over disputes involving foreign entities is governed by procedural rules [8]. Therefore, although foreign companies have a fundamental right to litigate, any constraint placed on this right is viewed as a violation of justice and a departure from established international legal principles [8].

With the decision made by the Jordanian legislature to allow foreign companies to access national courts, they have also given permission for these companies to be subjected to lawsuits in those same courts, as outlined in Article 27 of the Jordanian Civil Procedures Law No. 24 of 1988 [9]. This specific article establishes a universal principle that grants Jordanian courts the authority to handle any civil litigation brought against both Jordanian citizens and foreigners, encompassing both individuals and entities [10].

Lawsuits brought against individuals or entities from foreign countries who do not reside or have a legal presence in Jordan fall under the jurisdiction of national courts. However, if the foreign party has established a chosen residence or domicile within Jordan, which serves as a designated location for executing specific legal actions or receiving relevant judicial documents, this chosen domicile must be documented in writing. Furthermore, national courts hold jurisdiction in cases involving property situated in Jordan, bankruptcy proceedings initiated in the country, or if any of the defendants maintain a residence in Jordan, as outlined in Article 28 of the Jordanian Civil Procedures Law No. 24 of 1988 [11].

In its ruling, the Jordanian Court of Cassation upheld the notion that if a foreign company is registered with the Companies Regulatory Official at the Ministry of Industry and Trade as well as in the register of foreign companies and their branches, and if the city of Amman is deemed the legal domicile for non-operational foreign companies for litigation purposes under Article 245(c) of the Companies Law, then it follows that Amman is also considered the domicile for operational foreign companies for litigation purposes. Therefore, the claim that the Jordanian courts have jurisdiction to hear the case against the appellant, who is a registered foreign company conducting business in Jordan, is in accordance with the law. The court's decision

was justified and complied with the requirements outlined in Article 188/4 of the Civil Procedures Law [12].

As stated in Article 10/6 of the Jordanian Civil Procedures Law No. 24 of 1988, "in accordance with Article 241/A/4 of the Jordanian Companies Law No. 22 of 1997, companies with branches or agents in Jordan are obligated to designate a representative by proxy from the parent company. This representative, or their legally authorized substitute, or the agent themselves, will be the recipient of legal documents delivered either in person, at their place of work, or at their residence" [12]. The requirement for a proxy representative is outlined in the law as follows: "…a copy of the proxy authorizing the foreign company to appoint a resident in the Jordan to manage its affairs and receive notifications on its behalf" [13].

Foreign companies are afforded the privilege of participating in lawful dealings. The acknowledgment of the legal identity of foreign companies bestows upon them the entitlement to engage in legal transactions, as confirmed by Article 1 of the International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions. This article stipulates that foreign companies possess, at the very least, the ability to engage in litigation, own assets, enter into contracts, and partake in various other legal transactions [13].

According to the definition, a legal transaction encompasses the intention to produce a legal consequence, whether it involves establishing, transferring, modifying, or terminating a right [14]. In line with Article 241/1/4 of the Jordanian Companies Law No. 22 of 1997, a foreign company has the ability to engage in various legal transactions, including sales, leases, gifts, and barter, through its agent or legal representative in the Kingdom. However, these transactions must align with the company's purpose, comply with the laws, public order, and morals of the host country, and not be prohibited or restricted by the legislation of the parent company's home country [15].

Enabling foreign companies to participate in lawful transactions is crucial for the advancement of the domestic economy and the promotion of investment. In an effort to attract more investment to Jordan and bolster the national economy, the Jordanian legislature has eliminated certain limitations that were previously imposed on foreign companies, including restrictions on non-Jordanians owning both movable and immovable assets. This favorable treatment allows these companies to engage in various legal activities, such as procuring raw materials and acquiring properties for the purpose of establishing economic ventures [16].

National and foreign companies alike possess the same entitlement to utilize public utilities, as long as they fulfill their financial obligations in the form of fees and taxes [17]. They have the right to access transportation services and enjoy the benefits of electricity, water, roads, and various other services. This privilege is explicitly stated in Articles 1 and 6 of the International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions [18].

The International Convention on the Recognition of the Legal Personality of Foreign Companies, Associations, and Institutions states that foreign companies have the right to own both movable and immovable property. This convention defines a public utility as any activity conducted by the government, either directly or through

individuals under its supervision, with the purpose of meeting public needs and utilizing certain privileges of public authority [19].

However, the ownership of property by foreign companies is heavily regulated under Jordanian legislation, with strict limitations imposed on them. These limitations restrict foreign companies to only use the property for the specific purpose for which they were established, a legal principle known as the "Principle of Specialization." This principle is outlined in Article 51/2/b of the Jordanian Civil Code No. 43 of 1976, which states that foreign companies can only exercise their capacity within the boundaries set by their establishment document or as prescribed by law [20]. Furthermore, Article 5 of the Law on the Disposal of Immovable Property by Legal Persons No. 61 of 1953 allows industrial, commercial, and financial companies registered within the Kingdom but established abroad to own immovable property to the extent necessary for their operations, subject to the approval of the Council of Ministers [21].

As per the provisions of Article 5/A of the Jordanian Investment Environment Law No. 21 of 2022, investors are bestowed with the privilege of engaging in any economic activity through complete ownership, participation, or contribution, except for activities that are regulated. This law ensures that both Jordanian and non-Jordanian investors are granted equal rights and privileges, and are treated fairly, transparently, and equitably. The fair and equitable treatment of all investors, regardless of their nationality, is emphasized in paragraph A of Article 3, which mandates equal treatment in terms of rights, privileges, and obligations.

The Law on Leasing and Selling Immovable Property to Non-Jordanians and Legal Entities No. 47 of 2006, upon examination, initially establishes equality between Jordanian and non-Jordanian legal entities in terms of owning immovable property. This is outlined in Article 2, which defines a legal entity as "a person who is granted legal personality under the legislation of the state in which it is established and registered, whether Jordanian or foreign". The law distinguishes between two scenarios regarding the ownership of immovable property by legal entities. The first scenario pertains to property ownership within specific boundaries, allowing for land ownership within these limits as required for the establishment of a project, subject to the approval of the Minister of Finance and the recommendation of the Director of the Department of Lands and Survey, provided that the area does not exceed 30 km^2. If the area exceeds thirty km^2, the approval of the Council of Ministers and the recommendation of the Minister of Finance are required, as stated in Article 10 of the same law [22].

The second scenario pertains to land that falls outside the confines of an organization. According to the law, individuals are permitted to own land for the sole purpose of establishing an investment project, granted that it does not exceed fifty km^2. In such cases, approval from the Minister of Finance, upon the recommendation of the Director of the Department of Lands and Survey, is required [22, 23]. Additionally, consultation with the relevant authority is necessary. However, if the land area surpasses fifty km^2, the approval of the Council of Ministers is mandatory. This approval must be based on the recommendation of the Minister of Finance and

after consulting with the relevant authority, as outlined in Article 11 of the same law [22, 24].

The legislator has clearly outlined the powers of the Council of Ministers and the Minister of Finance in approving the ownership of immovable property by foreign companies within and outside organizational boundaries. This approval is granted on the condition that these companies have the necessary legal status as specified in Article 4 of the Jordanian Companies Law No. 22 of 1997. Such provisions enable these companies to effectively conduct their intended operations.

In accordance with Article 16/A of the same legislation, foreign companies that have been established specifically for the purpose of conducting economic activities within industrial cities have the privilege of owning up to fifty km^2 of land without seeking approval from the Council of Ministers or the Minister of Finance. Instead, they are only required to complete registration procedures with the Department of Lands and Survey [25]. In order to promote investment and attract foreign capital, the legislature has implemented new economic policies centered around privatization. Foreign companies are now allowed to lease land that exceeds ten km^2, granted that they obtain approval from the Minister of Interior or their representative. Additionally, the lease term must surpass three years, and the lease agreements must be documented in accordance with the instructions provided by the minister [26], as outlined in Article 12 of the Law on Leasing and Selling Immovable Property to Non-Jordanians and Legal Entities No. 47 of 2006 [27].

Article 13/A/1 of the Jordanian Investment Environment Law No. 21 of 2022 offers incentives, exemptions, and advantages to international corporations that lease state-owned land for economic purposes, as mentioned in the law [28].

In an effort to safeguard the national economy and promote investment, the Jordanian legislature has implemented certain measures to protect against potential risks associated with foreign ownership of immovable property. While foreign companies are allowed to own property both within and outside organizational boundaries, there are specific conditions that must be met. For residential or commercial purposes, the company must complete their project within a three-year timeframe, while other purposes require completion within five years. In certain cases, the period may be extended for an additional three years, subject to the recommendation of the Director of the Department of Lands and Survey and the approval of the Minister of Finance. Failure to meet the designated timeframe will result in an annual fine of 5% of the property's market value, as determined by the Director of the Department of Lands and Survey, for a maximum period of ten years. If the foreign company does not sell the property, it will be publicly auctioned with the proceeds going to the owner, as stipulated in Article 13 of the Law on Leasing and Selling Immovable Property to Non-Jordanians and Legal Entities No. 47 of 2006 [29].

Foreign operating companies face additional limitations, as dictated by the Jordanian legislature. One such restriction is the prohibition on transferring immovable property until a specific time has passed since its acquisition. However, there is an exception to this rule if the purpose of the acquisition is to establish a residential or commercial project and the company has already begun the project. This provision

can be found in Article 14 of the Law on Leasing and Selling Immovable Property to Non-Jordanians and Legal Entities No. 47 of 2006.

In terms of the legal rights of foreign operating companies according to Egyptian law, these companies are acknowledged as having their own legal identity by the Egyptian legislator. This recognition grants them the ability to engage in legal proceedings, utilize public facilities, and conduct general legal transactions, as long as they have been properly established in the country where their primary headquarters is located. The Investment Incentives and Guarantees Law No. 72 of 2017 ensures that foreign investors are treated fairly and equally, receiving similar treatment to domestic investors. Additionally, in certain situations, foreign investors may even receive preferential treatment over domestic investors, as determined by the Council of Ministers [30].

Foreign operating companies have the right to engage in legal proceedings in Egyptian courts, regardless of whether they are the plaintiffs or defendants. This is established in Article 11/2 of the Egyptian Civil Code No. 131 of 1949, which explicitly states that the legal framework for foreign legal entities, including companies, associations, and institutions, is determined by the laws of the country where their primary management is located. However, if these entities conduct their primary operations within Egypt, then Egyptian law takes precedence. Consequently, foreign operating companies are able to pursue litigation in Egyptian courts.

The establishment of international jurisdiction in Egyptian courts to handle lawsuits against foreign operating companies is outlined in Articles 29, 30, and 32 of the Egyptian Code of Civil and Commercial Procedure No. 13 of 1968. This provision ensures that foreign operating companies can be held accountable in Egyptian courts.

Through the establishment of a branch in Egypt, foreign operating companies are granted legal personality, enabling them to participate in various legal transactions such as selling, leasing, and gifting. These companies are also entitled to utilize public utilities like water, electricity, and roads, on the condition that they fulfill their financial obligations in terms of fees and taxes. The rights bestowed upon foreign companies stem from both domestic legislation and international law, which mandates that countries must guarantee foreigners a minimum level of rights as outlined in international treaties and customary practices.

In order to promote investment and stimulate economic growth, the Egyptian legislator has implemented new policies that allow foreign operating companies to possess real estate and vacant land. This permission is granted under Law No. 230 of 1996, with certain stipulations that must be met:

1. Ownership is limited to a maximum of two properties throughout the country intended for private residential purposes for the owner and his family, without prejudice to the right of ownership of the property necessary to carry out the licensed activity granted by the competent authorities in the country.
2. The area of each property must not exceed 4000 m^2 and the total area must not exceed 8000 m^2, as having more than that is considered excessive.

3. The property cannot be classified as an archaeological site within the meaning of the Monument Protection Act No. 117 of 1983 [31].

The significance of foreign operating companies in bolstering the national economy and the acknowledgement of foreigners' rights, both domestically and internationally, are the underlying reasons behind the rights bestowed upon them by legislators in Jordan and Egypt, according to the researcher. These rights serve as the basic prerequisites for foreign operating companies to carry out their business and operations within the host country. It would be illogical to grant a foreign operating company the required permit to operate in the host country, only to restrict its access to public amenities, impede its access to national courts, or deny its ownership of the essential property needed for the establishment of its commercial venture.

Duties of Foreign Operating Companies.

When a foreign operating company obtains legal personality, it is bestowed with specific rights that naturally accompany this status. However, with these rights come a set of obligations that the company must adhere to while conducting business in Jordan, as failure to do so may result in deregistration.

In order to closely monitor foreign operating companies and safeguard the national economy, the legislator has implemented these duties that grant authority to the minister or the General Regulatory Official of Companies. This measure aims to ensure the financial and legal status of these companies and protect those who engage in business with them, recognizing the significant impact they have on the country's economy.

The Jordanian legislator has addressed these duties in Articles 242, 243, and 244 of the Jordanian Companies Law No. 22 of 1997. The researcher will cover the duties of foreign operating companies as follows [32–35]:

- A branch of a foreign company operating in Jordan is obliged to disclose in its official documents and correspondence the name of the foreign parent company, its nationality, legal form, address, capital in the home state and in Jordan and the registration number of its branch company with a controller [36–38].
- Submit the balance sheet and profit and loss account to the General Regulatory Official of Companies within three months of the end of each financial year [39-42].
- Publish the balance sheet and profit and loss account in at least two local newspapers within sixty days of delivery of these documents to the administrator [29–31].
- Make the company's books and documents available to the General Regulatory Official of Companies [27, 28].
- Notify the administrator in writing of the date you will cease operations or the expected date you will cease operations in Jordan.
- Prove settlement of all obligations arising from activities in Jordan.

In the opinion of the researcher, it is necessary for the legislator to enforce more severe sanctions on foreign operating companies that do not comply with the obligations set forth in this legislation. The researcher expresses the desire for the legislator to include a specific legal provision within Chapter Twelve of the Jordanian Companies Law No. 22 of 1997, outlining appropriate penalties for foreign operating companies that fail to meet their obligations. This is because the current penalty stated in Article 282 of the same law does not adequately address the seriousness of this violation.

In Egyptian Law.

According to the executive regulations of the Egyptian Companies Law, it is mandatory for branches of foreign companies to inform the Companies Authority within three months after the end of the financial year. This notification must include a copy of the financial statements, the auditor's report, and comprehensive details regarding the directors, such as their nationalities, number of employees, roles, nationalities, salaries, and share of profits. Furthermore, the General Regulatory Official of Companies must be informed about the parent foreign company, including its name, nationality, legal form, main address, purpose, capital, registration number, and address. It is also required for the branch to advertise this information within their offices. In addition to these obligations, the branch must allow the Companies Authority to inspect their books and provide any necessary clarifications or documents [33].

In the event that a court decision alters the legal standing of the foreign operating company, such as bankruptcy or dissolution, the company is required to submit a copy of the ruling to the registry office within a three-week timeframe. If the ruling originates from a court outside of Egypt, it must be enforced by an Egyptian court and officially communicated to the commercial registry in order to update the company's information in the commercial register [34].

4 Conclusion

The analysis presented in this study encompasses a thorough examination of the legal obligations that foreign operating companies must adhere to in Jordan, as stipulated by the Jordanian Companies Law No. 22 of 1997. The study delves into the significance of these companies in bolstering the national economy and the challenges they encounter when striving to comply with legal mandates. Furthermore, practical recommendations have been put forth to enhance the legal and regulatory framework governing these companies, with the ultimate goal of attracting greater foreign investment and fostering stakeholder confidence. It is anticipated that this study will contribute to the formulation of policies and legislation that strike a harmonious balance between effective oversight and support for sustainable economic growth in Jordan.

4.1 Findings

Following the study of the duties of foreign operating companies under Jordanian legislation, the study reached several key findings summarized as follows:

1. Foreign operating companies in Jordan are required to disclose their basic data in their official documents, which enhances transparency and ensures that stakeholders are informed of all legal and financial details.
2. Foreign companies must submit a detailed annual financial statement to the General Regulatory Official of Companies, which helps ensure effective oversight of their activities and adherence to financial standards.
3. Foreign companies are required to publish their financial statements and profit and loss accounts in local newspapers, ensuring that financial information is accessible to the public and stakeholders.
4. Foreign companies must make their books and documents available to the General Regulatory Official of Companies, which enhances the controller's ability to perform their oversight role effectively.
5. Foreign companies must notify the controller in writing of the expected date of their cessation of operations in Jordan, to protect the rights of those dealing with them and ensure proper settlement of all obligations.

4.2 Recommendations

Based on the findings of the study, the following recommendations are proposed to enhance the enforcement of duties for foreign companies in Jordan:

1. Update laws to include electronic publication of financial statements and reports in addition to publication in local newspapers, aligning with technological advancements and ease of access to information online.
2. Increase penalties for foreign companies that fail to fulfill their legal duties, to ensure full compliance and effective oversight.
3. Strengthen the role of the General Regulatory Official of Companies and provide necessary resources for effective performance, including ongoing training and the use of modern technology in oversight processes.

A Novel Model for Crop Disease Detection Using CNN

G. Komarasamy, R. Ganeshan, Murad Zeer, and Maram Y. Al-Safarini

Abstract This study aims to explore the convergence between an AI-Powered Retina-Based Diagnostic Tool and state-of-the-art deep learning models that can pave the way for early identification of the risk of cardiovascular disease (CVD). A critical review was conducted using 30 studies that demonstrated the impressive potential of deep learning methodologies with an ability to extract the risk factors pertaining to CVD from retinal images. These methodologies acquire tracking retinal-vessel characteristics with remarkable accuracy, revealing rich signs of CVD risk factors. The pioneering AI algorithm, born out of this research and precise calculation of retinal vasculature from retinal images, has leaped a giant step forward of fusing retinal vasculature imaging with traditional risk factors—a breakthrough prediction model for predicting cardiovascular events. Whether strategizing ways to standardize methodologies across studies or creatively merging AI-enabled retinal imaging with traditional risk through the integration of AI-enabled retinal imaging with traditional risk factor, the study underlines the accelerating pace at power of integrating of AI into clinical practice. According to the World Health Organization, 17.9 million people die of CVDs annually—an estimated 31% of all deaths worldwide. The medical and social costs of their widespread prevalence—and the increasingly longer lifespans of

1 Introduction

Agriculture is very important in India's economic development and the need for efficient methods to protect crops and enhance food production. Challenges include the identification and monitoring of crop diseases, However, the selection of the right classification algorithm for different data types remains a challenge, which can lead to low production and economic losses. The objectives detail the goals of detecting leaf diseases, extracting relevant features, and comparing machine learning algorithms for classification. The introduction provides context on the importance of agriculture and challenges in crop disease detection.

Literature work reviews existing research and identifies gaps the current study aims to address. Existing work outlines prior methods and techniques in plant disease detection, while the proposed work introduces innovative methodologies and potential impacts. The overall architecture and flow diagram visualize the system's structure and process. The software and hardware used section lists the tools and resources utilized in the research. Experimental results present the outcomes and comparisons of different algorithms, including charts and tables. The conclusion summarizes key findings and suggests potential areas for future research. References provide sources cited, and the contribution of all members acknowledges each team member's role in the research.

2 Literature Survey

Shruthi et al. presented the stages of general plant diseases detection system and study of machine learning techniques for plant disease detection. They showed that a convolutional neural network (CNN) detects many diseases with high accuracy [1]. P. Srinivasan et al. developed the software to classify and categorize groundnut leaf diseases. In their approach, groundnut crop disease such as Early leaf spot, Late leaf spot, Rust, early and late spot Bud Necrosis were categorized only 4 dissimilar disease using image acquisition, image preprocessing, segmentation, feature extraction, and the K Nearest Neighbor (KNN) [2]. L. Sherly reviewed of various types of plant diseases and different classification techniques in machine learning that are used for identifying diseases in different plant leaves along with the pros and cons. This paper summarized different algorithms used for classifying and detecting bacterial, fungal and viral plant leaf diseases [3]. Gurleen Kaur et al. reviewed the methods of

plant leaves disease detection the major techniques employed were: BPNN, SVM, K-means clustering, Otsu's algorithm, CCM and SGDM for image segmentation, feature extraction, and classification [4]. Md. Selim et al. used eleven statistical features and the Support Vector Machine classifier (SVM) to recognize the diseases. The advantages of this increase the efficiency of the detection, identification, and classification process. It gives 93% accurate results in disease classification [5]. Monzurul Islam et al. integrated image processing and machine learning to allow diagnosing diseases from leaf images of potato plants. It gave 95% of the accuracy of disease classification using Color thresholder, GLCM and multiclass SVM [6]. Jobin Francis et al. calculated damaged ratio of leaf for the identification of leaf diseases in pepper plants. Masking and threshold based segmentation carried out to separate leaf from background. Using back propagation algorithms two types of diseases were identified [7]. Vijai Singh et al. used genetic algorithm for leaf image segmentation. The advantages of this method are that the plant diseases can be identified at an early stage or the initial stage, and with minimal computational efforts and the optimum results [8]. Mrunmayee et al. describe methods of an image processing and neural network for disease detection and classification. The color images preprocessed, and for segmentation, k-means clustering is used. The texture features are extracted using a gray level co-occurrence matrix (GLCM) method and given to the artificial neural network. The overall accuracy of this method is 90% [9]. Sachin D. Khirade et al. discussed segmentation and feature extraction algorithm used in plant disease detection. For classification of disease in plants neural network methods such as self-organizing feature maps, backpropagation algorithms, SVMs, etc. were proposed [10]. Usama Mokhtar et al. used an color space transformation and gray-level co-occurrence matrix (GLCM) for preprocessing and feature extraction respectively. Support Vector Machine (SVM) algorithm with different kernel functions is used for the classification phase. The result shows that the classification accuracy is 99.83% [11]. Melike Sardogan et al. presented a Convolutional Neural Network (CNN) model on three different input matrices have been obtained for R, G and B channels to start convolution for every image in the dataset. ReLU activation function and max pooling have been implied to the output matrix and Learning Vector Quantization (LVQ) algorithm used for four types of tomato leaf disease detection and classification [12].

3 Methodology

Image acquisition is the first step of a plant disease detection system is shown in Fig. 1. By using digital cameras, scanners, or drones, high-quality plant images can be captured. The images can also be taken from the web. Large numbers of image samples were collected from Kaggle datasets, which consist of diseased and healthy leaves. Image Preprocessing is used to increase the quality of leaf image and eliminate unwanted noise. The segmentation process is used to partition the plant image in various segments to separate the diseased portion of the leaf [13–19].

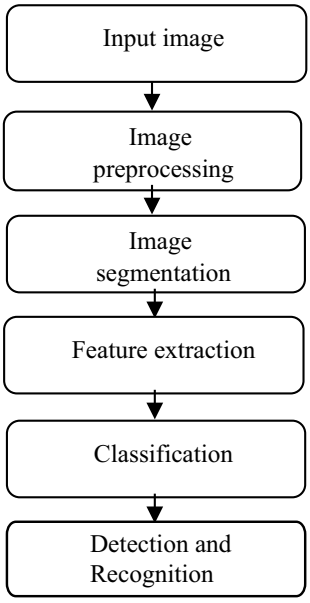

Fig. 1 Plant disease detection system

Plant disease classification is performed using machine learning techniques such as Support Vector Machine (SVM) and Convolutional Neural Network (CNN). SVM is a supervised classifier that efficiently handles high-dimensional data and identifies a hyper-plane to separate classes. CNN, on the other hand, is a deep neural network composed of various layers such as input, convolution, pooling, fully connected, and output layers. It is used to classify plant diseases from images by extracting and processing features. The combination of these methods allows for effective classification and identification of plant health.

Multi-class Classification

Plant disease datasets contain images of both healthy and infected plant samples, each associated with a specific class. For example, images of banana plants, whether healthy or infected, are categorized under the banana plant class. In multi-class classification, each image is classified into one of several distinct categories within a class, such as xanthomonas wilt, fusarium wilt, bunchy top virus, and black sigatoka for banana plants. In contrast, multi-label classification treats each category within a class as a separate class. For instance, if there are N classes, each with M categories, then each category within every class is considered an individual class, allowing for more nuanced classification where multiple categories can be assigned to a single image.

Transfer Learning Approach

Training state-of-the-art models typically takes days or weeks, even on high-end GPUs. For example, a CNN model built from scratch achieved 25% accuracy in

200 epochs, while a pre-trained CNN model using transfer learning reached 63% accuracy in about 100 epochs. Transfer learning, which involves various approaches based on pre-trained networks, offers a more efficient solution for model training.

ResNe-50

ResNet-50 is a convolutional neural network with 50 layers, organized into five stages featuring convolution and identity blocks. It introduces the concept of residual learning, where convolutional layers are stacked and skip connections are used to bypass the input directly to the output. These skip connections help address the vanishing gradient problem, allowing for deeper networks by ensuring gradients flow more effectively through the layers. This architecture improves the network's performance and accuracy in computer vision tasks.

Let us consider x as the input image, F(x) as the nonlinear layers fitting mappings, and H(x) as the residual mapping. Thus, the function for residual mapping becomes.

$$H(x) = F(x) + x \tag{1}$$

VGG-16

The VGG-16 network model, also known as the Very Deep Convolutional Network for Large-Scale Image Recognition, was built by the Visual Geometry Group from Oxford University. The depth is pushed to 16–19 weight layers and 138 M trainable parameters. The depth of the model is also expanded by reducing the convolution filter size to 3×3. This model requires more training time and occupies more disk space.

DenseNet-121

DenseNet-121 is a deep CNN model is shown in Fig. 2, designed for image classification using dense layers with shorter connections between them. In this network, each layer receives additional inputs from its preceding layers and passes its generated feature maps to the succeeding layer. Concatenation is performed between each layer, through which the next successive layer receives collective knowledge from all the preceding layers. Further, the network is thin and small since the preceding layers' feature maps are mapped to the subsequent layers.

$$Y = W_3\{x, h_1(x), h_2(x), h_3(x)\} \tag{2}$$

Inception V4

Images contain lots of details and salient features and may vary in size. With these variations in size, choosing the right filter size for feature extraction is challenging. For local information extraction, a smaller kernel size should be chosen, whereas, for global information, the kernel size should be large. Stacking up the convolution layers may result in overfitting and vanishing gradient problems. To solve this, the Inception modules incorporate different kernel sizes in each block, such that the

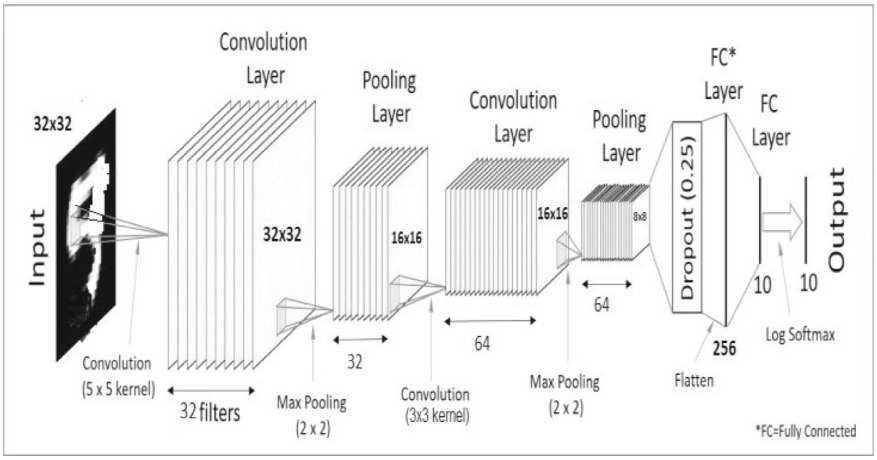

Fig. 2 CNN

network model becomes wider instead of deeper. For instance, the naïve Inception module can use 3×3, 1×1, or 5×5 sizes for the filter after three different stages of convolution. Max-pooling is then performed and the outcome is concatenated and passed to the next layer. The stem of the Inception layer is meant for setting up an initial set of operations to be performed before the Inception module. Further, Inception V4 has reduction blocks to alter the height and width of the grids.

Feature Extraction

The extraction of color, shape, and texture feature of the diseased part of the plant can be done using a grey level co-occurrence matrix (GLCM). There are different techniques of feature extraction that can be employed for growing the system such as gray-level co-occurrence matrix (GLCM), spatial grey-level dependence matrix, color co-occurrence method, and histogram-based feature extraction. The GLCM method is a statistical method for texture classification. In this work, we extracted 6 features (color and textural) from every leaf image of the dataset. The Gray Level Co-occurrence Matrix (GLCM) was used for extracting statistical texture features like contrast, energy, and homogeneity. Besides, numerical indicators like mean, standard deviation, entropy are calculated.

Some notations—$g_{ij} = (i, j)^{th}$ entry in GLCM.

L−1 = number of distinct gray levels.

Contrast—It measures spatial frequency. It is the difference between the highest and lowest values of an adjacent set of $\sum_{\mathrm{i}} \sum_{\mathrm{j}} (\alpha - \mathrm{i})^2 g_{\mathrm{ij}}$.

Energy- Measures the textural uniformity. It reaches a maximum value when the gray level distribution has the same form. It is given by

$$\sum_{\mathrm{i}} \sum_{\mathrm{j}} \mathrm{g}_{\mathrm{ij}}^2$$

Homogeneity—It passes the value that calculates the tightness of the distribution of the elements in the GLCM. It is given by

$$\sum_{i}\sum_{j} 1/\left(1+(\alpha-i)^2 g_{ij}\right)$$

Entropy measures the disorder or complexity in the image. It is large when the image is not texturally uniform and GLCM features have very small values. Entropy is given by

$$\sum_{i=0}^{1-1} P(g(i))\log_2 P(g(i))$$

Support Victor Machine (SVM) Classifier

For plant disease classification, the Support Vector Machine (SVM) classifier is employed due to its advantages, such as effectiveness in high-dimensional spaces and memory efficiency, as it uses only a subset of training points called support vectors. SVM is a supervised machine learning algorithm used for both classification and regression. It works by plotting data points in an n-dimensional space and finding a hyper-plane that best separates different classes of data. This hyper-plane allows for accurate classification by distinguishing between healthy and diseased plant samples (Fig. 3).

Convolutional Neural Network (CNN)

Convolutional Neural Networks (CNNs) are deep neural networks used for image classification. The model consists of an input layer, convolutional layers for feature extraction, pooling layers to reduce dimensionality, and a fully connected layer that consolidates features into a single vector. The output layer then classifies the plant disease based on the extracted features. Table 1 demonstrates the model performance of CNNs.

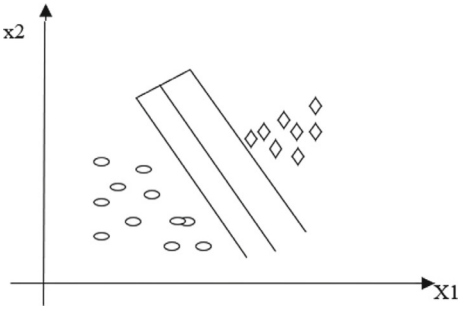

Fig. 3 Support vector machine

Table 1 Model performance of convolutional neural networks (CNNs)

Crop focus	Disease addressed	Dataset	Classes	Model	Model performance
Several	Citrus canker, black mould, bacterial blight, etc.	Plant disease symptoms database	12 56 diseases under 12 classes	CNN GoogLeNet with tenfold cross-validation	Accuracy
Several	Black rot, late blight, early blight	Self-collected database	527 species of diseases under 5 classes	CNN	Accuracy 96.5%
Tomato plant	Various diseases and pests in tomato plant	Self-generated database	9	Faster region-based CNN with SSD 1 and region-based fully convolutional network	Precision: 85.98%
Several	Powdery mildew, early and late blights, cucumber mosaic, downy mildew, etc	Open dataset	58	CNN with pre-trained VGG network	Accuracy: 99.53%
Several	Black rot, late blight, early blight	PlantVillage	38	VGG-16, Inception V4, ResNet with 50, 101, and 152 layers, and DenseNet with 121 layers	Accuracy: 99.75%
Apple	Apple scab, apple grey spot, general and serious cedar apple rust, serious apple scab	AI-challenger plant disease recognition	6	DenseNet-121	Accuracy: 93.71%
Tomato	ToMV, leaf mold fungus, powdery mildew, blight	AI-challenger plant disease recognition	4	Faster regional CNN	Accuracy
Several	Rice leaf smut, maize common rust, maize eyespot, rice bacterial leaf streak	Public database	7	Pre-trained models	Accuracy: 92%

4 Experiments

For SVM, 52 images are taken from open source. In that 37 images are used for training and 15 images are used for testing. SVM detects whether a leaf is healthy or infected. For CNN, the source of data is collected from the Kaggle website i.e. "new plant diseases dataset". From that dataset 12,949 images are used for training. Image dataset containing healthy and unhealthy crop leaves such as apple, cherry, corn (maize), grape, peach, pepper bell, potato, strawberry, tomato, etc. The images thus collated are labeled with different categories of diseases and healthy (to differentiate healthy leaves from affected ones).

The SI unit for magnetic field strength H is A/m. However, if you wish to use units of T, either refer to magnetic flux density B or magnetic field strength symbolized as $\mu_0 H$. Use the center dot to separate compound units, e.g., "$A \cdot m^2$."

The results shows the result of the SVM classifier. The classification shows whether the plant leaf is infected or not. SVM gives 80% accuracy. The convolutional neural network (Alexnet) is experimented with to identify leaf diseases with an expectation of improved accuracy. The 80/20 splitting ratio is used to divide the database into two datasets i.e. training and testing. CNN detects leaf is healthy or diseased if so, it predicts the class of disease as well. CNN model was trained using the initial learning rate of 0.001 in 10 epochs. The overall accuracy for Apple leaves is 99%. The classification accuracy of respective plants is summarized in Table 1. The overall accuracy is found as 97.71%.

The second experiment evaluated the VGG-16 model using the same dataset. After standardization of the hyperparameters, the model was trained with 80% of the same dataset, with 10% used for testing and the remaining 10% of the image samples used for testing and validation. The analysis showed that the model recognition accuracy reached around 78% in the initial 10 epochs, after which is steadily increased to attain the maximum recognition accuracy of 84.27%, which was lower than the Inception V4 model. The training loss and the validation model were found to be 0.52% and 0.64%, respectively. The third experiment was undertaken with the ResNet-50 model. The same method was applied in the evaluation of model loss and recognition accuracy. This model achieved an accuracy of 99.83 and a model loss of 0.027. It outperformed the Inception V4 and VGG-16 models.

After hyperparameter standardization, the final experiment was executed with DenseNet-121, which has 121 layers with four dense blocks and a transition layer between each dense block. In the testing phase after training, the maximum accuracy achieved was 99.81% and the maximum validation loss calculated was 0.0154%.

In agricultural production, early diagnosis of crop disease is essential for high yields. To maintain a high production rate, the latest technologies should be implemented in the early diagnosis of plant disease. It was observed from the literature study that deep learning models are efficient in image classification, and transfer learning-based models are efficient in eliminating training complexity and huge dataset requirements. Hence, in this work, we evaluated four pre-trained models—VGG-16, ResNet-50, Inception V4, and DenseNet-121—to determine the model that

was best capable of classifying various plant diseases. The results for the pre-trained models were evaluated with evaluation metrics, such as specificity, sensitivity, and F1 score values. The validation accuracy in terms of the F1 score was calculated. It was inferred that DenseNet-121 outperformed the other network models and attained the highest validation peak with 0.998, which is very close to an F1 score of 1. In general, the value of an F1 score ranges from 0 to 1. A model's performance is relatively better when it is closer to 1. In our analysis, after repeating the same experiments for all the pre-trained models, we found that the highest validation accuracy in terms of the F1 score was achieved by DenseNet-121 at 0.998, whereas it was 0.887 for Inception V4, 0.901 for VGG-16, and 0.935 for ResNet-50.

A statistical representation of the pre-trained network models based on the evaluation metrics is shown in the Fig. 4. The vanishing gradient issues resulting from skip connections were eliminated using regularization techniques, such as batch normalization. With deeper models, various challenges, such as overfitting, covariant shifts, and training time complexity, occurred. To overcome these challenges in our experiments, we fine-tuned the hyperparameters. The experiments used sensitivity to predict the proportion of actually healthy plants classed as healthy (true positive) and actually healthy plants classed as unhealthy (false negative). From the evaluation, it was observed that ResNet-50 and DenseNet-121 performed better than the VGG-16 and Inception V4 models. A performance analysis of the different pre-trained models based on the specificity, sensitivity, and F1 score is shown in Fig. 4.

$$\begin{aligned} Sensitivity(recall) &= True\ Positive(True\ positive \\ &\quad + False\ Negative) sensitivity\ recall \\ &= True\ Positive + True\ positive \\ &\quad + False\ Negative \end{aligned} \tag{3}$$

The performance analysis of pre-trained models involves evaluating specificity, which measures the proportion of truly unhealthy plants correctly identified as unhealthy (true negatives) versus those incorrectly predicted as healthy (false positives). Comparing our results with state-of-the-art studies that used transfer learning on the PlantVillage dataset, our fine-tuned pre-trained model demonstrated superior performance by achieving the highest accuracy of 99.81%. This indicates that our model effectively handled a greater number of plant disease classes and outperformed existing approaches.

5 Conclusion

The primary objective of this study was to develop a robust plant disease detection system using machine learning techniques. The increasing need for early and accurate detection of plant diseases to ensure optimal agricultural production and minimize crop losses motivated this research. The study utilized advanced image processing

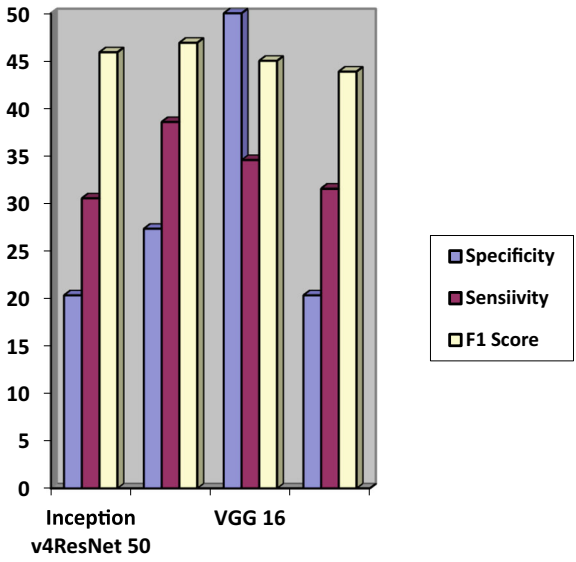

Fig. 4 Statistical representation of the pre-trained network models

and machine learning algorithms, specifically Support Vector Machine (SVM) and Convolutional Neural Network (CNN), to classify plant leaves as healthy or diseased based on their images.

Achievements

Efficient Disease Detection: The SVM classifier achieved an accuracy of 80%, while the CNN model (AlexNet) demonstrated a significant improvement with an accuracy of 97.71%. This indicates the effectiveness of machine learning algorithms in accurately detecting plant diseases from leaf images.

Comprehensive Dataset: A large dataset comprising over 12,949 images from various plant types was utilized, ensuring a diverse and representative sample for training and testing the models.

Feature-rich Analysis: The use of Gray Level Co-occurrence Matrix (GLCM) facilitated the extraction of comprehensive texture, color, and shape features, enhancing the accuracy and reliability of disease classification.

Future Enhancements

Transfer Learning: Implementing transfer learning techniques can further enhance the performance of the CNN model by leveraging pre-trained models and adapting them to the specific domain of plant disease detection.

Integration of IoT: Integrating Internet of Things (IoT) devices for real-time image capture and analysis can enable continuous monitoring of plant health, facilitating timely interventions and enhancing agricultural productivity.

Multi-class Classification: Expanding the classification system to identify specific types of diseases rather than just distinguishing between healthy and diseased leaves can provide more detailed insights and targeted solutions for disease management.

User-friendly Interface: Develop a user-friendly interface or mobile application to enable farmers and agricultural experts to easily capture and analyze plant images, interpret results, and receive timely recommendations for disease management.

Influence of Behavioral Biases on Women Investor's Portfolio Performance

Mamatha S. Updayay, C. Nagadeepa, K. P. Jaheer Mukthar, and Hayel Khafajeh

Abstract This study aims to examine the impact of three behavioral biases—Herding, Anchoring, and Loss Aversion, on portfolio performance among women investors. Behavioral finance views financial decisions as often deviating from rationality due to psychological, cognitive or social factors. The effects of these biases on decision-making have been ranked by the study using Analytic Hierarchy Process (AHP). The data of 200 working women from diverse fields was collected through structured questionnaire and based on expert inputs, completing the feedback loop with these participants to give priority among biases using AHP technique. Based on the results, Herding Bias has significantly affected women investors in comparison to Loss Aversion and Anchoring Bias. The results have implications for policy related to the general public with regard to how social conformity, fear of loss and cognitive anchoring influence women in financial decision-making. The results of the study underscore the necessity for financial literacy to mediate between these biases in order to yield better decision outcomes. The findings of the study provides the knowledge of gendered tendencies in financial behavior, and also provide considerations to empower women breaking these stereotypes.

1 Introduction

Over the last few years, female participation in financial markets has risen. As a woman have gained more control over their own finances, typically influenced by psychological factors that it is gaining traction as a focus area [1]. The field of behavioural finance underscores the behaviour of investors when they do not operate in a rational way, their behaviours being influenced by cognitive biases and emotions. Investors are completely unaware of these biases, which can lead to disastrous investment outcomes and could allow us not only fall victim to the usual retail investor biases but a whole heap more [2]. Yet, despite this widely-researched topic, the degree and manifestations of these biases on women investors has been largely unexplored. This is important to understand because of what we know about the different attitudes and behaviors in women compared with men when it comes to financial goals, risk preferences, and investment [3]. The main aim of the study is to look into the impact of behavioral biases like herding, anchoring and loss aversion on portfolio performance.

Herding Bias

The human trait of investors are to follow the lemming-like behaviour in making investment decisions, rather than thinking and acting independently on available information [4]. It depends on being slaved own group decision so they can feel safer but it leads to downfalls too when their collective opinion itself travels through the wrong path. For women investors, herding behavior could be a product of social networks and peer pressure or advice from trusted advisors such as friends, colleagues and financial experts.

Anchoring Bias

Anchoring bias is the tendency to rely on a previous reference point, which often includes their purchase price for that stock when it comes to making further decisions [5]. Women investors may be implicitly anchored to stock prices in the past or they think too much about specific financial goals, which can distort their assessment of current market conditions. This bias can result in a too fast or slow money movement strategy where women are more unwilling to sell when stock prices have not reached the desired value and thus, potentially holding profits back.

Loss Aversion Bias

Loss aversion is the behavioural bias that states human decision making will almost always be motivated and driven by a fear of losses rather than an equivalent prospect of gains [6]. Women display greater loss aversion than men and are traditionally more conservative investors, so heightened risk awareness may lead them to steer clear of a good deal on risky but lucrative investments. This can lead to a portfolio that is too safe—and may not perform well over time as a result. Not cutting losses on poor performing investments also dilutes portfolio returns due to loss aversion.

All of these biases; Herding, Anchoring, Loss Aversion etc. are indicators how the non rational factors move and determine financial behavior. Examining these biases in the case of women investors, this study forms part of a broader literature that tries to find answers regarding gender differences when it comes to investment decision making and performance. The way that the Analytic Hierarchy Process (AHP) was utilized for this study allows a quantitative ranking of these biases based on their relative impact with respect to women investment decision process.

Significance of the Study

The key of this research is aimed at female investors, still a smaller cited body compared to that in regular finance aligned studies. The growth of women as individual investors demands financial advice and strategies developed exclusively for them based on their specific behavior. This study attempts to explore the psychological factors of herding, anchoring, and loss aversion bias affecting womens portfolio performance. These biases are relevant to financial advisors and women investors—experts in the former can benefit easily. The insights can help advisors to create improved strategies that will dampen the influence of behavioral biases, in turn leading to better portfolio results. At the same time, women investors can understand better their own psychological biases affecting their investment decisions and be more informed as well balanced in investing.

2 Literature Review

This research investigates the effects of some behavioral biases on portfolio performance by examining different types of Herding Bias, Anchoring and Loss Aversion impacting women investors. Behavioral finance as a discipline attempts to comprehend and elucidates the instances where human beings act like unintelligent robotrons, which is exactly what traditional finance theories assume that we are; fully-rational investors who only operate on cold hard facts. The scientific literature from the fields of behavioral biases has established a solid base for enabling us to comprehend how psychological, cognitive and social aspects influence investment behavior specifically within female investors.

Investor Decision-Making and Behavioral Finance

The early theories in behavioral finance belong to scholars like Kahneman and Amos Tversky [7], who developed prospect theory which states that people evaluate losses and gains relative to a reference point, not from absolute terms. Their work showed that loss aversion is real (as buyers are more likely to buy a product at lower of risk—the here and now) than an expected return based on it; these gains would be achieved by gain-buyers). This idea has been extended to explain why investors tend to hang on my losing investments longer than they ought or refuse investment risk even though but for the potential payoff.

Similarly, Sahi [8] substantiated this area by gauging gender discrepancies in the way people invest. Men trade more, due to overconfidence In psychological and psychiatry research that looks into gender differences of behavior when it comes to risk taking: men tend generally show overconfident trades compares with women. In comparison, women are more risk-averse by nature which is good in some respect but can put a damper on their portfolio returns. There were other benefits to women's more conservative take on investing, the study also showed: The frequent trading by men often cut into their profits.

Herding Bias

Herding Bias is a proven financial market syndrome, in which people follow the rest of their crowd without any regard for even their own logic. For example, Shiller (2000) has argued that herding behavior heightens the risk of asset bubbles by inflating prices as new investors jump on board and driving them back down when they fade in favor. Herding may be especially relevant for women investors who make decisions within social networks and receive peer advice, the authors suggest. Research like that of Banerji et al. [9] demonstrates how the herding instinct in financial markets appears on both individual and institutional investors, generally due to fear-of-missing-out or social pressures rather than sound fundamentals.

Chohan and Kerckhoven [10] found that the presence of herding syndicates among retail investors leads to illogical investment behavior and market inefficiency. Market trends can be exaggerated-When a large number of market participants follow the same strategy and trade in the direction of certain trend, herding makes that movement even larger. Of particular interest in this study is the impact of herding on women investors—a topic important to MRIN because it wants to understand how social conformity or following-the-flock dependent their investment networks can make female retail traders.

Anchoring Bias

Anchoring Bias—This happens when investors pay too much attention to that first piece of information, the anchor (e.g. the price at which they originally bought a stock). This bias was observed by Andersson and Johansson, [11], in their groundbreaking research showing that people "anchor" on initial information, even when it has no bearing upon the event. Anchoring may cause judgement errors, as investors have a tendency to place much emphasis on previous prices and disregard new information or market conditions.

Owusu [12] investigated how anchoring influences investment behaviour amongst retail investors when stock markets experience bubbles or crashes. They unsurprisingly concluded that when a stock has become hyperinflated during a bubble, anchoring onto its top price caused investors to keep holding it long after the value had plummeted confusingly expecting it to return back up. This study aims to determine whether anchoring influences the decision-making processes of female investors, especially during times of high market volatility.

Loss Aversion Bias

Behavioral Finance is well researched area and in created out of it, we know the important concept—Loss aversion which comes from prospect theory. Investors are generally more averse to losing money than gaining the same amount, and therefore have risk-aversion as noted by Kahneman and Tversky [13]. This bias becomes especially important when assessing women investors as an ever-growing body of research suggests that they tend to be more risk-averse than men.

For instance, Dawson [14] found women to be more loss-averse than men—this often leads them to adopt less aggressive investment behaviours. As protective as this risk aversion is, it can actually lead to missing out on higher returns. Pushpa and Druvakumar [3] investigated the long-run survival of a losing stock trading in an experimental market and provide additional evidence. This research focuses on understanding how loss aversion reflects in the behavior of women investors especially when it comes to their portfolio management strategy.

Women Investors and Behavioral Biases

Over the last few years, there has been an increased focus on combining gender and behavioral biases this intersection. In short, researches show some gender differences in financial risk taking due to the fact that women are generally more cautious when investing rather than gambling or play game. It is discovered that in general, women trade less often than men which is related to their greater aversion of risk or the potential loss [15]. Still, reliance on such caution can depress portfolio returns if it manifests in conservative investment decisions. Further it is suggested that social biases from advice given to women can also affect investment behavior such as herding. A cross-sectional study of women investors has pointed towards the role of literacy and education in mitigating behavioral biases. This knowledge gap can impede women from making informed investment decisions which often result in suboptimal financial outcomes.

2.1 Objectives

The primary objective of this study is to identify, prioritize, and analyze the impact of various behavioral biases on women investors' portfolio decisions. Using the Analytic Hierarchy Process (AHP), the study aims to rank the relative importance of Herding Bias, Anchoring Bias, and Loss Aversion Bias and determine how these biases affect investment behaviors. The study seeks to provide insights that could inform the development of educational tools, interventions, or policies aimed at minimizing the negative impact of these biases on financial decision-making, specifically for women investors.

3 Methodology

This research is quantitative in nature and employs the Analytic Hierarchy Process (AHP) to evaluate the behavioural biases affecting portfolio decisions of women investors. The study samples 200 women of different investment experience and backgrounds across all industries. Study, developed a structured questionnaire for measuring the perceptions of respondents about three primary behavioral biases (Herding Bias, Anchoring Bias and Loss Aversion Bias). The questionnaire is composed of (1) demographic information and (2) pairwise comparisons, which encourage the respondent to reveal their assessment regarding how one bias outweighs another in making investment decisions. Biases are ranked by impact on portfolio selection according to pairwise comparison method. Participants also ranked their self-reported bias tendencies using a series of Likert-scale questions.

Pairwise comparison matrices for each bias were then constructed using the responses once the data was collected. The priority values (weights) of the biases were calculated using these matrices in AHP methodology. Once they had these revised word vectors, then that of the other documents was found as well by weighting them up in such way to made consistent comparisons Also consistency index (CI) and consistency ratio (CR) of the results was calculated to validate. Lastly, the study intended to finalize a set of results that could help in deriving meaningful conclusions linking portfolio performance with specific biases most prevalent among women investors and determine possible areas for targeted financial education or direct behavioral interventions.

4 Data Analysis

The demographic analysis of the study sample consists of 200 women investors from various fields, providing a diverse representation of the population. The respondents are categorized based on key demographic factors, including age, education, income, and investment experience. A significant portion of the respondents, approximately 40%, fall within the age range of 30–45 years, while 30% are between 46 and 60 years old. The remaining participants are younger than 30 or older than 60, with 20% and 10% respectively. In terms of education, the majority of respondents (60%) hold a bachelor's degree, while 25% have completed postgraduate studies, and the remaining 15% possess either a diploma or high school education. This wide range of educational backgrounds provides insights into how different levels of financial literacy may influence investment decisions.

Income levels and investment experience also play critical roles in shaping the behavioral tendencies of the participants. About 35% of the respondents earn between INR 5 lakhs and INR 10 lakhs annually, while 25% earn above INR 10 lakhs, indicating a significant portion of the sample possesses middle to upper-income profiles. The remaining 40% earn below INR 5 lakhs per annum, reflecting a more modest

income bracket. When it comes to investment experience, 45% of the women have less than 5 years of investment experience, while 35% have between 5 and 10 years, and 20% have over a decade of experience in the financial markets. This diverse demographic data enables the study to assess how factors such as age, education, income, and experience affect the presence and intensity of behavioral biases among women investors (Table 1).

The Analytic Hierarchy Process (AHP) is a method for making decisions of this type: it has proved to be very useful in cases where multiple criteria need consideration.

In order to make the AHP calculations we followed these steps:

Construction of the Pairwise Comparison Matrix: Using expert input, we constructed a pairwise comparison matrix to assess how one behavioral bias should be more important than other. Herding Bias was rated in comparison to Anchoring Bias, and Loss Aversion bias etc. for the rest encouraging scoring against all criteria. Every entry in the matrix indicates a ratio between biases.

Matrix normalization: At the end of pairwise comparison matrix was formed, then each cell element in its respective column had been divided to sum up with it as reducing whole values. Here, this is what (axis = 0) aggregates only in the row. Unsurprisingly they gives sum of itself to 1 per column.

Calculation of Priority Weights (w): The priority weights for each compared bias were calculated in the normalized matrix. Each of the weights is taken to represent a level importance that each bias has in making decisions. We did this by taking the average of each row in our normalised matrix. These priority weights (eigenvalues) were used to prioritize the biases.

Calculation of Weighted Sum Vector (Aw): Then you calculated the weighted sum vector (Aw) by multiplying matrix from step#1 with your priority weights. This step gives a vector that will be used to verify the consistency of judgements.

Consistency Check (Aw/w): The consistency ratio (CR) was calculated to maintain the relatedness in judgments. The first was division of the weighted sum vector by its correspondent priority weights (obtain a consistency vectors). The formula used to calculate the Consistency Index is given by;

Table 1 Significance of behavioral biases of women investors

Behavioural biases	Herding bias	Anchoring bias	Loss aversion bias	Priority value (w)	Weighted sum vector (Aw)	Aw/w
Herding bias	1.00	3.00	2.00	0.50	2.00	1.25
Anchoring bias	0.33	1.00	0.50	0.20	0.08	0.40
Loss aversion bias	0.50	2.00	1.00	0.25	3.00	0.90

Where, CI = λ max − n/n − 1

We also calculated the consistency ratio (CR) by dividing the Consistency Index to Random Consistency Index (RI), a standard value based on number of criteria. The CR in this study was computed to be less than 0.10, which suggests acceptable reliability on consistency A CR value lower 0.10 indicates that the judgements are consistent and the results reliable.

Ranking the Criteria: In this step, criteria were ranked according to their priority weights. The bias with the highest priority weight was identified as the most important driver behind women investors' decisions. In the example of this study, Herding Bias was given a higher weight than Loss Aversion and Anchoring Bias respectively which illustrate that women investors in the sample cared more about social conformity fear losing money versus being anchored to historical prices.

The highest priority value (0.56) suggests that herding bias is the most important factor explaining investment decisions among women investors, according to experts; This is further justified by its weighted sum vector value being 2.00. Value of loss aversion has priority value 0.33 which is showing the same important but less in contrast to herding. But has a bigger vector of weighted sum, indicating more influence than other conditions. Anchoring Bias: With the bottom priority value of 0.17, we can thus infer that experts view anchoring as having the least impact on their industry among these three biases.

Rank analysis: Based on the analysis of the AHP results, the ranks of the behavioral biases in terms of their influence on portfolio performance are as follows:

Herding Bias emerges as the most influential bias, with the highest value of *Aw*/*w* at 1.25. This indicates that Herding Bias has the greatest impact on portfolio performance according to the study. It suggests that investors' tendency to follow the crowd significantly affects their investment decisions.

Loss Aversion Bias ranks second with a value of 0.90. While it is less influential than Herding Bias, it still plays a significant role in shaping investor behavior. The substantial weighted sum vector indicates that Loss Aversion Bias also affects portfolio performance notably, though not as strongly as Herding Bias.

Anchoring Bias is ranked the lowest with a value of 0.40, indicating it is perceived as the least influential among the three biases. This suggests that while Anchoring Bias does impact investment decisions, it has a comparatively smaller effect on portfolio performance relative to Herding and Loss Aversion Biases.

These results highlight the need to focus on mitigating Herding Bias when addressing portfolio performance issues, while still considering Loss Aversion Bias as a relevant factor. The lower impact of Anchoring Bias suggests it may be less critical but still worth exploring further in specific contexts. Ensure that the consistency ratio for the AHP is within an acceptable range to validate the reliability of these findings.

5 Conclusion

This study explored the impact of the behavioral biases i.e. Herding, Anchoring and Loss Aversion on women investor's portfolio performance; Using the Analytic Hierarchy Process (AHP) to measure and prioritize these biases, provides a systematic way of looking at how psychological, social or cognitive aspects contribute towards investment decisions. Women investors are most influenced by Herding Bias, followed by Loss Aversion and Anchoring Bias according to the findings. This led us to conclude that women, more so than men, trade out of either social conformity or loss aversion rather than through a rational analysis. The demographic analysis gives a snapshot of the diversity in women investors across age, education, income and experience—allowing for a complete picture to be formed about biases amongst various segments. Even though on the aggregate, women investors tend to be more prudent and risk-averse in nature they are also not immune fro irrational propensities that can erode their portfolio.

The study bolsters an expanding literature that shows gender differences in investment behavior, highlighting the importance of financial literacy and women's knowledge towards eradicating biases due to several behavioral factors. Through awareness of, and strategies to work with these biases, women investors can take better control over their financial decisions for a more successful overall portfolio and holistic financial life.

Consumer Protection in E-Commerce: A Study of the Deceptive Advertising and Electronic Fulfillment of Contracts

Yasar Alhiniti, Walaa Ahmed Muhammad Ali Al-Masry, and Abeer Mazen Alamayreh

Abstract This chapter looks into the consumer protection challenges of e-commerce in the two key areas of: unfair or misleading advertising and electronic fulfilment of contracts. It has as its aim a full examination of the barriers consumers face in this area and will make recommendations for improvements to the legal and regulatory framework. Descriptive methodology is applied to gather and analyze information on deceptive advertising in online retail, the effectiveness of legislative frameworks against digital fraud, and complications surrounding electronic contract performance. The data was taken from various sources like legal documents and previous studies, then analyzed to identify key issues in a very systematic manner. The study showed an increasing trend in misleading ads by online retailers, reflecting inadequacy in regulations governing such ads. The study further identified that there is a deficit in the statutory instruments on electronic fraud that also weakens the fight against cybercrimes and emphasizes more than ever before the need to update these laws in light of technological developments. It also highlighted risks associated with credit card and electronic cash transactions, underlining the need for security standards to be improved. The problems regarding proof of electronic contracts as evidenced by this were problems of preservation and record-keeping; thus, it requires improved techniques. In lines with these findings, it recommends that laws on electronic fraud should cover all aspects of cybercrime. It recommends improving security measures of electronic payments by introducing dual ways of verification and having security updates done regularly. In addition, the study stresses the need for specific criteria

to acknowledge electronic documents as admissible legal evidence, the development of strategies for data retention and prevention of fraud, more vigilance related to the risks associated with false advertising and electronic payments, and education for people on how to protect their personal information and prevent fraud.

Keywords Deceptive advertising · E-commerce · Electronic fulfillment · Electronic contracts · Consumer protection · Electronic fraud · Legal legislation · Electronic payment security · Digital documentation · Fraud awareness

1 Introduction

It is an important symbol of the development of information technology, and it has a special impact on modern individuals and enterprises who are actively using e-commerce. With the increasing dependence on e-commerce, various legal and regulatory issues have emerged that require attention to protect the legitimate rights and interests of both parties in electronic transactions and to ensure fairness. Misleading advertising by online stores, as well as problems related to electronic contract formation, represent two major considerations within this spectrum [1].

A major problem of deceptive advertising by online retailers is one of the major challenges that consumers face in e-commerce. Such advertising can lead to ill-informed consumer decisions based on false or overemphasized claims, therefore harming consumer rights and market fairness. Therefore, the protection of consumer rights depends greatly on the accuracy and honesty of advertisements [2].

On the other hand, equally important issues are raised regarding the performance of parties to contracts formed by electronic means. This includes difficulties relating to the validity of such contracts, identification of electronic signatures, and ensuring that obligations are met in the requirements of law and good practice [3]

This paper tries to explore the above-discussed issues from a legal and regulatory perspective with a view to enhancing consumer protection and ensuring effective contract implementation in the light of challenges brought about by e-commerce. In so doing, it endeavors to offer some proposals on how to embody legislative and regulatory reforms for establishing transparency and security in the conduct of electronic business.

1.1 Study Objectives

This study aims to achieve the following objectives:

- Analyze issues related to deceptive advertising in online stores.
- Assess the legal framework for combating electronic fraud.
- Explore issues related to the electronic execution of online contracts.

- Analyze problems with evidence in e-commerce.

1.2 Study Methodology

A descriptive methodology was utilized in the study to examine its subject matter. Various sources, including legal reports and prior research in the area, were tapped to gather data concerning deceptive advertising in online stores. This information was rigorously analyzed to uncover significant issues and challenges related to deceptive advertising by outlining the current landscape of the phenomenon and evaluating its effects on consumers. To present a thorough and impartial view of the issue, the study also depended on the examination of pertinent legal and legislative documents to highlight critical points that require attention.

2 Deceptive Advertising Through Online Stores

A form of cyber fraud is deceptive advertising employed to market online retailers. Cyber fraud refers to the exploitation of the internet to target victims with diverse messages that lure users, resulting in their entrapment and the theft of electronic or credit accounts [4].

A multitude of deceptive online stores has surfaced, seeking to exploit individuals' finances through misleading tactics. While Jordanian law does not provide a clear definition for either electronic or traditional fraud, Article 417 of the Jordanian Penal Code No. 16 of 1960 describes fundamental fraudulent practices. This article states that "anyone who deceives another into delivering property, whether movable or immovable, or a document involving a promise or a release, and fraudulently obtains it using deceptive methods that mislead the victim about the existence of a false project, event, or matter, or creates false hopes of obtaining a fictitious profit or repaying an amount obtained through fraud, or falsely claiming to settle a non-existent debt or a forged receipt, or acting with movable or immovable property without having the authority to do so, or using a false name or incorrect status" [5].

In a similar vein, Article 15 of the Cybercrime Law No. 17 of 2023 fails to offer a precise definition of electronic fraud. Instead, it declares that "anyone who commits a crime punishable under any applicable legislation using the information network, any information system, or a website, or participates in, intervenes in, or incites its commission, shall be punished with the penalty specified in that legislation" [2, 6].

The Federal Penal Code in the UAE does not provide a clear definition of electronic fraud; however, Article 399 addresses "punishment by imprisonment or a fine for anyone who unlawfully acquires property or a document, or alters or destroys it, through deceptive methods or by using a false name or incorrect status, if such actions are aimed at misleading the victim into surrendering it" [7].

According to Article 10 of Federal Decree Law No. 34 of 2021 regarding the Combatting of Rumors and Electronic Crimes, "any individual who deceitfully utilizes a network protocol address that belongs to another person, or employs any other method, with the aim of perpetrating a crime or hindering its discovery, will face temporary imprisonment and a penalty ranging from AED 500,000 to AED 2,000,000, or one of these sanctions. Consequently, the fraud described in Article 399 of the Federal Penal Code falls under the regulations specified in Article 10 of the Federal Decree Law related to the Combatting of Rumors and Electronic Crimes. From a jurisprudential viewpoint, electronic fraud is defined by some as "any criminal activity that is wholly or partially carried out via electronic methods, utilizing the internet, with the intention of unlawfully acquiring someone else's money through deceit and fraud" [8, 9].

It is characterized by some as "a crime executed through misleading tactics aimed at persuading the victim to invest in a fictitious scheme or to generate profit by instilling hope through informational channels, whether via direct engagement between the offender and the victim through the network or through direct manipulation of computer data, employing false information to trick the computer and carry out fraud [10].

It can also be described as the "intentional alteration of information and data that signifies monetary worth within a computer system, or the unauthorized entry of precise information and data, or the manipulation of commands and directives that control programming [11], or any other method that influences the computer to execute operations based on these data, commands, or directives, with the aim of achieving unlawful benefits and inflicting damage on others" [12, 13].

Due to technological progress that has erased geographical limits, electronic fraud is regarded as a transnational crime, contributing to the proliferation of offenses such as e-commerce fraud. Its serious nature stems from its substantial consequences, rising occurrence, and the challenges associated with proving it [14].

Fraud has transformed from basic tricks targeting individuals to the establishment of counterfeit projects and stores that are run under deceptive external facades. This transformation is linked to technological progress that has interconnected the globe, making the internet and online retail platforms ripe for a range of criminal activities, taking advantage of the surge in consumer traffic [15]. Consequently, any e-commerce platform has the ability to mimic reputable marketing websites and generate deceptive advertisements that mislead consumers, ultimately damaging the legitimate site owner. For example, an online store in Jordan called "Shein" that sells comparable products of differing quality while employing misleading advertising tactics to draw in as many customers as possible negatively impacts the authentic "Shein" website and erodes consumer confidence. Consequently, electronic fraud manifests in multiple ways, including the creation of counterfeit online stores that mimic well-known marketing sites, which ultimately harms the legitimate owners of those sites. A particularly hazardous tactic found in online retail is fraudulent advertising, where sellers deliberately employ misleading advertisements to misrepresent their products or services, thus misleading consumers. Given its severity, this topic

will be examined thoroughly, along with the efforts of legislators in Jordan and the UAE to tackle it, despite its prevalence across online stores [16].

3 Electronic Fulfillment of Electronic Contracts

Given the rapid nature of electronic contracts, which are finalized online, it is crucial that payments are processed as quickly as the contracts necessitate. In the realm of electronic contracts, payments are also conducted electronically, referred to as electronic payment. This term is described as "the process of paying for products or services digitally from a store or website by entering the customer's card or bank account details and completing the data entry [6, 17].

According to this definition, payment methods can be categorized as follows.

3.1 Credit Card Payments

A bank or another financial institution issues credit cards, enabling the holder to purchase goods or services on credit. The holder is not required to maintain an account with the issuing bank; rather, the bank covers the amount owed for the client and subsequently recoups this sum from them. Credit cards feature a repayment grace period and a credit limit, which denotes the highest amount the cardholder is permitted to utilize [5, 18].

3.2 Electronic Money

Commonly referred to as smart cards, these are slim electronic cards that contain all the holder's information, including name and address. They can also function as a disk that is inserted into a computer for transferring funds to or from the internet [19, 20].

3.3 Electronic Wallet Payments

This approach requires individuals to acquire electronic currency from their bank, which subsequently issues a card that corresponds to the virtual funds purchased. The card is kept on the bank's online platform. While making online purchases, the individual moves the payment from their virtual account to the seller's virtual account on the seller's site, which then deposits the amount from the virtual account into their standard bank account [21].

3.4 Electronic Check Payments

In this approach, the buyer inputs their account number on the website of their bank and initiates a request for an electronic check. They receive an electronic form to complete, which includes the check amount, their account information, and a security number. After electronically signing the form, the bank transfers the specified check amount to the seller's account, taking a commission from the total amount of the check [8, 22].

While electronic payment offers the benefit of quicker transactions without lengthy delays, it also brings challenges linked to credit card usage. This association has resulted in a rise in card theft, the theft of user information, and the cloning of credit cards, rendering users more susceptible to fraud. Furthermore, online retailers may keep personal and credit card details even after the end of their contractual relationship with customers. The primary concerns surrounding electronic payments center on security; it is crucial to have sufficient safeguards against those who create deceptive online stores that imitate reputable websites to mislead shoppers [11, 23]. These counterfeit sites deceive users into providing their credit card information under the guise of purchase confirmation, which can lead to unauthorized access to their bank or credit card details, potentially causing theft and significant financial losses. Additionally, electronic checks remain vulnerable to both forgery and theft [24, 25].

Considering the various dangers linked to credit cards, it is essential for legislators in both Jordan and the UAE to offer sufficient safeguards. Individuals must verify that they are engaging with reputable retailers, refrain from disclosing their credit card details, and consistently update and securely safeguard their cards to avert electronic theft [26].

At present, banks enhance security by sending a "secure code" to the buyer's mobile device during the payment process, which must be inputted to validate the purchase. The researchers advocate for making this procedure a legal requirement for all transactions. Furthermore, it is suggested that dedicated cards with predetermined limits be utilized for purchases, or that specific cards be issued for these types of transactions [27].

4 Issues Related to Proof

The primary purpose of written documentation in the majority of legal systems is to serve as proof. Typically, legal structures necessitate a written record to validate legal transactions. Nonetheless, the reliance of electronic commerce on non-physical documents creates obstacles in transaction verification and impedes the growth of online commerce. Due to their inherent characteristics, electronic documents frequently pose challenges when utilized as proof [28, 29].

4.1 Electronic Documents

Contracts established online consist of one party transmitting information and data that encompass a particular commercial proposal via the network. Various legal frameworks have outlined several terminologies for this data, including: electronic documents, data messages, and other terms that are commonly utilized to finalize the majority of electronic commerce agreements. An electronic document is characterized as "written content on a specific type of medium, whether paper or other electronic means [11, 30].

Definitions vary, with some characterizing it as "writing on an electronic medium accompanied by an electronic signature to establish a legal fact" [31]. Others refer to it as "letters, numbers, symbols, or other forms that offer recognizable indications utilized for transmitting data electronically within the realm of online commerce." As noted by the researchers, an electronic document encompasses any information or data communicated through electronic channels, serving to represent exchanges between parties to convey information or substantiate a right [15, 23].

Electronic documents can be categorized into several types [7, 32]:

- **Informal Documents**: These documents are produced by individuals without any official involvement in their creation. As long as they are signed, these papers do not need to adhere to a particular format to be accepted as valid proof, unless there is a denial.
- **Official Documents**: Legally authorized public officials prepare these to notarize contracts. The notarization by an authorized public official lends authenticity to an official document.

To be deemed legally valid, electronic documents must adhere to a particular framework. They should possess clarity, readability, and durability. The content must be consistent and able to be referenced during disagreements. Unlike electronic formats, traditional media offer the advantage of long-term preservation due to their tangible characteristics. Although electronic documents can be susceptible to device failures, more sophisticated techniques can be utilized to maintain information over longer durations and safeguard against alterations [33–35].

For electronic documents to be recognized as valid proof, they need to be clear and legible on a medium that guarantees their longevity and should remain unchangeable. Yet, these documents initially fall short of a crucial requirement necessary for their proof function: the capacity to establish trust in the information recorded. They can be vulnerable to tampering or forgery. However, contemporary information systems equipped with sophisticated techniques are capable of detecting any changes made to electronic data and can precisely pinpoint altered information, impacting their validity and acceptance as proof.

From the viewpoint of the researchers, the challenge of establishing proof can be tackled by ensuring that the electronic document retains its final version and is safeguarded against alterations. This can be accomplished by placing the document in electronic containers that are inaccessible or by transforming the text into a static

image that cannot be modified. Moreover, it is essential for the document to bear an electronic signature [19]. An electronic signature is described as "a specific procedure executed by the individual signing the document, which instills confidence that it was indeed issued by the rightful owner and prevents unauthorized use by others" [36]. This electronic signature is crucial for the signatory to validate the document's contents [37]. Nonetheless, issues emerge from the disconnect between the signature and the identity of its owner, as well as the risk of it being duplicated without the owner's knowledge or consent, particularly when advanced technological methods are employed for its protection [38–41]. Additionally, there is no assurance that an electronic signature accurately conveys the signatory's intention to agree to the contract and accept associated obligations [42–44]. It remains uncertain whether the individual electronically signing is truly who they claim to be, especially if the actual signer is not physically present during the signing process [37, 45–47].

The researchers assert that it is essential to establish solid legal proof and eliminate any uncertainty related to electronic documents and signatures [48–50]. Achieving this goal requires the development of a legal structure that allows specialized authorities to certify signatures, thereby fostering trust and security in electronic transactions [51, 52]. This structure should involve linking any signature-related contractual process to either an email address or a designated phone number, with a confirmation text message from these authorities verifying that the individual whose signature was utilized has engaged in an electronic contract [38].

When it comes to the evidential significance of electronic writing, numerous legislations treat electronic documents on par with traditional written forms, failing to differentiate between paper and electronic records. Therefore, recognizing the legal implications of documents in electronic format is essential. This perspective is adopted by legislators in both Jordan and the UAE. As stated in Article 19 of Jordan's Electronic Transactions Law, "The holder of the electronic document is considered the rightful owner of a transferable document with rights and defenses similar to those of a bearer of a conventional document, provided the document meets all its requirements unless otherwise agreed" [39].

According to Article 18/1 of the Federal Decree-Law on Electronic Transactions and Trust Services, "The acceptance of electronic signatures, electronic seals, or electronic documents as evidence in any legal proceedings shall not be denied solely on the grounds that they are in electronic form and processed through trust services and accredited trust services" [40]. Furthermore, Article 17 of the Civil and Commercial Transactions Evidence Law clarifies that "Any transfer, sending, receiving, or storage of symbols, signals, writings, images, or sounds, regardless of their nature, through an information technology medium is considered written." Provided that they comply with the conditions outlined in the law, electronic documents and electronic writing possess the same evidentiary weight as traditional writings and documents [41–45]. Consequently, legislators in both Jordan and the UAE have assigned electronic documents the equivalent legal status as that of conventional documents [46–48]. This implies that electronic documents will produce the same legal consequences as traditional written documents, as long as the required criteria for classifying them as electronic written documents are fulfilled [49–51].

4.2 The Electronic Commercial Register

Similar to conventional commercial books, the commercial register plays a comparable role in documenting the transactions carried out by traders. This record, known as the commercial register, is where all transactions are logged and acts as a tool for proof in case of any disputes. Indeed, Article 2 of the Jordanian Electronic Transactions Law describes the electronic register as "an information message that includes a record, contract, document, or any other kind of document, which is created, stored, utilized, copied, transmitted, communicated, or received through electronic methods" [15, 30, 42, 52].

5 Conclusion

To summarize, this research highlights that deceptive advertising in online retail and problems concerning the fulfillment of electronic contracts rank among the major challenges confronting e-commerce today. The results demonstrate notable deficiencies in existing laws and regulations, resulting in heightened risks for consumers and eroding their confidence in the e-commerce landscape. Drawing from the examination of data and legal documents, it is crucial to implement decisive actions aimed at improving regulatory effectiveness and bolstering security measures to safeguard consumers against fraud.

5.1 Results

The study concluded the following results:

1. The rise in deceptive advertising techniques in online shops is harmful to consumers and shows the need for better regulation of these advertisements.
2. There are laws related to specific definitions of electronic fraud that have not been clearly defined, leading to problems in effectively addressing cybercrimes. This highlights the need for enhancements and updates in the legislation so that it is more extensive and up-to technological progress.
3. The research found increased risks with credit cards and electronic cash fraud and information theft. Thus, more strict security measures need implementation to enhance the safety of e-payment systems.
4. The research faced problems while authenticating electronic agreements. This underscores the need for higher levels of preservation and documentation techniques so that the validity, reliability, and accuracy of electronic transactions can be maintained.

5.2 Recommendations

1. Update electronic fraud laws to ensure they cover all aspects of cybercrime.
2. Improve electronic payment and credit card protection methods, such as the use of two-factor authentication and regular security updates.
3. Establish clear standards for accepting electronic documents as legal evidence, including developing technologies to store data and prevent fraud.
4. Raise awareness of the risks of misleading advertising and electronic payments, and train individuals to protect their personal data and avoid fraud.

An Efficient Healthcare Monitoring System Using IoT

G. Komarasamy, R. Ganeshan, Ahmed Abdou, Maram Y. Al-Safarini, and Mohammad Kouali

Abstract In the rapidly evolving Internet of Things (IoT) ecosystem, parallel and distributed computing plays a critical role in managing the massive data flows generated by IoT devices. This includes addressing issues that create implementation challenges, such as processing bottlenecks due to large data volumes and the diversity of IoT devices. To solve these problems, advanced technologies such as MapReduce, parallel databases, and platforms such as Apache Hadoop and Spark are used. These methodologies distribute computing tasks across nodes, speeding up data processing and analysis. Parallel and distributed computing enable organizations to efficiently process IoT data to drive real-time insights and improve service delivery through optimized processing and analysis.

Keywords IoT · Apache Hadoop · MapReduce · Technological progress

1 Introduction

The Internet of Things plays an important role in society. Make your life more convenient by easily connecting various devices. Communication. The main goal of IoT-based services. Healthcare is designed to provide users with deep insights without much effort. This saves effort and money and improves communication quality life [1].

The Internet of Things provides the ability to connect networks to networks. A device that delivers efficiency, reliability, and digital intelligence. This service is aimed at elderly and frail patients with medical conditions. Many healthcare systems are integrated using smart technologies. Devices such as smart sensors, remote servers, and networks connection device [2].

The mobile computer supports IoT services using the M Health System mobile application. These mobile services are used for the following purposes: promoting healthcare and providing effective and efficient solutions. Mobile health integrates the Internet of Things. It provides various services such as IP connectivity, miniaturization and security, and low power consumption [2]. Numerous mobile applications have recently been developed, enabling us to offer a wide range of medical services through mobile devices.

The evolution of the Internet of Things is getting bigger and bigger with time, and various researchers are coming up with ideas. Kinkorova and Topolčan [3] developed the Ho-kernel. The reasons for pursuing the business in 2020 are the financial system, biobanking, and intuition [4]. A gift analysis study of 499 elderly patients with congestive heart failure. Studies have shown that older people tend to be older [5].

Over 60 years. The study sample was collected after 19 months of continuous clinical follow-up [6]. Relationship between regular sizes. In the biomarkers and treatment effects of loop diuretics, spironolactone, beta blockers, and renin were confirmed [7]. Angiotensin system inhibitors with risk of hospitalization due to heart failure. Generation of hypotheses [8]. Nazir et al. [9] identified a variety of healthcare-related problems [10]. Recently, a pandemic (global pandemic) has occurred due to the spread of non-communicable diseases [11]. Illness, lack of formal education, poor medical care and ethical considerations of treatment, poor communication from politicians. At the same time, the nature of healthcare makes computing devices unique. Different types of communication.

Thanks to integration, expensive hardware components, and individual approaches to the patient and care make the device more expensive. Many IoT applications include medicine, disease management, and clinical decision support. Researchers encounter many things [12]. There was a problem retrieving extended information [13]. IoT device applications and sensing in healthcare [14]. Disease and treatment [15]. Existing literature reports a variety of approaches [16]. Minimize time, cost, and quality [17]. Although care and privacy of healthcare facilities are at our doorstep, there is a lack of comprehensive research in the latest literature. Healthcare-based parallel computing for efficient IIoT has been reported [18].

Therefore, this study provides a comprehensive analysis of the existing IoT in healthcare [19]. Parallel computing. This study will be useful to researchers. This provides a new solution and is considered evidence. The purpose of this article is to demystify some of the mysteries surrounding human intelligence, particularly the Internet of Things in the brain for knowledge acquisition and problem solving, as well as medicine [20].

2 Theoretical Framework

Several approaches have been presented by researchers for healthcare based on the IoT [20]. The IoT devices are interconnected with each other for the smooth communication of devices for human needs. IoT has the applications of using mobile computing and has stayed with a substantial role [21]. An interface is provided with the help of mobile applications for the data collected from different wearable devices and sensors. Such data are used for different analyses and many other purposes [22].

Mobile apps with the use of personalized healthcare systems have massive applications in healthcare where the devices are connected through different gyroscopes, accelerometers, altimeters, and other reduced-cost devices that are portable [23]. With the growth of wearable devices, mobile applications, and their commercial use, the idea of the IoT-based personalized healthcare system becomes more widespread [24]. Such systems in healthcare are linked with each other for creating an IoT network to perform different activities like surgeries at distance, monitoring, and identifying disease [25]. The use of mobile computing based on IoT in healthcare provides massive services through the interface of mobile phones, apps, or the M-Healthcare system [26]. IoT devices are linked to the M-healthcare systems for contributing to the IoT for providing different services such as IP connectivity, consumptions of less power, security, and compactness [27].

Today, diverse mobile apps are developed for providing services to the users in the healthcare system [28]. These applications empower the patients to identify the disease based on the analysis in the field of pediatrics and gynecology [29]. The idea of smart healthcare arose with the use of mobile computing in the IoT [30]. The services of smart healthcare are linked to wireless technologies with low power for building the IoT, and the concept is called Smart Health IoT [31]. The history of the patient is monitored through the interface by which the patient is connected to the smart healthcare IoT [32]. Such a history shows the patient's status, whether the patient is in a move or a home environment. This connection is made through vital-sign sensors linked to the mobile phones [33].

The smart healthcare IoT is useful in situations where the patient requires constant care and monitoring to facilitate the services, like patients with disabilities, elderly people living alone, patients with heart attacks, patients with high blood pressure, and stress patients [34]. The patient's location can also be traced with the help of GPS coordinates if any emergency occurs [35]. The smart healthcare IoT provides the services of enhanced care at low cost and better treatment. Several other approaches

are available for facilitating healthcare based on the IoT [36]. Figure represents the IoT architecture of the healthcare system. In this figure, the IoT applications are connected with various IoT devices, users, communication systems, health, security mechanisms, and others [37, 44, 45].

Diverse approaches have been used by different researchers to facilitate healthcare with the support of the IoT devices. These devices are integrated for smooth and efficient running of the activities of healthcare [38]. Parallel computing plays a significant role in efficiently running activities in healthcare. The approaches of IoT use deal with different perspectives of healthcare. Different healthcare documents are used globally [39].

The healthcare companies face numerous issues in their conception and analysis on a large scale. For its semantic transformation and to overcome the problem, a Hadoop-based approach is adopted and presented clinical architecture standard documents for the case studies [40].

Big data mining has its own role in extracting important information from the big data in order to use it in healthcare for facilitating patients care and to provide better care and treatment [41]. The nature of healthcare data is different, such as analytics of heterogeneous and complex data spaces, sensitive data, nontextual information, distributed data, data with constraints of security and performances, analytics to assimilate information of bioinformatics based on clinical interpretations at organ, tissue, and organism scales to define the "physiological envelope" through the patient life [42]. The role of social media is obvious in collecting data about diverse issues of patients in healthcare, with the easy access of social media to all of its users without any disruption compared to standing in long queues at conventional healthcare stations [43].

Figure 1 depicts the architecture of an IoT-based healthcare monitoring system, where connected devices, mobile platforms, and cloud services work together to provide effective and real-time healthcare. Intelligent devices and wearable sensors continuously capture critical health information such as temperature, heart rate, and activity. It is transmitted through low-power wireless communication modules to central processing units and mobile applications. Sophisticated computing methods such as parallel processing and big data analytics (e.g., Hadoop, Spark) process this data to provide real-time insights. The architecture provides secure communication and data protection through the use of encryption and authentication mechanisms. End users such as patients and clinicians utilize the system via easy-to-use mobile interfaces. Patients get real-time feedback, reminders, and alerts, whereas clinicians can view detailed reports for proper diagnosis and remote monitoring. Overall, the diagram represents a smart, networked system that improves healthcare delivery via IoT, mobile computing, and data analytics integration. With the help of the Facebook application, more than 1400 users were engaged in collecting data on their adherence to the Mediterranean diet, cardiovascular risk, and neurological degenerative diseases with low adherence to a healthy diet [44, 45]. The data were gathered in a shorter amount of time without delay [14]. A summary of these approaches from the existing literature is analyzed and shown in Fig. 1.

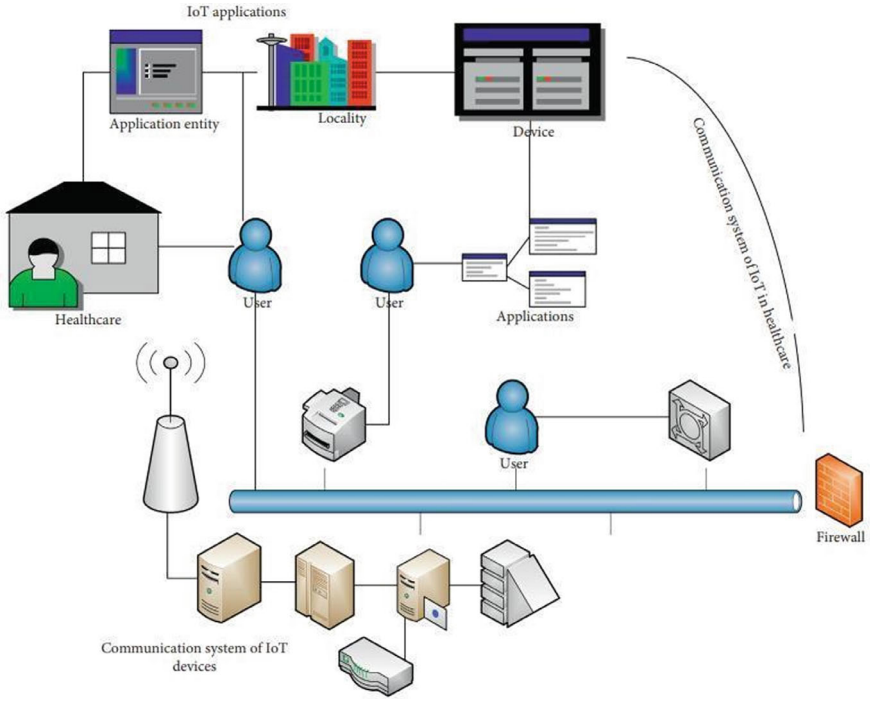

Fig. 1 Healthcare monitoring system

3 Working Details

PIR sensor (passive infrared sensor)—motion detection: How it works: PIR sensors detect motion by detecting changes in the level of infrared light emitted by objects in their field of view. The product consists of two main components: a pyroelectric sensor and a Fresnel lens. Pyroelectric sensors detect changes in infrared radiation emitted or reflected by objects in their field of view. When an object moves within the sensor range, the infrared radiation pattern detected by the sensor changes. These changes cause the sensor to generate signals that indicate movement. Applications: PIR sensors are commonly used for motion detection in security systems, automatic lighting systems, and smart home devices. When motion is detected, sensors can sound an alarm, turn on lights, or activate other devices.

Ultrasonic Sensors—Social Distancing: How It Works: Ultrasonic sensors use ultrasonic waves to measure the distance to an object. It generally consists of a transmitter that emits ultrasonic waves and a receiver that detects ultrasonic waves reflected by objects. By measuring the time it takes for ultrasound waves to reach an object and return, the sensor can use the speed of sound to calculate the distance to the object. Applications: Ultrasonic sensors are used in social distancing systems to monitor the distance between people in public places. By placing ultrasonic sensors

in strategic locations, such as entrances or checkout counters, the system can detect when people are too close to each other and issue warnings or notifications to keep them at a safe distance.

BMI calculator: How it works: Body mass index (BMI) is a measure of body fat based on a person's weight and height. BMI formula: BMI = weight (kg)/(height (m))^2. The BMI calculator uses this formula to calculate an individual's BMI based on weight and height input. Application: The BMI calculator is widely used in medical institutions, fitness centers, and online health tools. This provides an easy way to assess whether a person's weight is within a healthy range for their height. BMI is often used as a screening tool to identify potential health risks associated with weight.

Medical Alert: How it works: Medical alerts are devices designed to remind people to take their medications at specific times. This typically consists of a clock or timer function, a programmable medication reminder schedule, and an alarm or notification system that notifies the user when it is time to take medication. Application: Medication Alerts are used by people who need to take medications regularly, such as people with chronic illnesses or complex drug regimens. It helps ensure medication adherence by providing timely reminders and reducing the risk of missing medications.

Temperature sensor—for temperature measurement: How it works: A temperature sensor measures the ambient temperature. There are many different types of temperature sensors, including thermocouples, resistive temperature sensors (RTDs), and semiconductor sensors such as thermistors. These sensors detect changes in temperature by measuring corresponding changes in electrical resistance, voltage, or other physical properties. Applications: Temperature sensors are used in a wide range of applications, including environmental monitoring, HVAC systems, industrial processes, and home appliances. It provides critical data for controlling and monitoring temperature-sensitive processes and equipment, ensuring optimal performance and safety.

Arduino Uno P3: Description: Arduino Uno R3 is a popular microcontroller board based on the ATmega328P microcontroller. It features digital and analog input/output pins, built-in voltage regulation, USB connectivity for programming and communication, and a variety of other features that make prototyping and electronic design easier. How it works: The Arduino Uno R3 board is programmed using the Arduino IDE (Integrated Development Environment), which allows users to write and upload code to the board. The code runs on the microcontroller to control connected sensors, actuators, and other electronic components based on programmed logic. Applications: Arduino Uno R3 boards are widely used by hobbyists, students, and professionals to prototype and develop a wide range of electronic projects, including home automation, robotics, Internet of Things (IoT) devices, and interactive art installations. It provides a flexible and accessible platform to learn and experiment with electronics and programming.

4 Findings

A versatile healthcare tool, the system is designed to address all aspects of self-management. Its main functions include measuring body temperature and pulse, calculating BMI, detecting nearby objects or the human body, and providing medication alerts.

The device uses temperature and pulse sensors to measure body temperature and pulse. It stores physiological parameters and displays them on the LCD screen when the user is inspired. It also indicates a health problem by using an automatic system that warns the user with an audible alert if the temperature exceeds the predetermined limit. Height and weight. Using this information, the device calculates BMI and displays the results on the LCD screen. It also gives users a better understanding of their overall health by dividing BMI into various health categories such as underweight, normal, overweight or obese, or human life. When detected, it warns the user with a beep and displays the relevant message on the LCD screen to increase security. In the calendar, users can enter the medication schedule, and the device will set reminders in the morning and evening. These warnings are notified with an audible warning and displayed on the LCD screen, ensuring timely administration of the medicine. By combining the importance of care, environmental awareness, and medication management, it enables users to take important steps in managing their health. The component details are mentioned in Table 1.

The code begins with an initialization that includes the required libraries and sets up pins for the various components: LCD, sensors, buttons, buzzer, etc. This allows

Table 1 Component details

Name	Quantity	Component
U1	1	ARDUINO UNO R3
U2	1	LCD 16 X 2
RPOT1	1	1023 KΩ POTENTIOMETER
U3	1	TEMPERATURE SENSOR [TMP36]
DIST1	1	ULTRASONIC DISTANCE SENSOR (4-PIN)
PIR1	1	– 157.0704026733083 – 284.08300347342134 – 108.07058382195396 PIR SENSOR
R2	1	220 Ω RESISTOR

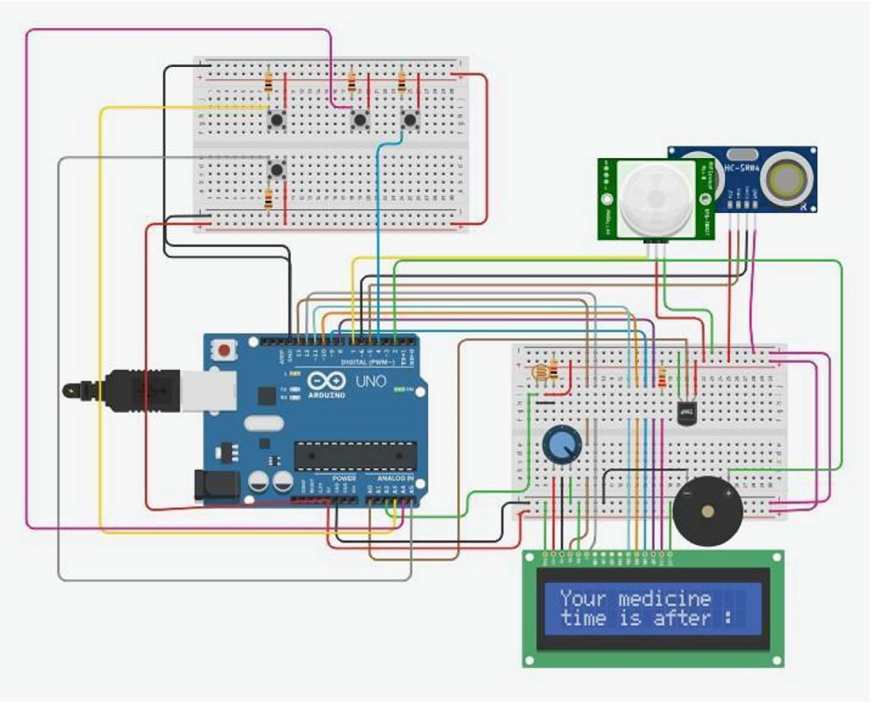

Fig. 2 Healthcare system connections

the Arduino board to communicate with these components. Figure 2 shows the healthcare system connections. The setup() function, which runs once when the program starts, sets pins as inputs or outputs, and initializes the LCD. A welcome message will appear on the LCD, indicating that the system is ready for use. Additionally, pinMode is set for pins associated with sensors and actuators.

The loop() function contains the basic logic of a continuously executing program. It waits for the user to enter a button and performs different actions depending on which button is pressed. When button 1 is pressed, the system measures body temperature using a temperature sensor connected to pin A0. Temperature readings are displayed on the LCD display. If it exceeds 38 °C, which indicates fever, a warning message will be displayed and an alarm will sound. During the 10-s countdown cycle initiated by button 1, heart rate is measured using the heart rate sensor connected to pin A2. Heart rate values are displayed on the LCD display. If your heart rate exceeds a certain threshold, a warning message will appear and an alarm will sound.

When you press button 2, you will be prompted to enter your height and weight through the serial monitor. Your BMI is then calculated using the height and weight you enter. The calculated BMI value and corresponding BMI category are displayed on the LCD display. Pressing button 3 activates the ultrasonic presence sensor. When

a person is detected within a certain distance, the message 'Person detected' is displayed on the LCD, and a buzzer sounds.

Pressing button 4 will prompt the user to enter the medication reminder time (hours, minutes, seconds) via the serial monitor. The system continuously checks the current time and compares it to your set medication reminder time. When the medication reminder time comes, a reminder message is displayed on the LCD, and a warning sound sounds. Therefore, this Arduino code creates a health monitoring system with many features, including temperature measurement, heart rate monitoring, BMI calculation, human presence detection, and medication notification. It uses sensors, buttons, and sounds to interact with the user and provide real-time feedback on health parameters [35–39].

5 Conclusion

IoT innovations are spreading across all aspects of life, especially healthcare. Research and development in the field of the Internet of Things enables the production of enormous amounts of information and computing. IoT devices communicate with each other and transmit data to a central server. This data may later be received, analyzed, processed, and used by the service provider. IoHT is an advanced version of IoHT that plays an important role in observing, consulting, monitoring, and processing remote communication processes. Parallel computing plays an important role in efficient and intelligent IoHT. Reporting a comprehensive analysis of the available literature is an urgent need for the research. Community, based on which researchers will propose new solutions for effective healthcare through the IoT. The proposed study therefore provides a comprehensive review of the literature on IIoHT support.

Socio-Technical Systems in Social Security: Balancing Automation and Human Interaction for Beneficiary Services

Ali Alrahamneh, Aref A. Murshed, and Al-Hareth Alhalalmeh

Abstract This study examines the intricate relationship between human interaction and automation technologies in the realm of social security service delivery, emphasizing socio-technical systems. Technologies such as chatbots and artificial intelligence (AI) present opportunities to automate numerous tasks within social security frameworks; however, it raises the critical question of which tasks are suitable for automation and where human interaction remains vital. The research zeroes in on the implications of these technologies within social security systems, especially in more advanced economies. Utilizing a qualitative methodology, the study incorporates descriptive and analytical techniques to assess literature, case studies, and policy documents. It underscores the managerial challenges of achieving a balance between automation and human involvement to enhance efficiency, service quality, and citizen empowerment. Additionally, the research investigates how these technological innovations impact social security beneficiaries, who are increasingly regarded as lifelong clients. The findings offer both theoretical and empirical perspectives on the evolving landscape of e-government, social security policy, and citizen empowerment. Ultimately, the study presents a refreshed viewpoint on how socio-technical systems in social security can foster the creation of more efficient, user-focused public services while ensuring a balance between automation and human discretionary decision-making.

1 Introduction

The application of social security policies tends to be intricate and expensive for both citizens and social security agencies [1]. Technologies that are evolving, such as artificial intelligence and chatbots, offer the potential to partially automate these processes [2, 3]. This raises an important question: which tasks should be automated, and which ones still necessitate human interaction? This inquiry is particularly pertinent for nations with robust social security systems [4]. The emphasis is placed on implementing these technologies in more developed countries and ideal contexts, rather than relying on most public benchmarks from Europe [5, 6]. While more advanced economies, including Nordic countries and Southern European nations with lesser degrees of social security, are frequently cited, they face challenges such as an alarming tendency to prioritize user control over empowerment, driven by new information and communication technologies and process reengineering [1, 7, 8]. In addition to internal academic research that highlights lessons learned and considerations, this work aims to establish a theoretical and empirical literature benchmark for emerging trends currently being pursued in social security policy and its execution. In a situation where numerous Southern European nations, heavily impacted by the recent economic downturn, are reevaluating the viability of their social security welfare systems in terms of financial sustainability and the adequacy of services offered, it becomes essential to explore the process of public scenario development and its effect on policy-making regarding the creation of new e-government services [2]. Can a dialogue be established among policymakers, academics, and stakeholders regarding undesirable policy evolution scenarios? If such a dialogue is feasible, might it shape the design of public policy? This study seeks to examine how emerging trends within the socio-technical frameworks of social security services affect citizens' empowerment in accessing or delivering these services [9, 10]. The broader viewpoint regarding the social security beneficiaries who need to be served or treated carries significant managerial implications related to efficiency, effectiveness, service quality, and the empowerment of citizens and users, which involves a shift in the 'power' dynamics between service providers and technology [2, 11, 12]. From this updated perspective, social security 'users' are viewed as lifelong clients, customers, or beneficiaries of services that may be based on compensation or recourse. This research presents a refreshed viewpoint on e-government as it pertains to social security or health policy applications, approached through the lens of complex socio-technical systems. This involves considering how the design of relevant technical systems and services interacts with the subsequent alterations in the socio-institutional layer, which relates to either the public administration or the service recipients. Various experimental implementations within developing social security or healthcare services are outlined, aiming to enhance citizen control and empowerment in relation to both administrative and technological elements [3, 13, 14]. The conclusion highlights the potential of this approach to contribute to the theoretical development of social security systems, as well as to the understanding of historical and socio-political variations in their nature and distribution mechanisms.

1.1 Background and Significance

The progress of digital technology has created a substantial chance for developing automation systems within the public sector concerning social security [15]. In this realm, innovative information systems and artificial intelligence methods are being implemented to create automation systems capable of performing tasks that public servants currently handle [3, 16, 17]. The concept of automation in the public sector encompasses a wide-ranging and general phenomenon. It can be understood through the differentiation between technical and socio-technical systems [18]. A technical system primarily consists of hardware and software, whereas a socio-technical system incorporates institutional structures, socio-cultural values, and the social actors engaged in utilizing the technology [19]. Approaches that focus on socio-technical systems in technology development consider the assumptions, frameworks, and factors from both disciplines, striving to achieve an optimal integration of these two systems [4, 20].

The idea of socio-technical systems emerged from research conducted on the implementation of new technologies in coal mines during the 1950s. In both national policy trials and corporate settings, the development of technology and organizational transformation is addressed by defining the socio-technical system(s) that need to be designed and developed, grounded in specific technological and organizational proposals [21]. The feasibility of these developing socio-technical systems, in terms of technical, social, and economic aspects, is tested experimentally within laboratory marketplaces [4, 22].

The Netherlands possesses significant expertise in the design and development of socio-technical systems across various sectors, including energy, telecommunications, public transportation, and urban planning [5, 23]. Recently, this expertise has been applied to create a socio-technical system aimed at data protection within civil registration organizations, utilizing scenario technology [24]. The process of designing such a system for data protection unfolds in four distinct phases [25]. Initially, the system boundaries concerning specific new information technology systems within the socio-technical frameworks of civil registration organizations are defined []. The second phase involves examining the impacts of these new socio-technical systems on personnel, organizational structure, tasks, and information systems through the use of scenarios. In the third phase, potential policy options to alleviate any negative consequences are developed, while the final phase entails a comparison of various scenarios [26].

1.2 Research Objectives

Although the automation of beneficiary services is anticipated to enhance efficiency and lower costs, the socio-technical system may worsen conditions for vulnerable groups, including the elderly, disabled, low-income individuals, and minorities, if it

overlooks or fails to properly balance social aspects and unintended repercussions. Research objectives following an initial exploration of the socio-technical system in social security concerning its intended aims and valuable insights from analogous sectors, the research objectives are outlined through five specific sub-goals or focus areas, as described below. The primary aim is to examine the social dimension in connection with the automation of beneficiary services within social security. Therefore, the following sub-goals for the first stage have been established:

1. Analyze the various factors influencing demographic and economic growth that are fueling the increasing demand for automation in social security beneficiary services; and assess how well the socio-technical systems align with the desired objectives, drawing insights from related sectors as a preliminary step in exploring the social aspect.
2. Investigate the possible risks within the socio-technical systems of beneficiary services in social security, along with any unintended outcomes that may arise from making informed decisions about balancing automation with human interaction, drawing on the development of parallel sectors as a potential subsequent phase in examining the social aspect.
3. Investigate and assess a thorough range of practical approaches to harmonize the technical aspects with social factors by examining proposed design changes in the social security systems of the Netherlands, Denmark, and Belgium, serving as a possible third phase in the exploration of the social dimension.
4. Examine the detailed design of the extensive array of practical solutions aimed at harmonizing automation with human interaction throughout the three case studies, considering it as a possible fourth step in exploring the social dimension.

1.3 Methodology

The research methodology for is fundamentally qualitative. A descriptive method is employed to examine a substantial body of existing literature, which encompasses academic studies, policy reports, and case studies. This information sheds light on the interaction between automation technologies and human components within social security systems, as well as how these elements affect beneficiary services. The research integrates essential findings from diverse sources to create a comprehensive understanding of socio-technical systems and their impact on service delivery. Following this, an analytical approach is adopted to assess the data, uncover patterns, and identify trends concerning the equilibrium between automation and human interaction in social security. The chapter assesses the successful incorporation of automation and human factors across different systems to improve service quality, drawing from real-world examples and case studies for its analysis. As a result, this examination facilitates the development of significant conclusions and discussions regarding the effectiveness, challenges, and possible enhancements related to the balance between automation and human participation in beneficiary services.

2 Automation in Social Security Systems

Social security systems worldwide are undergoing continuous transformation due to technological innovations. Notably, automation is being utilized to improve both efficiency and effectiveness in the provision of beneficiary services [6]. This chapter outlines various methods and technologies aimed at automating the delivery of social security services to individuals, encompassing social welfare, pensions, and unemployment benefits, among others [27]. Features such as automatic enrollment, direct bank transfers, and portable social securities are highlighted as internet and mobile technologies that facilitate passive services without necessitating formal applications from users [28]. Additionally, mobile notifications and online benefit calculators are examined as semi-automatic services that require minimal user engagement, though they do not involve formal applications [29]. To complement these automatic and semi-automatic services, call centers are presented as essential resources, as human agents are frequently needed to support users facing challenging circumstances [7, 30]. Furthermore, chatbots, which merge automation with artificial intelligence for natural language processing, are proposed as cost-effective substitutes for call centers. The chapter also introduces social media as a valuable platform for connecting with beneficiaries, particularly those from marginalized communities. Across the globe, social assistance, pensions, and unemployment benefits rank among the most prevalent social security measures. Their goal is to shield individuals and families from dropping below minimum income thresholds due to factors such as losing income from old age, disability, unemployment, or the shift to parenthood [8, 31]. Typically, these transfer payments are disbursed in cash via bank transfers. Consequently, numerous countries are focusing on delivering cash transfers through personal bank accounts, which is often regarded as a potentially economical approach. A significant ongoing evolution in social security systems, in conjunction with this financial shift, involves the initiative to establish comprehensive national registries for social security beneficiaries [32]. Legislation prohibiting data secrecy supports these automated information registries. While automation may change the dynamics among technology, organizations, and individuals within social security systems, it could also be influenced or contested by this environment. The background, key concepts, methodologies, and technological advocates of automated social security systems are discussed, encompassing two fundamental components recognized in automation theory: technical and organizational dimensions [33]. From a technical standpoint, this pertains to technologies that automate tasks once carried out by human agents []. From an organizational perspective, it involves reorganizing an entity by altering the ways in which individuals interact with one another and with technology. To sum up, the influence of automation on social security systems could be significant, necessitating comprehensive research into the interactions between social security technologies within the upcoming techno-economic landscape [34].

2.1 Types of Automation Technologies

A significant use of artificial intelligence (AI) and automation technologies facilitates the management of routine tasks, including the completion or approval of claims []. This capability enables employees who are inundated with inquiries or requests for information and claims processing to concentrate on more intricate cases that necessitate investigation or personal interaction [35, 36]. Additionally, intelligent automation finds further routine applications in virtual assistants that manage customer inquiries and chatbots designed to respond to basic questions. Although many chatbots have struggled in the past, there are notable examples of success. These fundamental applications handle simple checks or direct requests. In the realm of social benefits, such inquiries might include "Has my benefit application been approved?" or "What is the current status of my application?" Typically, these situations yield straightforward answers based on previously stored information [37]. However, there are also more complicated requests that require initial information gathering from the systems, along with verification of that information's accuracy. Estimates suggest that over 80% of requests are classified as simple [9]. The tradition of programmatic automation of current processes is significantly longer, with many of the cases generating excitement today stemming from automation as a subsequent measure following issues related to reducing workforce numbers or simply achieving cost efficiency. Numerous countries have established computerized benefit systems, and innovations in many instances have led to increased efficiency or lowered costs [38]. Nevertheless, many implementations have faced considerable challenges and adverse impacts on service quality and user experience. In certain situations, there has been widespread dissatisfaction and protests against these systems. This highlights the research area concerning socio-technical systems, emphasizing the necessity to examine the relationship between technology and its contextual environment [15]. Within social security frameworks, a systems approach often lacks an adequate controller [27]. The national or municipal conditions, including regulations or legal structures, do not adapt as swiftly as the anticipated advantages of new technologies. Queries that could once be resolved quickly and easily by suitably trained individuals with the necessary expertise may now evolve into intricate investigations, potentially leading to lawsuits and significant operational disruptions.

2.2 Benefits and Challenges of Automation

This chapter examines the social security system with an emphasis on automated interactions involving welfare beneficiaries. It delves into various technologies applicable for these interactions, design alternatives for automation, and essential factors to ensure successful implementation [10]. This investigation lays the groundwork for additional research into the automation of social security systems. Automation technologies offer a diverse array of services and are already partially integrated

within social security frameworks, carrying potential societal implications. Key tools include Automatic Decision-Making Systems, Natural Language Processing, Knowledge Management Technologies, and Automatic Logging Systems [28]. While the first two tools might replace human interactions, the latter two are intended to support them. Successful automation of specific tools hinges on certain preconditions, such as the quality of information technology, adequate and comparable digitized data, trust in technology, collaboration, clear objectives, and agreement among stakeholders. Further investigation is necessary to explore these preconditions. For effective automation design, it is crucial to conduct an assessment of tasks and activities, perform a workflow analysis, and facilitate knowledge transfer [18]. The assessment of tasks and activities should address the aim, process, context, participants, and potential consequences of the task. Workflow analysis requires examining vector fields and arrows, assessing social, technological, and workflow dimensions. Knowledge transfer focuses on technical objectives, sources, types, and methods of communication. The welfare agencies and social security systems are being tested by the aging population, leading to an investigation into automated interaction technologies [4]. It is essential to determine whether such automation is advisable, first in relation to specific tools and second concerning their consequences and limitations. A framework that addresses normative and ethical considerations for assessing societal impact needs to be established. In the Netherlands, the social security system, which is grappling with economic crises, globalization, and emerging care and welfare demands, has already implemented some automation but still necessitates a personal approach [29].

3 Human Interaction in Social Security Systems

As efforts to automate beneficiary services within social security systems continue, there is a growing demand for the integration of human-centered design principles and the recognition of human service providers' roles in the architecture of socio-technical welfare states []. Beneficiaries of social security systems fundamentally require assistance in accessing their entitlements, support in navigating the complexities of the system, and a sense of being heard and understood regarding their concerns [30]. Only human service professionals, equipped with the necessary expertise, authority, and resources, can adequately and comprehensively address these needs on behalf of beneficiaries. Technological solutions aimed at automating welfare state processes must take these essential requirements into account; otherwise, they risk becoming naive, dehumanizing, and unaccountable socio-technical systems of welfare state automation [9]. Recent research in human-centered design further emphasizes the importance of acknowledging the central role of human service providers in social security systems. Since the early 1970s, Participatory Design has emerged as a leading design discipline, concentrating on the social, cultural, and political aspects of design, where stakeholder involvement and shared power are regarded as best practices [31]. The ongoing scripting, oversight, and

significant modification of the workplace for human service providers throughout European welfare states have limited their ability to engage in system design [14]. Over decades, these processes have led to a lack of understanding regarding the nuances of human service work and the ways in which socio-technical systems can both support and obstruct it. This has impeded social security systems from effectively accommodating and addressing the life experiences and vulnerabilities of beneficiaries. Consequently, the exclusion of human service providers from the initial design phases raises concerns about design equity; beyond that, it prompts a wider examination of the future of welfare state environments in Europe. This chapter posits that prioritizing welfare provision over financial considerations is essential, or Europe may risk losing its identity.

3.1 Importance of Human-Centered Design

Socio-technical systems, which encompass the interplay between individuals and technology within a particular context, can tackle the difficulties associated with service design by integrating both social and technical subsystems to enhance their interactions for greater advantage [20]. Services benefiting individuals in social security, especially those concerning disability benefits and services, are marked by significant complexity and uncertainty, alongside strong moral dualities, creating challenges for effective service design [32]. Furthermore, the ongoing trend of digitization in beneficiary services, which employs sophisticated technologies such as automated decision systems, raises alarms regarding the potential dehumanization and other negative consequences of digital service delivery [38]. This situation may result in the marginalization of service users, as the morphological disenfranchisement of individuals who are unable or unwilling to engage with new technologies exacerbates the so-called second digital divide.

In social security systems, achieving a careful equilibrium between completely automated processing and necessary human administrative involvement is essential, as is the strategic placement of human oversight within the automated framework [33]. To support this equilibrium, human-centered design emerges as a valuable strategy for socio-technical systems and their service delivery [3]. This multidisciplinary approach focuses on creating a service system that is both inclusive and protective, taking into account the social and technical subsystems, their interactions, and the resulting phenomena to maximize the potential benefits of these connections.

Participatory design plays a crucial role in human-centered design by ensuring the ongoing and active participation of all stakeholders, particularly service users, throughout the entire design process of a system. Its goal is to foster mutual learning among stakeholders regarding their needs, skills, imaginations, and contexts, allowing for their collective input in co-designing the system [34]. This approach is seen as an empowering endeavor that democratizes both the design process and the system being developed, enabling users or their representatives to exert greater

influence over the function and application of technology, especially in a landscape marked by increasing inequality, disadvantage, and exclusion.

In numerous European nations, the processes and outcomes of co-design are commonly known as design democracy [2]. Within these design democracy frameworks, the phrases 'co-design' and 'participatory design' are often used synonymously. Although there are distinctions between design democracy and co-design, both approaches require contributions from individuals who are not experts [7]. Input from non-expert stakeholders is essential for articulating the problem based on their needs and abilities, as well as for investigating alternative solutions, thereby guaranteeing that the final design encompasses a wider array of viewpoints [34].

3.2 Role of Human Service Providers

Automated systems can often be intricate and challenging for users to navigate, especially for vulnerable populations such as elderly individuals, those with low socio-economic backgrounds, non-native speakers, and people with disabilities [1]. Engaging with social security representatives within these systems has proven to be intimidating []. Therefore, to enhance service transactions effectively, human service providers must adopt a supportive role in automation-focused socio-technical social security frameworks [35]. This not only requires an examination of the technical systems themselves but, more critically, an understanding of the social and individual needs of users during interactions [6]. For at-risk groups, human providers are essential, serving as a significant counterbalance to the potential negative impacts of automation [22]. Beyond addressing basic requirements, they must also cater to emotional needs reflected in design and personas that are compassionate, friendly, sympathetic, pleasant, understanding, sensitive, good listeners, respectful, genuinely interested in the user and their circumstances, and caring, among other attributes [8]. To perform effectively, service providers need training and skills to operate the technical systems and should be well-acquainted with potential challenges in their application. The level of education attained by these providers plays a crucial role in shaping the socio-demographic profile of human service personnel [23]. Additionally, architectural elements like a space for personal service interactions, along with privacy, security, and a welcoming atmosphere, are essential for ensuring a positive user experience and facilitating constructive interactions [36]. It is crucial to go beyond merely addressing the fundamental aspects of human-centered design and recognizing the social requirements of users; a thorough exploration of the emotional dimensions of social interactions through human providers is necessary to optimize the functioning of socio-technical systems in areas such as advantageous survivability, consent, user satisfaction, and the success of social transactions [26]. Ultimately, human providers should be viewed as a complement to automation, contributing their own assistance while also fulfilling the emotional needs inherent in social interactions [].

4 Balancing Automation and Human Interaction

In the realm of public service, managing beneficiary services encompasses a broad array of socio-technical systems, including applications like social security, health services, and social assistance [20]. Although automation can lead to reduced operational expenses and enhanced quality, it often neglects a crucial objective of the service system which is improving the beneficiary experience [24]. The mechanisms of standardization and automation frequently disregard the intricate and individualized nature of a service system where numerous non-routine tasks coexist alongside routine ones [36]. To cut public spending on service systems while simultaneously enhancing the beneficiary experience, this chapter proposes that an effective allocation of routine and non-routine tasks between human agents and artificial agents can create synergies between the responsibilities assumed by automated systems and those retained by human agents. In contemporary societies, a variety of service systems function as an interconnected network that underpins national economies []. These systems integrate human agents and technology to develop and deliver services tailored to the requirements of beneficiaries. A key objective of a service system may include improving the experience of service beneficiaries while managing the costs associated with service delivery for providers, which typically consist of companies, agencies, or institutions in the public sector [37]. In this context, the intricate web of distinct service systems often mirrors the complexity of a spider's web, with each system operating under its own set of rules and routines [19]. Given the intricate nature of public sector service systems, routine tasks are managed by both human and technological agents to foster synergies among them, whereas numerous non-routine tasks remain assigned to human agents, as it is not economically or technologically feasible for service providers to undertake these at a significant cost [18].

Given the strong capabilities of AI systems and the difficulty of integrating them into complex socio-technical systems, four initial integration strategies are proposed [37]:

1. Downstream Strategy with Limited Automation—Agentive Systems.
2. Jumping In—Reactive Systems.
3. Man in the Loop—Interactive Systems.
4. Partnering with Experts—Collaborative Systems.

Integration strategies may be utilized alongside levels 1, 2, 3, and 4 of adaptation. These strategies can be classified as off-the-shelf, incremental changes, or transformative approaches, which involve redesigning work practices in collaboration with intended users [38]. The range of the four strategies varies from limited, low-risk (downstream) options to high-risk (jumping in) alternatives. It is crucial for users and managers to determine the need for augmentation through a bottom-up approach, taking into account potential effects, technical risks, unintended consequences, associated costs, and manual work dependencies. The decision to pursue augmentation is recommended to be made at the team level [38]. Furthermore, it is essential to consider user analytics and change management measures to assess

the impact of augmentation over time. In the case studies presented, the integration strategies were either poorly defined or involved a combination of multiple strategies. It became evident that organizations and implementers of AI solutions require domain experts capable of designing effective integration strategies, which, in some instances, proved to be a limitation. While current state-of-the-art AI algorithms can deliver satisfactory results in relatively simple applications and have been successfully applied across various domains, the AI applications in the case studies were complex and entailed numerous dependent, manual, back-office tasks.

5 Conclusion

Finding the appropriate equilibrium in the organization of beneficiary services for social security is a repetitive endeavor. Initially, concerns about fraud and misuse can result in an overdependence on human judgment. During this preliminary phase, decisions regarding eligibility are typically made by the staff or representatives of the agency responsible for benefits, who rigorously enforce complex program rules with minimal input from applicants. Consequently, some individuals seeking benefits may have their requests denied early on, often without realizing their rights to contest the unfavorable decisions issued by the agency. Following several appeals, the application might eventually reach a fair courtroom, which can lead to the implementation of a straightforward, efficient, and relatively standardized procedure intended for these applicants. Nevertheless, a rightward shift is likely to occur. Modernization reforms in the public sector have prompted numerous social security agencies to pursue cost-effective business processes. Given that evaluative criteria in many national social security programs encompass vast populations, extensive computerization has been integrated into the eligibility decision-making process. Automated screening systems have been created to process the information submitted by applicants. Only a portion of these applications is chosen for additional review by staff members. Following this automated and frequently standardized determination of eligibility, there is an opportunity for discretionary evaluation of specific cases. Typically, this manifests as local practices within the agency that address the unique policy challenges relevant to that setting. The interplay between the focus on non-discretionary procedures and the discretionary assessment of individual cases may largely remain obscured from formal oversight. Nonetheless, principles guiding discretionary decision-making tend to become more standardized and apparent in everyday operations. Another balancing dynamic is likely to occur, starting from a strict central oversight of national conditions for routine processing, moving through discretion in local and agency cultures, and then leading to a tightening of control once again. This renewed strictness aims to harmonize the disparities that have arisen. Explanatory narratives regarding the reasoning behind a specific approach to balancing typically support this process.

Digital Transformation in the Banking Sector and Its Impact on Borrowers' Rights Protection: An Analytical Study

Yasar Alhiniti and Muhammad Nader Doshan Al-Madi

Abstract This chapter explores the opportunities and challenges posed by technological advancements in the realm of bank loans. It aims to fulfill several goals, such as elucidating the definition and features of a bank loan contract, assessing whether it functions as an adhesion or consensual contract, and comparing it with other banking agreements like credit and partnership contracts. Additionally, the study investigates the influence of bank loans on monetary policy and the local economy while offering recommendations to enhance the legal and regulatory frameworks governing bank loans. Employing a descriptive-analytical approach for data collection and analysis, the study provides a detailed description and thorough examination of the current situation. The digital dimension was significantly incorporated, focusing on how digital transformation influences the loan approval process and safeguards borrowers' rights, as well as the technical challenges and opportunities that technological innovation brings to improving transparency and streamlining procedures. The findings indicate that the bank loan contract is a binding bilateral agreement marked by its consensual nature, while it displays a contractual character during the negotiation of terms. Furthermore, the study highlights the crucial role of bank loans in shaping monetary policy. Recommendations include enhancing the clarity of loan terms and conditions, updating legislation to align with digital advancements, improving oversight of financial institutions through modern technologies, offering training and awareness initiatives for borrowers regarding the effective use of digital tools, fostering the development of new banking products in line with technological innovations, and creating an efficient system for addressing borrowers' complaints in response to digital challenges.

1 Introduction

The bank loan contract is regarded as a key financial instrument. It goes beyond being a simple financing agreement between a borrower and a lender; it encompasses economic, financial, and social consequences that can affect all parties involved and the broader economy. The disparity in economic status between the contracting parties leads to an imbalance within the contract, giving it an adhesive quality. Furthermore, the commercial essence of the bank loan contract is well acknowledged. The different types of bank loan contracts raise the need to differentiate among them, which requires the elimination of ambiguities and a clear understanding of their similarities and distinctions. As a result, this study intends to offer a thorough analysis and accurate clarification of the nature and features of bank loan contracts, along with suggestions for enhancing the associated legal and regulatory frameworks [1].

In today's digital age, the banking loan industry is increasingly dependent on technology, employing digital systems for managing loans, facilitating applications, and improving transparency of information. Technologies like artificial intelligence and big data analytics play a vital role in refining risk assessments for loans and safeguarding financial transactions. Considering the profound effects of these technologies on the processes of granting and securing loans, this study also explores how digital transformation affects the safeguarding of borrowers' rights and bolsters the efficiency of the legal and regulatory framework amid swift technological advancements.

1.1 Study Objectives

This study seeks to achieve the following objectives:

1. Explain the concept of a bank loan agreement based on legal and jurisprudential provisions.
2. Learn how to distinguish a bank loan agreement from other contracts based on its specific features.
3. Analyze the basic features of a bank loan agreement such as being consensual, binding on both parties and mutual.
4. Analyze the nature of a bank loan agreement as an adhesive or consensual contract.
5. Compare a bank loan agreement with other banking contracts such as credit and partnership agreements to distinguish them.
6. Analyze the impact of bank loans on monetary policy and local economy.
7. Make recommendations for improving the legal and regulatory framework related to bank loan agreements.

1.2 Methodology of the Study

A descriptive-analytical methodology was employed in the study to gather and examine data concerning borrowers' rights in bank loans. This method facilitated an accurate depiction of the existing situation and allowed for the analysis of data, leading to practical recommendations aimed at improving the safeguarding of borrowers' rights and enhancing the effectiveness of legislation pertaining to bank loans.

2 Definition of the Bank Loan Contract and Its Characteristics

The bank loan contract lacks a definition from the Jordanian legislator, which has resulted in jurisprudence and the judiciary being tasked with defining and elaborating on some of its provisions while clarifying its concept. Thus, it is essential to first elucidate the concept of the bank loan contract and identify its characteristics. This section will be organized into two primary branches: the first branch will focus on defining the bank loan contract, while the second branch will explain its characteristics.

2.1 Definition of the Bank Loan Contract

The bank loan contract, as a compound term, necessitates that the researcher elucidate the meanings of these words within the language and subsequently define it as a compound term. The term "loan" signifies an amount of money provided with the expectation of repayment. Indeed, the lack of legal regulation surrounding the bank loan contract has resulted in jurisprudence assuming the task of defining this agreement, leading legal scholars to propose various definitions in an effort to clarify its concept and legal characteristics. Notably, the challenge stems from the diverse interpretations within jurisprudence regarding the definition of this contract, which varies based on the viewpoint adopted, given its substantial role in both legal and economic contexts. Consequently, the researchers will concentrate exclusively on the legal definition of the bank loan contract [2].

Services offered to workers have been characterized as those that provide individuals, institutions, and organizations within society with essential funding, with the debtor obligated to repay interest, expenses, and fees either as a lump sum or in scheduled installments as per the agreement [3]. The researcher contest this characterization, arguing that it fails to elucidate the contractual nature of a bank loan agreement and does not emphasize the parties engaged in the contractual arrangement. Instead, the definition only outlines the responsibilities of the involved parties.

Additionally, it has been described as a loan extended to clients for a designated purpose, which is to be repaid in monthly installments mutually agreed upon by the client and the bank, concluding with the full repayment, including interest in the installments [4].

The term "loan" is deemed inappropriate by the researchers, as the aim of the definition is to elucidate the nature of a bank loan as a contractual agreement between two parties. Additionally, it has been characterized as a contract involving the bank and the client, in which the bank provides a specified sum of money to the client, contingent upon the client fulfilling necessary conditions by presenting guarantees and a dossier that includes details such as their name, address, profession, and the intended use of the loan, along with signing sufficient guarantees to safeguard the bank's funds [5].

The researchers believe that this definition has underscored the contractual characteristics of a bank loan and made clear the parties engaged in the contracting process. Nevertheless, it faces criticism for confining the definition of the "lender" in the bank loan contract solely to the bank, when it would be more fitting to encompass either a bank or an individual authorized to perform banking activities as the lender.

An alternative perspective suggests that a bank loan contract is an agreement made between the bank or an individual authorized to perform banking activities and the client, with its focus on banking operations or financial services that the law allows the bank to offer the client through the loan agreement [6]. The researchers argue that this definition is the most thorough and effectively elucidates the concept of the bank loan contract.

From the information presented, the researchers can characterize the bank loan contract as an agreement in which a bank or an individual authorized to conduct banking operations provides a sum of money to the borrower through a loan or credits this amount into the borrower's bank account. The borrower is required to repay both the principal loan amount and the associated interest to the bank according to the specified dates and terms established in the agreement.

The Jordanian legislator has refrained from defining the bank loan contract, viewing this as a matter for jurisprudence and the judiciary rather than falling within the legislator's responsibilities. Consequently, there is a noticeable lack of comprehensive regulation regarding bank loan provisions, which are instead governed by the general stipulations of the loan contract outlined in the Jordanian Civil Code. Nevertheless, Article (59/1) of the Commercial Law does apply to the bank loan contract, stating that "Contracts of sale, loan, insurance, and all contracts whose rules are not specified in this law shall be subject to the Civil Code and customs" [7].

Consequently, the researcher will examine the loan contract as outlined in the Jordanian Civil Code and evaluate how its provisions relate to the bank loan contract. The definition provided by the Jordanian legislator describes the loan contract as "the loan is the transfer of ownership of money or a fungible item to another, provided that a similar amount, kind, and quality be returned to the lender at the end of the loan period" [8]. In contrast, the Egyptian legislator characterizes it as "a contract by which the lender commits to transferring to the borrower the ownership of a sum of

money or any other fungible item, provided that the borrower returns a similar item in amount, kind, and quality at the end of the loan" [9].

The researchers hold the view that the Egyptian legislator's definition of the loan contract is more precise, as it highlights the importance of the contractual value by categorizing the loan as a contract, unlike the approach of the Jordanian legislator. Consequently, the researcher deems it essential to revise Article (636) of the Jordanian Civil Code to align it with the definition provided by the Egyptian legislator.

In a recent judgment, the respected Jordanian Court of Cassation addressed the notion of bank loans, employing the term "credit." The court stated: "Banking operations encompass receiving deposits from the public and utilizing them, either fully or partially, to extend credit. Credit is defined as the disbursement of money by the bank to the client in return for the entitlement to reclaim it along with interest. Therefore, the provision of credit, or loans, by the bank is classified as one of the banking operations" [10].

In multiple rulings, the Court of Cassation has identified the loan given by the bank to the client as a bank loan, including in one decision where it noted: "… And given that the circumstances of this case relate to the plaintiff's demand against the defendant for the remaining amount of a bank loan …" [11].

2.2 Characteristics of the Bank Loan Contract

Based on the aforementioned explanations, the bank loan contract has several characteristics that distinguish it from other contracts, as outlined below:

The Bank Loan Contract is a Consensual Contract

A consensual contract is defined as one that is established simply through the legitimate exchange of an offer and acceptance. The modern approach to contracts asserts that consent alone is adequate to create and form the contract, unless specific formalities are mandated by law [12].

A debate exists within jurisprudence about the consensual aspect of loan contracts. Certain legal scholars view the loan contract as a real contract; traditionally, loans were seen as real contracts that required the actual delivery of the borrowed funds to the borrower [13].

In this context, the distinguished jurist Al-Sanhuri asserts that "the true essence of the loan is derived from Roman law, where contracts were initially formal. This formality was later supplanted by the act of delivery in real contracts. Nevertheless, viewing the loan as a real contract is no longer justifiable today, as mutual consent alone is adequate for the contract's conclusion" [13].

Concerning the jurisprudence of the Jordanian Court of Cassation on this issue, its decisions have consistently affirmed that the loan contract is a consensual agreement. In one judgment, the court noted: "The relationship between the parties to the case is governed by the loan contract concluded between them, and the contract fundamentally relies on the consent of the contracting parties, as outlined in Article

(213) of the Civil Code, which asserts that the contract serves as the law for those involved" [14]. Therefore, the researchers deduce that the bank loan contract constitutes a consensual agreement that remains valid through the mutual consent of both parties, demonstrated via offer and acceptance.

The Bank Loan Contract is a Bilateral Contract

A bilateral contract is formed by the loan agreement, establishing mutual responsibilities for each party involved. The lender must provide the item to the borrower and cannot request its return until the specified due date. In turn, the borrower is required to repay an amount equivalent to what was received, either at the agreed-upon time or upon demand, as outlined in the contract [15].

The Bank Loan Contract is a Commutative Contract

Contracts that are commutative involve an exchange where each participant gains something in return for what they provide [16]. Initially, the loan agreement is viewed as a gratuitous contract, indicating that the borrower must return an equivalent of the item borrowed without any alteration in value, as a safeguard against usury. This viewpoint aligns with the Jordanian Civil Code, since Islamic legal scholars regard any advantage acquired through a loan contract as usury, which refers to an increase in the debt amount in exchange for the time extended to the borrower [17].

When interest is specified as a condition for the loan, the loan contract transforms into a commutative contract [18]. Banks or financial institutions aim to generate profit through the provision of loans. Consequently, this results in a commutative contract between the two parties, where the lender (the bank or financial institution) offers the capital (the loan amount) in return for the same sum plus the interest accrued. The borrower, on the other hand, gains from the monetary amount provided for a designated period. Therefore, the bank loan contract is identified as a commutative contract [19].

The Bank Loan Contract is a Time-Bound Contract

A bank loan contract is defined by its time-sensitive nature, making the element of time crucial. The advantages gained from this agreement can only be obtained through the utilization of the asset over a designated timeframe [19]. This aspect is especially significant in the realm of bank loan contracts, as the interest rate is established according to the length of time the borrower enjoys the principal sum [10].

The Bank Loan Contract is an Innominate Contract

Contracts that are nominated are those explicitly identified and governed by the legislator through particular provisions. On the other hand, innominate contracts lack specific regulation from the legislator and fall under the general rules of the theory of obligations [20].

Upon initial examination, one might perceive the bank loan contract as a nominated contract, given that the Jordanian legislator has allocated a chapter in the legal

framework addressing contracts that confer ownership to the loan contract, specifically detailed in Articles 636–646 of the Jordanian Civil Code [12]. Nevertheless, the researchers conclude that the substantial distinctions between the loan contract as characterized in the Civil Code and the bank loan contract, which lacks specific regulatory provisions from the Jordanian legislator, render it more fitting to classify it as an innominate contract with commercial characteristics [13].

The Bank Loan Contract as a Form of Credit

Transactions known as credit operations occur when a bank consents to extend credit to a client or another individual upon the client's request, in return for a specific interest or commission, either right away or at a designated time, through capital or alternative means [14]. Banks are essential in conveying monetary policy actions throughout the economy. Although the primary source of funds for banks comes from deposits, the principal utilization of those deposits is represented by the bank credit extended to clients [15].

Banks serve as intermediaries in the relationship between savings and investments by receiving deposits from savers and subsequently lending those deposits to investors via different credit operations. The most basic type of credit provided by a bank is represented by the bank loan contract [16].

Generally, individuals who turn to bank loan agreements are not merchants. Instead, merchants tend to favor acquiring credit facilities as an open credit line, which comes with a specified limit that they can utilize as needed to avoid the unnecessary accumulation of interest on bank loans [21].

3 The Legal Nature of the Bank Loan Contract and Its Distinction from Similar Forms

The task of legal characterization involves both judicial and jurisprudential elements, as the judge assigns the correct legal definition to the case at hand before applying the relevant legal ruling. The bank loan contract exhibits resemblances to other types of contracts, which can often make them hard to differentiate, resulting in common misunderstandings. To meet the goals of this study, the researcher will split this section into two primary segments: the first segment will address the legal nature of the bank loan contract, while the second segment will distinguish the bank loan contract from comparable forms.

3.1 The Legal Nature of the Bank Loan Contract

The legal nature pertains to "the legal characterization and description of the contract. "Once the concept of the bank loan contract is defined and its unique characteristics

are detailed, it becomes evident that this type of contract can assume one of the following legal descriptions:

The Bank Loan Contract as a Contract of Adhesion

To explore how the adhesion contract influences the modification of interest rates, the researcher must initially address the legal classification of the bank loan contract and assess how the adhesion contract pertains to its legal nature. Following this, an analysis of the adhesion contract's impact on interest rates can take place. Thus, the researcher will delineate the subsequent rules:

To begin with, defining adhesion is crucial. Changes in economic, social, and electronic realms have influenced contracting practices, resulting in a broader range of adhesion contracts. In these agreements, the party with greater economic and informational power drafts the contract unilaterally, presenting the other party with the sole choice to either accept or decline it [22, 23].

The principle of the autonomy of will in contracts is undermined by these agreements, resulting in a disruption of contractual justice [24]. Modern advancements and the era's demands have influenced the legal definition of adhesion, leading numerous countries to revise their legislative approaches and embrace contemporary trends, which will be elaborated on below [25].

Typically, the intent between the offeror and the offeree is conveyed through a series of exchanges and negotiations, culminating in the offeree's decision that entering into the contract is beneficial for them [26]. However, recent economic changes have given rise to a specific kind of contract where the offeree can merely indicate their intention to participate without any room for negotiation [27]. This situation arises because these contracts pertain to vital services, like water and electricity that are indispensable [23, 28].

An adhesion contract refers to a situation where the offeree agrees to terms established by the offeror without any negotiation, especially in relation to a good or essential service that is either monopolized legally or practically, or where competition is restricted in its extent [24, 29]. The esteemed legal scholar characterizes the adhesion contract as a type of coercion; however, this coercion is economic in nature rather than stemming from psychological influences, with coercion viewed as a flaw in the will [11, 30].

Accordingly, adhesion contracts are distinguished from other contracts by the following characteristics [25, 31, 32, 33]:

- The agreement pertains to goods or services deemed vital for the consumer or recipient, including essential utilities like water, gas, or electricity.
- These products or services are either legally or effectively controlled by a single entity, resulting in minimal competition surrounding them.
- The proposal to utilize these products or services is uniformly presented to the public on the same terms, giving the other party merely the choice to either accept or decline.

According to the stipulations outlined in the Jordanian Civil Code, the concept of adhesion is not explicitly addressed by the Jordanian legislator, as it is the responsibility of jurisprudence and the judiciary to define it rather than the legislator [34]. The Jordanian Court of Cassation, in its rulings, has characterized the adhesion contract as "a contract in which the offeree accepts predetermined terms set by the offeror without negotiation" [14].

The provisions regarding acceptance in adhesion contracts were clarified by the Jordanian legislator, as Article (104) of the Jordanian Civil Code states that "acceptance in adhesion contracts is limited to merely accepting predetermined terms set by the offeror, without allowing any negotiation" [26]. This interpretation was upheld by the Jordanian Court of Cassation in a ruling, which noted that "a contract is not considered an adhesion contract if the terms set by the offeror were discussed, in accordance with the provisions of Article (104) of the Civil Code" [23].

In terms of legal safeguards for the adherent party, the Jordanian legislator has established several provisions, the most significant being the requirement that contract interpretations favor the adherent. According to Article (240/2) of the Jordanian Civil Code, "ambiguous phrases in adhesion contracts should not be interpreted in a way that harms the interests of the adherent party" [27]. Furthermore, the judiciary has been empowered by the Jordanian legislator to intervene when unfair terms detrimental to the adherent are present, with the intention of either amending or exempting these terms. This authority is clearly outlined in Article (204) of the Jordanian Civil Code [25].

The researchers critique Article (204) of the Jordanian Civil Code, noting that the judiciary's ability to intervene and modify unfair terms is merely discretionary, as evidenced by the legislator's choice of the word "may." It is the researcher's view that this authority ought to be mandatory, as such a requirement would promote fairness and enhance legal protection for the weaker party in contractual agreements. Consequently, the researchers advocate for an amendment to Article (204) of the Jordanian Civil Code. The rise of various forms and types of adhesion contracts, propelled by economic changes, scientific advancements, and technological innovations, has allowed the stronger party to create pre-drafted contracts that include unfair terms and benefits at the expense of the weaker party [35, 36]. This situation disrupts the balance of contracts and undermines the essence of contractual justice, highlighting the urgent need for judicial protection against the unfair terms imposed on the weaker party [37, 38]. Furthermore, the legislator should take action by implementing protective measures that defend the rights of the weaker party and restore equilibrium in the contractual relationship between both parties [26, 39].

Recent advancements have resulted in the embrace of a modern jurisprudence of adhesion, associating it with the existence of unfair terms, independent of the necessity for commodity monopoly [40, 41]. This modern jurisprudence asserts that adhesion is contingent upon the presence of unfair terms or their absence [27].

An unfair term is characterized as a provision within a contract that one party includes to exert their influence over the other, aiming for an extraordinary and disproportionate personal advantage, which consequently undermines the rights of the party that acquiesces to the dominance of the imposing party [28]. In the context

of Jordanian law, the concept of unfair terms is addressed in Article (204) of the Jordanian Civil Code [29].

Consequently, the researchers conclude that the modern jurisprudence of adhesion is more accurate and better reflects the demands of reality. For an adhesion contract to exist, it is adequate to demonstrate a breach of contractual equilibrium between the involved parties, alongside the presence of unfair or oppressive terms within the contract. The application of adhesion provisions does not require the commodification to be monopolized. Therefore, it is advisable for the Jordanian legislator to embrace this jurisprudence, as it aligns more closely with the realities at hand and is more precise [30].

From the above, it becomes clear that the most accurate legal description of the banking loan contract is an adhesion contract for the following reasons [47, 48, 49, 50]:

- The disparity in contractual authority between the more powerful party, the bank, and the less powerful party, the borrowing client [44, 45, 46].
- The bank, as the dominant party, prepares the loan agreement in advance, which forces the borrowing client to either accept or decline the contract without any opportunity to negotiate its terms [40, 41, 42, 43.
- The variety and multitude of banks in Jordan, which provide clients with the ability to select among them, does not indicate that the banking loan agreement is a negotiable contract that eliminates the concept of adhesion. Even with the numerous options available, these banks do not allow clients the opportunity to negotiate or deliberate on the contract's terms; they are merely presented with the choice to accept or decline. Consequently, this suggests that the banking loan contract ought to be categorized as an adhesion contract due to the existing imbalance and inequity between the two parties involved, as well as the frequent presence of unfair conditions within the contract [36, 37, 38, 39.
- The rulings of the Court of Cassation seek to reestablish the contractual equilibrium between the two parties involved, as previously noted. This aligns with the stipulations of Article (204) of the Jordanian Civil Code, which categorizes this agreement as an adhesion contract [31].

The issue of adhesion within the context of a banking loan contract has been addressed by the Jordanian Court of Cassation [31]. The court remarked: "It is determined that if the condition fails to satisfy the criteria of adhesion and the appellants have not articulated why it should be regarded as such, then the requirement for account accuracy in agreements between banks and clients does not qualify as adhesion. Clients are free to choose not to contract and can opt for another bank [32, 33]. Courts have deemed such conditions as valid [35]. Furthermore, these conditions are open to challenge, allowing for scrutiny of the accuracy of interest rate figures and their compliance with Central Bank regulations. Consequently, expertise is sought based on the specifics of each case to ensure their precision [34, 35, 36]. Rescheduling signifies a new agreement to establish due amounts, and objections from those who have signed cannot be revisited. Thus, this rationale does not influence the contested ruling and should be dismissed" [29, 37].

While this ruling reflects the court's perspective that the condition is valid and not an adhesion condition, it also implicitly recognizes that adhesion conditions could exist in banking loan agreements; otherwise, the Court of Cassation would not have addressed this clause in principle [30, 38].

The Commercial Nature of the Banking Loan Contract

Scholars find it challenging to articulate the definition of commercial contracts. The dominant perspective suggests that commercial contracts do not exist in a manner that is separate from civil contracts, which are subject to particular regulations. General rules also govern commercial contracts [11]. As a result, it is more advantageous to create a standard for categorizing a contract as commercial [12, 37].

Certain academics have sought to characterize commercial contracts as agreements that establish a commercial obligation for one or both parties involved. Nevertheless, this characterization has faced criticism for its lack of clarity, as it pertains more to the concept of commercial obligation than to the nature of the commercial contract itself [23, 38].

Concerning the stance of the Jordanian legislator, it is observed that while there is no specific mention of the concept of a commercial contract, criteria have been established to classify an activity as commercial. As a result, all operations involving currency exchange are deemed to be commercial activities [14, 39].

Consequently, the activities conducted by banks are unquestionably classified as commercial operations, governed by commercial law that pertains to limitation periods, modes of commercial evidence, and various other stipulations [15, 40]. The contention lies in determining whether the actions of the borrower are categorized as commercial or civil. Is the loan agreement with the bank inherently a commercial contract, or does it represent a mixed commercial contract? [16, 41].

Certain academics interpret the banking loan agreement as a hybrid commercial contract [42]. From the lender's (bank's) viewpoint, it is commercial, whereas the classification for the borrower hinges on their status. If the borrower is engaged in trade and the loan relates to their business activities, the contract is deemed commercial. Conversely, if the borrower is not a trader, the agreement is classified as civil [18].

For banks or exchangers, currency exchange transactions are a commercial activity. In contrast, for clients, these operations are not fundamentally commercial unless the client is a trader and the exchange pertains to their trading activities [29].

The issue regarding the banking loan contract has been addressed by the Jordanian legislator, who has classified it as a commercial activity by its very nature. According to Article (92/h) of the Jordanian Banking Law, "All banking and financial activities are considered commercial by their intrinsic nature, regardless of the status of the contracting client or their dealings with the bank, whether civil or commercial. The provisions of the applicable Commercial Law and the provisions of the Murabaha Law shall apply" [10].

The Jordanian Court of Cassation has made it clear in its judicial rulings that commercial regulations govern the contractual relationship. The Court stated:

"Banking operations are inherently commercial in nature, as per Article (92/h) of the Banking Law. Consequently, the limitation periods set forth in Article (58) of the Commercial Law are applicable to the claim at hand, with a ten-year duration commencing from the date the right arises" [1]. Article (58) of the Jordanian Commercial Law specifies the limitation periods in commercial matters as follows: "(1) in commercial cases, the right to file a claim expires after ten years unless a shorter duration is provided. (2)The right to invoke res judicata ceases after fifteen years" [12].

The researchers critique the position of the Jordanian legislator, which categorizes banking activities as inherently commercial, irrespective of the borrower's condition. This viewpoint is seen as problematic because it strays from established norms and bestows upon banks a legal status that surpasses that of the typically weaker borrower. By deeming the contract as commercial without regard for the borrower's situation, the legislator emphasizes the lender's (bank's) status. This perspective unjustly elevates banks and diminishes the intended legal protections for borrowers, who are frequently at a disadvantage in the contractual arrangement. Furthermore, borrowers generally pursue loans from banks, while traders often opt to establish credit lines with banks to sidestep unnecessary interest on loans.

4 Conclusion

Examining the assurances in place for safeguarding borrowers' rights in banking loans represents a crucial advancement in promoting financial justice and transparency within banking operations. Gaining insight into the obstacles borrowers encounter and offering targeted recommendations can lead to a more secure and efficient financial landscape. By bolstering transparency, strengthening borrower safeguards, and creating legislative and regulatory frameworks, trust can be fostered between financial entities and their clients, resulting in greater financial stability and shared advantages.

4.1 Results

The study concluded the following results:

1. A banking loan agreement is a two-party contract that entails the bank providing a sum of money to the borrower, who in turn agrees to repay the principal along with interest over a designated timeframe.
2. The banking loan agreement is defined as a consensual contract that carries a legally binding obligation for a specified duration, distinguishing it from other types of contracts.

3. While the banking loan agreement is frequently viewed as an adhesion contract, it can also exhibit a contractual character during the negotiation of its terms and conditions.
4. The banking loan agreement and credit and participation contracts are distinctly different, particularly regarding their emphasis on financing the principal sum and interest.
5. Loans from banks are crucial to monetary policy as they affect savings and investment levels, helping to meet economic objectives.

4.2 Recommendations

1. Increase the transparency of bank loan agreement terms to ensure that all parties understand the obligations and rights associated with the loan.
2. Establish effective mechanisms to protect borrowers' rights, including providing clear information on interest rates, costs and risks associated with loans.
3. Update regulations on bank loan agreements to keep up with economic and technological changes and meet market needs.
4. Improve supervision and control of financial institutions to ensure their compliance with applicable laws and regulations and protect customers' interests.
5. Provide training and education programs for borrowers on how to choose appropriate loans and effectively manage debt.
6. Support the development of new banking products that meet different customer needs and offer flexible financing options.
7. Establish an effective system for handling borrower complaints in line with digital challenges.

The Role of Technology in Preserving Indigenous Cultures and Languages

Aref A. Murshed, Ali alrahamneh, Al-Hareth Alhalalmeh, and Mohammed Al-Badawi

Abstract This chapter aims to reveal the role of technology in preserving indigenous cultures and languages, which are increasingly at risk due to globalization and advancements in technology. Indigenous languages serve not only as means of communication but are also vital channels for maintaining cultural heritage, national identity and collective memory. The extinction of these languages can lead to the erosion of cultural traditions and, consequently, the societies that uphold them. Therefore, this study employs a qualitative research design utilizing descriptive and analytical methods to explore how technological innovations, including digital platforms, language-learning apps and artificial intelligence, can support the documentation, teaching and revitalization of endangered languages. It systematically reviews existing research and case studies to provide a comprehensive overview of technology's impact on the preservation of indigenous languages. The study critically evaluates the achievements and obstacles faced by current technological initiatives and offers actionable recommendations to improve their effectiveness. The findings emphasize the need for strategic policies that position technology as a means to enhance language diversity and empower marginalized communities through cultural resilience.

1 Introduction

Language transcends being a mere system, a basic function, or a fundamental infrastructure; it occupies a profound and significant role in the evolution of humanity [1]. The language spoken in each household acts as an essential gateway to the vast reservoir of human knowledge and the rich cultural heritage accumulated over generations [1, 2]. In the absence of a home language, children are effectively barred from grasping their origins, hindering their ability to engage fully in the shared memory that arises from the distinctive experiences of their community [3]. Thus, local languages serve not just as tools for communication; they are vital means of fostering belonging and are integral to the formation of one's identity and cultural essence [1, 4]. By appreciating and understanding these languages, individuals can forge connections that enhance both personal growth and the broader community [5, 6].

In this chapter, we discuss the crucial role that languages play in safeguarding indigenous cultures worldwide. We begin by clarifying our definition of cultural heritage and exploring the connection between language and the preservation of that heritage, particularly focusing on lesser-known languages with smaller speaker populations. The importance of technology is emphasized, as advanced tools in today's digital era can significantly aid in the documentation and preservation of languages and cultures. Our discussion includes the impact of language on heritage conservation and the effects of digital technology on educating future generations. Additionally, we examine the predominantly oral traditions of indigenous communities. We present various related digital and physical resources, projects, research studies and what is referred to as language technology. Finally, we conclude with suggestions for future foundational initiatives and pathways.

1.1 Research Significance

The significance of this research is heightened in an era where globalization and technological progress threaten the survival of numerous native languages [7, 8]. The languages being examined are not simply tools for everyday communication; they serve as conduits for transmitting shared legacies, symbols of identity and collective memories that are essential in shaping the social fabric of their respective communities [2, 9, 10]. The silence that accompanies the extinction of a language often signifies the extinguishing of its culture along with its traditions [11, 12]. Thus, by exploring how technology can be harnessed to revitalize these endangered languages, this

research addresses a matter of global importance. It aims to demonstrate—through examples from digital platforms, artificial intelligence and other innovations—that technological advancements can be utilized not only for preservation but also for education and revitalization of regional dialects [3, 13, 14]. This initiative not only safeguards those with less linguistic power across the globe but also offers support for cultural groups, ensuring that future generations remain connected to their heritage and identity markers. The findings of this research could inform policies and strategies aimed at cultural preservation, promoting technology as an ally rather than an adversary in the continuity of indigenous cultures.

1.2 Methodology

This chapter employs a qualitative methodology that encompasses both descriptive and analytical elements. The descriptive aspect evaluates the appropriate literature, including case studies, academic articles and reports that delve into the intersection of technology with the preservation of indigenous languages and cultures. This investigation methodically explores current technological resources such as digital archives, language learning apps and artificial intelligence tools used in language documentation, offering a comprehensive overview of the existing landscape. Meanwhile, the analytical component critically examines the genuine effects of these technologies on the communities by assessing the successes and challenges faced by language preservation initiatives; it also highlights deficiencies in technological applications that could lead to further advancements. Together, the descriptive and analytical methods contribute to this study by shedding light on how technology can serve as a means for cultural preservation and by providing recommendations aimed at enhancing the efficacy of these initiatives in safeguarding indigenous languages and cultures.

2 The Importance of Preserving Indigenous Cultures and Languages

The world presents itself as a vast and complex tapestry, showcasing an impressive diversity of languages, with estimates suggesting that between 6000 and 7000 are spoken around the globe [4, 15, 16]. Alarmingly, statistics indicate that nearly half of these languages may be at risk of extinction, potentially disappearing from the pages of history [17, 18]. Ironically, those languages that are spoken by the largest and most varied populations often have a minimal presence online [19, 20]. As a result, accessing crucial human knowledge and cultural heritage digitally poses a significant challenge for many indigenous cultures today [21]. The sorrowful decline of languages is taking place precisely in regions where invaluable information is at

stake [22]. Spoken languages act as essential vessels for traditional and indigenous knowledge, including the uses of numerous plants and animals, which are crucial for the survival and identity of these cultures [5, 23]. Biocultural diversity illustrates the intricate and rich interplay between biological diversity and sociocultural diversity, which collectively place upon humanity the duty of being stewards of knowledge and caretakers of the earth [24]. Effective methods for conveying experiential information about the natural world using their own distinct words and expressions are vital for indigenous cultures [25]. The authentic exchange of language fosters the preservation of both linguistic and biological diversity, ensuring that these forms of knowledge are effectively communicated and transmitted across generations [6, 26]. In today's rapidly evolving information society, significant challenges arise for the committed guardians of indigenous languages and their traditional practices due to the swift changes in media and technology [27]. There has been a recent surge of awareness regarding the vital importance of linguistic diversity to the essence of human culture, driven largely by a shared objective of cultural preservation [6, 28, 29]. Indeed, each indigenous community has the extraordinary capacity to create distinct worldviews and develop unique approaches to expressing the complexities of their surroundings [30]. These viewpoints are deeply rooted in traditional language and expressions, which subsequently influence human thought and experience. Indigenous knowledge not only validates their unique stance and elevates their voices on a global scale but also enhances their credibility in the collective endeavor to manage bioecological resources [7, 31]. Furthermore, it provides essential support for their initiatives to nurture and advance vernacular languages, enabling them to participate in and reap benefits from these ongoing efforts in ways that respect their heritage and ensure their survival [32].

Experts predict that among the roughly 7000 unique languages spoken across the world's rich and varied cultures today, a significant and alarming issue is that only about half of these languages are expected to remain in use by the end of the twenty-first century [7, 33]. This forecast brings forth serious concerns regarding the future of linguistic diversity on our planet [34]. Even more concerning is the expectation that fewer than 300 of these languages that survive will have speakers from all age demographics who actively use them in their daily lives [8, 35]. This stark reality suggests that the majority of human languages, particularly those classified as minority languages, are facing an increasingly urgent threat of extinction in a relatively short period [36]. In a similar vein, experts have shown that out of the 230 recognized nation-states and territories worldwide, approximately 110 are at significant risk of state collapse [8, 37]. This considerable danger primarily stems from the notable cultural and regional diversity that poses challenges to the essential notions of national unity [38]. The ongoing battle for both cultural and linguistic preservation in the face of the relentless and often overpowering forces of globalization may be unprecedented in human history [39]. This is particularly evident when one reflects on the significant human toll linked to these losses: the suffering, alienation and marginalization of individuals and entire communities that often accompany globalizing processes [8, 40]. Such processes typically unfold without allowing traditional societies any substantial control, resulting in feelings of despair and powerlessness.

Additionally, the current trends and their resultant effects have led an increasing number of experts to underscore the critical importance of preserving linguistic diversity in our world [23]. They assert that this diversity not only acts as a vital tool for the sustainable development of the future but also serves as an essential means of communication among the diverse cultures that inhabit our planet [1, 24]. In this crucial context, they highlight the important role that minority languages play in cultivating more inclusive, harmonious and less confrontational national societies [25]. This contribution is vital as it enhances social stability and unity, fostering a richer and more respectful coexistence among various cultural identities [26].

3 Challenges Faced by Indigenous Communities

Indigenous communities are deeply engaged in numerous essential activities that highlight the pressing necessity for safeguarding indigenous languages and other critical elements of their cultures, including traditional knowledge, artistic expressions and cultural practices [27, 28]. To achieve self-empowerment for informed decision-making within the marketplace and to encourage the authentic promotion and revitalization of their cultural heritage, many communities are starting to digitize their cultural resources and create their own databases [2, 9]. This approach not only improves information management but also increases access to cultural assets [29]. However, despite these encouraging and constructive measures taken by indigenous communities, their efforts have regrettably been impacted by a variety of intricate factors [30]. One of the most prominent challenges is the imbalanced relationship between indigenous communities and the rapidly evolving domain of Internet technology [31]. The early introduction of the Internet into numerous indigenous communities has led to the current scenario, where these communities often find themselves in predominantly passive roles regarding significant matters of information dissemination [32, 33]. The result of this situation is that many communities find themselves overwhelmed by an influx of passive information, predominantly stemming from external commercial enterprises; this information tends to be largely irrelevant to their unique and urgent needs [34, 35]. Initiatives aimed at tackling this widespread issue in indigenous communities, such as the creation of ‘home pages’ and online representation, frequently do not achieve the expected outcomes [3, 28]. When considering the numerous technological obstacles—like basic dial-up systems, insufficient web servers and dependence on outdated dial-up services for accessing online resources—these contemporary approaches are often met with doubt. Furthermore, the services leased from the Public Telecommunications Transport (PTT) fail to provide a viable foundation for development and there is a critical shortage of communal spaces for sharing indigenous content online [36]. The limited bandwidth of existing connections significantly hinders the effective distribution of multimedia content, thereby excluding essential platforms like radio and television from being utilized within these communities [37]. The current technology infrastructure in these telecenters cannot compete with the capabilities of personal computers,

primarily due to the subpar quality of the technology in use [4, 28]. Additionally, various forums have proposed solutions aimed at protecting indigenous languages and cultures through technology, which appear to have converged into three primary categories: creating and supporting indigenous databases, enhancing and establishing technology training programs and enacting laws specifically crafted to safeguard and promote indigenous languages [38]. These combined initiatives highlight the persistent efforts of indigenous communities to maintain their vibrant cultural heritage in the digital realm while also striving to regain control over their narratives and knowledge systems [5, 29].

The terms globalization and Westernization are often mistakenly used interchangeably in various discussions and analyses, primarily because the ongoing development of globalization processes is typically linked to the expanding and pervasive impact of Western culture worldwide [39]. Nonetheless, significant evidence also points to the emergence of "hybrid" forms of international art and culture, which have arisen directly from the heightened interactions in global culture enabled by globalization [40]. Key characteristics that define Western culture include humanism, secularism, rationalism and enlightenment, each of which plays an essential role in shaping societies in the West [6, 30]. The distinction between the collective tendencies frequently observed in non-Western cultures and the individualistic patterns predominantly found in Western cultures has been and remains, a central focus of research across various fields such as anthropology, sociology, political science and social philosophy [20]. These academic disciplines aim to comprehend the subtleties and consequences of cultural differences around the world [29]. Additionally, the examination of communication patterns and the vigorous exchange of cultural elements and models has become another significant area of study for social scientists dedicated to investigating the intersection of globalization and culture [7, 28]. The emergence of new information and communication technology presents a dual challenge; it is viewed as both a potential danger to cultural diversity, due to its ability to provide transmission channels that may weaken local cultures and as an important element that encourages any culture, including local ones, to assimilate aspects of the wider global culture [27]. This assimilation can foster the creation of a unique and critical individual model that harmonizes diverse influences [31]. Consequently, the analysis aims to measure and analyze dynamics over time, evaluate the influence of cultural components, investigate the effects of reforms and examine the notion of cultural distances, all of which are vital for understanding the intricate patterns of cultural interactions in an ever-globalizing world [8, 26].

4 Technology Solutions for Preserving Indigenous Cultures and Languages

In today's global environment, technology plays an increasingly crucial role in the preservation of indigenous cultures and languages. Unlike scientific literature, which predominantly arises from majority languages, the documentation and safeguarding of scientific knowledge in indigenous languages is carefully designed for the indigenous communities themselves, ensuring that this knowledge remains both accessible and pertinent to their needs [32]. This significant reflection on the coexistence of diverse forms of knowledge, each with its own unique value and perspective, profoundly inspires our work [25]. However, the planning and effective use of technology to support the preservation of indigenous languages and cultures is an exceptionally intricate challenge [22]. This endeavor requires a nuanced comprehension of how members of these communities view their surroundings, their historical interactions with the technology now being utilized to protect what is deeply significant to them, and the current political landscape regarding the roles, rights and concessions afforded to indigenous peoples across various nations worldwide [23]. Efforts directed at technology-based language preservation can be approached from three main perspectives: the scientific viewpoint, which includes computational linguistics; the technical angle, emphasizing signal processing and human–computer interaction and the humanistic perspective, which draws on ethnography and field linguistics [9, 33].

In recent years, a newer perspective has also gained momentum, emerging alongside Māori and Western-influenced collaborative models for preserving language and culture [34]. This approach is grounded in a business-oriented development framework, particularly within international development and telecommunications, focusing on language technology that supports development and the safeguarding of living heritage. This section outlines specific technology initiatives aimed at preserving language and culture [24]. It also addresses several unresolved ethical questions regarding the roles of intermediaries in this area, as well as various research domains that, despite their unlikely potential for significant profit, could offer considerable advantages to small language communities [21]. These discussions are essential for comprehending the complex relationships among technology, culture and language within indigenous communities and their lasting legacies.

Per the ILO 169, it is essential for indigenous peoples and governments to establish their own priorities to fulfill the ILO 169 objectives, with many indigenous communities viewing the preservation and promotion of their languages as a primary aim [35]. This endeavor, however, presents significant challenges, as these languages are often minority languages within their respective nations and are rapidly losing speakers for various reasons [10]. To address this issue, digital archiving and repositories have been implemented to gather, document and safeguard the ancestral knowledge of these communities, encompassing both language and culture [19]. These digital systems are specifically created to store, preserve, index and showcase artifacts, with metadata playing a crucial role in the discovery and accessibility of these items

[16]. The foremost benefit of digital archives and repositories lies in their ability to preserve and safeguard ancient knowledge and legends through digital conversion [17]. Utilizing speech processing techniques, language engineering applications can facilitate tasks such as indexing, browsing, information retrieval, speech synthesis and transcription [18]. Additionally, this knowledge allows for the regeneration of sound archives and text for training purposes, as well as providing language support for languages that are rarely documented, among other applications [36]. The primary focus in designing a digital archive for data preservation is ensuring that the data remains intact over the long term [15]. This comprehensive system comprises various elements, such as procedures for assembly and disassembly, analysis of device failures and recovery mechanisms, energy policies that can be implemented and considerations regarding the availability of technology, costs and the value of each step necessary for achieving enduring preservation [14]. Long-term preservation, as outlined in digital preservation design, can be categorized into several key classes, including digital timelines, data migration and preparing systems for new environments. Smaller datasets can be packaged and transferred to more resilient media, placed in sustainable settings like network-based or portable desktop magnetic disks, tape cassettes, backup CDs and DVDs, as well as servers related to software [37]. There exists a palpable fear among these individuals of losing their heritage and history, a concern that is justified given how drastically different their lives were compared to contemporary society [13]. Additionally, there are numerous ongoing research initiatives that involve both technology and human efforts, highlighting a robust demand for digital archiving [38]. Menschen is developing a digital archive intended to categorize and preserve various materials, including full texts, images, audio recordings, videos and websites in Swiss languages and dialects. As part of the initiative to design the Digital Oral Archive for Endangered Knowledge, the Association AIDA is contemplating the creation of digital archives [39]. Each category boasts a significant number of archives [12]. Additionally, the Library of Congress hosts numerous digital archives as well [11]. These archives are meticulously structured regarding their usage, digital formats and data descriptions [40].

5 Conclusion

Globally, there is a significant and increasing interest in indigenous peoples and their traditional or minority languages, as well as a related curiosity about how these communities utilize digital technologies. While this text acknowledges both areas of interest, it notably diverges from much of the existing literature that emphasizes the potential benefits of digital technologies for reclaiming indigenous languages. Instead, the primary focus here has been to investigate some of the risks associated with indigenous knowledge and understanding, as well as the languages that convey them. This is not to suggest that digital technologies lack the capacity to play a crucial and distinctive role in recording, preserving and maintaining indigenous knowledge
